```
template<typename _InternT, typename _ExternT, typename _StateT>
virtual result std::codecvt< _InternT, _ExternT, _StateT >::do_out (
 state_type & __state,
 const intern_type * __from,
 const intern_type * __from_end,
 const intern_type *& __from_next,
 extern_type * __to,
 extern_type * __to_end,
 extern_type *& __to_next) const [protected], [virtual], [inherited]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This function is a hook for derived classes to change the value returned.

##### See also

[do\\_in](#) for more information.

Implements [std::\\_\\_codecvt\\_abstract\\_base](#)< `_InternT`, `_ExternT`, `_StateT` >.

#### 4.357.2.2 in()

```
template<typename _InternT, typename _ExternT, typename _StateT>
result std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >::in (
 state_type & __state,
 const extern_type * __from,
 const extern_type * __from_end,
 const extern_type *& __from_next,
 intern_type * __to,
 intern_type * __to_end,
 intern_type *& __to_next) const [inline], [inherited]
```

Convert from external to internal character set.

Converts input string of `extern_type` to output string of `intern_type`. This is analogous to `mbsrtowcs`. It does this by calling `codecvt::do_in`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

## Parameters

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

## Returns

codecvt\_base::result.

Definition at line 196 of file codecvt.h.

## 4.357.2.3 out()

```
template<typename _InternT, typename _ExternT, typename _StateT>
result std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >::out (
 state_type & __state,
 const intern_type * __from,
 const intern_type * __from_end,
 const intern_type *& __from_next,
 extern_type * __to,
 extern_type * __to_end,
 extern_type *& __to_next) const [inline], [inherited]
```

Convert from internal to external character set.

Converts input string of intern\_type to output string of extern\_type. This is analogous to wcsrtombs. It does this by calling codecvt::do\_out.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from\_end) are converted and written to [to,to\_end). from\_next and to\_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from\_next and to\_next are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of codecvt\_base::result. If all the input is converted, returns codecvt\_base::ok. If no conversion is necessary, returns codecvt\_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt\_base::partial. Otherwise the conversion failed and codecvt\_base::error is returned.

**Parameters**

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

**Returns**

`codecvt_base::result`.

Definition at line 116 of file `codecvt.h`.

**4.357.2.4 unshift()**

```
template<typename _InternT, typename _ExternT, typename _StateT>
result std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >::unshift (
 state_type & __state,
 extern_type * __to,
 extern_type * __to_end,
 extern_type *& __to_next) const [inline], [inherited]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

**Parameters**

|                        |                                      |
|------------------------|--------------------------------------|
| <code>__state</code>   | Persistent conversion state data.    |
| <code>__to</code>      | Start of output buffer.              |
| <code>__to_end</code>  | End of output buffer.                |
| <code>__to_next</code> | Returns start of unused output area. |

## Returns

codecvt\_base::result.

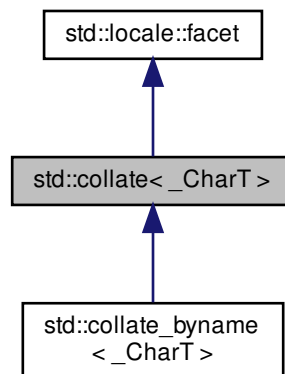

Definition at line 155 of file codecvt.h.

#### 4.358.1 Detailed Description

```
template<typename _CharT>
class std::collate<_CharT>
```

Facet for localized string comparison.

This facet encapsulates the code to compare strings in a localized manner.

The collate template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the collate facet.

Definition at line 644 of file locale\_classes.h.

#### 4.358.2 Member Typedef Documentation

##### 4.358.2.1 char\_type

```
template<typename _CharT>
typedef _CharT std::collate<_CharT>::char_type
```

Public typedefs.

Definition at line 650 of file locale\_classes.h.

##### 4.358.2.2 string\_type

```
template<typename _CharT>
typedef basic_string<_CharT> std::collate<_CharT>::string_type
```

Public typedefs.

Definition at line 651 of file locale\_classes.h.

#### 4.358.3 Constructor & Destructor Documentation

##### 4.358.3.1 collate() [1/2]

```
template<typename _CharT>
std::collate<_CharT>::collate (
 size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

**Parameters**

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

Definition at line 671 of file locale\_classes.h.

**4.358.3.2 collate()** [2/2]

```
template<typename _CharT>
std::collate< _CharT >::collate (
 __c_locale __cloc,
 size_t __refs = 0) [inline], [explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

**Parameters**

|                     |                                 |
|---------------------|---------------------------------|
| <code>__cloc</code> | The C locale.                   |
| <code>__refs</code> | Passed to the base facet class. |

Definition at line 685 of file locale\_classes.h.

**4.358.3.3 ~collate()**

```
template<typename _CharT>
virtual std::collate< _CharT >::~~collate () [inline], [protected], [virtual]
```

Destructor.

Definition at line 748 of file locale\_classes.h.

**4.358.4 Member Function Documentation****4.358.4.1 compare()**

```
template<typename _CharT>
int std::collate< _CharT >::compare (
 const _CharT * __lo1,
 const _CharT * __hi1,
 const _CharT * __lo2,
 const _CharT * __hi2) const [inline]
```

Compare two strings.

This function compares two strings and returns the result by calling `collate::do_compare()`.

## Parameters

|                    |                    |
|--------------------|--------------------|
| <code>__lo1</code> | Start of string 1. |
| <code>__hi1</code> | End of string 1.   |
| <code>__lo2</code> | Start of string 2. |
| <code>__hi2</code> | End of string 2.   |

## Returns

1 if `string1 > string2`, -1 if `string1 < string2`, else 0.

Definition at line 702 of file `locale_classes.h`.

## 4.358.4.2 do\_compare()

```
template<typename _CharT>
int std::collate<_CharT>::do_compare (
 const _CharT * __lo1,
 const _CharT * __hi1,
 const _CharT * __lo2,
 const _CharT * __hi2) const [protected], [virtual]
```

Compare two strings.

This function is a hook for derived classes to change the value returned.

## See also

`compare()`.

## Parameters

|                    |                    |
|--------------------|--------------------|
| <code>__lo1</code> | Start of string 1. |
| <code>__hi1</code> | End of string 1.   |
| <code>__lo2</code> | Start of string 2. |
| <code>__hi2</code> | End of string 2.   |

## Returns

1 if `string1 > string2`, -1 if `string1 < string2`, else 0.

Definition at line 161 of file `locale_classes.tcc`.

References `std::basic_string<_CharT, _Traits, _Alloc>::c_str()`, `std::basic_string<_CharT, _Traits, _Alloc>::data()`, and `std::basic_string<_CharT, _Traits, _Alloc>::length()`.

#### 4.358.4.3 do\_hash()

```
template<typename _CharT>
long std::collate< _CharT >::do_hash (
 const _CharT * __lo,
 const _CharT * __hi) const [protected], [virtual]
```

Return hash of a string.

This function computes and returns a hash on the input string. This function is a hook for derived classes to change the value returned.

##### Parameters

|                     |                  |
|---------------------|------------------|
| $\leftarrow$<br>_lo | Start of string. |
| $\leftarrow$<br>_hi | End of string.   |

##### Returns

Hash value.

Definition at line 256 of file locale\_classes.tcc.

#### 4.358.4.4 do\_transform()

```
template<typename _CharT>
collate< _CharT >::string_type std::collate< _CharT >::do_transform (
 const _CharT * __lo,
 const _CharT * __hi) const [protected], [virtual]
```

Transform string to comparable form.

This function is a hook for derived classes to change the value returned.

##### Parameters

|                     |        |
|---------------------|--------|
| $\leftarrow$<br>_lo | Start. |
| $\leftarrow$<br>_hi | End.   |

##### Returns

transformed string.

Definition at line 200 of file locale\_classes.tcc.

References `std::basic_string<_CharT, _Traits, _Alloc>::c_str()`, `std::basic_string<_CharT, _Traits, _Alloc>::data()`, and `std::basic_string<_CharT, _Traits, _Alloc>::length()`.

#### 4.358.4.5 hash()

```
template<typename _CharT>
long std::collate<_CharT>::hash (
 const _CharT * __lo,
 const _CharT * __hi) const [inline]
```

Return hash of a string.

This function computes and returns a hash on the input string. It does so by returning `collate::do_hash()`.

##### Parameters

|                        |                  |
|------------------------|------------------|
| <code>↔<br/>_lo</code> | Start of string. |
| <code>↔<br/>_hi</code> | End of string.   |

##### Returns

Hash value.

Definition at line 735 of file locale\_classes.h.

#### 4.358.4.6 transform()

```
template<typename _CharT>
string_type std::collate<_CharT>::transform (
 const _CharT * __lo,
 const _CharT * __hi) const [inline]
```

Transform string to comparable form.

This function is a wrapper for `strxfrm` functionality. It takes the input string and returns a modified string that can be directly compared to other transformed strings. In the C locale, this function just returns a copy of the input string. In some other locales, it may replace two chars with one, change a char for another, etc. It does so by returning `collate::do_transform()`.

## Parameters

|                         |                  |
|-------------------------|------------------|
| <code>_↵<br/>_lo</code> | Start of string. |
| <code>_↵<br/>_hi</code> | End of string.   |

## Returns

Transformed string\_type.

Definition at line 721 of file locale\_classes.h.

## 4.358.5 Member Data Documentation

## 4.358.5.1 id

```
template<typename _CharT>
locale::id std::collate< _CharT >::id [static]
```

Numpunct facet id.

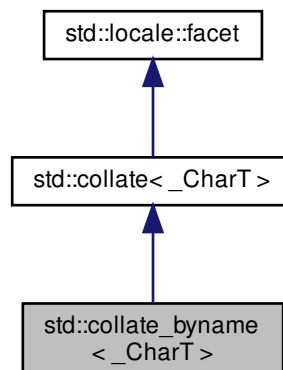

Definition at line 661 of file locale\_classes.h.

```
template<typename _CharT >
typedef basic_string<_CharT> std::collate_byname< _CharT >::string_type
```

Public typedefs.

Definition at line 824 of file `locale_classes.h`.

### 4.359.3 Member Function Documentation

#### 4.359.3.1 `compare()`

```
template<typename _CharT>
int std::collate< _CharT >::compare (
 const _CharT * __lo1,
 const _CharT * __hi1,
 const _CharT * __lo2,
 const _CharT * __hi2) const [inline], [inherited]
```

Compare two strings.

This function compares two strings and returns the result by calling `collate::do_compare()`.

## Parameters

|                    |                    |
|--------------------|--------------------|
| <code>__lo1</code> | Start of string 1. |
| <code>__hi1</code> | End of string 1.   |
| <code>__lo2</code> | Start of string 2. |
| <code>__hi2</code> | End of string 2.   |

## Returns

1 if `string1 > string2`, -1 if `string1 < string2`, else 0.

Definition at line 702 of file `locale_classes.h`.

## 4.359.3.2 do\_compare()

```
template<typename _CharT>
int std::collate< _CharT >::do_compare (
 const _CharT * __lo1,
 const _CharT * __hi1,
 const _CharT * __lo2,
 const _CharT * __hi2) const [protected], [virtual], [inherited]
```

Compare two strings.

This function is a hook for derived classes to change the value returned.

## See also

`compare()`.

## Parameters

|                    |                    |
|--------------------|--------------------|
| <code>__lo1</code> | Start of string 1. |
| <code>__hi1</code> | End of string 1.   |
| <code>__lo2</code> | Start of string 2. |
| <code>__hi2</code> | End of string 2.   |

## Returns

1 if `string1 > string2`, -1 if `string1 < string2`, else 0.

Definition at line 161 of file `locale_classes.tcc`.

References `std::basic_string< _CharT, _Traits, _Alloc >::c_str()`, `std::basic_string< _CharT, _Traits, _Alloc >::data()`, and `std::basic_string< _CharT, _Traits, _Alloc >::length()`.

#### 4.359.3.3 do\_hash()

```
template<typename _CharT>
long std::collate< _CharT >::do_hash (
 const _CharT * __lo,
 const _CharT * __hi) const [protected], [virtual], [inherited]
```

Return hash of a string.

This function computes and returns a hash on the input string. This function is a hook for derived classes to change the value returned.

##### Parameters

|                                                                                               |                  |
|-----------------------------------------------------------------------------------------------|------------------|
|  <i>__lo</i> | Start of string. |
|  <i>__hi</i> | End of string.   |

##### Returns

Hash value.

Definition at line 256 of file locale\_classes.tcc.

#### 4.359.3.4 do\_transform()

```
template<typename _CharT>
collate< _CharT >::string_type std::collate< _CharT >::do_transform (
 const _CharT * __lo,
 const _CharT * __hi) const [protected], [virtual], [inherited]
```

Transform string to comparable form.

This function is a hook for derived classes to change the value returned.

##### Parameters

|                                                                                                 |        |
|-------------------------------------------------------------------------------------------------|--------|
|  <i>__lo</i> | Start. |
|  <i>__hi</i> | End.   |

##### Returns

transformed string.

Definition at line 200 of file locale\_classes.tcc.

References `std::basic_string< _CharT, _Traits, _Alloc >::c_str()`, `std::basic_string< _CharT, _Traits, _Alloc >::data()`, and `std::basic_string< _CharT, _Traits, _Alloc >::length()`.

#### 4.359.3.5 hash()

```
template<typename _CharT>
long std::collate< _CharT >::hash (
 const _CharT * __lo,
 const _CharT * __hi) const [inline], [inherited]
```

Return hash of a string.

This function computes and returns a hash on the input string. It does so by returning `collate::do_hash()`.

##### Parameters

|                   |                  |
|-------------------|------------------|
| <code>__lo</code> | Start of string. |
| <code>__hi</code> | End of string.   |

##### Returns

Hash value.

Definition at line 735 of file locale\_classes.h.

#### 4.359.3.6 transform()

```
template<typename _CharT>
string_type std::collate< _CharT >::transform (
 const _CharT * __lo,
 const _CharT * __hi) const [inline], [inherited]
```

Transform string to comparable form.

This function is a wrapper for `strxfrm` functionality. It takes the input string and returns a modified string that can be directly compared to other transformed strings. In the C locale, this function just returns a copy of the input string. In some other locales, it may replace two chars with one, change a char for another, etc. It does so by returning `collate::do_transform()`.

**Parameters**

|                         |                  |
|-------------------------|------------------|
| <code>_↵<br/>_lo</code> | Start of string. |
| <code>_↵<br/>_hi</code> | End of string.   |

**Returns**

Transformed string\_type.

Definition at line 721 of file locale\_classes.h.

**4.359.4 Member Data Documentation****4.359.4.1 id**

```
template<typename _CharT>
locale::id std::collate<_CharT >::id [static], [inherited]
```

Numpunct facet id.

## 4.367.1 Detailed Description

```
template<typename _Tp>
struct std::complex< _Tp >
```

Template to represent complex numbers.

Specializations for float, double, and long double are part of the library. Results with any other type are not guaranteed.

## Parameters

|           |                                    |
|-----------|------------------------------------|
| <i>Tp</i> | Type of real and imaginary values. |
|-----------|------------------------------------|

Definition at line 67 of file complex.

## 4.367.2 Member Typedef Documentation

#### 4.367.2.1 value\_type

```
template<typename _Tp >
typedef _Tp std::complex< _Tp >::value_type
```

Value typedef.

Definition at line 130 of file complex.

### 4.367.3 Constructor & Destructor Documentation

#### 4.367.3.1 complex() [1/2]

```
template<typename _Tp >
constexpr std::complex< _Tp >::complex (
 const _Tp & __r = _Tp(),
 const _Tp & __i = _Tp()) [inline]
```

Default constructor. First parameter is x, second parameter is y. Unspecified parameters default to 0.

Definition at line 134 of file complex.

#### 4.367.3.2 complex() [2/2]

```
template<typename _Tp >
template<typename _Up >
constexpr std::complex< _Tp >::complex (
 const complex< _Up > & __z) [inline]
```

Converting constructor.

Definition at line 144 of file complex.

### 4.367.4 Member Function Documentation

#### 4.367.4.1 operator+=()

```
template<typename _Tp >
constexpr complex<_Tp>& std::complex< _Tp >::operator+= (
 const _Tp & __t) [inline]
```

Add a scalar to this complex number.

Definition at line 189 of file complex.

#### 4.367.4.2 operator-=( )

```
template<typename _Tp >
constexpr complex<_Tp>& std::complex< _Tp >::operator-= (
 const _Tp & __t) [inline]
```

Subtract a scalar from this complex number.

Definition at line 198 of file `complex`.

#### 4.379 std::const\_mem\_fun1\_t< \_Ret, \_Tp, \_Arg > Class Template Reference

Inheritance diagram for std::const\_mem\_fun1\_t< \_Ret, \_Tp, \_Arg >:

##### Public Types

- typedef const \_Tp \* [first\\_argument\\_type](#)
- typedef \_Ret [result\\_type](#)
- typedef \_Arg [second\\_argument\\_type](#)

##### Public Member Functions

- **const\_mem\_fun1\_t** (\_Ret(\_Tp::\*\_\_pf)(\_Arg) const)
- \_Ret **operator()** (const \_Tp \* \_\_p, \_Arg \_\_x) const

#### 4.379.1 Detailed Description

```
template<typename _Ret, typename _Tp, typename _Arg>
class std::const_mem_fun1_t<_Ret, _Tp, _Arg>
```

One of the [adaptors for member pointers](#).

Definition at line 1293 of file stl\_function.h.

#### 4.379.2 Member Typedef Documentation

##### 4.379.2.1 first\_argument\_type

```
typedef const _Tp * std::binary_function< const _Tp * , _Arg , _Ret >::first_argument_type [inherited]
```

first\_argument\_type is the type of the first argument

Definition at line 121 of file stl\_function.h.

##### 4.379.2.2 result\_type

```
typedef _Ret std::binary_function< const _Tp * , _Arg , _Ret >::result_type [inherited]
```

result\_type is the return type

Definition at line 127 of file stl\_function.h.

##### 4.379.2.3 second\_argument\_type

```
typedef _Arg std::binary_function< const _Tp * , _Arg , _Ret >::second_argument_type [inherited]
```

second\_argument\_type is the type of the second argument

Definition at line 124 of file stl\_function.h.

The documentation for this class was generated from the following file:

- [stl\\_function.h](#)

### 4.380 `std::const_mem_fun_ref_t<_Ret, _Tp>` Class Template Reference

Inheritance diagram for `std::const_mem_fun_ref_t<_Ret, _Tp>`:

#### Public Types

- typedef `_Tp` [argument\\_type](#)
- typedef `_Ret` [result\\_type](#)

#### Public Member Functions

- **`const_mem_fun_ref_t`** (`_Ret(_Tp::*__pf)()` const)
- `_Ret` **`operator()`** (const `_Tp &__r`) const

#### 4.380.1 Detailed Description

```
template<typename _Ret, typename _Tp>
class std::const_mem_fun_ref_t<_Ret, _Tp>
```

One of the [adaptors for member pointers](#).

Definition at line 1257 of file `stl_function.h`.

#### 4.380.2 Member Typedef Documentation

## 4.380.2.1 argument\_type

```
typedef _Tp std::unary_function< _Tp , _Ret >::argument_type [inherited]
```

argument\_type is the type of the argument

Definition at line 108 of file stl\_function.h.

## 4.380.2.2 result\_type

```
typedef _Ret std::unary_function< _Tp , _Ret >::result_type [inherited]
```

result\_type is the return type

Definition at line 111 of file stl\_function.h.

The documentation for this class was generated from the following file:

- [stl\\_function.h](#)

## 4.381 std::const\_mem\_fun\_t&lt;\_Ret, \_Tp&gt; Class Template Reference

Inheritance diagram for std::const\_mem\_fun\_t<\_Ret, \_Tp>:

## Public Types

- typedef const\_Tp \* [argument\\_type](#)
- typedef \_Ret [result\\_type](#)

## Public Member Functions

- **const\_mem\_fun\_t** (\_Ret(\_Tp::\_\_pf)() const)
- **\_Ret operator()** (const \_Tp \*\_\_p) const

### 4.381.1 Detailed Description

```
template<typename _Ret, typename _Tp>
class std::const_mem_fun_t<_Ret, _Tp>
```

One of the [adaptors for member pointers](#).

Definition at line 1221 of file `stl_function.h`.

### 4.381.2 Member Typedef Documentation

#### 4.381.2.1 argument\_type

```
typedef const _Tp * std::unary_function< const _Tp * , _Ret >::argument_type [inherited]
```

`argument_type` is the type of the argument

Definition at line 108 of file `stl_function.h`.

#### 4.381.2.2 result\_type

```
typedef _Ret std::unary_function< const _Tp * , _Ret >::result_type [inherited]
```

`result_type` is the return type

Definition at line 111 of file `stl_function.h`.

The documentation for this class was generated from the following file:

- [stl\\_function.h](#)

## 4.382 `__gnu_cxx::constant_binary_fun<_Result, _Arg1, _Arg2>` Struct Template Reference

Inherits `__gnu_cxx::Constant_binary_fun<_Result, _Arg1, _Arg2>`.

## Public Types

- typedef `_Arg1` **first\_argument\_type**
- typedef `_Result` **result\_type**
- typedef `_Arg2` **second\_argument\_type**

## Public Member Functions

- **constant\_binary\_fun** (const `_Result` &\_\_v)
- const `result_type` & **operator()** (const `_Arg1` &, const `_Arg2` &) const

## Public Attributes

- `_Result` **M\_val**

## 4.382.1 Detailed Description

```
template<class _Result, class _Arg1 = _Result, class _Arg2 = _Arg1>
struct __gnu_cxx::constant_binary_fun< _Result, _Arg1, _Arg2 >
```

An [SGI extension](#) .

Definition at line 312 of file `ext/functional`.

The documentation for this struct was generated from the following file:

- [ext/functional](#)

4.383 `__gnu_parallel::constant_size_blocks_tag` Struct Reference

Inheritance diagram for `__gnu_parallel::constant_size_blocks_tag`:

#### 4.383.1 Detailed Description

Selects the constant block size variant for `std::find()`.

See also

`_GLIBCXX_FIND_CONSTANT_SIZE_BLOCKS`

Definition at line 178 of file `tags.h`.

The documentation for this struct was generated from the following file:

- [tags.h](#)

#### 4.384 `__gnu_cxx::constant_unary_fun<_Result, _Argument>` Struct Template Reference

Inherits `__gnu_cxx::_Constant_unary_fun<_Result, _Argument>`.

##### Public Types

- `typedef _Argument argument_type`
- `typedef _Result result_type`

##### Public Member Functions

- `constant_unary_fun (const _Result &__v)`
- `const result_type & operator() (const _Argument &) const`

##### Public Attributes

- `result_type _M_val`

#### 4.384.1 Detailed Description

```
template<class _Result, class _Argument = _Result>
struct __gnu_cxx::constant_unary_fun<_Result, _Argument>
```

An [SGL extension](#) .

Definition at line 304 of file `ext/functional`.

The documentation for this struct was generated from the following file:

- [ext/functional](#)

## 4.385 `__gnu_cxx::constant_void_fun<_Result>` Struct Template Reference

Inherits `__gnu_cxx::_Constant_void_fun<_Result>`.

### Public Types

- typedef `_Result` **result\_type**

### Public Member Functions

- **constant\_void\_fun** (const `_Result` &\_\_v)
- const `result_type` & **operator()** () const

### Public Attributes

- `result_type` **\_M\_val**

#### 4.385.1 Detailed Description

```
template<class _Result>
struct __gnu_cxx::constant_void_fun<_Result>
```

An [SGI extension](#) .

Definition at line 295 of file `ext/functional`.

The documentation for this struct was generated from the following file:

- [ext/functional](#)

## 4.386 `__gnu_pbds::detail::container_base_dispatch<Key, Mapped, _Alloc, Tag, Policy_TI>` Struct Template Reference

#### 4.386.1 Detailed Description

```
template<typename Key, typename Mapped, typename _Alloc, typename Tag, typename Policy_TI = null_type>
struct __gnu_pbds::detail::container_base_dispatch<Key, Mapped, _Alloc, Tag, Policy_TI>
```

Dispatch mechanism, primary template for associative types.

Definition at line 449 of file `tag_and_trait.hpp`.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

#### 4.387 `__gnu_pbds::detail::container_base_dispatch<_VTp, Cmp_Fn, _Alloc, binary_heap_tag, null_type >` Struct Template Reference

##### Public Types

- typedef `binary_heap<_VTp, Cmp_Fn, _Alloc >` `type`

##### 4.387.1 Detailed Description

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
struct __gnu_pbds::detail::container_base_dispatch<_VTp, Cmp_Fn, _Alloc, binary_heap_tag, null_type >
```

Specialization for `binary_heap`.

Definition at line 95 of file `priority_queue_base_dispatch.hpp`.

##### 4.387.2 Member Typedef Documentation

###### 4.387.2.1 `type`

```
template<typename _VTp , typename Cmp_Fn , typename _Alloc >
typedef binary_heap<_VTp, Cmp_Fn, _Alloc> __gnu_pbds::detail::container_base_dispatch<_VTp,
Cmp_Fn, _Alloc, binary_heap_tag, null_type >::type
```

Dispatched type.

Definition at line 99 of file `priority_queue_base_dispatch.hpp`.

The documentation for this struct was generated from the following file:

- `priority_queue_base_dispatch.hpp`

#### 4.388 `__gnu_pbds::detail::container_base_dispatch<_VTp, Cmp_Fn, _Alloc, binomial_heap_tag, null_type >` Struct Template Reference

##### Public Types

- typedef `binomial_heap<_VTp, Cmp_Fn, _Alloc >` `type`

#### 4.388.1 Detailed Description

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
struct __gnu_pbds::detail::container_base_dispatch<_VTp, Cmp_Fn, _Alloc, binomial_heap_tag, null_type >
```

Specialization for binomial\_heap.

Definition at line 77 of file priority\_queue\_base\_dispatch.hpp.

#### 4.388.2 Member Typedef Documentation

##### 4.388.2.1 type

```
template<typename _VTp , typename Cmp_Fn , typename _Alloc >
typedef binomial_heap<_VTp, Cmp_Fn, _Alloc> __gnu_pbds::detail::container_base_dispatch<_VTp,
Cmp_Fn, _Alloc, binomial_heap_tag, null_type >::type
```

Dispatched type.

Definition at line 81 of file priority\_queue\_base\_dispatch.hpp.

The documentation for this struct was generated from the following file:

- [priority\\_queue\\_base\\_dispatch.hpp](#)

## 4.389 \_\_gnu\_pbds::detail::container\_base\_dispatch<\_VTp, Cmp\_Fn, \_Alloc, pairing\_heap\_tag, null\_type >

### Struct Template Reference

#### Public Types

- typedef [pairing\\_heap](#)<\_VTp, Cmp\_Fn, \_Alloc > [type](#)

#### 4.389.1 Detailed Description

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
struct __gnu_pbds::detail::container_base_dispatch<_VTp, Cmp_Fn, _Alloc, pairing_heap_tag, null_type >
```

Specialization for pairing\_heap.

Definition at line 68 of file priority\_queue\_base\_dispatch.hpp.

#### 4.389.2 Member Typedef Documentation

##### 4.389.2.1 type

```
template<typename _VTp , typename Cmp_Fn , typename _Alloc >
typedef pairing_heap<_VTp, Cmp_Fn, _Alloc> __gnu_pbds::detail::container_base_dispatch< _VTp,
Cmp_Fn, _Alloc, pairing_heap_tag, null_type >::type
```

Dispatched type.

Definition at line 72 of file `priority_queue_base_dispatch.hpp`.

The documentation for this struct was generated from the following file:

- [priority\\_queue\\_base\\_dispatch.hpp](#)

#### 4.390 [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch](#)< \_VTp, Cmp\_Fn, \_Alloc, [rc\\_binomial\\_heap\\_tag](#), [null\\_type](#) > Struct Template Reference

##### Public Types

- typedef [rc\\_binomial\\_heap](#)< \_VTp, Cmp\_Fn, \_Alloc > [type](#)

##### 4.390.1 Detailed Description

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
struct __gnu_pbds::detail::container_base_dispatch< _VTp, Cmp_Fn, _Alloc, rc_binomial_heap_tag, null_type >
```

Specialization for `rc_binary_heap`.

Definition at line 86 of file `priority_queue_base_dispatch.hpp`.

#### 4.390.2 Member Typedef Documentation

##### 4.390.2.1 type

```
template<typename _VTp , typename Cmp_Fn , typename _Alloc >
typedef rc_binomial_heap<_VTp, Cmp_Fn, _Alloc> __gnu_pbds::detail::container_base_dispatch< _VTp,
Cmp_Fn, _Alloc, rc_binomial_heap_tag, null_type >::type
```

Dispatched type.

Definition at line 90 of file `priority_queue_base_dispatch.hpp`.

The documentation for this struct was generated from the following file:

- [priority\\_queue\\_base\\_dispatch.hpp](#)

#### 4.391 `__gnu_pbds::detail::container_base_dispatch<_VTp, Cmp_Fn, _Alloc, thin_heap_tag, null_type>` Struct Template Reference

##### Public Types

- typedef `thin_heap<_VTp, Cmp_Fn, _Alloc>` `type`

##### 4.391.1 Detailed Description

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
struct __gnu_pbds::detail::container_base_dispatch<_VTp, Cmp_Fn, _Alloc, thin_heap_tag, null_type>
```

Specialization for `thin_heap`.

Definition at line 104 of file `priority_queue_base_dispatch.hpp`.

##### 4.391.2 Member Typedef Documentation

###### 4.391.2.1 `type`

```
template<typename _VTp , typename Cmp_Fn , typename _Alloc >
typedef thin_heap<_VTp, Cmp_Fn, _Alloc> __gnu_pbds::detail::container_base_dispatch<_VTp, Cmp_Fn, _Alloc, thin_heap_tag, null_type>::type
```

Dispatched type.

Definition at line 108 of file `priority_queue_base_dispatch.hpp`.

The documentation for this struct was generated from the following file:

- `priority_queue_base_dispatch.hpp`

#### 4.392 `__gnu_pbds::detail::container_base_dispatch<Key, Mapped, _Alloc, cc_hash_tag, Policy_Tl>` Struct Template Reference

##### Public Types

- typedef `cc_ht_map<Key, Mapped, at0t, at1t, _Alloc, at3t::value, at4t, at2t>` `type`

#### 4.392.1 Detailed Description

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_Tl>
struct __gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, cc_hash_tag, Policy_Tl >
```

Specialization collision-chaining hash map.

Definition at line 258 of file container\_base\_dispatch.hpp.

#### 4.392.2 Member Typedef Documentation

##### 4.392.2.1 type

```
template<typename Key , typename Mapped , typename _Alloc , typename Policy_Tl >
typedef cc_ht_map<Key, Mapped, at0t, at1t, _Alloc, at3t::value, at4t, at2t> __gnu_pbds::detail::container_base_d
Key, Mapped, _Alloc, cc_hash_tag, Policy_Tl >::type
```

Dispatched type.

Definition at line 275 of file container\_base\_dispatch.hpp.

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

#### 4.393 \_\_gnu\_pbds::detail::container\_base\_dispatch< Key, Mapped, \_Alloc, gp\_hash\_tag, Policy\_Tl > Struct Template Reference

##### Public Types

- typedef [gp\\_ht\\_map](#)< Key, Mapped, at0t, at1t, \_Alloc, at3t::value, at4t, at5t, at2t > [type](#)

#### 4.393.1 Detailed Description

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_Tl>
struct __gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, gp_hash_tag, Policy_Tl >
```

Specialization general-probe hash map.

Definition at line 303 of file container\_base\_dispatch.hpp.

#### 4.393.2 Member Typedef Documentation

##### 4.393.2.1 type

```
template<typename Key , typename Mapped , typename _Alloc , typename Policy_Tl >
typedef gp_ht_map<Key, Mapped, at0t, at1t, _Alloc, at3t::value, at4t, at5t, at2t> __gnu_pbds::detail::container_b
Key, Mapped, _Alloc, gp_hash_tag, Policy_Tl >::type
```

Dispatched type.

Definition at line 322 of file `container_base_dispatch.hpp`.

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

#### 4.394 `__gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, list_update_tag, Policy_Tl >`

##### Struct Template Reference

##### Public Types

- typedef [lu\\_map](#)< Key, Mapped, at0t, \_Alloc, at1t > [type](#)

#### 4.394.1 Detailed Description

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_Tl>
struct __gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, list_update_tag, Policy_Tl >
```

Specialization for list-update map.

Definition at line 107 of file `container_base_dispatch.hpp`.

#### 4.394.2 Member Typedef Documentation

##### 4.394.2.1 type

```
template<typename Key , typename Mapped , typename _Alloc , typename Policy_Tl >
typedef lu_map<Key, Mapped, at0t, _Alloc, at1t> __gnu_pbds::detail::container_base_dispatch< Key,
Mapped, _Alloc, list_update_tag, Policy_Tl >::type
```

Dispatched type.

Definition at line 118 of file `container_base_dispatch.hpp`.

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

#### 4.395 `__gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, ov_tree_tag, Policy_Tl >` Struct Template Reference

##### Public Types

- typedef `ov_tree_map< Key, Mapped, at0t, at1t, _Alloc >` `type`

##### 4.395.1 Detailed Description

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_Tl>
struct __gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, ov_tree_tag, Policy_Tl >
```

Specialization ordered-vector tree map.

Definition at line 227 of file `container_base_dispatch.hpp`.

##### 4.395.2 Member Typedef Documentation

###### 4.395.2.1 `type`

```
template<typename Key , typename Mapped , typename _Alloc , typename Policy_Tl >
typedef ov_tree_map<Key, Mapped, at0t, at1t, _Alloc> __gnu_pbds::detail::container_base_dispatch<
Key, Mapped, _Alloc, ov_tree_tag, Policy_Tl >::type
```

Dispatched type.

Definition at line 237 of file `container_base_dispatch.hpp`.

The documentation for this struct was generated from the following file:

- `container_base_dispatch.hpp`

#### 4.396 `__gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, pat_trie_tag, Policy_Tl >` Struct Template Reference

##### Public Types

- typedef `pat_trie_map< Key, Mapped, at1t, _Alloc >` `type`

#### 4.396.1 Detailed Description

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_Tl>
struct __gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, pat_trie_tag, Policy_Tl >
```

Specialization for PATRICIA trie map.

Definition at line 139 of file `container_base_dispatch.hpp`.

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

### 4.397 `__gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, rb_tree_tag, Policy_Tl >` Struct Template Reference

#### Public Types

- typedef [rb\\_tree\\_map](#)< Key, Mapped, at0t, at1t, \_Alloc > [type](#)

#### 4.397.1 Detailed Description

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_Tl>
struct __gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, rb_tree_tag, Policy_Tl >
```

Specialization for R-B tree map.

Definition at line 165 of file `container_base_dispatch.hpp`.

#### 4.397.2 Member Typedef Documentation

##### 4.397.2.1 `type`

```
template<typename Key , typename Mapped , typename _Alloc , typename Policy_Tl >
typedef rb_tree_map<Key, Mapped, at0t, at1t, _Alloc> __gnu_pbds::detail::container_base_dispatch<
Key, Mapped, _Alloc, rb_tree_tag, Policy_Tl >::type
```

Dispatched type.

Definition at line 175 of file `container_base_dispatch.hpp`.

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

#### 4.398 `__gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, splay_tree_tag, Policy_Tl >` Struct Template Reference

##### Public Types

- typedef `splay_tree_map< Key, Mapped, at0t, at1t, _Alloc >` `type`

##### 4.398.1 Detailed Description

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_Tl>
struct __gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, splay_tree_tag, Policy_Tl >
```

Specialization splay tree map.

Definition at line 195 of file `container_base_dispatch.hpp`.

##### 4.398.2 Member Typedef Documentation

###### 4.398.2.1 `type`

```
template<typename Key , typename Mapped , typename _Alloc , typename Policy_Tl >
typedef splay_tree_map<Key, Mapped, at0t, at1t, _Alloc> __gnu_pbds::detail::container_base_dispatch<
Key, Mapped, _Alloc, splay_tree_tag, Policy_Tl >::type
```

Dispatched type.

Definition at line 206 of file `container_base_dispatch.hpp`.

The documentation for this struct was generated from the following file:

- `container_base_dispatch.hpp`

#### 4.399 `__gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, cc_hash_tag, Policy_Tl >` Struct Template Reference

##### Public Types

- typedef `cc_ht_set< Key, null_type, at0t, at1t, _Alloc, at3t::value, at4t, at2t >` `type`

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

#### 4.403 `__gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, pat_trie_tag, Policy_Tl >` Struct Template Reference

##### Public Types

- `typedef pat_trie_set< Key, null\_type, at1t, _Alloc > type`

#### 4.403.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Policy_Tl>
struct __gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, pat_trie_tag, Policy_Tl >
```

Specialization for PATRICIA trie set.

Definition at line 151 of file container\_base\_dispatch.hpp.

#### 4.403.2 Member Typedef Documentation

##### 4.403.2.1 type

```
template<typename Key , typename _Alloc , typename Policy_Tl >
typedef pat_trie_set<Key, null_type, at1t, _Alloc> __gnu_pbds::detail::container_base_dispatch<
Key, null_type, _Alloc, pat_trie_tag, Policy_Tl >::type
```

Dispatched type.

Definition at line 160 of file container\_base\_dispatch.hpp.

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

#### 4.404 \_\_gnu\_pbds::detail::container\_base\_dispatch< Key, null\_type, \_Alloc, rb\_tree\_tag, Policy\_Tl > Struct Template Reference

##### Public Types

- typedef rb\_tree\_set< Key, [null\\_type](#), at0t, at1t, \_Alloc > **type**

#### 4.404.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Policy_Tl>
struct __gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, rb_tree_tag, Policy_Tl >
```

Specialization for R-B tree set.

Definition at line 180 of file container\_base\_dispatch.hpp.

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

#### 4.405 `__gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, splay_tree_tag, Policy_Tl >` Struct Template Reference

##### Public Types

- `typedef splay_tree_set< Key, null\_type, at0t, at1t, _Alloc > type`

##### 4.405.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Policy_Tl>
struct __gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, splay_tree_tag, Policy_Tl >
```

Specialization splay tree set.

Definition at line 211 of file `container_base_dispatch.hpp`.

##### 4.405.2 Member Typedef Documentation

###### 4.405.2.1 `type`

```
template<typename Key , typename _Alloc , typename Policy_Tl >
typedef splay_tree_set<Key, null_type, at0t, at1t, _Alloc> __gnu_pbds::detail::container_base_dispatch<
Key, null_type, _Alloc, splay_tree_tag, Policy_Tl >::type
```

Dispatched type.

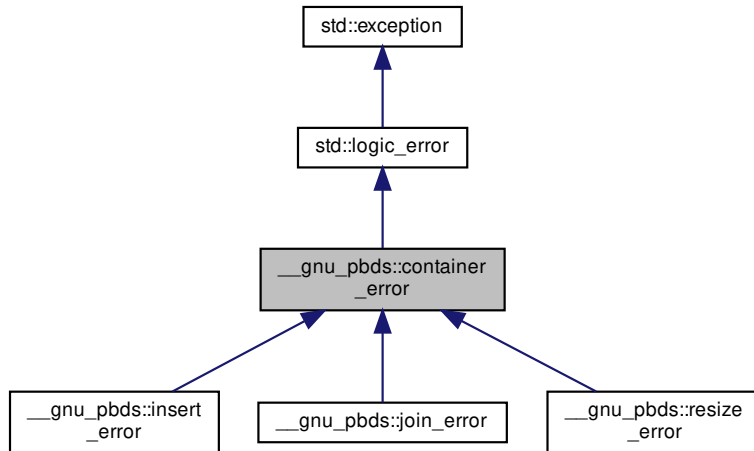

Definition at line 222 of file `container_base_dispatch.hpp`.

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

#### 4.406 `__gnu_pbds::container_error` Struct Reference

Inheritance diagram for `__gnu_pbds::container_error`:

##### Public Member Functions

- virtual const char \* [what](#) () const noexcept

##### 4.406.1 Detailed Description

Base class for exceptions.

Definition at line 57 of file `exception.hpp`.

##### 4.406.2 Member Function Documentation

###### 4.406.2.1 `what()`

```
virtual const char* std::logic_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future\\_error](#).

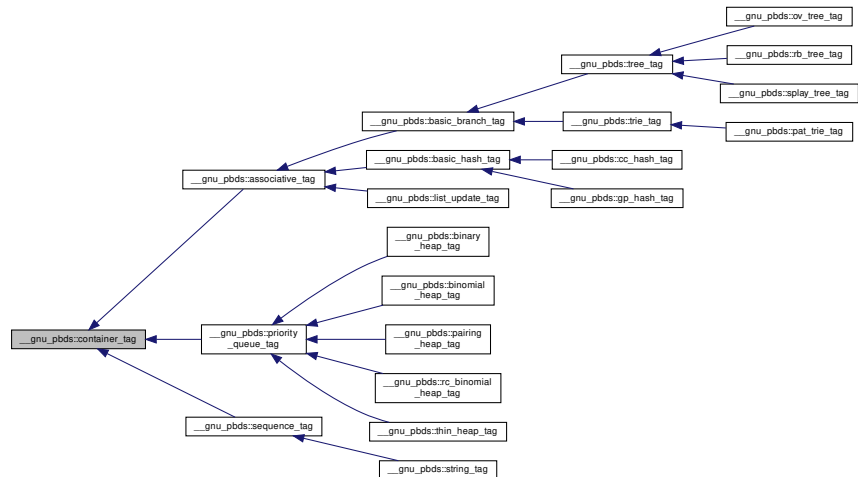

The documentation for this struct was generated from the following file:

- [exception.hpp](#)

## 4.407 \_\_gnu\_pbds::container\_tag Struct Reference

Inheritance diagram for \_\_gnu\_pbds::container\_tag:

## 4.407.1 Detailed Description

Base data structure tag.

Definition at line 125 of file tag\_and\_trait.hpp.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 4.408 \_\_gnu\_pbds::container\_traits&lt; Cntnr &gt; Struct Template Reference

Inheritance diagram for \_\_gnu\_pbds::container\_traits< Cntnr >:

## Public Types

- enum { [order\\_preserving](#), [erase\\_can\\_throw](#), [split\\_join\\_can\\_throw](#), [reverse\\_iteration](#) }
- typedef [container\\_traits\\_base](#)< container\_category > **base\_type**
- typedef Cntnr::container\_category **container\_category**
- typedef Cntnr **container\_type**
- typedef base\_type::invalidation\_guarantee **invalidation\_guarantee**

### 4.408.1 Detailed Description

```
template<typename Cntnr>
struct __gnu_pbds::container_traits< Cntnr >
```

Container traits.

Definition at line 418 of file tag\_and\_trait.hpp.

### 4.408.2 Member Enumeration Documentation

#### 4.408.2.1 anonymous enum

```
template<typename Cntnr >
anonymous enum
```

#### Enumerator

|                                      |                                                             |
|--------------------------------------|-------------------------------------------------------------|
| <a href="#">order_preserving</a>     | True only if Cntnr objects guarantee storing keys by order. |
| <a href="#">erase_can_throw</a>      | True only if erasing a key can throw.                       |
| <a href="#">split_join_can_throw</a> | True only if split or join operations can throw.            |
| <a href="#">reverse_iteration</a>    | True only reverse iterators are supported.                  |

Definition at line 426 of file tag\_and\_trait.hpp.

## 4.422.1 Detailed Description

```
template<typename _CharT>
class std::ctype<_CharT>
```

Primary class template ctype facet.

This template class defines classification and conversion functions for character sets. It wraps ctype functionality. Ctype gets used by streams for many I/O operations.

This template provides the protected virtual functions the developer will have to replace in a derived class or specialization to make a working facet. The public functions that access them are defined in `__ctype_abstract_base`, to allow for implementation flexibility. See `ctype<wchar_t>` for an example. The functions are documented in `__ctype_abstract_base`.

Note: implementations are provided for all the protected virtual functions, but will likely not be useful.

Definition at line 612 of file `locale_facets.h`.

## 4.422.2 Member Function Documentation

## 4.422.2.1 do\_is() [1/2]

```
template<typename _CharT>
virtual bool std::ctype<_CharT>::do_is (
 mask __m,
 char_type __c) const [protected], [virtual]
```

Test `char_type` classification.

This function finds a mask `M` for `c` and compares it to mask `m`.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

**Parameters**

|                                  |                                    |
|----------------------------------|------------------------------------|
| <a href="#"><code>__c</code></a> | The char_type to find the mask of. |
| <a href="#"><code>__m</code></a> | The mask to compare against.       |

**Returns**

(M & `__m`) != 0.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

**4.422.2.2 do\_is()** [2/2]

```
template<typename _CharT>
virtual const char_type* std::__ctype<_CharT>::do_is (
 const char_type * __lo,
 const char_type * __hi,
 mask * __vec) const [protected], [virtual]
```

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the input.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

**Parameters**

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

**Returns**

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

## 4.422.2.3 do\_narrow() [1/2]

```
template<typename _CharT>
virtual char std::ctype<_CharT>::do_narrow (
 char_type __c,
 char __dfault) const [protected], [virtual]
```

Narrow char\_type to char.

This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead.

do\_narrow() is a hook for a derived facet to change the behavior of narrowing. do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

|                       |                                     |
|-----------------------|-------------------------------------|
| <code>__c</code>      | The char_type to convert.           |
| <code>__dfault</code> | Char to return if conversion fails. |

## Returns

The converted char.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by [std::ctype<char>::narrow\(\)](#).

## 4.422.2.4 do\_narrow() [2/2]

```
template<typename _CharT>
virtual const char_type* std::ctype<_CharT>::do_narrow (
 const char_type * __lo,
 const char_type * __hi,
 char __dfault,
 char * __to) const [protected], [virtual]
```

Narrow char\_type array to char.

This virtual function converts each char\_type in the range [`__lo`,`__hi`) to char using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, `__dfault` is used instead.

do\_narrow() is a hook for a derived facet to change the behavior of narrowing. do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|                       |                                   |
|-----------------------|-----------------------------------|
| <code>__lo</code>     | Pointer to start of range.        |
| <code>__hi</code>     | Pointer to end of range.          |
| <code>__dfault</code> | Char to use if conversion fails.  |
| <code>__to</code>     | Pointer to the destination array. |

**Returns**

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

**4.422.2.5 do\_scan\_is()**

```
template<typename _CharT>
virtual const char_type* std::__ctype<_CharT>::do_scan_is (
 mask __m,
 const char_type * __lo,
 const char_type * __hi) const [protected], [virtual]
```

Find char\_type matching mask.

This function searches for and returns the first char\_type c in [`__lo`,`__hi`) for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

**Parameters**

|                   |                              |
|-------------------|------------------------------|
| <code>__m</code>  | The mask to compare against. |
| <code>__lo</code> | Pointer to start of range.   |
| <code>__hi</code> | Pointer to end of range.     |

**Returns**

Pointer to a matching char\_type if found, else `__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

## 4.422.2.6 do\_scan\_not()

```
template<typename _CharT>
virtual const char_type* std::ctype<_CharT>::do_scan_not (
 mask __m,
 const char_type * __lo,
 const char_type * __hi) const [protected], [virtual]
```

Find char\_type not matching mask.

This function searches for and returns a pointer to the first char\_type c of [lo,hi) for which is(m,c) is false.

do\_scan\_is() is a hook for a derived facet to change the behavior of match searching. do\_is() must always return the same result for the same input.

## Parameters

|                   |                              |
|-------------------|------------------------------|
| <code>__m</code>  | The mask to compare against. |
| <code>__lo</code> | Pointer to start of range.   |
| <code>__hi</code> | Pointer to end of range.     |

## Returns

Pointer to a non-matching char\_type if found, else `__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

## 4.422.2.7 do\_tolower() [1/2]

```
template<typename _CharT>
virtual char_type std::ctype<_CharT>::do_tolower (
 char_type __c) const [protected], [virtual]
```

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

## Parameters

|                  |                           |
|------------------|---------------------------|
| <code>__c</code> | The char_type to convert. |
|------------------|---------------------------|

**Returns**

The lowercase `char_type` if convertible, else `__c`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by `std::ctype<char>::tolower()`.

**4.422.2.8 do\_tolower()** [2/2]

```
template<typename _CharT>
virtual const char_type* std::ctype<_CharT>::do_tolower (
 char_type * __lo,
 const char_type * __hi) const [protected], [virtual]
```

Convert array to lowercase.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

**Parameters**

|                   |                            |
|-------------------|----------------------------|
| <code>__lo</code> | Pointer to start of range. |
| <code>__hi</code> | Pointer to end of range.   |

**Returns**

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

**4.422.2.9 do\_toupper()** [1/2]

```
template<typename _CharT>
virtual char_type std::ctype<_CharT>::do_toupper (
 char_type __c) const [protected], [virtual]
```

Convert to uppercase.

This virtual function converts the `char_type` argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

## Parameters

|                                                                                                                      |                           |
|----------------------------------------------------------------------------------------------------------------------|---------------------------|
| <a href="#"></a><br><code>_c</code> | The char_type to convert. |
|----------------------------------------------------------------------------------------------------------------------|---------------------------|

## Returns

The uppercase char\_type if convertible, else `__c`.

Implements [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >](#).

Referenced by `std::ctype< char >::toupper()`.

## 4.422.2.10 do\_toupper() [2/2]

```
template<typename _CharT>
virtual const char_type* std::ctype< _CharT >::do_toupper (
 char_type * __lo,
 const char_type * __hi) const [protected], [virtual]
```

Convert array to uppercase.

This virtual function converts each char\_type in the range [`__lo`,`__hi`) to uppercase if possible. Other elements remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

## Parameters

|                                                                                                                          |                            |
|--------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"></a><br><code>__lo</code> | Pointer to start of range. |
| <a href="#"></a><br><code>__hi</code> | Pointer to end of range.   |

## Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >](#).

## 4.422.2.11 do\_widen() [1/2]

```
template<typename _CharT>
virtual char_type std::ctype< _CharT >::do_widen (
 char __c) const [protected], [virtual]
```

Widen char.

This virtual function converts the char to char\_type using the simplest reasonable transformation.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

|                         |                      |
|-------------------------|----------------------|
| $\leftrightarrow$<br>_c | The char to convert. |
|-------------------------|----------------------|

#### Returns

The converted char\_type

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by `std::ctype<char>::widen()`.

#### 4.422.2.12 do\_widen() [2/2]

```
template<typename _CharT>
virtual const char* std::ctype<_CharT>::do_widen (
 const char * __lo,
 const char * __hi,
 char_type * __to) const [protected], [virtual]
```

Widen char array.

This function converts each char in the input to char\_type using the simplest reasonable transformation.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

|                          |                                   |
|--------------------------|-----------------------------------|
| $\leftrightarrow$<br>_lo | Pointer to start range.           |
| $\leftrightarrow$<br>_hi | Pointer to end of range.          |
| $\leftrightarrow$<br>_to | Pointer to the destination array. |

**Returns**`__hi`.Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).**4.422.2.13 is()** [1/2]

```
template<typename _CharT>
bool std::__ctype_abstract_base<_CharT>::is (
 mask __m,
 char_type __c) const [inline], [inherited]
```

Test char\_type classification.

This function finds a mask M for `__c` and compares it to mask `__m`. It does so by returning the value of `ctype<char_↔type>::do_is()`.

**Parameters**

|                        |                                       |
|------------------------|---------------------------------------|
| <code>↔<br/>__c</code> | The char_type to compare the mask of. |
| <code>↔<br/>__m</code> | The mask to compare against.          |

**Returns**`(M & __m) != 0`.

Definition at line 169 of file locale\_facets.h.

Referenced by `std::time_get<_CharT, _InIter>::get()`.**4.422.2.14 is()** [2/2]

```
template<typename _CharT>
const char_type* std::__ctype_abstract_base<_CharT>::is (
 const char_type * __lo,
 const char_type * __hi,
 mask * __vec) const [inline], [inherited]
```

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of `ctype<char_type>::do_is()`.

**Parameters**

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

**Returns**

`__hi`.

Definition at line 186 of file `locale_facets.h`.

**4.422.2.15 narrow()** [1/2]

```
template<typename _CharT>
char std::__ctype_abstract_base< _CharT >::narrow (
 char_type __c,
 char __dfault) const [inline], [inherited]
```

Narrow `char_type` to `char`.

This function converts the `char_type` to `char` using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead. It does so by returning `ctype<char_type>::do_narrow(__c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

|                       |                                        |
|-----------------------|----------------------------------------|
| <code>__c</code>      | The <code>char_type</code> to convert. |
| <code>__dfault</code> | Char to return if conversion fails.    |

**Returns**

The converted `char`.

Definition at line 331 of file `locale_facets.h`.

Referenced by `std::time_get< _CharT, _InIter >::get()`, and `std::time_put< _CharT, _OutIter >::put()`.

**4.422.2.16 narrow()** [2/2]

```
template<typename _CharT>
const char_type* std::__ctype_abstract_base< _CharT >::narrow (
```

```

const char_type * __lo,
const char_type * __hi,
char __default,
char * __to) const [inline], [inherited]

```

Narrow array to char array.

This function converts each `char_type` in the input to `char` using the simplest reasonable transformation and writes the results to the destination array. For any `char_type` in the input that cannot be converted, *default* is used instead. It does so by returning `ctype<char_type>::do_narrow(__lo, __hi, __default, __to)`.

Note: this is not what you want for codepage conversions. See `codecv`t for that.

#### Parameters

|                        |                                   |
|------------------------|-----------------------------------|
| <code>__lo</code>      | Pointer to start of range.        |
| <code>__hi</code>      | Pointer to end of range.          |
| <code>__default</code> | Char to use if conversion fails.  |
| <code>__to</code>      | Pointer to the destination array. |

#### Returns

`__hi`.

Definition at line 353 of file `locale_facets.h`.

#### 4.422.2.17 scan\_is()

```

template<typename _CharT>
const char_type* std::__ctype_abstract_base<_CharT>::scan_is (
 mask __m,
 const char_type * __lo,
 const char_type * __hi) const [inline], [inherited]

```

Find `char_type` matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is true. It does so by returning `ctype<char_type>::do_scan_is()`.

#### Parameters

|                   |                              |
|-------------------|------------------------------|
| <code>__m</code>  | The mask to compare against. |
| <code>__lo</code> | Pointer to start of range.   |
| <code>__hi</code> | Pointer to end of range.     |

**Returns**

Pointer to matching `char_type` if found, else `__hi`.

Definition at line 202 of file `locale_facets.h`.

**4.422.2.18 scan\_not()**

```
template<typename _CharT>
const char_type* std::__ctype_abstract_base< _CharT >::scan_not (
 mask __m,
 const char_type * __lo,
 const char_type * __hi) const [inline], [inherited]
```

Find `char_type` not matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is false. It does so by returning `ctype<char_type>::do_scan_not()`.

**Parameters**

|                                     |                                 |
|-------------------------------------|---------------------------------|
| <code>↔</code><br><code>__m</code>  | The mask to compare against.    |
| <code>↔</code><br><code>__lo</code> | Pointer to first char in range. |
| <code>↔</code><br><code>__hi</code> | Pointer to end of range.        |

**Returns**

Pointer to non-matching char if found, else `__hi`.

Definition at line 218 of file `locale_facets.h`.

**4.422.2.19 tolower()** [1/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::tolower (
 char_type __c) const [inline], [inherited]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_tolower(c)`.

## Parameters

|                  |                           |
|------------------|---------------------------|
| <code>__c</code> | The char_type to convert. |
|------------------|---------------------------|

## Returns

The lowercase char\_type if convertible, else `__c`.

Definition at line 261 of file locale\_facets.h.

Referenced by `std::time_get< _CharT, _InIter >::get()`.

## 4.422.2.20 tolower() [2/2]

```
template<typename _CharT>
const char_type* std::__ctype_abstract_base< _CharT >::tolower (
 char_type * __lo,
 const char_type * __hi) const [inline], [inherited]
```

Convert array to lowercase.

This function converts each char\_type in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_tolower(__lo,__hi)`.

## Parameters

|                   |                            |
|-------------------|----------------------------|
| <code>__lo</code> | Pointer to start of range. |
| <code>__hi</code> | Pointer to end of range.   |

## Returns

`__hi`.

Definition at line 276 of file locale\_facets.h.

## 4.422.2.21 toupper() [1/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::toupper (
 char_type __c) const [inline], [inherited]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

**Parameters**

|                                                                                                    |                           |
|----------------------------------------------------------------------------------------------------|---------------------------|
|  <code>__c</code> | The char_type to convert. |
|----------------------------------------------------------------------------------------------------|---------------------------|

**Returns**

The uppercase char\_type if convertible, else `__c`.

Definition at line 232 of file locale\_facets.h.

Referenced by `std::time_get<_CharT, _InIter >::get()`.

**4.422.2.22 toupper()** [2/2]

```
template<typename _CharT>
const char_type* std::__ctype_abstract_base<_CharT >::toupper (
 char_type * __lo,
 const char_type * __hi) const [inline], [inherited]
```

Convert array to uppercase.

This function converts each char\_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_toupper(lo, hi)`.

**Parameters**

|                                                                                                       |                            |
|-------------------------------------------------------------------------------------------------------|----------------------------|
|  <code>__lo</code> | Pointer to start of range. |
|  <code>__hi</code> | Pointer to end of range.   |

**Returns**

`__hi`.

Definition at line 247 of file locale\_facets.h.

**4.422.2.23 widen()** [1/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base<_CharT >::widen (
 char __c) const [inline], [inherited]
```

Widen `char` to `char_type`.

This function converts the `char` argument to `char_type` using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

|                 |                      |
|-----------------|----------------------|
| <code>_↵</code> | The char to convert. |
| <code>_c</code> |                      |

**Returns**

The converted `char_type`.

Definition at line 293 of file `locale_facets.h`.

Referenced by `std::time_get<_CharT, _InIter >::do_get()`, `std::money_get<_CharT, _InIter >::do_get()`, `std::time_↵put<_CharT, _OutIter >::do_put()`, and `std::money_put<_CharT, _OutIter >::do_put()`.

**4.422.2.24 widen() [2/2]**

```
template<typename _CharT>
const char* std::__ctype_abstract_base<_CharT >::widen (
 const char * __lo,
 const char * __hi,
 char_type * __to) const [inline], [inherited]
```

Widen array to `char_type`.

This function converts each char in the input to `char_type` using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

|                                     |                                   |
|-------------------------------------|-----------------------------------|
| <code>_↵</code><br><code>_lo</code> | Pointer to start of range.        |
| <code>_↵</code><br><code>_hi</code> | Pointer to end of range.          |
| <code>_↵</code><br><code>_to</code> | Pointer to the destination array. |

**Returns**

`__hi`.

Definition at line 312 of file `locale_facets.h`.

**4.422.3 Member Data Documentation**

## 4.422.3.1 id

```
template<typename _CharT>
locale::id std::ctype< _CharT >::id [static]
```

The facet id for ctype<char\_type>

## 4.423.1 Detailed Description

```
template<>
class std::ctype< char >
```

The ctype<char> specialization.

This class defines classification and conversion functions for the char type. It gets used by char streams for many I/O operations. The char specialization provides a number of optimizations as well.

Definition at line 681 of file locale\_facets.h.

## 4.423.2 Member Typedef Documentation

## 4.423.2.1 char\_type

```
typedef char std::ctype< char >::char_type
```

Typedef for the template parameter char.

Definition at line 686 of file locale\_facets.h.

### 4.423.3 Constructor & Destructor Documentation

#### 4.423.3.1 ctype() [1/2]

```
std::ctype< char >::ctype (
 const mask * __table = 0,
 bool __del = false,
 size_t __refs = 0) [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

##### Parameters

|                      |                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------|
| <code>__table</code> | If non-zero, table is used as the per-char mask. Else <code>classic_table()</code> is used. |
| <code>__del</code>   | If true, passes ownership of table to this facet.                                           |
| <code>__refs</code>  | Passed to the base facet class.                                                             |

#### 4.423.3.2 ctype() [2/2]

```
std::ctype< char >::ctype (
 __c_locale __cloc,
 const mask * __table = 0,
 bool __del = false,
 size_t __refs = 0) [explicit]
```

Constructor performs static initialization.

This constructor is used to construct the initial C locale facet.

##### Parameters

|                      |                                                   |
|----------------------|---------------------------------------------------|
| <code>__cloc</code>  | Handle to C locale data.                          |
| <code>__table</code> | If non-zero, table is used as the per-char mask.  |
| <code>__del</code>   | If true, passes ownership of table to this facet. |
| <code>__refs</code>  | Passed to the base facet class.                   |

#### 4.423.3.3 ~ctype()

```
virtual std::ctype< char >::~ctype () [protected], [virtual]
```

Destructor.

This function deletes table() if *del* was true in the constructor.

#### 4.423.4 Member Function Documentation

##### 4.423.4.1 classic\_table()

```
static const mask* std::ctype< char >::classic_table () throw () [static]
```

Returns a pointer to the C locale mask table.

##### 4.423.4.2 do\_narrow() [1/2]

```
virtual char std::ctype< char >::do_narrow (
 char_type __c,
 char __dfault) const [inline], [protected], [virtual]
```

Narrow char.

This virtual function converts the char to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. For an underived ctype<char> facet, c will be returned unchanged.

do\_narrow() is a hook for a derived facet to change the behavior of narrowing. do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

##### Parameters

|                       |                                     |
|-----------------------|-------------------------------------|
| <code>__c</code>      | The char to convert.                |
| <code>__dfault</code> | Char to return if conversion fails. |

##### Returns

The converted char.

Definition at line 1134 of file locale\_facets.h.

#### 4.423.4.3 do\_narrow() [2/2]

```
virtual const char_type* std::ctype< char >::do_narrow (
 const char_type * __lo,
 const char_type * __hi,
 char __dfault,
 char * __to) const [inline], [protected], [virtual]
```

Narrow char array to char array.

This virtual function converts each char in the range [lo,hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *dfault* is used instead. For an undervied ctype<char> facet, the argument will be copied unchanged.

do\_narrow() is a hook for a derived facet to change the behavior of narrowing. do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

##### Parameters

|                       |                                   |
|-----------------------|-----------------------------------|
| <code>__lo</code>     | Pointer to start of range.        |
| <code>__hi</code>     | Pointer to end of range.          |
| <code>__dfault</code> | Char to use if conversion fails.  |
| <code>__to</code>     | Pointer to the destination array. |

##### Returns

`__hi`.

Definition at line 1160 of file locale\_facets.h.

#### 4.423.4.4 do\_tolower() [1/2]

```
virtual char_type std::ctype< char >::do_tolower (
 char_type __c) const [protected], [virtual]
```

Convert to lowercase.

This virtual function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

## Parameters

|                                                                                   |                      |
|-----------------------------------------------------------------------------------|----------------------|
|  | The char to convert. |
| <code>__c</code>                                                                  |                      |

## Returns

The lowercase char if convertible, else `__c`.

## 4.423.4.5 do\_tolower() [2/2]

```
virtual const char_type* std::ctype< char >::do_tolower (
 char_type * __lo,
 const char_type * __hi) const [protected], [virtual]
```

Convert array to lowercase.

This virtual function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

## Parameters

|                                                                                     |                                 |
|-------------------------------------------------------------------------------------|---------------------------------|
|  | Pointer to first char in range. |
| <code>__lo</code>                                                                   |                                 |
|  | Pointer to end of range.        |
| <code>__hi</code>                                                                   |                                 |

## Returns

`__hi`.

## 4.423.4.6 do\_toupper() [1/2]

```
virtual char_type std::ctype< char >::do_toupper (
 char_type __c) const [protected], [virtual]
```

Convert to uppercase.

This virtual function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

**Parameters**

|                                                                                   |                      |
|-----------------------------------------------------------------------------------|----------------------|
|  | The char to convert. |
| <code>__c</code>                                                                  |                      |

**Returns**

The uppercase char if convertible, else `__c`.

**4.423.4.7 do\_toupper()** [2/2]

```
virtual const char_type* std::ctype< char >::do_toupper (
 char_type * __lo,
 const char_type * __hi) const [protected], [virtual]
```

Convert array to uppercase.

This virtual function converts each char in the range [lo,hi) to uppercase if possible. Other chars remain untouched.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

**Parameters**

|                                                                                                          |                            |
|----------------------------------------------------------------------------------------------------------|----------------------------|
| <br><code>__lo</code> | Pointer to start of range. |
| <br><code>__hi</code> | Pointer to end of range.   |

**Returns**

`__hi`.

**4.423.4.8 do\_widen()** [1/2]

```
virtual char_type std::ctype< char >::do_widen (
 char __c) const [inline], [protected], [virtual]
```

Widen char.

This virtual function converts the char to char using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be returned unchanged.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

|                  |                      |
|------------------|----------------------|
| <code>__c</code> | The char to convert. |
|------------------|----------------------|

## Returns

The converted character.

Definition at line 1084 of file locale\_facets.h.

## 4.423.4.9 do\_widen() [2/2]

```
virtual const char* std::ctype< char >::do_widen (
 const char * __lo,
 const char * __hi,
 char_type * __to) const [inline], [protected], [virtual]
```

Widen char array.

This function converts each char in the range [lo,hi) to char using the simplest reasonable transformation. For an undervied ctype<char> facet, the argument will be copied unchanged.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

|                   |                                   |
|-------------------|-----------------------------------|
| <code>__lo</code> | Pointer to start of range.        |
| <code>__hi</code> | Pointer to end of range.          |
| <code>__to</code> | Pointer to the destination array. |

## Returns

`__hi`.

Definition at line 1107 of file locale\_facets.h.

**4.423.4.10** `is()` [1/2]

```
bool std::ctype< char >::is (
 mask __m,
 char __c) const [inline]
```

Test char classification.

This function compares the mask `table[c]` to `__m`.

**Parameters**

|                  |                                  |
|------------------|----------------------------------|
| <code>__c</code> | The char to compare the mask of. |
| <code>__m</code> | The mask to compare against.     |

**Returns**

True if `__m & table[__c]` is true, false otherwise.

Definition at line 43 of file `ctype_inline.h`.

**4.423.4.11** `is()` [2/2]

```
const char * std::ctype< char >::is (
 const char * __lo,
 const char * __hi,
 mask * __vec) const [inline]
```

Return a mask array.

This function finds the mask for each char in the range `[lo, hi)` and successively writes it to `vec`. `vec` must have as many elements as the char array.

**Parameters**

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

**Returns**

`__hi`.

Definition at line 48 of file `ctype_inline.h`.

## 4.423.4.12 narrow() [1/2]

```
char std::ctype< char >::narrow (
 char_type __c,
 char __default) const [inline]
```

Narrow char.

This function converts the char to char using the simplest reasonable transformation. If the conversion fails, *default* is returned instead. For an underived ctype<char> facet, *c* will be returned unchanged.

This function works as if it returns ctype<char>::do\_narrow(*c*). do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

|                        |                                     |
|------------------------|-------------------------------------|
| <code>__c</code>       | The char to convert.                |
| <code>__default</code> | Char to return if conversion fails. |

## Returns

The converted character.

Definition at line 931 of file locale\_facets.h.

References std::ctype< \_CharT >::do\_narrow().

## 4.423.4.13 narrow() [2/2]

```
const char_type* std::ctype< char >::narrow (
 const char_type * __lo,
 const char_type * __hi,
 char __default,
 char * __to) const [inline]
```

Narrow char array.

This function converts each char in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *default* is used instead. For an underived ctype<char> facet, the argument will be copied unchanged.

This function works as if it returns ctype<char>::do\_narrow(*lo*, *hi*, *default*, *to*). do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|                       |                                   |
|-----------------------|-----------------------------------|
| <code>__lo</code>     | Pointer to start of range.        |
| <code>__hi</code>     | Pointer to end of range.          |
| <code>__dfault</code> | Char to use if conversion fails.  |
| <code>__to</code>     | Pointer to the destination array. |

**Returns**

`__hi`.

Definition at line 964 of file `locale_facets.h`.

References `std::ctype<_CharT>::do_narrow()`.

**4.423.4.14 `scan_is()`**

```
const char * std::ctype< char >::scan_is (
 mask __m,
 const char * __lo,
 const char * __hi) const [inline]
```

Find char matching a mask.

This function searches for and returns the first char in `[lo,hi)` for which `is(m,char)` is true.

**Parameters**

|                         |                              |
|-------------------------|------------------------------|
| <code>↵<br/>__m</code>  | The mask to compare against. |
| <code>↵<br/>__lo</code> | Pointer to start of range.   |
| <code>↵<br/>__hi</code> | Pointer to end of range.     |

**Returns**

Pointer to a matching char if found, else `__hi`.

Definition at line 57 of file `ctype_inline.h`.

## 4.423.4.15 scan\_not()

```
const char * std::ctype< char >::scan_not (
 mask __m,
 const char * __lo,
 const char * __hi) const [inline]
```

Find char not matching a mask.

This function searches for and returns a pointer to the first char in [\_\_lo,\_\_hi) for which is(m,char) is false.

## Parameters

|                                                                                           |                              |
|-------------------------------------------------------------------------------------------|------------------------------|
| <br>__m  | The mask to compare against. |
| <br>__lo | Pointer to start of range.   |
| <br>__hi | Pointer to end of range.     |

## Returns

Pointer to a non-matching char if found, else \_\_hi.

Definition at line 67 of file ctype\_inline.h.

## 4.423.4.16 table()

```
const mask* std::ctype< char >::table () const throw () [inline]
```

Returns a pointer to the mask table provided to the constructor, or the default from classic\_table() if none was provided.

Definition at line 983 of file locale\_facets.h.

## 4.423.4.17 tolower() [1/2]

```
char_type std::ctype< char >::tolower (
 char_type __c) const [inline]
```

Convert to lowercase.

This function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

tolower() acts as if it returns ctype<char>::do\_tolower(\_\_c). do\_tolower() must always return the same result for the same input.

**Parameters**

|                                                                                   |                      |
|-----------------------------------------------------------------------------------|----------------------|
|  | The char to convert. |
| <code>__c</code>                                                                  |                      |

**Returns**

The lowercase char if convertible, else `__c`.

Definition at line 835 of file `locale_facets.h`.

References `std::ctype<_CharT>::do_tolower()`.

**4.423.4.18 tolower()** [2/2]

```
const char_type* std::ctype< char >::tolower (
 char_type * __lo,
 const char_type * __hi) const [inline]
```

Convert array to lowercase.

This function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.

`tolower()` acts as if it returns `ctype<char>::do_tolower(__lo, __hi)`. `do_tolower()` must always return the same result for the same input.

**Parameters**

|                                                                                     |                                 |
|-------------------------------------------------------------------------------------|---------------------------------|
|  | Pointer to first char in range. |
| <code>__lo</code>                                                                   |                                 |
|  | Pointer to end of range.        |
| <code>__hi</code>                                                                   |                                 |

**Returns**

`__hi`.

Definition at line 852 of file `locale_facets.h`.

References `std::ctype<_CharT>::do_tolower()`.

## 4.423.4.19 toupper() [1/2]

```
char_type std::ctype< char >::toupper (
 char_type __c) const [inline]
```

Convert to uppercase.

This function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

toupper() acts as if it returns ctype<char>::do\_toupper(c). do\_toupper() must always return the same result for the same input.

**Parameters**

|                          |                      |
|--------------------------|----------------------|
| $\leftrightarrow$<br>__c | The char to convert. |
|--------------------------|----------------------|

**Returns**

The uppercase char if convertible, else \_\_c.

Definition at line 802 of file locale\_facets.h.

References std::ctype< \_CharT >::do\_toupper().

## 4.423.4.20 toupper() [2/2]

```
const char_type* std::ctype< char >::toupper (
 char_type * __lo,
 const char_type * __hi) const [inline]
```

Convert array to uppercase.

This function converts each char in the range [\_\_lo,\_\_hi) to uppercase if possible. Other chars remain untouched.

toupper() acts as if it returns ctype<char>:: do\_toupper(\_\_lo, \_\_hi). do\_toupper() must always return the same result for the same input.

**Parameters**

|                           |                                 |
|---------------------------|---------------------------------|
| $\leftrightarrow$<br>__lo | Pointer to first char in range. |
| $\leftrightarrow$<br>__hi | Pointer to end of range.        |

**Returns**

`__hi`.

Definition at line 819 of file `locale_facets.h`.

References `std::ctype<_CharT>::do_toupper()`.

**4.423.4.21 widen()** [1/2]

```
char_type std::ctype< char >::widen (
 char __c) const [inline]
```

Widen char.

This function converts the `char` to `char_type` using the simplest reasonable transformation. For an underived `ctype<char>` facet, the argument will be returned unchanged.

This function works as if it returns `ctype<char>::do_widen(c)`. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

|                  |                      |
|------------------|----------------------|
| <code>__c</code> | The char to convert. |
|------------------|----------------------|

**Returns**

The converted character.

Definition at line 872 of file `locale_facets.h`.

References `std::ctype<_CharT>::do_widen()`.

**4.423.4.22 widen()** [2/2]

```
const char* std::ctype< char >::widen (
 const char * __lo,
 const char * __hi,
 char_type * __to) const [inline]
```

Widen char array.

This function converts each `char` in the input to `char` using the simplest reasonable transformation. For an underived `ctype<char>` facet, the argument will be copied unchanged.

This function works as if it returns `ctype<char>::do_widen(c)`. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

|                                                                                                      |                                   |
|------------------------------------------------------------------------------------------------------|-----------------------------------|
| <a href="#">_lo</a> | Pointer to first char in range.   |
| <a href="#">_hi</a> | Pointer to end of range.          |
| <a href="#">_to</a> | Pointer to the destination array. |

## Returns

[!\[\]\(a03a7eb2f4046e1d3c76772003e549ea\_img.jpg\)\\_hi](#).

Definition at line 899 of file locale\_facets.h.

References `std::ctype<_CharT>::do_widen()`.

## 4.423.5 Member Data Documentation

## 4.423.5.1 id

```
locale::id std::ctype< char >::id [static]
```

The facet id for `ctype<char>`

Definition at line 703 of file locale\_facets.h.

## 4.423.5.2 table\_size

```
const size_t std::ctype< char >::table_size [static]
```

The size of the mask table. It is `SCHAR_MAX + 1`.

Definition at line 705 of file locale\_facets.h.

The documentation for this class was generated from the following files:

#### 4.424.1 Detailed Description

```
template<>
class std::ctype< wchar_t >
```

The ctype<wchar\_t> specialization.

This class defines classification and conversion functions for the wchar\_t type. It gets used by wchar\_t streams for many I/O operations. The wchar\_t specialization provides a number of optimizations as well.

ctype<wchar\_t> inherits its public methods from \_\_ctype\_abstract\_base<wchar\_t>.

Definition at line 1186 of file locale\_facets.h.

#### 4.424.2 Member Typedef Documentation

##### 4.424.2.1 char\_type

```
typedef wchar_t std::ctype< wchar_t >::char_type
```

Typedef for the template parameter wchar\_t.

Definition at line 1191 of file locale\_facets.h.

#### 4.424.3 Constructor & Destructor Documentation

##### 4.424.3.1 ctype() [1/2]

```
std::ctype< wchar_t >::ctype (
 size_t __refs = 0) [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

##### Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

## 4.424.3.2 ctype() [2/2]

```
std::ctype< wchar_t >::ctype (
 __c_locale __cloc,
 size_t __refs = 0) [explicit]
```

Constructor performs static initialization.

This constructor is used to construct the initial C locale facet.

## Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__cloc</code> | Handle to C locale data.        |
| <code>__refs</code> | Passed to the base facet class. |

## 4.424.3.3 ~ctype()

```
virtual std::ctype< wchar_t >::~ctype () [protected], [virtual]
```

Destructor.

## 4.424.4 Member Function Documentation

## 4.424.4.1 do\_is() [1/2]

```
virtual bool std::ctype< wchar_t >::do_is (
 mask __m,
 char_type __c) const [protected], [virtual]
```

Test wchar\_t classification.

This function finds a mask *M* for *c* and compares it to mask *m*.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

## Parameters

|                  |                                  |
|------------------|----------------------------------|
| <code>__c</code> | The wchar_t to find the mask of. |
| <code>__m</code> | The mask to compare against.     |

**Returns**

(M & \_\_m) != 0.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**4.424.4.2 do\_is()** [2/2]

```
virtual const char_type* std::ctype< wchar_t >::do_is (
 const char_type * __lo,
 const char_type * __hi,
 mask * __vec) const [protected], [virtual]
```

Return a mask array.

This function finds the mask for each `wchar_t` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the input.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

**Parameters**

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

**Returns**

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**4.424.4.3 do\_narrow()** [1/2]

```
virtual char std::ctype< wchar_t >::do_narrow (
 char_type __c,
 char __dfault) const [protected], [virtual]
```

Narrow `wchar_t` to `char`.

This virtual function converts the argument to `char` using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead. For an underived `ctype<wchar_t>` facet, `c` will be cast to `char` and returned.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

|                        |                                      |
|------------------------|--------------------------------------|
| <code>__c</code>       | The <code>wchar_t</code> to convert. |
| <code>__default</code> | Char to return if conversion fails.  |

## Returns

The converted char.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

## 4.424.4.4 do\_narrow() [2/2]

```
virtual const char_type* std::ctype< wchar_t >::do_narrow (
 const char_type * __lo,
 const char_type * __hi,
 char __default,
 char * __to) const [protected], [virtual]
```

Narrow `wchar_t` array to char array.

This virtual function converts each `wchar_t` in the range `[lo,hi)` to char using the simplest reasonable transformation and writes the results to the destination array. For any `wchar_t` in the input that cannot be converted, `default` is used instead. For an underived `ctype<wchar_t>` facet, the argument will be copied, casting each element to char.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

|                        |                                   |
|------------------------|-----------------------------------|
| <code>__lo</code>      | Pointer to start of range.        |
| <code>__hi</code>      | Pointer to end of range.          |
| <code>__default</code> | Char to use if conversion fails.  |
| <code>__to</code>      | Pointer to the destination array. |

## Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

## 4.424.4.5 do\_scan\_is()

```
virtual const char_type* std::ctype< wchar_t >::do_scan_is (
 mask __m,
 const char_type * __lo,
 const char_type * __hi) const [protected], [virtual]
```

Find wchar\_t matching mask.

This function searches for and returns the first wchar\_t c in [\_\_lo,\_\_hi) for which is(\_\_m,c) is true.

do\_scan\_is() is a hook for a derived facet to change the behavior of match searching. do\_is() must always return the same result for the same input.

## Parameters

|                   |                              |
|-------------------|------------------------------|
| <code>__m</code>  | The mask to compare against. |
| <code>__lo</code> | Pointer to start of range.   |
| <code>__hi</code> | Pointer to end of range.     |

## Returns

Pointer to a matching wchar\_t if found, else \_\_hi.

Implements `std::__ctype_abstract_base< wchar_t >`.

## 4.424.4.6 do\_scan\_not()

```
virtual const char_type* std::ctype< wchar_t >::do_scan_not (
 mask __m,
 const char_type * __lo,
 const char_type * __hi) const [protected], [virtual]
```

Find wchar\_t not matching mask.

This function searches for and returns a pointer to the first wchar\_t c of [\_\_lo,\_\_hi) for which is(\_\_m,c) is false.

do\_scan\_is() is a hook for a derived facet to change the behavior of match searching. do\_is() must always return the same result for the same input.

## Parameters

|                   |                              |
|-------------------|------------------------------|
| <code>__m</code>  | The mask to compare against. |
| <code>__lo</code> | Pointer to start of range.   |
| <code>__hi</code> | Pointer to end of range.     |

**Returns**

Pointer to a non-matching wchar\_t if found, else `__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**4.424.4.7 do\_tolower()** [1/2]

```
virtual char_type std::ctype< wchar_t >::do_tolower (
 char_type __c) const [protected], [virtual]
```

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

**Parameters**

|                  |                         |
|------------------|-------------------------|
| <code>__c</code> | The wchar_t to convert. |
| <code>__C</code> |                         |

**Returns**

The lowercase wchar\_t if convertible, else `__c`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**4.424.4.8 do\_tolower()** [2/2]

```
virtual const char_type* std::ctype< wchar_t >::do_tolower (
 char_type * __lo,
 const char_type * __hi) const [protected], [virtual]
```

Convert array to lowercase.

This virtual function converts each wchar\_t in the range [lo,hi) to lowercase if possible. Other elements remain untouched.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

**Parameters**

|                                                                                                                        |                            |
|------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"></a><br><code>__lo</code> | Pointer to start of range. |
| <a href="#"></a><br><code>__hi</code> | Pointer to end of range.   |

**Returns**

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**4.424.4.9 do\_toupper()** [1/2]

```
virtual char_type std::ctype< wchar_t >::do_toupper (
 char_type __c) const [protected], [virtual]
```

Convert to uppercase.

This virtual function converts the `wchar_t` argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

**Parameters**

|                                                                                                                         |                                      |
|-------------------------------------------------------------------------------------------------------------------------|--------------------------------------|
| <a href="#"></a><br><code>__c</code> | The <code>wchar_t</code> to convert. |
|-------------------------------------------------------------------------------------------------------------------------|--------------------------------------|

**Returns**

The uppercase `wchar_t` if convertible, else `__c`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**4.424.4.10 do\_toupper()** [2/2]

```
virtual const char_type* std::ctype< wchar_t >::do_toupper (
 char_type * __lo,
 const char_type * __hi) const [protected], [virtual]
```

Convert array to uppercase.

This virtual function converts each `wchar_t` in the range `[lo,hi)` to uppercase if possible. Other elements remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

**Parameters**

|                                                                                                                        |                            |
|------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"></a><br><code>__lo</code> | Pointer to start of range. |
| <a href="#"></a><br><code>__hi</code> | Pointer to end of range.   |

**Returns**

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**4.424.4.11 do\_widen()** [1/2]

```
virtual char_type std::ctype< wchar_t >::do_widen (
 char __c) const [protected], [virtual]
```

Widen char to `wchar_t`.

This virtual function converts the char to `wchar_t` using the simplest reasonable transformation. For an underived `ctype<wchar_t>` facet, the argument will be cast to `wchar_t`.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

|                                                                                                                         |                      |
|-------------------------------------------------------------------------------------------------------------------------|----------------------|
| <a href="#"></a><br><code>__c</code> | The char to convert. |
|-------------------------------------------------------------------------------------------------------------------------|----------------------|

**Returns**

The converted `wchar_t`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**4.424.4.12 do\_widen()** [2/2]

```
virtual const char* std::ctype< wchar_t >::do_widen (
 const char * __lo,
```

```
const char * __hi,
char_type * __to) const [protected], [virtual]
```

Widen char array to wchar\_t array.

This function converts each char in the input to wchar\_t using the simplest reasonable transformation. For an underived ctype<wchar\_t> facet, the argument will be copied, casting each element to wchar\_t.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

|                                   |                                   |
|-----------------------------------|-----------------------------------|
| <a href="#"><code>__lo</code></a> | Pointer to start range.           |
| <a href="#"><code>__hi</code></a> | Pointer to end of range.          |
| <a href="#"><code>__to</code></a> | Pointer to the destination array. |

#### Returns

[`\_\_hi`](#).

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

#### 4.424.4.13 is() [1/2]

```
bool std::__ctype_abstract_base< wchar_t >::is (
 mask __m,
 char_type __c) const [inline], [inherited]
```

Test char\_type classification.

This function finds a mask M for `__c` and compares it to mask `__m`. It does so by returning the value of `ctype<char_↵ type>::do_is()`.

#### Parameters

|                                  |                                       |
|----------------------------------|---------------------------------------|
| <a href="#"><code>__c</code></a> | The char_type to compare the mask of. |
| <a href="#"><code>__m</code></a> | The mask to compare against.          |

**Returns**

(M & \_\_m) != 0.

Definition at line 169 of file locale\_facets.h.

**4.424.4.14 is()** [2/2]

```
const char_type* std::__ctype_abstract_base< wchar_t >::is (
 const char_type * __lo,
 const char_type * __hi,
 mask * __vec) const [inline], [inherited]
```

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char\_type>::do\_is().

**Parameters**

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

**Returns**

`__hi`.

Definition at line 186 of file locale\_facets.h.

**4.424.4.15 narrow()** [1/2]

```
char std::__ctype_abstract_base< wchar_t >::narrow (
 char_type __c,
 char __default) const [inline], [inherited]
```

Narrow char\_type to char.

This function converts the char\_type to char using the simplest reasonable transformation. If the conversion fails, default is returned instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_c).

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|                        |                                     |
|------------------------|-------------------------------------|
| <code>__c</code>       | The char_type to convert.           |
| <code>__default</code> | Char to return if conversion fails. |

**Returns**

The converted char.

Definition at line 331 of file locale\_facets.h.

**4.424.4.16 narrow()** [2/2]

```
const char_type* std::__ctype_abstract_base< wchar_t >::narrow (
 const char_type * __lo,
 const char_type * __hi,
 char __default,
 char * __to) const [inline], [inherited]
```

Narrow array to char array.

This function converts each char\_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char\_type in the input that cannot be converted, *default* is used instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_lo, \_\_hi, \_\_default, \_\_to).

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|                        |                                   |
|------------------------|-----------------------------------|
| <code>__lo</code>      | Pointer to start of range.        |
| <code>__hi</code>      | Pointer to end of range.          |
| <code>__default</code> | Char to use if conversion fails.  |
| <code>__to</code>      | Pointer to the destination array. |

**Returns**

`__hi`.

Definition at line 353 of file locale\_facets.h.

**4.424.4.17 scan\_is()**

```
const char_type* std::__ctype_abstract_base< wchar_t >::scan_is (
 mask __m,
 const char_type * __lo,
 const char_type * __hi) const [inline], [inherited]
```

Find char\_type matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char\_type>::do\_scan\_is().

**Parameters**

|                                                                                                                        |                              |
|------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <a href="#"></a><br><code>__m</code>  | The mask to compare against. |
| <a href="#"></a><br><code>__lo</code> | Pointer to start of range.   |
| <a href="#"></a><br><code>__hi</code> | Pointer to end of range.     |

**Returns**

Pointer to matching `char_type` if found, else `__hi`.

Definition at line 202 of file `locale_facets.h`.

**4.424.4.18 scan\_not()**

```
const char_type* std::__ctype_abstract_base< wchar_t >::scan_not (
 mask __m,
 const char_type * __lo,
 const char_type * __hi) const [inline], [inherited]
```

Find `char_type` not matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is false. It does so by returning `ctype<char_type>::do_scan_not()`.

**Parameters**

|                                                                                                                          |                                 |
|--------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| <a href="#"></a><br><code>__m</code>  | The mask to compare against.    |
| <a href="#"></a><br><code>__lo</code> | Pointer to first char in range. |
| <a href="#"></a><br><code>__hi</code> | Pointer to end of range.        |

**Returns**

Pointer to non-matching char if found, else `__hi`.

Definition at line 218 of file `locale_facets.h`.

## 4.424.4.19 tolower() [1/2]

```
char_type std::__ctype_abstract_base< wchar_t >::tolower (
 char_type __c) const [inline], [inherited]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char\_type>::do\_tolower(c).

## Parameters

|                     |                           |
|---------------------|---------------------------|
| $\leftarrow$<br>__c | The char_type to convert. |
|---------------------|---------------------------|

## Returns

The lowercase char\_type if convertible, else \_\_c.

Definition at line 261 of file locale\_facets.h.

## 4.424.4.20 tolower() [2/2]

```
const char_type* std::__ctype_abstract_base< wchar_t >::tolower (
 char_type * __lo,
 const char_type * __hi) const [inline], [inherited]
```

Convert array to lowercase.

This function converts each char\_type in the range [\_\_lo,\_\_hi) to lowercase if possible. Other elements remain untouched. It does so by returning ctype<char\_type>::do\_tolower(\_\_lo,\_\_hi).

## Parameters

|                      |                            |
|----------------------|----------------------------|
| $\leftarrow$<br>__lo | Pointer to start of range. |
| $\leftarrow$<br>__hi | Pointer to end of range.   |

## Returns

\_\_hi.

Definition at line 276 of file locale\_facets.h.

**4.424.4.21 toupper()** [1/2]

```
char_type std::__ctype_abstract_base< wchar_t >::toupper (
 char_type __c) const [inline], [inherited]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char\_type>::do\_toupper().

**Parameters**

|                                                                                          |                           |
|------------------------------------------------------------------------------------------|---------------------------|
| <br>__c | The char_type to convert. |
|------------------------------------------------------------------------------------------|---------------------------|

**Returns**

The uppercase char\_type if convertible, else \_\_c.

Definition at line 232 of file locale\_facets.h.

**4.424.4.22 toupper()** [2/2]

```
const char_type* std::__ctype_abstract_base< wchar_t >::toupper (
 char_type * __lo,
 const char_type * __hi) const [inline], [inherited]
```

Convert array to uppercase.

This function converts each char\_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning ctype<char\_type>::do\_toupper(lo, hi).

**Parameters**

|                                                                                             |                            |
|---------------------------------------------------------------------------------------------|----------------------------|
| <br>__lo | Pointer to start of range. |
| <br>__hi | Pointer to end of range.   |

**Returns**

\_\_hi.

Definition at line 247 of file locale\_facets.h.

## 4.424.4.23 widen() [1/2]

```
char_type std::__ctype_abstract_base< wchar_t >::widen (
 char __c) const [inline], [inherited]
```

Widen char to char\_type.

This function converts the char argument to char\_type using the simplest reasonable transformation. It does so by returning ctype<char\_type>::do\_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

|                  |                      |
|------------------|----------------------|
| <code>__c</code> | The char to convert. |
|------------------|----------------------|

## Returns

The converted char\_type.

Definition at line 293 of file locale\_facets.h.

## 4.424.4.24 widen() [2/2]

```
const char* std::__ctype_abstract_base< wchar_t >::widen (
 const char * __lo,
 const char * __hi,
 char_type * __to) const [inline], [inherited]
```

Widen array to char\_type.

This function converts each char in the input to char\_type using the simplest reasonable transformation. It does so by returning ctype<char\_type>::do\_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

|                   |                                   |
|-------------------|-----------------------------------|
| <code>__lo</code> | Pointer to start of range.        |
| <code>__hi</code> | Pointer to end of range.          |
| <code>__to</code> | Pointer to the destination array. |

## Returns

`__hi`.

Definition at line 312 of file `locale_facets.h`.

## 4.424.5 Member Data Documentation

4.424.5.1 `id`

```
locale::id std::ctype< wchar_t >::id [static]
```

The facet id for `ctype<wchar_t>`

Definition at line 1209 of file `locale_facets.h`.

The documentation for this class was generated from the following file:

- [locale\\_facets.h](#)

4.425 `std::ctype_base` Struct Reference

Inheritance diagram for `std::ctype_base`:

## Public Types

- typedef const int \* **\_\_to\_type**

## 4.426.1 Detailed Description

```
template<typename _CharT>
class std::ctype_byname<_CharT>
```

class ctype\_byname [22.2.1.2].

Definition at line 1478 of file locale\_facets.h.

## 4.426.2 Member Function Documentation

## 4.426.2.1 do\_is() [1/2]

```
template<typename _CharT>
virtual bool std::ctype<_CharT>::do_is (
 mask __m,
 char_type __c) const [protected], [virtual], [inherited]
```

Test char\_type classification.

This function finds a mask M for *c* and compares it to mask *m*.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

## Parameters

|                  |                                    |
|------------------|------------------------------------|
| <code>__c</code> | The char_type to find the mask of. |
| <code>__m</code> | The mask to compare against.       |

## Returns

(M & \_\_m) != 0.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

#### 4.426.2.2 do\_is() [2/2]

```
template<typename _CharT>
virtual const char_type* std::__ctype<_CharT>::do_is (
 const char_type * __lo,
 const char_type * __hi,
 mask * __vec) const [protected], [virtual], [inherited]
```

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the input.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

##### Parameters

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

##### Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

#### 4.426.2.3 do\_narrow() [1/2]

```
template<typename _CharT>
virtual char std::__ctype<_CharT>::do_narrow (
 char_type __c,
 char __dfault) const [protected], [virtual], [inherited]
```

Narrow char\_type to char.

This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead.

do\_narrow() is a hook for a derived facet to change the behavior of narrowing. do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

|                        |                                        |
|------------------------|----------------------------------------|
| <code>__c</code>       | The <code>char_type</code> to convert. |
| <code>__default</code> | Char to return if conversion fails.    |

## Returns

The converted char.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by `std::ctype<char>::narrow()`.

## 4.426.2.4 do\_narrow() [2/2]

```
template<typename _CharT>
virtual const char_type* std::ctype<_CharT>::do_narrow (
 const char_type * __lo,
 const char_type * __hi,
 char __default,
 char * __to) const [protected], [virtual], [inherited]
```

Narrow `char_type` array to `char`.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to `char` using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, `__default` is used instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

|                        |                                   |
|------------------------|-----------------------------------|
| <code>__lo</code>      | Pointer to start of range.        |
| <code>__hi</code>      | Pointer to end of range.          |
| <code>__default</code> | Char to use if conversion fails.  |
| <code>__to</code>      | Pointer to the destination array. |

## Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

4.426.2.5 `do_scan_is()`

```
template<typename _CharT>
virtual const char_type* std::ctype< _CharT >::do_scan_is (
 mask __m,
 const char_type * __lo,
 const char_type * __hi) const [protected], [virtual], [inherited]
```

Find `char_type` matching mask.

This function searches for and returns the first `char_type` `c` in `[__lo,__hi)` for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

## Parameters

|                   |                              |
|-------------------|------------------------------|
| <code>__m</code>  | The mask to compare against. |
| <code>__lo</code> | Pointer to start of range.   |
| <code>__hi</code> | Pointer to end of range.     |

## Returns

Pointer to a matching `char_type` if found, else `__hi`.

Implements `std::__ctype_abstract_base< _CharT >`.

4.426.2.6 `do_scan_not()`

```
template<typename _CharT>
virtual const char_type* std::ctype< _CharT >::do_scan_not (
 mask __m,
 const char_type * __lo,
 const char_type * __hi) const [protected], [virtual], [inherited]
```

Find `char_type` not matching mask.

This function searches for and returns a pointer to the first `char_type` `c` of `[lo,hi)` for which `is(m,c)` is false.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

## Parameters

|                   |                              |
|-------------------|------------------------------|
| <code>__m</code>  | The mask to compare against. |
| <code>__lo</code> | Pointer to start of range.   |
| <code>__hi</code> | Pointer to end of range.     |

**Returns**

Pointer to a non-matching char\_type if found, else `__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

**4.426.2.7 do\_tolower()** [1/2]

```
template<typename _CharT>
virtual char_type std::ctype<_CharT>::do_tolower (
 char_type __c) const [protected], [virtual], [inherited]
```

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

**Parameters**

|                  |                           |
|------------------|---------------------------|
| <code>__c</code> | The char_type to convert. |
|------------------|---------------------------|

**Returns**

The lowercase char\_type if convertible, else `__c`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by `std::ctype<char>::tolower()`.

**4.426.2.8 do\_tolower()** [2/2]

```
template<typename _CharT>
virtual const char_type* std::ctype<_CharT>::do_tolower (
 char_type * __lo,
 const char_type * __hi) const [protected], [virtual], [inherited]
```

Convert array to lowercase.

This virtual function converts each char\_type in the range [`__lo`,`__hi`) to lowercase if possible. Other elements remain untouched.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

**Parameters**

|                                                                                                                       |                            |
|-----------------------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"></a><br><code>_lo</code> | Pointer to start of range. |
| <a href="#"></a><br><code>_hi</code> | Pointer to end of range.   |

**Returns**

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

**4.426.2.9 do\_toupper()** [1/2]

```
template<typename _CharT>
virtual char_type std::ctype<_CharT>::do_toupper (
 char_type __c) const [protected], [virtual], [inherited]
```

Convert to uppercase.

This virtual function converts the `char_type` argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

**Parameters**

|                                                                                                                        |                                        |
|------------------------------------------------------------------------------------------------------------------------|----------------------------------------|
| <a href="#"></a><br><code>_c</code> | The <code>char_type</code> to convert. |
|------------------------------------------------------------------------------------------------------------------------|----------------------------------------|

**Returns**

The uppercase `char_type` if convertible, else `__c`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by `std::ctype<char>::toupper()`.

**4.426.2.10 do\_toupper()** [2/2]

```
template<typename _CharT>
virtual const char_type* std::ctype<_CharT>::do_toupper (
```

```
char_type * __lo,
const char_type * __hi) const [protected], [virtual], [inherited]
```

Convert array to uppercase.

This virtual function converts each char\_type in the range [\_\_lo,\_\_hi) to uppercase if possible. Other elements remain untouched.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

#### Parameters

|                                                                                                        |                            |
|--------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"> __lo</a> | Pointer to start of range. |
| <a href="#"> __hi</a> | Pointer to end of range.   |

#### Returns

[!\[\]\(3cb60d42b10e53f9522bb0b392c1c4cd\_img.jpg\) \\_\\_hi](#).

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

#### 4.426.2.11 do\_widen() [1/2]

```
template<typename _CharT>
virtual char_type std::ctype<_CharT>::do_widen (
 char __c) const [protected], [virtual], [inherited]
```

Widen char.

This virtual function converts the char to char\_type using the simplest reasonable transformation.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

|                                                                                                         |                      |
|---------------------------------------------------------------------------------------------------------|----------------------|
| <a href="#"> __c</a> | The char to convert. |
|---------------------------------------------------------------------------------------------------------|----------------------|

#### Returns

The converted char\_type

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by [std::ctype<char>::widen\(\)](#).

#### 4.426.2.12 do\_widen() [2/2]

```
template<typename _CharT>
virtual const char* std::ctype<_CharT>::do_widen (
 const char * __lo,
 const char * __hi,
 char_type * __to) const [protected], [virtual], [inherited]
```

Widen char array.

This function converts each char in the input to [char\\_type](#) using the simplest reasonable transformation.

[do\\_widen\(\)](#) is a hook for a derived facet to change the behavior of widening. [do\\_widen\(\)](#) must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See [codecvt](#) for that.

##### Parameters

|                            |                                   |
|----------------------------|-----------------------------------|
| <a href="#">_↵<br/>_lo</a> | Pointer to start range.           |
| <a href="#">_↵<br/>_hi</a> | Pointer to end of range.          |
| <a href="#">_↵<br/>_to</a> | Pointer to the destination array. |

##### Returns

[\\_\\_hi](#).

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

#### 4.426.2.13 is() [1/2]

```
template<typename _CharT>
bool std::__ctype_abstract_base<_CharT>::is (
 mask __m,
 char_type __c) const [inline], [inherited]
```

Test [char\\_type](#) classification.

This function finds a mask M for [\\_\\_c](#) and compares it to mask [\\_\\_m](#). It does so by returning the value of [ctype<char\\_↵  
type>::do\\_is\(\)](#).

## Parameters

|                  |                                       |
|------------------|---------------------------------------|
| <code>__c</code> | The char_type to compare the mask of. |
| <code>__m</code> | The mask to compare against.          |

## Returns

`(M & __m) != 0.`

Definition at line 169 of file locale\_facets.h.

Referenced by `std::time_get<_CharT, _InIter>::get()`.

## 4.426.2.14 is() [2/2]

```
template<typename _CharT>
const char_type* std::__ctype_abstract_base<_CharT>::is (
 const char_type * __lo,
 const char_type * __hi,
 mask * __vec) const [inline], [inherited]
```

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of `ctype<char_type>::do_is()`.

## Parameters

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

## Returns

`__hi.`

Definition at line 186 of file locale\_facets.h.

## 4.426.2.15 narrow() [1/2]

```
template<typename _CharT>
char std::__ctype_abstract_base<_CharT>::narrow (
```

```
char_type __c,
char __default) const [inline], [inherited]
```

Narrow char\_type to char.

This function converts the char\_type to char using the simplest reasonable transformation. If the conversion fails, default is returned instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_c).

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

|                        |                                     |
|------------------------|-------------------------------------|
| <code>__c</code>       | The char_type to convert.           |
| <code>__default</code> | Char to return if conversion fails. |

#### Returns

The converted char.

Definition at line 331 of file locale\_facets.h.

Referenced by std::time\_get<\_CharT, \_InIter >::get(), and std::time\_put<\_CharT, \_OutIter >::put().

#### 4.426.2.16 narrow() [2/2]

```
template<typename _CharT>
const char_type* std::__ctype_abstract_base<_CharT >::narrow (
 const char_type * __lo,
 const char_type * __hi,
 char __default,
 char * __to) const [inline], [inherited]
```

Narrow array to char array.

This function converts each char\_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char\_type in the input that cannot be converted, default is used instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_lo, \_\_hi, \_\_default, \_\_to).

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

|                        |                                   |
|------------------------|-----------------------------------|
| <code>__lo</code>      | Pointer to start of range.        |
| <code>__hi</code>      | Pointer to end of range.          |
| <code>__default</code> | Char to use if conversion fails.  |
| <code>__to</code>      | Pointer to the destination array. |

**Returns**`__hi`.

Definition at line 353 of file locale\_facets.h.

**4.426.2.17 scan\_is()**

```
template<typename _CharT>
const char_type* std::__ctype_abstract_base<_CharT>::scan_is (
 mask __m,
 const char_type * __lo,
 const char_type * __hi) const [inline], [inherited]
```

Find char\_type matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char\_type>::do\_scan\_is().

**Parameters**

|                         |                              |
|-------------------------|------------------------------|
| <code>↔<br/>__m</code>  | The mask to compare against. |
| <code>↔<br/>__lo</code> | Pointer to start of range.   |
| <code>↔<br/>__hi</code> | Pointer to end of range.     |

**Returns**Pointer to matching char\_type if found, else `__hi`.

Definition at line 202 of file locale\_facets.h.

**4.426.2.18 scan\_not()**

```
template<typename _CharT>
const char_type* std::__ctype_abstract_base<_CharT>::scan_not (
 mask __m,
 const char_type * __lo,
 const char_type * __hi) const [inline], [inherited]
```

Find char\_type not matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char\_type>::do\_scan\_not().

**Parameters**

|                                                                                                       |                                 |
|-------------------------------------------------------------------------------------------------------|---------------------------------|
| <br><code>_m</code>  | The mask to compare against.    |
| <br><code>_lo</code> | Pointer to first char in range. |
| <br><code>_hi</code> | Pointer to end of range.        |

**Returns**

Pointer to non-matching char if found, else `__hi`.

Definition at line 218 of file `locale_facets.h`.

**4.426.2.19 tolower()** [1/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::tolower (
 char_type __c) const [inline], [inherited]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_tolower(c)`.

**Parameters**

|                                                                                                        |                                        |
|--------------------------------------------------------------------------------------------------------|----------------------------------------|
| <br><code>_c</code> | The <code>char_type</code> to convert. |
|--------------------------------------------------------------------------------------------------------|----------------------------------------|

**Returns**

The lowercase `char_type` if convertible, else `__c`.

Definition at line 261 of file `locale_facets.h`.

Referenced by `std::time_get< _CharT, _InIter >::get()`.

**4.426.2.20 tolower()** [2/2]

```
template<typename _CharT>
const char_type* std::__ctype_abstract_base< _CharT >::tolower (
```

```
char_type * __lo,
const char_type * __hi) const [inline], [inherited]
```

Convert array to lowercase.

This function converts each char\_type in the range [\_\_lo,\_\_hi) to lowercase if possible. Other elements remain untouched. It does so by returning ctype<char\_type>::do\_tolower(\_\_lo, \_\_hi).

**Parameters**

|                                                                                                        |                            |
|--------------------------------------------------------------------------------------------------------|----------------------------|
| <br><code>__lo</code> | Pointer to start of range. |
| <br><code>__hi</code> | Pointer to end of range.   |

**Returns**

`__hi`.

Definition at line 276 of file `locale_facets.h`.

**4.426.2.21 toupper()** [1/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::toupper (
 char_type __c) const [inline], [inherited]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

**Parameters**

|                                                                                                         |                                        |
|---------------------------------------------------------------------------------------------------------|----------------------------------------|
| <br><code>__c</code> | The <code>char_type</code> to convert. |
|---------------------------------------------------------------------------------------------------------|----------------------------------------|

**Returns**

The uppercase `char_type` if convertible, else `__c`.

Definition at line 232 of file `locale_facets.h`.

Referenced by `std::time_get< _CharT, _Inlter >::get()`.

**4.426.2.22 toupper()** [2/2]

```
template<typename _CharT>
const char_type* std::__ctype_abstract_base< _CharT >::toupper (
 char_type * __lo,
 const char_type * __hi) const [inline], [inherited]
```

Convert array to uppercase.

This function converts each `char_type` in the range `[lo,hi)` to uppercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_toupper(lo, hi)`.

## Parameters

|                                                                                                                       |                            |
|-----------------------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"></a><br><code>_lo</code> | Pointer to start of range. |
| <a href="#"></a><br><code>_hi</code> | Pointer to end of range.   |

## Returns

`__hi.`

Definition at line 247 of file locale\_facets.h.

## 4.426.2.23 widen() [1/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base<_CharT>::widen (
 char __c) const [inline], [inherited]
```

Widen char to char\_type.

This function converts the char argument to char\_type using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

|                                                                                                                        |                      |
|------------------------------------------------------------------------------------------------------------------------|----------------------|
| <a href="#"></a><br><code>_c</code> | The char to convert. |
|------------------------------------------------------------------------------------------------------------------------|----------------------|

## Returns

The converted char\_type.

Definition at line 293 of file locale\_facets.h.

Referenced by `std::time_get<_CharT, _InIter>::do_get()`, `std::money_get<_CharT, _InIter>::do_get()`, `std::time_put<_CharT, _OutIter>::do_put()`, and `std::money_put<_CharT, _OutIter>::do_put()`.

## 4.426.2.24 widen() [2/2]

```
template<typename _CharT>
const char* std::__ctype_abstract_base<_CharT>::widen (
```

```
const char * __lo,
const char * __hi,
char_type * __to) const [inline], [inherited]
```

Widen array to char\_type.

This function converts each char in the input to char\_type using the simplest reasonable transformation. It does so by returning ctype<char\_type>::do\_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

|                                                                                                      |                                   |
|------------------------------------------------------------------------------------------------------|-----------------------------------|
| <a href="#">_lo</a> | Pointer to start of range.        |
| <a href="#">_hi</a> | Pointer to end of range.          |
| <a href="#">_to</a> | Pointer to the destination array. |

#### Returns

[!\[\]\(e8fb589d58dad1692debababa5e928b6\_img.jpg\)\\_hi](#).

Definition at line 312 of file locale\_facets.h.

### 4.426.3 Member Data Documentation

#### 4.426.3.1 id

```
template<typename _CharT>
locale::id std::ctype< _CharT >::id [static], [inherited]
```

The facet id for ctype<char\_type>

Definition at line 620 of file locale\_facets.h.

The documentation for this class was generated from the following file:

- [locale\\_facets.h](#)

## 4.427.1 Detailed Description

```
template<>
```

```
class std::ctype_byname< char >
```

22.2.1.4 Class `ctype_byname` specializations.

Definition at line 1499 of file `locale_facets.h`.

## 4.427.2 Member Typedef Documentation

4.427.2.1 `char_type`

```
typedef char std::ctype< char >::char_type [inherited]
```

Typedef for the template parameter `char`.

Definition at line 686 of file `locale_facets.h`.

## 4.427.3 Member Function Documentation

4.427.3.1 `classic_table()`

```
static const mask* std::ctype< char >::classic_table () throw () [static], [inherited]
```

Returns a pointer to the C locale mask table.

4.427.3.2 `do_narrow()` [1/2]

```
virtual char std::ctype< char >::do_narrow (
 char_type __c,
 char __dfault) const [inline], [protected], [virtual], [inherited]
```

Narrow `char`.

This virtual function converts the `char` to `char` using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead. For an underived `ctype<char>` facet, `c` will be returned unchanged.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

|                        |                                     |
|------------------------|-------------------------------------|
| <code>__c</code>       | The char to convert.                |
| <code>__default</code> | Char to return if conversion fails. |

**Returns**

The converted char.

Definition at line 1134 of file `locale_facets.h`.

**4.427.3.3 do\_narrow()** [2/2]

```
virtual const char_type* std::ctype< char >::do_narrow (
 const char_type * __lo,
 const char_type * __hi,
 char __default,
 char * __to) const [inline], [protected], [virtual], [inherited]
```

Narrow char array to char array.

This virtual function converts each char in the range [lo,hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *default* is used instead. For an undervied `ctype<char>` facet, the argument will be copied unchanged.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

|                        |                                   |
|------------------------|-----------------------------------|
| <code>__lo</code>      | Pointer to start of range.        |
| <code>__hi</code>      | Pointer to end of range.          |
| <code>__default</code> | Char to use if conversion fails.  |
| <code>__to</code>      | Pointer to the destination array. |

**Returns**

`__hi`.

Definition at line 1160 of file `locale_facets.h`.

## 4.427.3.4 do\_tolower() [1/2]

```
virtual char_type std::ctype< char >::do_tolower (
 char_type __c) const [protected], [virtual], [inherited]
```

Convert to lowercase.

This virtual function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

## Parameters

|                                                                                          |                      |
|------------------------------------------------------------------------------------------|----------------------|
| <br>__c | The char to convert. |
|------------------------------------------------------------------------------------------|----------------------|

## Returns

The lowercase char if convertible, else \_\_c.

## 4.427.3.5 do\_tolower() [2/2]

```
virtual const char_type* std::ctype< char >::do_tolower (
 char_type * __lo,
 const char_type * __hi) const [protected], [virtual], [inherited]
```

Convert array to lowercase.

This virtual function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

## Parameters

|                                                                                             |                                 |
|---------------------------------------------------------------------------------------------|---------------------------------|
| <br>__lo | Pointer to first char in range. |
| <br>__hi | Pointer to end of range.        |

## Returns

\_\_hi.

**4.427.3.6 do\_toupper()** [1/2]

```
virtual char_type std::ctype< char >::do_toupper (
 char_type __c) const [protected], [virtual], [inherited]
```

Convert to uppercase.

This virtual function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

**Parameters**

|                                                                                          |                      |
|------------------------------------------------------------------------------------------|----------------------|
| <br>__c | The char to convert. |
|------------------------------------------------------------------------------------------|----------------------|

**Returns**

The uppercase char if convertible, else \_\_c.

**4.427.3.7 do\_toupper()** [2/2]

```
virtual const char_type* std::ctype< char >::do_toupper (
 char_type * __lo,
 const char_type * __hi) const [protected], [virtual], [inherited]
```

Convert array to uppercase.

This virtual function converts each char in the range [lo,hi) to uppercase if possible. Other chars remain untouched.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

**Parameters**

|                                                                                             |                            |
|---------------------------------------------------------------------------------------------|----------------------------|
| <br>__lo | Pointer to start of range. |
| <br>__hi | Pointer to end of range.   |

**Returns**

\_\_hi.

4.427.3.8 do\_widen() [1/2]

```
virtual char_type std::ctype< char >::do_widen (
 char __c) const [inline], [protected], [virtual], [inherited]
```

Widen char.

This virtual function converts the char to char using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be returned unchanged.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

|                                       |                      |
|---------------------------------------|----------------------|
| <div><div>↔</div><div>__c</div></div> | The char to convert. |
|---------------------------------------|----------------------|

Returns

The converted character.

Definition at line 1084 of file locale\_facets.h.

4.427.3.9 do\_widen() [2/2]

```
virtual const char* std::ctype< char >::do_widen (
 const char * __lo,
 const char * __hi,
 char_type * __to) const [inline], [protected], [virtual], [inherited]
```

Widen char array.

This function converts each char in the range [lo,hi) to char using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be copied unchanged.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

|                                        |                                   |
|----------------------------------------|-----------------------------------|
| <div><div>↔</div><div>__lo</div></div> | Pointer to start of range.        |
| <div><div>↔</div><div>__hi</div></div> | Pointer to end of range.          |
| <div><div>↔</div><div>__to</div></div> | Pointer to the destination array. |
| Generated by Doxygen                   |                                   |

**Returns**

`__hi`.

Definition at line 1107 of file `locale_facets.h`.

**4.427.3.10 is()** [1/2]

```
bool std::ctype< char >::is (
 mask __m,
 char __c) const [inline], [inherited]
```

Test char classification.

This function compares the mask `table[c]` to `__m`.

**Parameters**

|                  |                                  |
|------------------|----------------------------------|
| <code>__c</code> | The char to compare the mask of. |
| <code>__m</code> | The mask to compare against.     |

**Returns**

True if `__m & table[__c]` is true, false otherwise.

Definition at line 43 of file `ctype_inline.h`.

**4.427.3.11 is()** [2/2]

```
const char * std::ctype< char >::is (
 const char * __lo,
 const char * __hi,
 mask * __vec) const [inline], [inherited]
```

Return a mask array.

This function finds the mask for each char in the range `[lo, hi)` and successively writes it to `vec`. `vec` must have as many elements as the char array.

**Parameters**

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

**Returns**

`__hi`.

Definition at line 48 of file ctype\_inline.h.

**4.427.3.12 narrow()** [1/2]

```
char std::ctype< char >::narrow (
 char_type __c,
 char __default) const [inline], [inherited]
```

Narrow char.

This function converts the char to char using the simplest reasonable transformation. If the conversion fails, default is returned instead. For an underived ctype<char> facet, c will be returned unchanged.

This function works as if it returns ctype<char>::do\_narrow(c). do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|                        |                                     |
|------------------------|-------------------------------------|
| <code>__c</code>       | The char to convert.                |
| <code>__default</code> | Char to return if conversion fails. |

**Returns**

The converted character.

Definition at line 931 of file locale\_facets.h.

References std::ctype< \_CharT >::do\_narrow().

**4.427.3.13 narrow()** [2/2]

```
const char_type* std::ctype< char >::narrow (
 const char_type * __lo,
 const char_type * __hi,
 char __default,
 char * __to) const [inline], [inherited]
```

Narrow char array.

This function converts each char in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *dfault* is used instead. For an underived ctype<char> facet, the argument will be copied unchanged.

This function works as if it returns ctype<char>::do\_narrow(lo, hi, dfault, to). do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

|                       |                                   |
|-----------------------|-----------------------------------|
| <code>__lo</code>     | Pointer to start of range.        |
| <code>__hi</code>     | Pointer to end of range.          |
| <code>__dfault</code> | Char to use if conversion fails.  |
| <code>__to</code>     | Pointer to the destination array. |

## Returns

`__hi`.

Definition at line 964 of file locale\_facets.h.

References `std::ctype< _CharT >::do_narrow()`.

## 4.427.3.14 scan\_is()

```
const char * std::ctype< char >::scan_is (
 mask __m,
 const char * __lo,
 const char * __hi) const [inline], [inherited]
```

Find char matching a mask.

This function searches for and returns the first char in [lo,hi) for which `is(m,char)` is true.

## Parameters

|                         |                              |
|-------------------------|------------------------------|
| <code>↵<br/>__m</code>  | The mask to compare against. |
| <code>↵<br/>__lo</code> | Pointer to start of range.   |
| <code>↵<br/>__hi</code> | Pointer to end of range.     |

## Returns

Pointer to a matching char if found, else `__hi`.

Definition at line 57 of file ctype\_inline.h.

#### 4.427.3.15 scan\_not()

```
const char * std::ctype< char >::scan_not (
 mask __m,
 const char * __lo,
 const char * __hi) const [inline], [inherited]
```

Find char not matching a mask.

This function searches for and returns a pointer to the first char in [\_\_lo,\_\_hi) for which is(m,char) is false.

##### Parameters

|                         |                              |
|-------------------------|------------------------------|
| <code>↵<br/>__m</code>  | The mask to compare against. |
| <code>↵<br/>__lo</code> | Pointer to start of range.   |
| <code>↵<br/>__hi</code> | Pointer to end of range.     |

##### Returns

Pointer to a non-matching char if found, else `__hi`.

Definition at line 67 of file ctype\_inline.h.

#### 4.427.3.16 table()

```
const mask* std::ctype< char >::table () const throw () [inline], [inherited]
```

Returns a pointer to the mask table provided to the constructor, or the default from classic\_table() if none was provided.

Definition at line 983 of file locale\_facets.h.

#### 4.427.3.17 tolower() [1/2]

```
char_type std::ctype< char >::tolower (
 char_type __c) const [inline], [inherited]
```

Convert to lowercase.

This function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

tolower() acts as if it returns ctype<char>::do\_tolower(\_\_c). do\_tolower() must always return the same result for the same input.

## Parameters

|                                                                                   |                      |
|-----------------------------------------------------------------------------------|----------------------|
|  | The char to convert. |
| <code>__c</code>                                                                  |                      |

## Returns

The lowercase char if convertible, else `__c`.

Definition at line 835 of file locale\_facets.h.

References `std::ctype< _CharT >::do_tolower()`.

## 4.427.3.18 tolower() [2/2]

```
const char_type* std::ctype< char >::tolower (
 char_type * __lo,
 const char_type * __hi) const [inline], [inherited]
```

Convert array to lowercase.

This function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.

`tolower()` acts as if it returns `ctype<char>::do_tolower(__lo, __hi)`. `do_tolower()` must always return the same result for the same input.

## Parameters

|                                                                                     |                                 |
|-------------------------------------------------------------------------------------|---------------------------------|
|  | Pointer to first char in range. |
| <code>__lo</code>                                                                   |                                 |
|  | Pointer to end of range.        |
| <code>__hi</code>                                                                   |                                 |

## Returns

`__hi`.

Definition at line 852 of file locale\_facets.h.

References `std::ctype< _CharT >::do_tolower()`.

**4.427.3.19 toupper()** [1/2]

```
char_type std::ctype< char >::toupper (
 char_type __c) const [inline], [inherited]
```

Convert to uppercase.

This function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

toupper() acts as if it returns ctype<char>::do\_toupper(c). do\_toupper() must always return the same result for the same input.

**Parameters**

|                                                                                                    |                      |
|----------------------------------------------------------------------------------------------------|----------------------|
|  <code>__c</code> | The char to convert. |
|----------------------------------------------------------------------------------------------------|----------------------|

**Returns**

The uppercase char if convertible, else `__c`.

Definition at line 802 of file locale\_facets.h.

References std::ctype<\_CharT>::do\_toupper().

**4.427.3.20 toupper()** [2/2]

```
const char_type* std::ctype< char >::toupper (
 char_type * __lo,
 const char_type * __hi) const [inline], [inherited]
```

Convert array to uppercase.

This function converts each char in the range [`__lo`,`__hi`) to uppercase if possible. Other chars remain untouched.

toupper() acts as if it returns ctype<char>::do\_toupper(`__lo`, `__hi`). do\_toupper() must always return the same result for the same input.

**Parameters**

|                                                                                                       |                                 |
|-------------------------------------------------------------------------------------------------------|---------------------------------|
|  <code>__lo</code> | Pointer to first char in range. |
|  <code>__hi</code> | Pointer to end of range.        |

**Returns**`__hi.`

Definition at line 819 of file locale\_facets.h.

References `std::ctype< _CharT >::do_toupper()`.

**4.427.3.21 widen() [1/2]**

```
char_type std::ctype< char >::widen (
 char __c) const [inline], [inherited]
```

Widen char.

This function converts the char to char\_type using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be returned unchanged.

This function works as if it returns `ctype<char>::do_widen(c)`. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

|                  |                      |
|------------------|----------------------|
| <code>__c</code> | The char to convert. |
|------------------|----------------------|

**Returns**

The converted character.

Definition at line 872 of file locale\_facets.h.

References `std::ctype< _CharT >::do_widen()`.

**4.427.3.22 widen() [2/2]**

```
const char* std::ctype< char >::widen (
 const char * __lo,
 const char * __hi,
 char_type * __to) const [inline], [inherited]
```

Widen char array.

This function converts each char in the input to char using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be copied unchanged.

This function works as if it returns `ctype<char>::do_widen(c)`. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

|                        |                                   |
|------------------------|-----------------------------------|
| <code>↵<br/>_lo</code> | Pointer to first char in range.   |
| <code>↵<br/>_hi</code> | Pointer to end of range.          |
| <code>↵<br/>_to</code> | Pointer to the destination array. |

**Returns**

`__hi`.

Definition at line 899 of file `locale_facets.h`.

References `std::ctype<_CharT>::do_widen()`.

**4.427.4 Member Data Documentation****4.427.4.1 id**

```
locale::id std::ctype< char >::id [static], [inherited]
```

The facet id for `ctype<char>`

Definition at line 703 of file `locale_facets.h`.

**4.427.4.2 table\_size**

```
const size_t std::ctype< char >::table_size [static], [inherited]
```

The size of the mask table. It is `SCHAR_MAX + 1`.

Definition at line 705 of file `locale_facets.h`.

#### 4.432.1 Detailed Description

##### 3.2.3 Class `decimal64`.

Definition at line 313 of file `decimal`.

#### 4.432.2 Constructor & Destructor Documentation

##### 4.432.2.1 `decimal64()`

```
std::decimal::decimal64::decimal64 (
 __decfloat64 __z) [inline]
```

Conforming extension: Conversion from scalar decimal type.

Definition at line 337 of file `decimal`.

The documentation for this class was generated from the following file:

- `decimal`

#### 4.433 `__gnu_pbds::detail::default_comb_hash_fn` Struct Reference

##### Public Types

- typedef `direct_mask_range_hashing` type

#### 4.433.1 Detailed Description

Primary template, default\_comb\_hash\_fn.

Definition at line 80 of file standard\_policies.hpp.

#### 4.433.2 Member Typedef Documentation

##### 4.433.2.1 type

```
typedef direct_mask_range_hashing __gnu_pbds::detail::default_comb_hash_fn::type
```

Dispatched type.

Definition at line 83 of file standard\_policies.hpp.

The documentation for this struct was generated from the following file:

- [standard\\_policies.hpp](#)

### 4.434 std::default\_delete< \_Tp > Struct Template Reference

#### Public Member Functions

- constexpr [default\\_delete](#) () noexcept=default
- template<typename \_Up , typename = \_Require<is\_convertible<\_Up\*, \_Tp\*>>>>  
[default\\_delete](#) (const [default\\_delete](#)< \_Up > &) noexcept
- void [operator\(\)](#) (\_Tp \*\_\_ptr) const

#### 4.434.1 Detailed Description

```
template<typename _Tp>
struct std::default_delete< _Tp >
```

Primary template of default\_delete, used by unique\_ptr for single objects.

Definition at line 63 of file unique\_ptr.h.

#### 4.434.2 Constructor & Destructor Documentation

4.434.2.1 `default_delete()` [1/2]

```
template<typename _Tp >
constexpr std::default_delete<_Tp >::default_delete () [default], [noexcept]
```

Default constructor.

4.434.2.2 `default_delete()` [2/2]

```
template<typename _Tp >
template<typename _Up , typename = _Require<is_convertible<_Up*, _Tp*>>>
std::default_delete<_Tp >::default_delete (
 const default_delete<_Up > &) [inline], [noexcept]
```

Converting constructor.

Allows conversion from a deleter for objects of another type, `_Up`, only if `_Up*` is convertible to `_Tp*`.

Definition at line 75 of file `unique_ptr.h`.

## 4.434.3 Member Function Documentation

4.434.3.1 `operator()()`

```
template<typename _Tp >
void std::default_delete<_Tp >::operator() (
 _Tp * __ptr) const [inline]
```

Calls `delete __ptr`

Definition at line 79 of file `unique_ptr.h`.

The documentation for this struct was generated from the following file:

- [unique\\_ptr.h](#)

4.435 `std::default_delete<_Tp[]>` Struct Template Reference

## Public Member Functions

- constexpr `default_delete` ( ) noexcept=default
- template<typename `_Up` , typename = `_Require<is_convertible<_Up*[], _Tp*[]>>>`  
`default_delete` (const `default_delete<_Up[]> &`) noexcept
- template<typename `_Up` >  
`enable_if<is_convertible<_Up*[], _Tp*[]>::value >::type operator()` ( `_Up * __ptr` ) const

#### 4.435.1 Detailed Description

```
template<typename _Tp>
struct std::default_delete<_Tp[]>
```

Specialization of `default_delete` for arrays, used by `unique_ptr<T[]>`

Definition at line 94 of file `unique_ptr.h`.

#### 4.435.2 Constructor & Destructor Documentation

##### 4.435.2.1 `default_delete()` [1/2]

```
template<typename _Tp >
constexpr std::default_delete<_Tp[]>::default_delete () [default], [noexcept]
```

Default constructor.

##### 4.435.2.2 `default_delete()` [2/2]

```
template<typename _Tp >
template<typename _Up , typename = _Require<is_convertible<_Up(*)[], _Tp(*)[]>>>
std::default_delete<_Tp[]>::default_delete (
 const default_delete<_Up[]> &) [inline], [noexcept]
```

Converting constructor.

Allows conversion from a deleter for arrays of another type, such as a const-qualified version of `_Tp`.

Conversions from types derived from `_Tp` are not allowed because it is undefined to `delete[]` an array of derived types through a pointer to the base type.

Definition at line 111 of file `unique_ptr.h`.

#### 4.435.3 Member Function Documentation

4.435.3.1 `operator()`

```
template<typename _Tp >
template<typename _Up >
enable_if<is_convertible<_Up(*)[], _Tp(*)[]>::value>::type std::default_delete< _Tp[]>::operator()
(
 _Up * __ptr) const [inline]
```

Calls `delete[] __ptr`

Definition at line 116 of file `unique_ptr.h`.

The documentation for this struct was generated from the following file:

- [unique\\_ptr.h](#)

4.436 `__gnu_pbds::detail::default_eq_fn< Key >` Struct Template Reference

## Public Types

- typedef `std::equal_to< Key > type`

## 4.436.1 Detailed Description

```
template<typename Key>
struct __gnu_pbds::detail::default_eq_fn< Key >
```

Primary template, `default_eq_fn`.

Definition at line 67 of file `standard_policies.hpp`.

## 4.436.2 Member Typedef Documentation

4.436.2.1 `type`

```
template<typename Key>
typedef std::equal_to<Key> __gnu_pbds::detail::default_eq_fn< Key >::type
```

Dispatched type.

Definition at line 70 of file `standard_policies.hpp`.

The documentation for this struct was generated from the following file:

- [standard\\_policies.hpp](#)

#### 4.437 `__gnu_pbds::detail::default_hash_fn< Key >` Struct Template Reference

##### Public Types

- `typedef std::tr1::hash< Key > type`

##### 4.437.1 Detailed Description

```
template<typename Key>
struct __gnu_pbds::detail::default_hash_fn< Key >
```

Primary template, `default_hash_fn`.

Definition at line 59 of file `standard_policies.hpp`.

##### 4.437.2 Member Typedef Documentation

###### 4.437.2.1 `type`

```
template<typename Key>
typedef std::tr1::hash<Key> __gnu_pbds::detail::default_hash_fn< Key >::type
```

Dispatched type.

Definition at line 62 of file `standard_policies.hpp`.

The documentation for this struct was generated from the following file:

- [standard\\_policies.hpp](#)

#### 4.438 `__gnu_parallel::default_parallel_tag` Struct Reference

Inheritance diagram for `__gnu_parallel::default_parallel_tag`:

## Public Member Functions

- `default_parallel_tag` (`_ThreadIndex` `__num_threads`)
- `_ThreadIndex` `__get_num_threads` ()
- void `set_num_threads` (`_ThreadIndex` `__num_threads`)

## 4.438.1 Detailed Description

Recommends parallel execution using the default parallel algorithm.

Definition at line 79 of file `tags.h`.

## 4.438.2 Member Function Documentation

4.438.2.1 `__get_num_threads()`

```
_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads () [inline], [inherited]
```

Find out desired number of threads.

## Returns

Desired number of threads.

Definition at line 63 of file `tags.h`.

Referenced by `__gnu_parallel::__parallel_sort()`.

4.438.2.2 `set_num_threads()`

```
void __gnu_parallel::parallel_tag::set_num_threads (
 _ThreadIndex __num_threads) [inline], [inherited]
```

Set the desired number of threads.

## Parameters

|                            |                            |
|----------------------------|----------------------------|
| <code>__num_threads</code> | Desired number of threads. |
|----------------------------|----------------------------|

Definition at line 73 of file `tags.h`.

The documentation for this struct was generated from the following file:

- [tags.h](#)

#### 4.439 `__gnu_pbds::detail::default_probe_fn`< `Comb_Probe_Fn` > Struct Template Reference

##### Public Types

- typedef `cond_type::__type` [type](#)

##### 4.439.1 Detailed Description

```
template<typename Comb_Probe_Fn>
struct __gnu_pbds::detail::default_probe_fn< Comb_Probe_Fn >
```

Primary template, `default_probe_fn`.

Definition at line 117 of file `standard_policies.hpp`.

##### 4.439.2 Member Typedef Documentation

###### 4.439.2.1 `type`

```
template<typename Comb_Probe_Fn >
typedef cond_type::__type __gnu_pbds::detail::default_probe_fn< Comb_Probe_Fn >::type
```

Dispatched type.

Definition at line 129 of file `standard_policies.hpp`.

The documentation for this struct was generated from the following file:

- [standard\\_policies.hpp](#)

#### 4.440 `__gnu_pbds::detail::default_resize_policy`< `Comb_Hash_Fn` > Struct Template Reference

##### Public Types

- typedef [hash\\_standard\\_resize\\_policy](#)< `size_policy_type`, [trigger](#), `false`, `size_type` > [type](#)

## 4.440.1 Detailed Description

```
template<typename Comb_Hash_Fn>
struct __gnu_pbds::detail::default_resize_policy< Comb_Hash_Fn >
```

Primary template, `default_resize_policy`.

Definition at line 88 of file `standard_policies.hpp`.

## 4.440.2 Member Typedef Documentation

4.440.2.1 `type`

```
template<typename Comb_Hash_Fn>
typedef hash_standard_resize_policy<size_policy_type, trigger, false, size_type> __gnu_pbds::detail::default_res
Comb_Hash_Fn >::type
```

Dispatched type.

Definition at line 105 of file `standard_policies.hpp`.

The documentation for this struct was generated from the following file:

- [standard\\_policies.hpp](#)

4.441 `__gnu_pbds::detail::default_trie_access_traits< Key >` Struct Template Reference

## 4.441.1 Detailed Description

```
template<typename Key>
struct __gnu_pbds::detail::default_trie_access_traits< Key >
```

Primary template, `default_trie_access_traits`.

Definition at line 135 of file `standard_policies.hpp`.

The documentation for this struct was generated from the following file:

- [standard\\_policies.hpp](#)

#### 4.442 `__gnu_pbds::detail::default_trie_access_traits< std::basic_string< Char, Char_Traits, std::allocator< char > > >` Struct Template Reference

##### Public Types

- typedef [trie\\_string\\_access\\_traits< string\\_type > type](#)

##### 4.442.1 Detailed Description

```
template<typename Char, typename Char_Traits>
struct __gnu_pbds::detail::default_trie_access_traits< std::basic_string< Char, Char_Traits, std::allocator< char > > >
```

Partial specialization, `default_trie_access_traits`.

Definition at line 142 of file `standard_policies.hpp`.

##### 4.442.2 Member Typedef Documentation

###### 4.442.2.1 `type`

```
template<typename Char , typename Char_Traits >
typedef trie_string_access_traits<string_type> __gnu_pbds::detail::default_trie_access_traits<
std::basic_string< Char, Char_Traits, std::allocator< char > > >::type
```

Dispatched type.

Definition at line 149 of file `standard_policies.hpp`.

The documentation for this struct was generated from the following file:

- [standard\\_policies.hpp](#)

#### 4.443 `__gnu_pbds::detail::default_update_policy` Struct Reference

##### Public Types

- typedef [lu\\_move\\_to\\_front\\_policy](#) `type`

##### 4.443.1 Detailed Description

Default update policy.

Definition at line 109 of file `standard_policies.hpp`.

## 4.443.2 Member Typedef Documentation

## 4.443.2.1 type

```
typedef lu_move_to_front_policy __gnu_pbds::detail::default_update_policy::type
```

Dispatched type.

Definition at line 112 of file standard\_policies.hpp.

The documentation for this struct was generated from the following file:

- [standard\\_policies.hpp](#)

## 4.444 std::defer\_lock\_t Struct Reference

## 4.444.1 Detailed Description

Do not acquire ownership of the mutex.

Definition at line 129 of file std\_mutex.h.

The documentation for this struct was generated from the following file:

- [std\\_mutex.h](#)

## 4.445 std::deque&lt;\_Tp, \_Alloc&gt; Class Template Reference

Inheritance diagram for std::deque<\_Tp, \_Alloc>:

#### Static Protected Member Functions

- `static size_t _S_check_init_len (size_t __n, const allocator_type &__a)`
- `static size_type _S_max_size (const _Tp_alloc_type &__a) noexcept`

#### 4.445.1 Detailed Description

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
class std::deque<_Tp, _Alloc>
```

A standard container using fixed-size memory allocation and constant-time manipulation of elements at either end.

#### Template Parameters

|                     |                                                                 |
|---------------------|-----------------------------------------------------------------|
| <code>_Tp</code>    | Type of element.                                                |
| <code>_Alloc</code> | Allocator type, defaults to <code>allocator&lt;_Tp&gt;</code> . |

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the

### optional sequence requirements.

In previous HP/SGI versions of deque, there was an extra template parameter so users could control the node size. This extension turned out to violate the C++ standard (it can be detected using template template parameters), and it was removed.

Here's how a deque<Tp> manages memory. Each deque has 4 members:

- Tp\*\* \_M\_map
- size\_t \_M\_map\_size
- iterator \_M\_start, \_M\_finish

map\_size is at least 8. map is an array of map\_size pointers-to-nodes. (The name map has nothing to do with the std::map class, and **nodes** should not be confused with std::list's usage of *node*.)

A *node* has no specific type name as such, but it is referred to as *node* in this file. It is a simple array-of-Tp. If Tp is very large, there will be one Tp element per node (i.e., an *array* of one). For non-huge Tp's, node size is inversely related to Tp size: the larger the Tp, the fewer Tp's will fit in a node. The goal here is to keep the total size of a node relatively small and constant over different Tp's, to improve allocator efficiency.

Not every pointer in the map array will point to a node. If the initial number of elements in the deque is small, the /middle/ map pointers will be valid, and the ones at the edges will be unused. This same situation will arise as the map grows: available map pointers, if any, will be on the ends. As new nodes are created, only a subset of the map's pointers need to be copied *outward*.

Class invariants:

- For any nonsingular iterator i:
  - i.node points to a member of the map array. (Yes, you read that correctly: i.node does not actually point to a node.) The member of the map array is what actually points to the node.
  - i.first == \*(i.node) (This points to the node (first Tp element).)
  - i.last == i.first + node\_size
  - i.cur is a pointer in the range [i.first, i.last). NOTE: the implication of this is that i.cur is always a dereferenceable pointer, even if i is a past-the-end iterator.
- Start and Finish are always nonsingular iterators. NOTE: this means that an empty deque must have one node, a deque with <N elements (where N is the node buffer size) must have one node, a deque with N through (2N-1) elements must have two nodes, etc.
- For every node other than start.node and finish.node, every element in the node is an initialized object. If start.↔node == finish.node, then [start.cur, finish.cur) are initialized objects, and the elements outside that range are uninitialized storage. Otherwise, [start.cur, start.last) and [finish.first, finish.cur) are initialized objects, and [start.↔first, start.cur) and [finish.cur, finish.last) are uninitialized storage.
- [map, map + map\_size) is a valid, non-empty range.
- [start.node, finish.node] is a valid range contained within [map, map + map\_size).
- A pointer in the range [map, map + map\_size) points to an allocated node if and only if the pointer is in the range [start.node, finish.node].

Here's the magic: nothing in deque is **aware** of the discontinuous storage!

The memory setup and layout occurs in the parent, \_Base, and the iterator class is entirely responsible for *leaping* from one node to the next. All the implementation routines for deque itself work only through the start and finish iterators. This keeps the routines simple and sane, and we can use other standard algorithms as well.

Definition at line 764 of file stl\_deque.h.

## 4.445.2 Constructor &amp; Destructor Documentation

## 4.445.2.1 deque() [1/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque () [default]
```

Creates a deque with no elements.

## 4.445.2.2 deque() [2/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
 const allocator_type & __a) [inline], [explicit]
```

Creates a deque with no elements.

## Parameters

|                          |                      |
|--------------------------|----------------------|
| $\leftrightarrow$<br>__a | An allocator object. |
|--------------------------|----------------------|

Definition at line 841 of file stl\_deque.h.

## 4.445.2.3 deque() [3/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
 size_type __n,
 const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Creates a deque with default constructed elements.

## Parameters

|                          |                                             |
|--------------------------|---------------------------------------------|
| $\leftrightarrow$<br>__n | The number of elements to initially create. |
| $\leftrightarrow$<br>__a | An allocator.                               |

This constructor fills the deque with *n* default constructed elements.

Definition at line 854 of file stl\_deque.h.

#### 4.445.2.4 deque() [4/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
 size_type __n,
 const value_type & __value,
 const allocator_type & __a = allocator_type()) [inline]
```

Creates a deque with copies of an exemplar element.

##### Parameters

|                      |                                             |
|----------------------|---------------------------------------------|
| <code>__n</code>     | The number of elements to initially create. |
| <code>__value</code> | An element to copy.                         |
| <code>__a</code>     | An allocator.                               |

This constructor fills the deque with `__n` copies of `__value`.

Definition at line 866 of file `stl_deque.h`.

#### 4.445.2.5 deque() [5/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
 const deque< _Tp, _Alloc > & __x) [inline]
```

Deque copy constructor.

##### Parameters

|                  |                                                   |
|------------------|---------------------------------------------------|
| <code>__x</code> | A deque of identical element and allocator types. |
|------------------|---------------------------------------------------|

The newly-created deque uses a copy of the allocator object used by `__x` (unless the allocator traits dictate a different object).

Definition at line 893 of file `stl_deque.h`.

#### 4.445.2.6 deque() [6/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
 deque< _Tp, _Alloc > &&) [default]
```

Deque move constructor.

The newly-created deque contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified deque.

#### 4.445.2.7 deque() [7/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
 const deque< _Tp, _Alloc > & __x,
 const allocator_type & __a) [inline]
```

Copy constructor with alternative allocator.

Definition at line 912 of file stl\_deque.h.

#### 4.445.2.8 deque() [8/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
 deque< _Tp, _Alloc > && __x,
 const allocator_type & __a) [inline]
```

Move constructor with alternative allocator.

Definition at line 919 of file stl\_deque.h.

#### 4.445.2.9 deque() [9/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
 initializer_list< value_type > __l,
 const allocator_type & __a = allocator_type()) [inline]
```

Builds a deque from an initializer list.

##### Parameters

|                  |                      |
|------------------|----------------------|
| <code>__l</code> | An initializer_list. |
| <code>__a</code> | An allocator object. |

Create a deque consisting of copies of the elements in the initializer\_list `__l`.

This will call the element type's copy constructor N times (where N is `__l.size()`) and do no memory reallocation.

Definition at line 952 of file `stl_deque.h`.

#### 4.445.2.10 `deque()` [10/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
std::deque<_Tp, _Alloc>::deque (
 _InputIterator __first,
 _InputIterator __last,
 const allocator_type & __a = allocator_type()) [inline]
```

Builds a deque from a range.

##### Parameters

|                      |                      |
|----------------------|----------------------|
| <code>__first</code> | An input iterator.   |
| <code>__last</code>  | An input iterator.   |
| <code>__a</code>     | An allocator object. |

Create a deque consisting of copies of the elements from `[__first, __last)`.

If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor  $N$  times (where  $N$  is `distance(__first, __last)`) and do no memory reallocation. But if only input iterators are used, then this will do at most  $2N$  calls to the copy constructor, and  $\log N$  memory reallocations.

Definition at line 979 of file `stl_deque.h`.

#### 4.445.2.11 `~deque()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque<_Tp, _Alloc>::~~deque () [inline]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1003 of file `stl_deque.h`.

### 4.445.3 Member Function Documentation

#### 4.445.3.1 `_M_fill_initialize()`

```
template<typename _Tp, typename _Alloc>
void deque::_M_fill_initialize (
 const value_type & __value) [protected]
```

Fills the deque with copies of `value`.

**Parameters**

|                      |                |
|----------------------|----------------|
| <code>__value</code> | Initial value. |
|----------------------|----------------|

**Returns**

Nothing.

**Precondition**

`_M_start` and `_M_finish` have already been initialized, but none of the deque's elements have yet been constructed.

This function is called only when the user provides an explicit size (with or without an explicit exemplar value).

Definition at line 394 of file `deque.tcc`.

Referenced by `std::deque< _StateSeqT >::deque()`.

**4.445.3.2 `_M_initialize_map()`**

```
template<typename _Tp , typename _Alloc >
void std::_Deque_base< _Tp, _Alloc >::_M_initialize_map (
 size_t __num_elements) [protected], [inherited]
```

Layout storage.

**Parameters**

|                             |                                                        |
|-----------------------------|--------------------------------------------------------|
| <code>__num_elements</code> | The count of T's for which to allocate space at first. |
|-----------------------------|--------------------------------------------------------|

**Returns**

Nothing.

The initial underlying memory layout is a bit complicated...

Definition at line 615 of file `stl_deque.h`.

**4.445.3.3 `_M_new_elements_at_back()`**

```
template<typename _Tp , typename _Alloc >
void deque::_M_new_elements_at_back (
 size_type __new_elements) [protected]
```

Memory-handling helpers for the previous internal insert functions.

Definition at line 904 of file deque.tcc.

Referenced by `std::deque<_StateSeqT>::_M_reserve_elements_at_back()`.

#### 4.445.3.4 `_M_new_elements_at_front()`

```
template<typename _Tp , typename _Alloc >
void deque::_M_new_elements_at_front (
 size_type __new_elements) [protected]
```

Memory-handling helpers for the previous internal insert functions.

Definition at line 879 of file deque.tcc.

Referenced by `std::deque<_StateSeqT>::_M_reserve_elements_at_front()`.

#### 4.445.3.5 `_M_pop_back_aux()`

```
template<typename _Tp , typename _Alloc >
void deque::_M_pop_back_aux () [protected]
```

Helper functions for `push_*` and `pop_*`.

Definition at line 558 of file deque.tcc.

#### 4.445.3.6 `_M_pop_front_aux()`

```
template<typename _Tp , typename _Alloc >
void deque::_M_pop_front_aux () [protected]
```

Helper functions for `push_*` and `pop_*`.

Definition at line 574 of file deque.tcc.

#### 4.445.3.7 `_M_push_back_aux()`

```
template<typename _Tp , typename _Alloc >
template<typename... _Args>
void deque::_M_push_back_aux (
 _Args &&... __args) [protected]
```

Helper functions for `push_*` and `pop_*`.

Definition at line 482 of file deque.tcc.

Referenced by `std::deque<_StateSeqT>::push_back()`.

## 4.445.3.8 \_M\_push\_front\_aux()

```
template<typename _Tp , typename _Alloc >
template<typename... _Args>
void deque::_M_push_front_aux (
 _Args &&... __args) [protected]
```

Helper functions for push\_\* and pop\_\*.

Definition at line 521 of file deque.tcc.

Referenced by std::deque< \_StateSeqT >::push\_front().

## 4.445.3.9 \_M\_range\_check()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::_M_range_check (
 size_type __n) const [inline], [protected]
```

Safety check used only from at().

Definition at line 1351 of file stl\_deque.h.

Referenced by std::deque< \_StateSeqT >::at().

## 4.445.3.10 \_M\_range\_initialize() [1/2]

```
template<typename _Tp , typename _Alloc >
template<typename _InputIterator >
void deque::_M_range_initialize (
 _InputIterator __first,
 _InputIterator __last,
 std::input_iterator_tag) [protected]
```

Fills the deque with whatever is in [first,last).

## Parameters

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

## Returns

Nothing.

If the iterators are actually forward iterators (or better), then the memory layout can be done all at once. Else we move forward using push\_back on each value from the iterator.

Definition at line 420 of file deque.tcc.

Referenced by `std::deque<_StateSeqT>::deque()`.

#### 4.445.3.11 `_M_range_initialize()` [2/2]

```
template<typename _Tp , typename _Alloc >
template<typename _ForwardIterator >
void deque::_M_range_initialize (
 _ForwardIterator __first,
 _ForwardIterator __last,
 std::forward_iterator_tag) [protected]
```

Fills the deque with whatever is in [first,last).

##### Parameters

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

##### Returns

Nothing.

If the iterators are actually forward iterators (or better), then the memory layout can be done all at once. Else we move forward using `push_back` on each value from the iterator.

Definition at line 444 of file deque.tcc.

#### 4.445.3.12 `_M_reallocate_map()`

```
template<typename _Tp , typename _Alloc >
void deque::_M_reallocate_map (
 size_type __nodes_to_add,
 bool __add_at_front) [protected]
```

Memory-handling helpers for the major map.

Makes sure the `_M_map` has space for new nodes. Does not actually add the nodes. Can invalidate `_M_map` pointers. (And consequently, deque iterators.)

Definition at line 929 of file deque.tcc.

Referenced by `std::deque<_StateSeqT>::_M_reserve_map_at_back()`, and `std::deque<_StateSeqT>::_M_reserve_map_at_front()`.

**4.445.3.13 \_M\_reserve\_elements\_at\_back()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::_M_reserve_elements_at_back (
 size_type __n) [inline], [protected]
```

Memory-handling helpers for the previous internal insert functions.

Definition at line 2097 of file stl\_deque.h.

**4.445.3.14 \_M\_reserve\_elements\_at\_front()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::_M_reserve_elements_at_front (
 size_type __n) [inline], [protected]
```

Memory-handling helpers for the previous internal insert functions.

Definition at line 2087 of file stl\_deque.h.

**4.445.3.15 \_M\_reserve\_map\_at\_back()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::_M_reserve_map_at_back (
 size_type __nodes_to_add = 1) [inline], [protected]
```

Memory-handling helpers for the major map.

Makes sure the \_M\_map has space for new nodes. Does not actually add the nodes. Can invalidate \_M\_map pointers. (And consequently, deque iterators.)

Definition at line 2123 of file stl\_deque.h.

**4.445.3.16 \_M\_reserve\_map\_at\_front()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::_M_reserve_map_at_front (
 size_type __nodes_to_add = 1) [inline], [protected]
```

Memory-handling helpers for the major map.

Makes sure the \_M\_map has space for new nodes. Does not actually add the nodes. Can invalidate \_M\_map pointers. (And consequently, deque iterators.)

Definition at line 2131 of file stl\_deque.h.

**4.445.3.17 assign()** [1/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::assign (
 size_type __n,
 const value_type & __val) [inline]
```

Assigns a given value to a deque.

**Parameters**

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Number of elements to be assigned. |
| <code>__val</code> | Value to be assigned.              |

This function fills a deque with  $n$  copies of the given value. Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned.

Definition at line 1066 of file `std_deque.h`.

**4.445.3.18 assign()** [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
void std::deque<_Tp, _Alloc>::assign (
 _InputIterator __first,
 _InputIterator __last) [inline]
```

Assigns a range to a deque.

**Parameters**

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

This function fills a deque with copies of the elements in the range `[__first,__last)`.

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned.

Definition at line 1085 of file `std_deque.h`.

**4.445.3.19 assign()** [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque<_Tp, _Alloc>::assign (
 initializer_list<value_type> __l) [inline]
```

Assigns an initializer list to a deque.

## Parameters

|   |                      |
|---|----------------------|
| ↩ | An initializer_list. |
| ↩ |                      |
| ↩ |                      |
| ↩ |                      |
| / |                      |

This function fills a deque with copies of the elements in the initializer\_list \_\_l.

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned.

Definition at line 1110 of file stl\_deque.h.

## 4.445.3.20 at() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::deque< _Tp, _Alloc >::at (
 size_type __n) [inline]
```

Provides access to the data contained in the deque.

## Parameters

|   |                                                             |
|---|-------------------------------------------------------------|
| ↩ | The index of the element for which data should be accessed. |
| n |                                                             |

## Returns

Read/write reference to data.

## Exceptions

|                   |                             |
|-------------------|-----------------------------|
| std::out_of_range | If __n is an invalid index. |
|-------------------|-----------------------------|

This function provides for safer data access. The parameter is first checked that it is in the range of the deque. The function throws out\_of\_range if the check fails.

Definition at line 1373 of file stl\_deque.h.

## 4.445.3.21 at() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::deque< _Tp, _Alloc >::at (
 size_type __n) const [inline]
```

Provides access to the data contained in the deque.

#### Parameters

|                        |                                                             |
|------------------------|-------------------------------------------------------------|
| <code>_↵<br/>_n</code> | The index of the element for which data should be accessed. |
|------------------------|-------------------------------------------------------------|

#### Returns

Read-only (constant) reference to data.

#### Exceptions

|                                |                                          |
|--------------------------------|------------------------------------------|
| <code>std::out_of_range</code> | If <code>__n</code> is an invalid index. |
|--------------------------------|------------------------------------------|

This function provides for safer data access. The parameter is first checked that it is in the range of the deque. The function throws `out_of_range` if the check fails.

Definition at line 1391 of file `stl_deque.h`.

#### 4.445.3.22 `back()` [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::deque< _Tp, _Alloc >::back () [inline], [noexcept]
```

Returns a read/write reference to the data at the last element of the deque.

Definition at line 1424 of file `stl_deque.h`.

#### 4.445.3.23 `back()` [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::deque< _Tp, _Alloc >::back () const [inline], [noexcept]
```

Returns a read-only (constant) reference to the data at the last element of the deque.

Definition at line 1437 of file `stl_deque.h`.

**4.445.3.24 begin()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::begin () [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the deque. Iteration is done in ordinary element order.

Definition at line 1125 of file stl\_deque.h.

Referenced by std::deque< \_StateSeqT >::clear(), std::deque< \_StateSeqT >::deque(), std::deque< \_StateSeqT >::insert(), std::operator<(), std::deque< \_StateSeqT >::operator=(), std::operator==( ), and std::deque< \_StateSeqT >::~~deque().

**4.445.3.25 begin()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::deque< _Tp, _Alloc >::begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the deque. Iteration is done in ordinary element order.

Definition at line 1133 of file stl\_deque.h.

**4.445.3.26 cbegin()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::deque< _Tp, _Alloc >::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the deque. Iteration is done in ordinary element order.

Definition at line 1196 of file stl\_deque.h.

Referenced by std::deque< \_StateSeqT >::insert().

**4.445.3.27 cend()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::deque< _Tp, _Alloc >::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

Definition at line 1205 of file stl\_deque.h.

#### 4.445.3.28 clear()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque<_Tp, _Alloc >::clear () [inline], [noexcept]
```

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1790 of file `stl_deque.h`.

#### 4.445.3.29 crbegin()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::deque<_Tp, _Alloc >::crbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

Definition at line 1214 of file `stl_deque.h`.

#### 4.445.3.30 crend()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::deque<_Tp, _Alloc >::crend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

Definition at line 1223 of file `stl_deque.h`.

#### 4.445.3.31 emplace()

```
template<typename _Tp , typename _Alloc >
template<typename... _Args>
deque<_Tp, _Alloc >::iterator deque::emplace (
 const_iterator __position,
 _Args &&... __args)
```

Inserts an object in deque before specified iterator.

##### Parameters

|                         |                                               |
|-------------------------|-----------------------------------------------|
| <code>__position</code> | A <code>const_iterator</code> into the deque. |
| <code>__args</code>     | Arguments.                                    |

**Returns**

An iterator that points to the inserted data.

This function will insert an object of type T constructed with T(std::forward<Args>(args)...) before the specified location.

Definition at line 188 of file deque.tcc.

Referenced by std::deque< \_StateSeqT >::insert().

**4.445.3.32 empty()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
bool std::deque< _Tp, _Alloc >::empty () const [inline], [noexcept]
```

Returns true if the deque is empty. (Thus begin() would equal end().)

Definition at line 1308 of file stl\_deque.h.

**4.445.3.33 end()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

Definition at line 1142 of file stl\_deque.h.

Referenced by std::deque< \_StateSeqT >::deque(), std::operator<(), std::deque< \_StateSeqT >::operator=(), std::deque< \_StateSeqT >::operator==(), and std::deque< \_StateSeqT >::~~deque().

**4.445.3.34 end()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::deque< _Tp, _Alloc >::end () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

Definition at line 1151 of file stl\_deque.h.

**4.445.3.35 erase()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::erase (
 const_iterator __position) [inline]
```

Remove element at given position.

**Parameters**

|                         |                                            |
|-------------------------|--------------------------------------------|
| <code>__position</code> | Iterator pointing to element to be erased. |
|-------------------------|--------------------------------------------|

**Returns**

An iterator pointing to the next element (or end()).

This function will erase the element at the given position and thus shorten the deque by one.

The user is cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1730 of file `stl_deque.h`.

**4.445.3.36 erase()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::erase (
 const_iterator __first,
 const_iterator __last) [inline]
```

Remove a range of elements.

**Parameters**

|                      |                                                              |
|----------------------|--------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the first element to be erased.         |
| <code>__last</code>  | Iterator pointing to one past the last element to be erased. |

**Returns**

An iterator pointing to the element pointed to by *last* prior to erasing (or end()).

This function will erase the elements in the range [`__first`,`__last`) and shorten the deque accordingly.

The user is cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1754 of file `stl_deque.h`.

**4.445.3.37 front()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::deque< _Tp, _Alloc >::front () [inline], [noexcept]
```

Returns a read/write reference to the data at the first element of the deque.

Definition at line 1402 of file `stl_deque.h`.

**4.445.3.38** front() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::deque< _Tp, _Alloc >::front () const [inline], [noexcept]
```

Returns a read-only (constant) reference to the data at the first element of the deque.

Definition at line 1413 of file stl\_deque.h.

**4.445.3.39** get\_allocator()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
allocator_type std::deque< _Tp, _Alloc >::get_allocator () const [inline], [noexcept]
```

Get a copy of the memory allocation object.

Definition at line 1116 of file stl\_deque.h.

Referenced by std::deque< \_StateSeqT >::operator=().

**4.445.3.40** insert() [1/5]

```
template<typename _Tp , typename _Alloc >
deque< _Tp, _Alloc >::iterator deque::insert (
 const_iterator __position,
 const value_type & __x)
```

Inserts given value into deque before specified iterator.

**Parameters**

|                         |                                  |
|-------------------------|----------------------------------|
| <code>__position</code> | A const_iterator into the deque. |
| <code>__x</code>        | Data to be inserted.             |

**Returns**

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location.

Definition at line 212 of file deque.tcc.

**4.445.3.41** `insert()` [2/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::insert (
 const_iterator __position,
 value_type && __x) [inline]
```

Inserts given rvalue into deque before specified iterator.

**Parameters**

|                         |                                  |
|-------------------------|----------------------------------|
| <code>__position</code> | A const_iterator into the deque. |
| <code>__x</code>        | Data to be inserted.             |

**Returns**

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location.

Definition at line 1616 of file `stl_deque.h`.

**4.445.3.42** `insert()` [3/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::insert (
 const_iterator __p,
 initializer_list< value_type > __l) [inline]
```

Inserts an initializer list into the deque.

**Parameters**

|                  |                             |
|------------------|-----------------------------|
| <code>__p</code> | An iterator into the deque. |
| <code>__l</code> | An initializer_list.        |

**Returns**

An iterator that points to the inserted data.

This function will insert copies of the data in the initializer\_list `__l` into the deque before the location specified by `__p`. This is known as *list insert*.

Definition at line 1630 of file `stl_deque.h`.

## 4.445.3.43 insert() [4/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::insert (
 const_iterator __position,
 size_type __n,
 const value_type & __x) [inline]
```

Inserts a number of copies of given data into the deque.

## Parameters

|                         |                                    |
|-------------------------|------------------------------------|
| <code>__position</code> | A const_iterator into the deque.   |
| <code>__n</code>        | Number of elements to be inserted. |
| <code>__x</code>        | Data to be inserted.               |

## Returns

An iterator that points to the inserted data.

This function will insert a specified number of copies of the given data before the location specified by `__position`.

Definition at line 1649 of file `stl_deque.h`.

## 4.445.3.44 insert() [5/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>>
iterator std::deque< _Tp, _Alloc >::insert (
 const_iterator __position,
 _InputIterator __first,
 _InputIterator __last) [inline]
```

Inserts a range into the deque.

## Parameters

|                         |                                  |
|-------------------------|----------------------------------|
| <code>__position</code> | A const_iterator into the deque. |
| <code>__first</code>    | An input iterator.               |
| <code>__last</code>     | An input iterator.               |

## Returns

An iterator that points to the inserted data.

This function will insert copies of the data in the range `[__first,__last)` into the deque before the location specified by `__position`. This is known as *range insert*.

Definition at line 1685 of file `stl_deque.h`.

#### 4.445.3.45 `max_size()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::deque<_Tp, _Alloc>::max_size () const [inline], [noexcept]
```

Returns the `size()` of the largest possible deque.

Definition at line 1235 of file `stl_deque.h`.

#### 4.445.3.46 `operator=()` [1/3]

```
template<typename _Tp , typename _Alloc >
deque<_Tp, _Alloc> & deque::operator= (
 const deque<_Tp, _Alloc> & __x)
```

Deque assignment operator.

##### Parameters

|                  |                                                   |
|------------------|---------------------------------------------------|
| <code>__x</code> | A deque of identical element and allocator types. |
|------------------|---------------------------------------------------|

All the elements of `x` are copied.

The newly-created deque uses a copy of the allocator object used by `__x` (unless the allocator traits dictate a different object).

Definition at line 96 of file `deque.tcc`.

#### 4.445.3.47 `operator=()` [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
deque& std::deque<_Tp, _Alloc>::operator= (
 deque<_Tp, _Alloc> && __x) [inline], [noexcept]
```

Deque move assignment operator.

##### Parameters

|                  |                                                   |
|------------------|---------------------------------------------------|
| <code>__x</code> | A deque of identical element and allocator types. |
|------------------|---------------------------------------------------|

The contents of `__x` are moved into this deque (without copying, if the allocators permit it). `__x` is a valid, but unspecified deque.

Definition at line 1028 of file `std_deque.h`.

#### 4.445.3.48 operator=() [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
deque& std::deque< _Tp, _Alloc >::operator= (
 initializer_list< value_type > __l) [inline]
```

Assigns an initializer list to a deque.

##### Parameters

|                  |                      |
|------------------|----------------------|
| <code>↩</code>   | An initializer_list. |
| <code>__↩</code> |                      |
| <code>↩</code>   |                      |
| <code>__↩</code> |                      |
| <code>l</code>   |                      |

This function fills a deque with copies of the elements in the initializer\_list `__l`.

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned.

Definition at line 1047 of file `std_deque.h`.

#### 4.445.3.49 operator[]() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::deque< _Tp, _Alloc >::operator[] (
 size_type __n) [inline], [noexcept]
```

Subscript access to the data contained in the deque.

##### Parameters

|                  |                                                             |
|------------------|-------------------------------------------------------------|
| <code>__↩</code> | The index of the element for which data should be accessed. |
| <code>__n</code> |                                                             |

##### Returns

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Definition at line 1324 of file `stl_deque.h`.

#### 4.445.3.50 `operator[]()` [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::deque< _Tp, _Alloc >::operator[] (
 size_type __n) const [inline], [noexcept]
```

Subscript access to the data contained in the deque.

##### Parameters

|                  |                                                             |
|------------------|-------------------------------------------------------------|
| <code>__n</code> | The index of the element for which data should be accessed. |
|------------------|-------------------------------------------------------------|

##### Returns

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Definition at line 1342 of file `stl_deque.h`.

#### 4.445.3.51 `pop_back()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::pop_back () [inline], [noexcept]
```

Removes last element.

This is a typical stack operation. It shrinks the deque by one.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before `pop_back()` is called.

Definition at line 1552 of file `stl_deque.h`.

#### 4.445.3.52 `pop_front()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::pop_front () [inline], [noexcept]
```

Removes first element.

This is a typical stack operation. It shrinks the deque by one.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop_front()` is called.

Definition at line 1529 of file `stl_deque.h`.

## 4.445.3.53 push\_back()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::push_back (
 const value_type & __x) [inline]
```

Add data to the end of the deque.

## Parameters

|       |                   |
|-------|-------------------|
| $\_x$ | Data to be added. |
|-------|-------------------|

This is a typical stack operation. The function creates an element at the end of the deque and assigns the given data to it. Due to the nature of a deque this operation can be done in constant time.

Definition at line 1493 of file stl\_deque.h.

## 4.445.3.54 push\_front()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::push_front (
 const value_type & __x) [inline]
```

Add data to the front of the deque.

## Parameters

|       |                   |
|-------|-------------------|
| $\_x$ | Data to be added. |
|-------|-------------------|

This is a typical stack operation. The function creates an element at the front of the deque and assigns the given data to it. Due to the nature of a deque this operation can be done in constant time.

Definition at line 1456 of file stl\_deque.h.

## 4.445.3.55 rbegin() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::deque< _Tp, _Alloc >::rbegin () [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

Definition at line 1160 of file stl\_deque.h.

**4.445.3.56** `rbegin()` [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::deque< _Tp, _Alloc >::rbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

Definition at line 1169 of file `stl_deque.h`.

**4.445.3.57** `rend()` [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::deque< _Tp, _Alloc >::rend () [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

Definition at line 1178 of file `stl_deque.h`.

**4.445.3.58** `rend()` [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::deque< _Tp, _Alloc >::rend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

Definition at line 1187 of file `stl_deque.h`.

**4.445.3.59** `resize()` [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::resize (
 size_type __new_size) [inline]
```

Resizes the deque to the specified number of elements.

**Parameters**

|                         |                                              |
|-------------------------|----------------------------------------------|
| <code>__new_size</code> | Number of elements the deque should contain. |
|-------------------------|----------------------------------------------|

This function will resize the deque to the specified number of elements. If the number is smaller than the deque's current size the deque is truncated, otherwise default constructed elements are appended.

Definition at line 1249 of file stl\_deque.h.

#### 4.445.3.60 resize() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::resize (
 size_type __new_size,
 const value_type & __x) [inline]
```

Resizes the deque to the specified number of elements.

##### Parameters

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__new_size</code> | Number of elements the deque should contain.      |
| <code>__x</code>        | Data with which new elements should be populated. |

This function will resize the deque to the specified number of elements. If the number is smaller than the deque's current size the deque is truncated, otherwise the deque is extended and new elements are populated with given data.

Definition at line 1271 of file stl\_deque.h.

#### 4.445.3.61 shrink\_to\_fit()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::shrink_to_fit () [inline], [noexcept]
```

A non-binding request to reduce memory use.

Definition at line 1299 of file stl\_deque.h.

#### 4.445.3.62 size()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::deque< _Tp, _Alloc >::size () const [inline], [noexcept]
```

Returns the number of elements in the deque.

Definition at line 1230 of file stl\_deque.h.

Referenced by `std::deque< _StateSeqT >::_M_range_check()`, `std::deque< _StateSeqT >::operator=()`, `std::deque< _StateSeqT >::operator==()`, and `std::deque< _StateSeqT >::resize()`.

#### 4.445.3.63 swap()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::swap (
 deque< _Tp, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another deque.

## Parameters

|                 |                                                  |
|-----------------|--------------------------------------------------|
| <code>_↔</code> | A deque of the same element and allocator types. |
| <code>_X</code> |                                                  |

This exchanges the elements between two deques in constant time. (Four pointers, so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(d1,d2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

Definition at line 1772 of file `stl_deque.h`.

#### Friends

- `template<typename _ItT, typename _SeqT, typename _CatT >`  
`class ::__gnu_debug::_Safe_iterator`

#### 4.446.1 Detailed Description

```
template<typename _Tp, typename _Allocator = std::allocator<_Tp>>
class std::__debug::deque<_Tp, _Allocator>
```

Class `std::deque` with safety/checking/debug instrumentation.

Definition at line 36 of file `debug/deque`.

#### 4.446.2 Member Function Documentation

##### 4.446.2.1 \_M\_detach\_all()

```
void __gnu_debug::_Safe_sequence_base::_M_detach_all () [protected], [inherited]
```

Detach all iterators, leaving them singular.

Referenced by `__gnu_debug::_Safe_sequence_base::~~Safe_sequence_base()`.

##### 4.446.2.2 \_M\_detach\_singular()

```
void __gnu_debug::_Safe_sequence_base::_M_detach_singular () [protected], [inherited]
```

Detach all singular iterators.

#### Postcondition

for all iterators *i* attached to this sequence, `i->_M_version == _M_version`.

##### 4.446.2.3 \_M\_get\_mutex()

```
__gnu_cxx::__mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex () throw () [protected],
[inherited]
```

For use in `_Safe_sequence`.

Referenced by `__gnu_debug::_Safe_sequence<map<_Key, _Tp, _Compare, _Allocator>>::_M_transfer_from_if()`.

##### 4.446.2.4 \_M\_invalidate\_all()

```
void __gnu_debug::_Safe_sequence_base::_M_invalidate_all () const [inline], [protected], [inherited]
```

Invalidates all iterators.

Definition at line 256 of file `safe_base.h`.

References `__gnu_debug::_Safe_sequence_base::_M_version`.

#### 4.446.2.5 `_M_invalidate_if()`

```
void __gnu_debug::_Safe_sequence< deque< _Tp, _Allocator > >::_M_invalidate_if (
 _Predicate __pred) [inherited]
```

Invalidates all iterators `x` that reference this sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

Definition at line 38 of file `safe_sequence.tcc`.

#### 4.446.2.6 `_M_revalidate_singular()`

```
void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular () [protected], [inherited]
```

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

#### 4.446.2.7 `_M_swap()`

```
void __gnu_debug::_Safe_sequence_base::_M_swap (
 _Safe_sequence_base & __x) [protected], [noexcept], [inherited]
```

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

#### 4.446.2.8 `_M_transfer_from_if()`

```
void __gnu_debug::_Safe_sequence< deque< _Tp, _Allocator > >::_M_transfer_from_if (
 _Safe_sequence< deque< _Tp, _Allocator > > & __from,
 _Predicate __pred) [inherited]
```

Transfers all iterators `x` that reference `from` sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

Definition at line 69 of file `safe_sequence.tcc`.

### 4.446.3 Member Data Documentation

#### 4.446.3.1 `_M_const_iterators`

```
_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_iterators [inherited]
```

The list of constant iterators that reference this container.

Definition at line 197 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

4.446.3.2 `_M_iterators`

```
_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators [inherited]
```

The list of mutable iterators that reference this container.

Definition at line 194 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map<_Key, _Tp, _Compare, _Allocator> >::_M_transfer_from_if()`.

4.446.3.3 `_M_version`

```
unsigned int __gnu_debug::_Safe_sequence_base::_M_version [mutable], [inherited]
```

The container version number. This number may never be 0.

Definition at line 200 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence_base::_M_invalidate_all()`.

The documentation for this class was generated from the following file:

- size\_type [operator\(\)](#) (size\_type hash) const
- size\_type **range\_hash** (size\_type hash) const
- void **swap** (mask\_based\_range\_hashing &other)

##### 4.448.1 Detailed Description

```
template<typename Size_Type = std::size_t>
class __gnu_pbds::direct_mask_range_hashing< Size_Type >
```

A mask range-hashing class (uses a bitmask).

Definition at line 109 of file `hash_policy.hpp`.

## 4.448.2 Member Function Documentation

4.448.2.1 `operator()`

```
template<typename Size_Type >
direct_mask_range_hashing< Size_Type >::size_type __gnu_pbds::direct_mask_range_hashing< Size_Type >::operator() (
 size_type hash) const [inline], [protected]
```

Transforms the `__hash` value `hash` into a ranged-hash value (using a bit-mask).

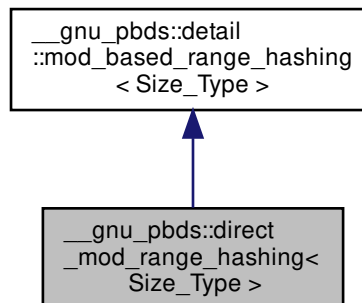

Definition at line 59 of file `hash_policy.hpp`.

The documentation for this class was generated from the following file:

- [hash\\_policy.hpp](#)

4.449 `__gnu_pbds::direct_mod_range_hashing< Size_Type >` Class Template Reference

Inheritance diagram for `__gnu_pbds::direct_mod_range_hashing< Size_Type >`:

- size\_type **operator()** (size\_type hash) const
- size\_type **range\_hash** (size\_type s) const
- void **swap** (mod\_based\_range\_hashing &other)

#### 4.449.1 Detailed Description

```
template<typename Size_Type = std::size_t>
class __gnu_pbds::direct_mod_range_hashing< Size_Type >
```

A mod range-hashing class (uses the modulo function).

Definition at line 141 of file hash\_policy.hpp.

#### 4.449.2 Member Function Documentation

##### 4.449.2.1 operator>()

```
template<typename Size_Type >
direct_mod_range_hashing< Size_Type >::size_type __gnu_pbds::direct_mod_range_hashing< Size_Type
>::operator() (
 size_type hash) const [inline], [protected]
```

Transforms the \_\_hash value hash into a ranged-hash value (using a modulo operation).

Definition at line 59 of file hash\_policy.hpp.

The documentation for this class was generated from the following file:

- [hash\\_policy.hpp](#)

## 4.450.1 Detailed Description

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
class std::discard_block_engine<_RandomNumberEngine, __p, __r>
```

Produces random numbers from some base engine by discarding blocks of data.

`0 <= __r <= __p`

Definition at line 884 of file random.h.

#### 4.450.2 Member Typedef Documentation

##### 4.450.2.1 result\_type

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
typedef _RandomNumberEngine::result_type std::discard_block_engine< _RandomNumberEngine, __p, __r
>::result_type
```

The type of the generated random value.

Definition at line 887 of file random.h.

#### 4.450.3 Constructor & Destructor Documentation

##### 4.450.3.1 discard\_block\_engine() [1/5]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine () [inline]
```

Constructs a default discard\_block\_engine engine.

The underlying engine is default constructed as well.

Definition at line 906 of file random.h.

##### 4.450.3.2 discard\_block\_engine() [2/5]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine (
 const _RandomNumberEngine & __rng) [inline], [explicit]
```

Copy constructs a discard\_block\_engine engine.

Copies an existing base class random number generator.

##### Parameters

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__rng</code> | An existing (base class) engine object. |
|--------------------|-----------------------------------------|

Definition at line 916 of file random.h.

## 4.450.3.3 discard\_block\_engine() [3/5]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine (
 _RandomNumberEngine && __rng) [inline], [explicit]
```

Move constructs a discard\_block\_engine engine.

Copies an existing base class random number generator.

## Parameters

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__rng</code> | An existing (base class) engine object. |
|--------------------|-----------------------------------------|

Definition at line 926 of file random.h.

## 4.450.3.4 discard\_block\_engine() [4/5]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine (
 result_type __s) [inline], [explicit]
```

Seed constructs a discard\_block\_engine engine.

Constructs the underlying generator engine seeded with \_\_s.

## Parameters

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__s</code> | A seed value for the base class engine. |
|------------------|-----------------------------------------|

Definition at line 936 of file random.h.

## 4.450.3.5 discard\_block\_engine() [5/5]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
template<typename _Sseq , typename = _If_seed_seq<_Sseq>>
std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine (
 _Sseq & __q) [inline], [explicit]
```

Generator construct a discard\_block\_engine engine.

**Parameters**

|                  |                  |
|------------------|------------------|
| <code>__q</code> | A seed sequence. |
|------------------|------------------|

Definition at line 946 of file random.h.

**4.450.4 Member Function Documentation****4.450.4.1 base()**

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
const _RandomNumberEngine& std::discard_block_engine< _RandomNumberEngine, __p, __r >::base ()
const [inline], [noexcept]
```

Gets a const reference to the underlying generator engine object.

Definition at line 990 of file random.h.

**4.450.4.2 discard()**

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
void std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard (
 unsigned long long __z) [inline]
```

Discard a sequence of random numbers.

Definition at line 1011 of file random.h.

**4.450.4.3 max()**

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
static constexpr result_type std::discard_block_engine< _RandomNumberEngine, __p, __r >::max ()
[inline], [static]
```

Gets the maximum value in the generated random number range.

Definition at line 1004 of file random.h.

References `std::max()`.

#### 4.450.4.4 min()

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
static constexpr result_type std::discard_block_engine<_RandomNumberEngine, __p, __r>::min ()
[inline], [static]
```

Gets the minimum value in the generated random number range.

Definition at line 997 of file random.h.

References std::min().

#### 4.450.4.5 operator()()

```
template<typename _RandomNumberEngine , size_t __p, size_t __r>
discard_block_engine<_RandomNumberEngine, __p, __r>::result_type std::discard_block_engine<_↵
RandomNumberEngine, __p, __r>::operator() ()
```

Gets the next value in the generated random number sequence.

Definition at line 682 of file bits/random.tcc.

#### 4.450.4.6 seed() [1/3]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
void std::discard_block_engine<_RandomNumberEngine, __p, __r>::seed () [inline]
```

Reseeds the discard\_block\_engine object with the default seed for the underlying base class generator engine.

Definition at line 955 of file random.h.

#### 4.450.4.7 seed() [2/3]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
void std::discard_block_engine<_RandomNumberEngine, __p, __r>::seed (
 result_type __s) [inline]
```

Reseeds the discard\_block\_engine object with the default seed for the underlying base class generator engine.

Definition at line 966 of file random.h.

#### 4.450.4.8 seed() [3/3]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
template<typename _Sseq>
_If_seed_seq<_Sseq> std::discard_block_engine<_RandomNumberEngine, __p, __r>::seed (
 _Sseq & __q) [inline]
```

Reseeds the discard\_block\_engine object with the given seed sequence.

**Parameters**

|                 |                            |
|-----------------|----------------------------|
| <code>_↵</code> | A seed generator function. |
| <code>_q</code> |                            |

Definition at line 979 of file random.h.

**4.450.5 Friends And Related Function Documentation****4.450.5.1 operator<<**

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
template<typename _RandomNumberEngine1, size_t __p1, size_t __r1, typename _CharT, typename _↵
Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
 std::basic_ostream< _CharT, _Traits > & __os,
 const std::discard_block_engine< _RandomNumberEngine1, __p1, __r1 > & __x) [friend]
```

Inserts the current state of a discard\_block\_engine random number generator engine \_\_x into the output stream \_\_os.

**Parameters**

|                   |                                                        |
|-------------------|--------------------------------------------------------|
| <code>__os</code> | An output stream.                                      |
| <code>__x</code>  | A discard_block_engine random number generator engine. |

**Returns**

The output stream with the state of \_\_x inserted or in an error state.

**4.450.5.2 operator==**

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
bool operator== (
 const discard_block_engine< _RandomNumberEngine, __p, __r > & __lhs,
 const discard_block_engine< _RandomNumberEngine, __p, __r > & __rhs) [friend]
```

Compares two discard\_block\_engine random number generator objects of the same type for equality.

**Parameters**

|                    |                                                              |
|--------------------|--------------------------------------------------------------|
| <code>__lhs</code> | A discard_block_engine random number generator object.       |
| <code>__rhs</code> | Another discard_block_engine random number generator object. |

**Returns**

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 1035 of file random.h.

**4.450.5.3 `operator>>`**

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
template<typename _RandomNumberEngine1, size_t __p1, size_t __r1, typename _CharT, typename _Traits>
std::basic_istream<_CharT, _Traits>& operator>> (
 std::basic_istream<_CharT, _Traits> & __is,
 std::discard_block_engine<_RandomNumberEngine1, __p1, __r1> & __x) [friend]
```

Extracts the current state of a % subtract\_with\_carry\_engine random number generator engine `__x` from the input stream `__is`.

**Parameters**

|                   |                                                        |
|-------------------|--------------------------------------------------------|
| <code>__is</code> | An input stream.                                       |
| <code>__x</code>  | A discard_block_engine random number generator engine. |

**Returns**

The input stream with the state of `__x` extracted or in an error state.

## 4.451.1 Detailed Description

```
template<typename _IntType = int>
class std::discrete_distribution< _IntType >
```

A `discrete_distribution` random number distribution.

The formula for the discrete probability mass function is

Definition at line 5277 of file `random.h`.

#### 4.451.2 Member Typedef Documentation

##### 4.451.2.1 result\_type

```
template<typename _IntType = int>
typedef _IntType std::discrete_distribution< _IntType >::result_type
```

The type of the range of the distribution.

Definition at line 5280 of file random.h.

#### 4.451.3 Member Function Documentation

##### 4.451.3.1 max()

```
template<typename _IntType = int>
result_type std::discrete_distribution< _IntType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

Definition at line 5402 of file random.h.

References std::vector<\_Tp, \_Alloc>::empty(), and std::vector<\_Tp, \_Alloc>::size().

##### 4.451.3.2 min()

```
template<typename _IntType = int>
result_type std::discrete_distribution< _IntType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

Definition at line 5395 of file random.h.

##### 4.451.3.3 operator>()

```
template<typename _IntType = int>
template<typename _UniformRandomNumberGenerator >
result_type std::discrete_distribution< _IntType >::operator() (
 _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Definition at line 5413 of file random.h.

#### 4.451.3.4 param() [1/2]

```
template<typename _IntType = int>
param_type std::discrete_distribution< _IntType >::param () const [inline]
```

Returns the parameter set of the distribution.

Definition at line 5380 of file random.h.

#### 4.451.3.5 param() [2/2]

```
template<typename _IntType = int>
void std::discrete_distribution< _IntType >::param (
 const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

##### Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

Definition at line 5388 of file random.h.

#### 4.451.3.6 probabilities()

```
template<typename _IntType = int>
std::vector<double> std::discrete_distribution< _IntType >::probabilities () const [inline]
```

Returns the probabilities of the distribution.

Definition at line 5370 of file random.h.

References `std::vector< _Tp, _Alloc >::empty()`.

#### 4.451.3.7 reset()

```
template<typename _IntType = int>
void std::discrete_distribution< _IntType >::reset () [inline]
```

Resets the distribution state.

Definition at line 5363 of file random.h.

## 4.451.4 Friends And Related Function Documentation

## 4.451.4.1 operator&lt;&lt;

```
template<typename _IntType = int>
template<typename _IntType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
 std::basic_ostream< _CharT, _Traits > & __os,
 const std::discrete_distribution< _IntType1 > & __x) [friend]
```

Inserts a discrete\_distribution random number distribution \_\_x into the output stream \_\_os.

## Parameters

|      |                                                     |
|------|-----------------------------------------------------|
| __os | An output stream.                                   |
| __x  | A discrete_distribution random number distribution. |

## Returns

The output stream with the state of \_\_x inserted or in an error state.

## 4.451.4.2 operator==

```
template<typename _IntType = int>
bool operator== (
 const discrete_distribution< _IntType > & __d1,
 const discrete_distribution< _IntType > & __d2) [friend]
```

Return true if two discrete distributions have the same parameters.

Definition at line 5448 of file random.h.

## 4.451.4.3 operator&gt;&gt;

```
template<typename _IntType = int>
template<typename _IntType1 , typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
 std::basic_istream< _CharT, _Traits > & __is,
 std::discrete_distribution< _IntType1 > & __x) [friend]
```

Extracts a discrete\_distribution random number distribution \_\_x from the input stream \_\_is.

## Parameters

|                         |                                                                      |
|-------------------------|----------------------------------------------------------------------|
| <code>_↔<br/>_is</code> | An input stream.                                                     |
| <code>_↔<br/>_x</code>  | A <code>discrete_distribution</code> random number generator engine. |

## Returns

The input stream with `__x` extracted or in an error state.

The documentation for this class was generated from the following files:

### 4.458.1 Detailed Description

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
class std::tr2::dynamic_bitset< _WordT, _Alloc >
```

The `dynamic_bitset` class represents a sequence of bits.

See N2050, Proposal to Add a Dynamically Sizeable Bitset to the Standard Library. <http://www.open-std.org/jtc1/sc22/wg21/docs/papers/2006/n2050.pdf>

In the general unoptimized case, storage is allocated in word-sized blocks. Let  $B$  be the number of bits in a word, then  $(Nb+(B-1))/B$  words will be used for storage.  $B - NbB$  bits are unused. (They are the high-order bits in the highest word.) It is a class invariant that those unused bits are always zero.

If you think of `dynamic_bitset` as "a simple array of bits," be aware that your mental picture is reversed: a `dynamic_bitset` behaves the same way as bits in integers do, with the bit at index 0 in the "least significant / right-hand" position, and the bit at index  $Nb-1$  in the "most significant / left-hand" position. Thus, unlike other containers, a `dynamic_bitset`'s index "counts from right to left," to put it very loosely.

This behavior is preserved when translating to and from strings. For example, the first line of the following program probably prints "b('a') is 0001100001" on a modern ASCII system.

```
#include <dynamic_bitset>
#include <iostream>
#include <sstream>
using namespace std;
int main()
{
 long a = 'a';
 dynamic_bitset<> b(a);
 cout << "b('a') is " << b << endl;
 ostringstream s;
 s << b;
 string str = s.str();
 cout << "index 3 in the string is " << str[3] << " but\n"
 << "index 3 in the bitset is " << b[3] << endl;
}
```

Most of the actual code isn't contained in `dynamic_bitset<>` itself, but in the base class `__dynamic_bitset_base`. The base class works with whole words, not with individual bits. This allows us to specialize `__dynamic_bitset_base` for the important special case where the `dynamic_bitset` is only a single word.

Extra confusion can result due to the fact that the storage for `__dynamic_bitset_base` is a vector, and is indexed as such. This is carefully encapsulated.

Definition at line 419 of file `dynamic_bitset`.

### 4.458.2 Constructor & Destructor Documentation

## 4.458.2.1 dynamic\_bitset() [1/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset () [default]
```

All bits set to zero.

## 4.458.2.2 dynamic\_bitset() [2/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
 const allocator_type & __alloc) [inline], [explicit]
```

All bits set to zero.

Definition at line 578 of file dynamic\_bitset.

## 4.458.2.3 dynamic\_bitset() [3/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
 size_type __nbits,
 unsigned long long __val = 0ULL,
 const allocator_type & __alloc = allocator_type()) [inline], [explicit]
```

Initial bits bitwise-copied from a single word (others set to zero).

Definition at line 584 of file dynamic\_bitset.

## 4.458.2.4 dynamic\_bitset() [4/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
template<typename _CharT , typename _Traits , typename _Alloc1 >
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
 const std::basic_string< _CharT, _Traits, _Alloc1 > & __str,
 typename basic_string< _CharT, _Traits, _Alloc1 >::size_type __pos = 0,
 typename basic_string< _CharT, _Traits, _Alloc1 >::size_type __n = std::basic_string<↵
 _CharT, _Traits, _Alloc1>::npos,
 _CharT __zero = _CharT('0'),
 _CharT __one = _CharT('1'),
 const allocator_type & __alloc = allocator_type()) [inline], [explicit]
```

Use a subset of a string.

**Parameters**

|                      |                                                            |
|----------------------|------------------------------------------------------------|
| <code>__str</code>   | A string of '0' and '1' characters.                        |
| <code>__pos</code>   | Index of the first character in <code>__str</code> to use. |
| <code>__n</code>     | The number of characters to copy.                          |
| <code>__zero</code>  | The character to use for unset bits.                       |
| <code>__one</code>   | The character to use for set bits.                         |
| <code>__alloc</code> | An allocator.                                              |

**Exceptions**

|                                    |                                                                    |
|------------------------------------|--------------------------------------------------------------------|
| <code>std::out_of_range</code>     | If <code>__pos</code> is bigger the size of <code>__str</code> .   |
| <code>std::invalid_argument</code> | If a character appears in the string which is neither '0' nor '1'. |

Definition at line 609 of file `dynamic_bitset`.

**4.458.2.5 `dynamic_bitset()`** [5/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
 const char * __str,
 const allocator_type & __alloc = allocator_type()) [inline], [explicit]
```

Construct from a string.

**Parameters**

|                      |                                     |
|----------------------|-------------------------------------|
| <code>__str</code>   | A string of '0' and '1' characters. |
| <code>__alloc</code> | An allocator.                       |

**Exceptions**

|                                    |                                                                    |
|------------------------------------|--------------------------------------------------------------------|
| <code>std::invalid_argument</code> | If a character appears in the string which is neither '0' nor '1'. |
|------------------------------------|--------------------------------------------------------------------|

Definition at line 636 of file `dynamic_bitset`.

**4.458.2.6 `dynamic_bitset()`** [6/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
 const dynamic_bitset< _WordT, _Alloc > &) [default]
```

Copy constructor.

#### 4.458.2.7 dynamic\_bitset() [7/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
 dynamic_bitset< _WordT, _Alloc > && __b) [inline], [noexcept]
```

Move constructor.

Definition at line 648 of file dynamic\_bitset.

### 4.458.3 Member Function Documentation

#### 4.458.3.1 all()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::all () const [inline]
```

Tests whether all the bits are on.

##### Returns

True if all the bits are set.

Definition at line 1036 of file dynamic\_bitset.

#### 4.458.3.2 any()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::any () const [inline]
```

Tests whether any of the bits are on.

##### Returns

True if at least one bit is set.

Definition at line 1044 of file dynamic\_bitset.

#### 4.458.3.3 `append()` [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::append (
 block_type __block) [inline]
```

Append a block.

Definition at line 726 of file `dynamic_bitset`.

#### 4.458.3.4 `append()` [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
template<typename _BlockInputIterator >
void std::tr2::dynamic_bitset< _WordT, _Alloc >::append (
 _BlockInputIterator __first,
 _BlockInputIterator __last) [inline]
```

Append an iterator range of blocks.

Definition at line 744 of file `dynamic_bitset`.

#### 4.458.3.5 `clear()`

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::clear () [inline]
```

Clear the bitset.

Definition at line 701 of file `dynamic_bitset`.

#### 4.458.3.6 `count()`

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::count () const [inline], [noexcept]
```

Returns the number of bits which are set.

Definition at line 992 of file `dynamic_bitset`.

#### 4.458.3.7 empty()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::empty () const [inline], [noexcept]
```

Returns true if the dynamic\_bitset is empty.

Definition at line 1007 of file dynamic\_bitset.

#### 4.458.3.8 find\_first()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::find_first () const [inline]
```

Finds the index of the first "on" bit.

##### Returns

The index of the first bit set, or size() if not found.

##### See also

find\_next

Definition at line 1072 of file dynamic\_bitset.

#### 4.458.3.9 find\_next()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::find_next (
 size_t __prev) const [inline]
```

Finds the index of the next "on" bit after prev.

##### Returns

The index of the next bit set, or size() if not found.

##### Parameters

|                     |                           |
|---------------------|---------------------------|
| <code>__prev</code> | Where to start searching. |
|---------------------|---------------------------|

See also

[find\\_first](#)

Definition at line 1082 of file `dynamic_bitset`.

#### 4.458.3.10 `flip()` [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset& std::tr2::dynamic_bitset< _WordT, _Alloc >::flip () [inline]
```

Toggles every bit to its opposite value.

Definition at line 883 of file `dynamic_bitset`.

#### 4.458.3.11 `flip()` [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset& std::tr2::dynamic_bitset< _WordT, _Alloc >::flip (
 size_type __pos) [inline]
```

Toggles a given bit to its opposite value.

##### Parameters

|                    |                       |
|--------------------|-----------------------|
| <code>__pos</code> | The index of the bit. |
|--------------------|-----------------------|

##### Exceptions

|                                |                                                      |
|--------------------------------|------------------------------------------------------|
| <code>std::out_of_range</code> | If <code>__pos</code> is bigger the size of the set. |
|--------------------------------|------------------------------------------------------|

Definition at line 896 of file `dynamic_bitset`.

#### 4.458.3.12 `get_allocator()`

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
allocator_type std::tr2::dynamic_bitset< _WordT, _Alloc >::get_allocator () const [inline],
[noexcept]
```

Return the allocator for the bitset.

Definition at line 681 of file `dynamic_bitset`.

## 4.458.3.13 max\_size()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
constexpr size_type std::tr2::dynamic_bitset<_WordT, _Alloc >::max_size () [inline], [noexcept]
```

Returns the maximum size of a dynamic\_bitset object having the same type as \*this. The real answer is max() \* bits\_per\_block but is likely to overflow.

Definition at line 1014 of file dynamic\_bitset.

## 4.458.3.14 none()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset<_WordT, _Alloc >::none () const [inline]
```

Tests whether any of the bits are on.

## Returns

True if none of the bits are set.

Definition at line 1052 of file dynamic\_bitset.

## 4.458.3.15 num\_blocks()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset<_WordT, _Alloc >::num_blocks () const [inline], [noexcept]
```

Returns the total number of blocks.

Definition at line 1002 of file dynamic\_bitset.

## 4.458.3.16 operator&amp;=() [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset& std::tr2::dynamic_bitset<_WordT, _Alloc >::operator&= (
 const dynamic_bitset<_WordT, _Alloc > & __rhs) [inline]
```

Operations on dynamic\_bitsets.

## Parameters

|                    |                              |
|--------------------|------------------------------|
| <code>__rhs</code> | A same-sized dynamic_bitset. |
|--------------------|------------------------------|

These should be self-explanatory.

Definition at line 759 of file `dynamic_bitset`.

#### 4.458.3.17 `operator&=()` [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset& std::tr2::dynamic_bitset< _WordT, _Alloc >::operator&= (
 dynamic_bitset< _WordT, _Alloc > && __rhs) [inline]
```

Operations on `dynamic_bitsets`.

##### Parameters

|                    |                                            |
|--------------------|--------------------------------------------|
| <code>__rhs</code> | A same-sized <code>dynamic_bitset</code> . |
|--------------------|--------------------------------------------|

These should be self-explanatory.

Definition at line 766 of file `dynamic_bitset`.

#### 4.458.3.18 `operator-=()`

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset& std::tr2::dynamic_bitset< _WordT, _Alloc >::operator-= (
 const dynamic_bitset< _WordT, _Alloc > & __rhs) [inline]
```

Operations on `dynamic_bitsets`.

##### Parameters

|                    |                                            |
|--------------------|--------------------------------------------|
| <code>__rhs</code> | A same-sized <code>dynamic_bitset</code> . |
|--------------------|--------------------------------------------|

These should be self-explanatory.

Definition at line 787 of file `dynamic_bitset`.

#### 4.458.3.19 `operator<<()`

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset std::tr2::dynamic_bitset< _WordT, _Alloc >::operator<< (
 size_type __pos) const [inline]
```

Self-explanatory.

Definition at line 1058 of file `dynamic_bitset`.

## 4.458.3.20 operator&lt;&lt;=()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset& std::tr2::dynamic_bitset< _WordT, _Alloc >::operator<<= (
 size_type __pos) [inline]
```

Operations on dynamic\_bitsets.

## Parameters

|                    |                                |
|--------------------|--------------------------------|
| <code>__pos</code> | The number of places to shift. |
|--------------------|--------------------------------|

These should be self-explanatory.

Definition at line 802 of file dynamic\_bitset.

## 4.458.3.21 operator=() [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset& std::tr2::dynamic_bitset< _WordT, _Alloc >::operator= (
 const dynamic_bitset< _WordT, _Alloc > &) [default]
```

Copy assignment operator.

## 4.458.3.22 operator=() [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset& std::tr2::dynamic_bitset< _WordT, _Alloc >::operator= (
 dynamic_bitset< _WordT, _Alloc > && __b) [inline], [noexcept]
```

Move assignment operator.

Definition at line 665 of file dynamic\_bitset.

## 4.458.3.23 operator&gt;&gt;()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset std::tr2::dynamic_bitset< _WordT, _Alloc >::operator>> (
 size_type __pos) const [inline]
```

Self-explanatory.

Definition at line 1062 of file dynamic\_bitset.

## 4.458.3.24 operator&gt;&gt;=()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset& std::tr2::dynamic_bitset< _WordT, _Alloc >::operator>>= (
 size_type __pos) [inline]
```

Operations on dynamic\_bitsets.

**Parameters**

|                    |                                |
|--------------------|--------------------------------|
| <code>__pos</code> | The number of places to shift. |
|--------------------|--------------------------------|

These should be self-explanatory.

Definition at line 815 of file `dynamic_bitset`.

**4.458.3.25 operator[]()** [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
reference std::tr2::dynamic_bitset< _WordT, _Alloc >::operator[] (
 size_type __pos) [inline]
```

Array-indexing support.

**Parameters**

|                    |                                              |
|--------------------|----------------------------------------------|
| <code>__pos</code> | Index into the <code>dynamic_bitset</code> . |
|--------------------|----------------------------------------------|

**Returns**

A bool for a 'const `dynamic_bitset`'. For non-const bitsets, an instance of the reference proxy class.

**Note**

These operators do no range checking and throw no exceptions, as required by DR 11 to the standard.

Definition at line 918 of file `dynamic_bitset`.

**4.458.3.26 operator[]()** [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
const_reference std::tr2::dynamic_bitset< _WordT, _Alloc >::operator[] (
 size_type __pos) const [inline]
```

Array-indexing support.

**Parameters**

|                    |                                              |
|--------------------|----------------------------------------------|
| <code>__pos</code> | Index into the <code>dynamic_bitset</code> . |
|--------------------|----------------------------------------------|

**Returns**

A bool for a 'const dynamic\_bitset'. For non-const bitsets, an instance of the reference proxy class.

**Note**

These operators do no range checking and throw no exceptions, as required by DR 11 to the standard.

Definition at line 922 of file dynamic\_bitset.

**4.458.3.27 operator^=()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset& std::tr2::dynamic_bitset<_WordT, _Alloc >::operator^= (
 const dynamic_bitset<_WordT, _Alloc > & __rhs) [inline]
```

Operations on dynamic\_bitsets.

**Parameters**

|                    |                              |
|--------------------|------------------------------|
| <code>__rhs</code> | A same-sized dynamic_bitset. |
|--------------------|------------------------------|

These should be self-explanatory.

Definition at line 780 of file dynamic\_bitset.

**4.458.3.28 operator" |=()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset& std::tr2::dynamic_bitset<_WordT, _Alloc >::operator|= (
 const dynamic_bitset<_WordT, _Alloc > & __rhs) [inline]
```

Operations on dynamic\_bitsets.

**Parameters**

|                    |                              |
|--------------------|------------------------------|
| <code>__rhs</code> | A same-sized dynamic_bitset. |
|--------------------|------------------------------|

These should be self-explanatory.

Definition at line 773 of file dynamic\_bitset.

#### 4.458.3.29 `operator~()`

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset< std::tr2::dynamic_bitset< _WordT, _Alloc >::operator~ () const [inline]
```

See the no-argument `flip()`.

Definition at line 905 of file `dynamic_bitset`.

#### 4.458.3.30 `push_back()`

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::push_back (
 bool __bit) [inline]
```

Push a bit onto the high end of the bitset.

Definition at line 711 of file `dynamic_bitset`.

#### 4.458.3.31 `reset()` [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset& std::tr2::dynamic_bitset< _WordT, _Alloc >::reset () [inline]
```

Sets every bit to false.

Definition at line 858 of file `dynamic_bitset`.

#### 4.458.3.32 `reset()` [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset& std::tr2::dynamic_bitset< _WordT, _Alloc >::reset (
 size_type __pos) [inline]
```

Sets a given bit to false.

##### Parameters

|                    |                       |
|--------------------|-----------------------|
| <code>__pos</code> | The index of the bit. |
|--------------------|-----------------------|

##### Exceptions

|                                |                                                      |
|--------------------------------|------------------------------------------------------|
| <code>std::out_of_range</code> | If <code>__pos</code> is bigger the size of the set. |
|--------------------------------|------------------------------------------------------|

Same as writing `set(__pos, false)`.

Definition at line 872 of file `dynamic_bitset`.

#### 4.458.3.33 `resize()`

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset<_WordT, _Alloc >::resize (
 size_type __nbits,
 bool __value = false) [inline]
```

Resize the bitset.

Definition at line 688 of file `dynamic_bitset`.

#### 4.458.3.34 `set()` [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset& std::tr2::dynamic_bitset<_WordT, _Alloc >::set () [inline]
```

Sets every bit to true.

Definition at line 833 of file `dynamic_bitset`.

#### 4.458.3.35 `set()` [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset& std::tr2::dynamic_bitset<_WordT, _Alloc >::set (
 size_type __pos,
 bool __val = true) [inline]
```

Sets a given bit to a particular value.

##### Parameters

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__pos</code> | The index of the bit.                   |
| <code>__val</code> | Either true or false, defaults to true. |

##### Exceptions

|                                |                                                      |
|--------------------------------|------------------------------------------------------|
| <code>std::out_of_range</code> | If <code>__pos</code> is bigger the size of the set. |
|--------------------------------|------------------------------------------------------|

Definition at line 847 of file `dynamic_bitset`.

**4.458.3.36 size()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::size () const [inline], [noexcept]
```

Returns the total number of bits.

Definition at line 997 of file `dynamic_bitset`.

Referenced by `std::tr2::operator>>()`.

**4.458.3.37 swap()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::swap (
 dynamic_bitset< _WordT, _Alloc > & __b) [inline], [noexcept]
```

Swap with another bitset.

Definition at line 654 of file `dynamic_bitset`.

**4.458.3.38 test()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::test (
 size_type __pos) const [inline]
```

Tests the value of a bit.

**Parameters**

|                    |                     |
|--------------------|---------------------|
| <code>__pos</code> | The index of a bit. |
|--------------------|---------------------|

**Returns**

The value at `__pos`.

**Exceptions**

|                                |                                                      |
|--------------------------------|------------------------------------------------------|
| <code>std::out_of_range</code> | If <code>__pos</code> is bigger the size of the set. |
|--------------------------------|------------------------------------------------------|

Definition at line 1024 of file `dynamic_bitset`.

## 4.458.3.39 to\_string()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
template<typename _CharT = char, typename _Traits = std::char_traits<_CharT>, typename _Alloc1 =
std::allocator<_CharT>>
std::basic_string<_CharT, _Traits, _Alloc1> std::tr2::dynamic_bitset<_WordT, _Alloc >::to_↵
string (
 _CharT __zero = _CharT('0'),
 _CharT __one = _CharT('1')) const [inline]
```

Returns a character interpretation of the dynamic\_bitset.

**Returns**

The string equivalent of the bits.

Note the ordering of the bits: decreasing character positions correspond to increasing bit positions (see the main class notes for an example).

Definition at line 958 of file dynamic\_bitset.

## 4.458.3.40 to\_ulong()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
unsigned long long std::tr2::dynamic_bitset<_WordT, _Alloc >::to_ulong () const [inline]
```

Returns a numerical interpretation of the dynamic\_bitset.

**Returns**

The integral equivalent of the bits.

**Exceptions**

|                                  |                                                                   |
|----------------------------------|-------------------------------------------------------------------|
| <code>std::overflow_error</code> | If there are too many bits to be represented in an unsigned long. |
|----------------------------------|-------------------------------------------------------------------|

Definition at line 943 of file dynamic\_bitset.

## 4.458.3.41 to\_ulong()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
unsigned long std::tr2::dynamic_bitset<_WordT, _Alloc >::to_ulong () const [inline]
```

Returns a numerical interpretation of the dynamic\_bitset.

**Returns**

The integral equivalent of the bits.

**Exceptions**

|                                  |                                                                   |
|----------------------------------|-------------------------------------------------------------------|
| <code>std::overflow_error</code> | If there are too many bits to be represented in an unsigned long. |
|----------------------------------|-------------------------------------------------------------------|

#### 4.461.1 Detailed Description

```
template<typename _CharT>
class __gnu_cxx::enc_filebuf< _CharT >
```

class enc\_filebuf.

Definition at line 42 of file enc\_filebuf.h.

#### 4.461.2 Member Function Documentation

4.461.2.1 `_M_create_pback()`

```
void std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_create_pback () [inline],
[protected], [inherited]
```

Initializes pback buffers, and moves normal buffers to safety. Assumptions: `_M_in_cur` has already been moved back

Definition at line 199 of file `fstream`.

4.461.2.2 `_M_destroy_pback()`

```
void std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_destroy_pback () throw (
) [inline], [protected], [inherited]
```

Deactivates pback buffer contents, and restores normal buffer. Assumptions: The pback buffer has only moved forward.

Definition at line 216 of file `fstream`.

4.461.2.3 `_M_set_buffer()`

```
void std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_set_buffer (
 streamsize __off) [inline], [protected], [inherited]
```

This function sets the pointers of the internal buffer, both get and put areas. Typically:

`__off == egptr() - eback()` upon underflow/uflow (**read** mode); `__off == 0` upon overflow (**write** mode); `__off == -1` upon open, setbuf, seekoff/pos (**uncommitted** mode).

NB: `egptr() - pbase() == _M_buf_size - 1`, since `_M_buf_size` reflects the actual allocated memory and the last cell is reserved for the overflow char of a full put area.

Definition at line 459 of file `fstream`.

4.461.2.4 `close()`

```
basic_filebuf<_CharT, encoding_char_traits<_CharT>>::__filebuf_type * std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::close () [inherited]
```

Closes the currently associated file.

## Returns

`this` on success, `NULL` on failure

If no file is currently open, this function immediately fails.

If a *put buffer area* exists, `overflow(eof)` is called to flush all the characters. The file is then closed.

If any operations fail, this function also fails.

Definition at line 250 of file `fstream.tcc`.

#### 4.461.2.5 eback()

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::eback () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Definition at line 489 of file streambuf.

#### 4.461.2.6 egptr()

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::egptr () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Definition at line 495 of file streambuf.

#### 4.461.2.7 epptr()

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::epptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Definition at line 542 of file streambuf.

#### 4.461.2.8 gbump()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::gbump (
 int __n) [inline], [protected], [inherited]
```

Moving the read position.

## Parameters

|                 |                             |
|-----------------|-----------------------------|
| <code>_↵</code> | The delta by which to move. |
| <code>_n</code> |                             |

This just advances the read position without returning any data.

Definition at line 505 of file `streambuf`.

4.461.2.9 `getloc()`

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf<_CharT, _Traits>::getloc () const [inline], [inherited]
```

Locale access.

## Returns

The current locale in effect.

If `pubimbue(loc)` has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.

Definition at line 233 of file `streambuf`.

4.461.2.10 `gptr()`

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf<_CharT, _Traits>::gptr () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Definition at line 492 of file `streambuf`.

4.461.2.11 `imbue()`

```
void std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::imbue (
 const locale & __loc) [protected], [virtual], [inherited]
```

Changes translations.

**Parameters**

|                    |               |
|--------------------|---------------|
| <code>__loc</code> | A new locale. |
|--------------------|---------------|

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from `streambuf` can safely cache results of calls to locale functions and to members of facets so obtained.*

**Note**

Base class version does nothing.

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits>](#).

Definition at line 1030 of file `fstream.tcc`.

**4.461.2.12 in\_avail()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::in_avail () [inline], [inherited]
```

Looking ahead into the stream.

**Returns**

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

Definition at line 291 of file `streambuf`.

**4.461.2.13 is\_open()**

```
bool std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::is_open () const throw ()
[inline], [inherited]
```

Returns true if the external file is open.

Definition at line 265 of file `fstream`.

**4.461.2.14 open() [1/2]**

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::__filebuf_type * std::basic_filebuf< ↵
_Chart, encoding_char_traits< _CharT > >::open (
 const char * __s,
 ios_base::openmode __mode) [inherited]
```

Opens an external file.

## Parameters

|                     |                       |
|---------------------|-----------------------|
| <code>__s</code>    | The name of the file. |
| <code>__mode</code> | The open mode flags.  |

## Returns

`this` on success, `NULL` on failure

If a file is already open, this function immediately fails. Otherwise it tries to open the file named `__s` using the flags given in `__mode`.

Table 92, adapted here, gives the relation between openmode combinations and the equivalent `fopen()` flags. (NB: lines `app`, `in|out|app`, `in|app`, `binary|app`, `binary|in|out|app`, and `binary|in|app` per DR 596)

| ios_base Flag combination |    |     |       |     | stdio equivalent |
|---------------------------|----|-----|-------|-----|------------------|
| binary                    | in | out | trunc | app |                  |
|                           |    | +   |       |     | w                |
|                           |    | +   |       | +   | a                |
|                           |    |     |       | +   | a                |
|                           |    | +   | +     |     | w                |
|                           | +  |     |       |     | r                |
|                           | +  | +   |       |     | r+               |
|                           | +  | +   | +     |     | w+               |
|                           | +  | +   |       | +   | a+               |
|                           |    | +   |       | +   | a+               |
| +                         |    | +   |       |     | wb               |
| +                         |    | +   |       | +   | ab               |
| +                         |    |     |       | +   | ab               |
| +                         |    | +   | +     |     | wb               |
| +                         | +  |     |       |     | rb               |
| +                         | +  | +   |       |     | r+b              |
| +                         | +  | +   | +     |     | w+b              |
| +                         | +  | +   |       | +   | a+b              |
| +                         | +  |     |       | +   | a+b              |

Definition at line 180 of file `fstream.tcc`.

4.461.2.15 `open()` [2/2]

```
__filebuf_type* std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::open (
 const std::string & __s,
 ios_base::openmode __mode) [inline], [inherited]
```

Opens an external file.

**Parameters**

|                     |                       |
|---------------------|-----------------------|
| <code>__s</code>    | The name of the file. |
| <code>__mode</code> | The open mode flags.  |

**Returns**

`this` on success, `NULL` on failure

Definition at line 331 of file `fstream`.

**4.461.2.16 overflow()**

```
basic_filebuf<_CharT, encoding_char_traits<_CharT>>::int_type std::basic_filebuf<_CharT,
encoding_char_traits<_CharT>>::overflow (
 int_type __c = _Traits::eof()) [protected], [virtual], [inherited]
```

Consumes data from the buffer; writes to the controlled sequence.

**Parameters**

|                  |                                     |
|------------------|-------------------------------------|
| <code>__c</code> | An additional character to consume. |
|------------------|-------------------------------------|

**Returns**

`eof()` to indicate failure, something else (usually `__c`, or `not_eof()`)

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character `c` is also written out, if `__c` is not `eof()`.

For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.

A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

Definition at line 542 of file `fstream.tcc`.

**4.461.2.17 pbackfail()**

```
basic_filebuf<_CharT, encoding_char_traits<_CharT>>::int_type std::basic_filebuf<_CharT,
encoding_char_traits<_CharT>>::pbackfail (
 int_type __c = _Traits::eof()) [protected], [virtual], [inherited]
```

Tries to back up the input sequence.

## Parameters

|                 |                                                      |
|-----------------|------------------------------------------------------|
| <code>_c</code> | The character to be inserted back into the sequence. |
|-----------------|------------------------------------------------------|

## Returns

`eof()` on failure, *some other value* on success

## Postcondition

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

## Note

Base class version does nothing, returns `eof()`.

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits>](#).

Definition at line 483 of file `fstream.tcc`.

4.461.2.18 `pbase()`

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf<_CharT, _Traits>::pbase () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `eptr()` returns the end pointer for the output sequence

Definition at line 536 of file `streambuf`.

4.461.2.19 `pbump()`

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf<_CharT, _Traits>::pbump (
 int __n) [inline], [protected], [inherited]
```

Moving the write position.

**Parameters**

|                 |                             |
|-----------------|-----------------------------|
| <code>_↵</code> | The delta by which to move. |
| <code>_n</code> |                             |

This just advances the write position without returning any data.

Definition at line 552 of file streambuf.

**4.461.2.20 pptr()**

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::pptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Definition at line 539 of file streambuf.

**4.461.2.21 pubimbue()**

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf< _CharT, _Traits >::pubimbue (
 const locale & __loc) [inline], [inherited]
```

Entry point for imbue().

**Parameters**

|                    |                 |
|--------------------|-----------------|
| <code>__loc</code> | The new locale. |
|--------------------|-----------------|

**Returns**

The previous locale.

Calls the derived imbue(\_\_loc).

Definition at line 216 of file streambuf.

## 4.461.2.22 pubseekoff()

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekoff (
 off_type __off,
 ios_base::seekdir __way,
 ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

## Parameters

|                     |                                             |
|---------------------|---------------------------------------------|
| <code>__off</code>  | Offset.                                     |
| <code>__way</code>  | Value for <code>ios_base::seekdir</code> .  |
| <code>__mode</code> | Value for <code>ios_base::openmode</code> . |

Calls virtual seekoff function.

Definition at line 258 of file streambuf.

## 4.461.2.23 pubseekpos()

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekpos (
 pos_type __sp,
 ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

## Parameters

|                     |                                             |
|---------------------|---------------------------------------------|
| <code>__sp</code>   | Position                                    |
| <code>__mode</code> | Value for <code>ios_base::openmode</code> . |

Calls virtual seekpos function.

Definition at line 270 of file streambuf.

## 4.461.2.24 pubsetbuf()

```
template<typename _CharT, typename _Traits>
basic_streambuf* std::basic_streambuf< _CharT, _Traits >::pubsetbuf (
 char_type * __s,
 streamsize __n) [inline], [inherited]
```

Entry points for derived buffer functions.

The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.

Definition at line 246 of file `streambuf`.

#### 4.461.2.25 `pubsync()`

```
template<typename _CharT, typename _Traits>
int std::basic_streambuf< _CharT, _Traits >::pubsync () [inline], [inherited]
```

Calls virtual `sync` function.

Definition at line 278 of file `streambuf`.

Referenced by `std::wbuffer_convert< _Codecvt, _Elem, _Tr >::sync()`.

#### 4.461.2.26 `sbumpc()`

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sbumpc () [inline], [inherited]
```

Getting the next character.

##### Returns

The next character, or `eof`.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `uflow()`.

Definition at line 323 of file `streambuf`.

#### 4.461.2.27 `seekoff()`

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::pos_type std::basic_filebuf< _CharT,
encoding_char_traits< _CharT > >::seekoff (
 off_type __off,
 ios_base::seekdir __way,
 ios_base::openmode __mode = ios_base::in | ios_base::out) [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

##### Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from `std::basic_streambuf< _CharT, _Traits >`.

Definition at line 833 of file `fstream.tcc`.

## 4.461.2.28 seekpos()

```
basic_filebuf<_CharT, encoding_char_traits<_CharT>>::pos_type std::basic_filebuf<_CharT,
encoding_char_traits<_CharT>>::seekpos (
 pos_type __pos,
 ios_base::openmode __mode = ios_base::in | ios_base::out) [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

## Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

Definition at line 893 of file `fstream.tcc`.

## 4.461.2.29 setbuf()

```
basic_filebuf<_CharT, encoding_char_traits<_CharT>>::__streambuf_type * std::basic_filebuf<
_CharT, encoding_char_traits<_CharT>>::setbuf (
 char_type * __s,
 streamsize __n) [protected], [virtual], [inherited]
```

Manipulates the buffer.

## Parameters

|                  |                            |
|------------------|----------------------------|
| <code>__s</code> | Pointer to a buffer area.  |
| <code>__n</code> | Size of <code>__s</code> . |

## Returns

`this`

If no file has been opened, and both `__s` and `__n` are zero, then the stream becomes unbuffered. Otherwise, `__s` is used as a buffer; see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.streambuf.buffering> for more.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

Definition at line 804 of file `fstream.tcc`.

**4.461.2.30 setg()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::setg (
 char_type * __gbeg,
 char_type * __gnext,
 char_type * __gend) [inline], [protected], [inherited]
```

Setting the three read area pointers.

**Parameters**

|                      |            |
|----------------------|------------|
| <code>__gbeg</code>  | A pointer. |
| <code>__gnext</code> | A pointer. |
| <code>__gend</code>  | A pointer. |

**Postcondition**

`__gbeg == eback()`, `__gnext == gptr()`, and `__gend == egptr()`

Definition at line 516 of file streambuf.

**4.461.2.31 setp()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::setp (
 char_type * __pbeg,
 char_type * __pend) [inline], [protected], [inherited]
```

Setting the three write area pointers.

**Parameters**

|                     |            |
|---------------------|------------|
| <code>__pbeg</code> | A pointer. |
| <code>__pend</code> | A pointer. |

**Postcondition**

`__pbeg == pbase()`, `__pbeg == pptr()`, and `__pend == epptr()`

Definition at line 562 of file streambuf.

## 4.461.2.32 sgetc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sgetc () [inline], [inherited]
```

Getting the next character.

## Returns

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.

Definition at line 345 of file `streambuf`.

## 4.461.2.33 sgetn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::sgetn (
 char_type * __s,
 streamsize __n) [inline], [inherited]
```

Entry point for `xsgetn`.

## Parameters

|                  |                |
|------------------|----------------|
| <code>__s</code> | A buffer area. |
| <code>__n</code> | A count.       |

Returns `xsgetn(__s,__n)`. The effect is to fill `__s[0]` through `__s[__n-1]` with characters from the input sequence, if possible.

Definition at line 364 of file `streambuf`.

## 4.461.2.34 showmanyc()

```
streamsize std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::showmanyc () [protected],
[virtual], [inherited]
```

Investigating the data available.

### Returns

An estimate of the number of characters available in the input sequence, or -1.

*If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been supplied. If `showmanyc()` returns -1, then calls to `underflow()` or `uflow()` will fail.* [27.5.2.4.3]/1

### Note

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to `underflow` or `uflow`] will not return `eof()` but that they will return immediately.*

The standard adds that *the morphemes of `showmanyc` are **es-how-many-see**, not **show-manic**.*

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits>](#).

Definition at line 298 of file `fstream.tcc`.

#### 4.461.2.35 `snextc()`

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::snextc () [inline], [inherited]
```

Getting the next character.

### Returns

The next character, or eof.

Calls `sbumpc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.

Definition at line 305 of file `streambuf`.

#### 4.461.2.36 `sputbackc()`

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sputbackc (
 char_type __c) [inline], [inherited]
```

Pushing characters back into the input stream.

### Parameters

|                  |                             |
|------------------|-----------------------------|
| <code>__c</code> | The character to push back. |
|------------------|-----------------------------|

**Returns**

The previous character, if possible.

Similar to `sungetc()`, but `__c` is pushed onto the stream instead of *the previous character*. If successful, the next character fetched from the input stream will be `__c`.

Definition at line 379 of file `streambuf`.

**4.461.2.37 sputc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sputc (
 char_type __c) [inline], [inherited]
```

Entry point for all single-character output functions.

**Parameters**

|                  |                        |
|------------------|------------------------|
| <code>__c</code> | A character to output. |
|------------------|------------------------|

**Returns**

`__c`, if possible.

One of two public output functions.

If a write position is available for the output sequence (i.e., the buffer is not full), stores `__c` in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(__c)`.

Definition at line 431 of file `streambuf`.

Referenced by `std::ostreambuf_iterator<_CharT, _Traits>::operator=()`.

**4.461.2.38 sputn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::sputn (
 const char_type * __s,
 streamsize __n) [inline], [inherited]
```

Entry point for all single-character output functions.

**Parameters**

|                  |                     |
|------------------|---------------------|
| <code>__s</code> | A buffer read area. |
| <code>__n</code> | A count.            |

One of two public output functions.

Returns `xspn(__s, __n)`. The effect is to write `__s[0]` through `__s[__n-1]` to the output sequence, if possible.

Definition at line 457 of file `streambuf`.

**4.461.2.39 `sungetc()`**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sungetc () [inline], [inherited]
```

Moving backwards in the input stream.

**Returns**

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns `pbackfail()`. The effect is to *unget* the last character *gotten*.

Definition at line 404 of file `streambuf`.

**4.461.2.40 `sync()`**

```
int std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::sync (
 void) [protected], [virtual], [inherited]
```

Synchronizes the buffer arrays with the controlled sequences.

**Returns**

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

**Note**

Base class version does nothing, returns zero.

Reimplemented from `std::basic_streambuf< _CharT, _Traits >`.

Definition at line 1013 of file `fstream.tcc`.

## 4.461.2.41 uflow()

```
template<typename _CharT, typename _Traits>
virtual int_type std::basic_streambuf< _CharT, _Traits >::uflow () [inline], [protected], [virtual],
[inherited]
```

Fetches more data from the controlled sequence.

## Returns

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.

Reimplemented in `__gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>`.

Definition at line 707 of file `streambuf`.

## 4.461.2.42 underflow()

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::int_type std::basic_filebuf< _CharT,
encoding_char_traits< _CharT > >::underflow () [protected], [virtual], [inherited]
```

Fetches more data from the controlled sequence.

## Returns

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.

For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.

A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html>

## Note

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

Definition at line 324 of file `fstream.tcc`.

## 4.461.2.43 xsgetn()

```
streamsize std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::xsgetn (
 char_type * __s,
 streamsize __n) [protected], [virtual], [inherited]
```

Multiple character extraction.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__s</code> | A buffer area.                          |
| <code>__n</code> | Maximum number of characters to assign. |

**Returns**

The number of characters assigned.

Fills `__s[0]` through `__s[__n-1]` with characters from the input sequence, as if by `sbumpc()`. Stops when either `__n` characters have been copied, or when `traits::eof()` would be copied.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits>](#).

Definition at line 670 of file `fstream.tcc`.

**4.461.2.44 xsputn()**

```
streamsize std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::xsputn (
 const char_type * __s,
 streamsize __n) [protected], [virtual], [inherited]
```

Multiple character insertion.

**Parameters**

|                  |                                        |
|------------------|----------------------------------------|
| <code>__s</code> | A buffer area.                         |
| <code>__n</code> | Maximum number of characters to write. |

**Returns**

The number of characters written.

Writes `__s[0]` through `__s[__n-1]` to the output sequence, as if by `sputc()`. Stops when either `n` characters have been copied, or when `sputc()` would return `traits::eof()`.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits>](#).

Definition at line 756 of file `fstream.tcc`.

### 4.461.3 Member Data Documentation

#### 4.461.3.1 \_M\_buf

```
char_type* std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_buf [protected],
[inherited]
```

Pointer to the beginning of internal buffer.

Definition at line 136 of file fstream.

#### 4.461.3.2 \_M\_buf\_locale

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf<_CharT, _Traits>::_M_buf_locale [protected], [inherited]
```

Current locale setting.

Definition at line 199 of file streambuf.

#### 4.461.3.3 \_M\_buf\_size

```
size_t std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_buf_size [protected],
[inherited]
```

Actual size of internal buffer. This number is equal to the size of the put area + 1 position, reserved for the overflow char of a full area.

Definition at line 143 of file fstream.

#### 4.461.3.4 \_M\_ext\_buf

```
char* std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_ext_buf [protected],
[inherited]
```

Buffer for external characters. Used for input when `codecvt::always_noconv() == false`. When valid, this corresponds to `eback()`.

Definition at line 178 of file fstream.

#### 4.461.3.5 `_M_ext_buf_size`

```
streamsize std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_ext_buf_size [protected],
[inherited]
```

Size of buffer held by `_M_ext_buf`.

Definition at line 183 of file `fstream`.

#### 4.461.3.6 `_M_ext_next`

```
const char* std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_ext_next [protected],
[inherited]
```

Pointers into the buffer held by `_M_ext_buf` that delimit a subsequence of bytes that have been read but not yet converted. When valid, `_M_ext_next` corresponds to `egptr()`.

Definition at line 190 of file `fstream`.

#### 4.461.3.7 `_M_in_beg`

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::_M_in_beg [protected], [inherited]
```

Start of get area.

Definition at line 191 of file `streambuf`.

#### 4.461.3.8 `_M_in_cur`

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::_M_in_cur [protected], [inherited]
```

Current read area.

Definition at line 192 of file `streambuf`.

#### 4.461.3.9 `_M_in_end`

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::_M_in_end [protected], [inherited]
```

End of get area.

Definition at line 193 of file `streambuf`.

#### 4.461.3.10 \_M\_mode

```
ios_base::openmode std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_mode [protected],
[inherited]
```

Place to stash in || out || in | out settings for current filebuf.

Definition at line 121 of file fstream.

#### 4.461.3.11 \_M\_out\_beg

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf<_CharT, _Traits>::_M_out_beg [protected], [inherited]
```

Start of put area.

Definition at line 194 of file streambuf.

#### 4.461.3.12 \_M\_out\_cur

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf<_CharT, _Traits>::_M_out_cur [protected], [inherited]
```

Current put area.

Definition at line 195 of file streambuf.

#### 4.461.3.13 \_M\_out\_end

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf<_CharT, _Traits>::_M_out_end [protected], [inherited]
```

End of put area.

Definition at line 196 of file streambuf.

#### 4.461.3.14 \_M\_pback

```
char_type std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_pback [protected],
[inherited]
```

Necessary bits for putback buffer management.

#### Note

pbacks of over one character are not currently supported.

Definition at line 164 of file fstream.

#### 4.461.3.15 `_M_pback_cur_save`

```
char_type* std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_pback_cur_save [protected],
[inherited]
```

Necessary bits for putback buffer management.

##### Note

pbacks of over one character are not currently supported.

Definition at line 165 of file fstream.

#### 4.461.3.16 `_M_pback_end_save`

```
char_type* std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_pback_end_save [protected],
[inherited]
```

Necessary bits for putback buffer management.

##### Note

pbacks of over one character are not currently supported.

Definition at line 166 of file fstream.

#### 4.461.3.17 `_M_pback_init`

```
bool std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_pback_init [protected],
[inherited]
```

Necessary bits for putback buffer management.

##### Note

pbacks of over one character are not currently supported.

Definition at line 167 of file fstream.

## 4.461.3.18 \_M\_reading

```
bool std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_reading [protected],
[inherited]
```

\_M\_reading == false && \_M\_writing == false for **uncommitted** mode; \_M\_reading == true for **read** mode; \_M\_writing == true for **write** mode;

NB: \_M\_reading == true && \_M\_writing == true is unused.

Definition at line 155 of file fstream.

- bool **operator==** (const [error\\_category](#) &`__other`) const noexcept

#### 4.474.1 Detailed Description

Abstract base class for types defining a category of error codes.

An error category defines a context that give meaning to the integer stored in an `error_code` or `error_condition` object. For example, the standard `errno` constants such a `EINVAL` and `ENOMEM` are associated with the "generic" category and other OS-specific error numbers are associated with the "system" category, but a user-defined category might give different meanings to the same numerical values.

Definition at line 89 of file `system_error`.

The documentation for this class was generated from the following file:

- [system\\_error](#)

- [error\\_code](#) **make\_error\_code** (errc \_\_e) noexcept

## 4.475.1 Detailed Description

Class `error_code`

This class is a value type storing an integer error number and a category that gives meaning to the error number. Typically this is done close to the point where the error happens, to capture the original error value.

An `error_code` object can be used to store the original error value emitted by some subsystem, with a category relevant to the subsystem. For example, errors from POSIX library functions can be represented by an `errno` value and the "generic" category, but errors from an HTTP library might be represented by an HTTP response status code (e.g. 404) and a custom category defined by the library.

Definition at line 180 of file `system_error`.

The documentation for this struct was generated from the following file:

#### 4.476.1 Detailed Description

Class `error_condition`

This class represents error conditions that may be visible at an API boundary. Different `error_code` values that can occur within a library or module might map to the same `error_condition`.

An `error_condition` represents something that the program can test for, and subsequently take appropriate action.

Definition at line 278 of file `system_error`.

Definition at line 4648 of file random.h.

## 4.480.3 Constructor &amp; Destructor Documentation

#### 4.480.3.1 `exponential_distribution()` [1/2]

```
template<typename _RealType = double>
std::exponential_distribution< _RealType >::exponential_distribution () [inline]
```

Constructs an exponential distribution with inverse scale parameter 1.0.

Definition at line 4689 of file random.h.

#### 4.480.3.2 `exponential_distribution()` [2/2]

```
template<typename _RealType = double>
std::exponential_distribution< _RealType >::exponential_distribution (
 _RealType __lambda) [inline], [explicit]
```

Constructs an exponential distribution with inverse scale parameter  $\lambda$ .

Definition at line 4696 of file random.h.

### 4.480.4 Member Function Documentation

#### 4.480.4.1 `lambda()`

```
template<typename _RealType = double>
_RealType std::exponential_distribution< _RealType >::lambda () const [inline]
```

Returns the inverse scale parameter of the distribution.

Definition at line 4717 of file random.h.

#### 4.480.4.2 `max()`

```
template<typename _RealType = double>
result_type std::exponential_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

Definition at line 4746 of file random.h.

References `std::numeric_limits< _Tp >::max()`.

#### 4.480.4.3 min()

```
template<typename _RealType = double>
result_type std::exponential_distribution<_RealType>::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

Definition at line 4739 of file random.h.

#### 4.480.4.4 operator>()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::exponential_distribution<_RealType>::operator() (
 _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Definition at line 4754 of file random.h.

#### 4.480.4.5 param() [1/2]

```
template<typename _RealType = double>
param_type std::exponential_distribution<_RealType>::param () const [inline]
```

Returns the parameter set of the distribution.

Definition at line 4724 of file random.h.

Referenced by std::operator>>().

#### 4.480.4.6 param() [2/2]

```
template<typename _RealType = double>
void std::exponential_distribution<_RealType>::param (
 const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

##### Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

Definition at line 4732 of file random.h.

#### 4.480.4.7 reset()

```
template<typename _RealType = double>
void std::exponential_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

Has no effect on exponential distributions.

Definition at line 4711 of file random.h.

### 4.480.5 Friends And Related Function Documentation

#### 4.480.5.1 operator==

```
template<typename _RealType = double>
bool operator== (
 const exponential_distribution< _RealType > & __d1,
 const exponential_distribution< _RealType > & __d2) [friend]
```

Return true if two exponential distributions have the same parameters.

Definition at line 4794 of file random.h.

The documentation for this class was generated from the following files:

- [random.h](#)
- [bits/random.tcc](#)

### 4.481 std::extent< typename, \_UInt > Struct Template Reference

Inheritance diagram for std::extent< typename, \_UInt >:

### Public Types

## Friends

- bool **operator==** (const [extreme\\_value\\_distribution](#) &\_\_d1, const [extreme\\_value\\_distribution](#) &\_\_d2)

## 4.482.1 Detailed Description

```
template<typename _RealType = double>
class std::extreme_value_distribution< _RealType >
```

A [extreme\\_value\\_distribution](#) random number distribution.

The formula for the normal probability mass function is

$$p(x|a,b) = \frac{1}{b} \exp\left(\frac{a-x}{b}\right) - \exp\left(\frac{a-x}{b}\right)$$

Definition at line 5070 of file random.h.

## 4.482.2 Member Typedef Documentation

#### 4.482.2.1 result\_type

```
template<typename _RealType = double>
typedef _RealType std::extreme_value_distribution<_RealType>::result_type
```

The type of the range of the distribution.

Definition at line 5073 of file random.h.

#### 4.482.3 Member Function Documentation

##### 4.482.3.1 a()

```
template<typename _RealType = double>
_RealType std::extreme_value_distribution<_RealType>::a () const [inline]
```

Return the  $a$  parameter of the distribution.

Definition at line 5135 of file random.h.

##### 4.482.3.2 b()

```
template<typename _RealType = double>
_RealType std::extreme_value_distribution<_RealType>::b () const [inline]
```

Return the  $b$  parameter of the distribution.

Definition at line 5142 of file random.h.

##### 4.482.3.3 max()

```
template<typename _RealType = double>
result_type std::extreme_value_distribution<_RealType>::max () const [inline]
```

Returns the least upper bound value of the distribution.

Definition at line 5171 of file random.h.

References std::numeric\_limits<\_Tp>::max().

#### 4.482.3.4 min()

```
template<typename _RealType = double>
result_type std::extreme_value_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

Definition at line 5164 of file random.h.

References `std::numeric_limits< _Tp >::lowest()`.

#### 4.482.3.5 operator>()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::extreme_value_distribution< _RealType >::operator() (
 _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Definition at line 5179 of file random.h.

#### 4.482.3.6 param() [1/2]

```
template<typename _RealType = double>
param_type std::extreme_value_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

Definition at line 5149 of file random.h.

Referenced by `std::operator>>()`.

#### 4.482.3.7 param() [2/2]

```
template<typename _RealType = double>
void std::extreme_value_distribution< _RealType >::param (
 const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

##### Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

Definition at line 5157 of file random.h.

#### 4.482.3.8 `reset()`

```
template<typename _RealType = double>
void std::extreme_value_distribution<_RealType>::reset () [inline]
```

Resets the distribution state.

Definition at line 5128 of file random.h.

### 4.482.4 Friends And Related Function Documentation

#### 4.482.4.1 `operator==`

```
template<typename _RealType = double>
bool operator== (
 const extreme_value_distribution<_RealType> & __d1,
 const extreme_value_distribution<_RealType> & __d2) [friend]
```

Return true if two extreme value distributions have the same parameters.

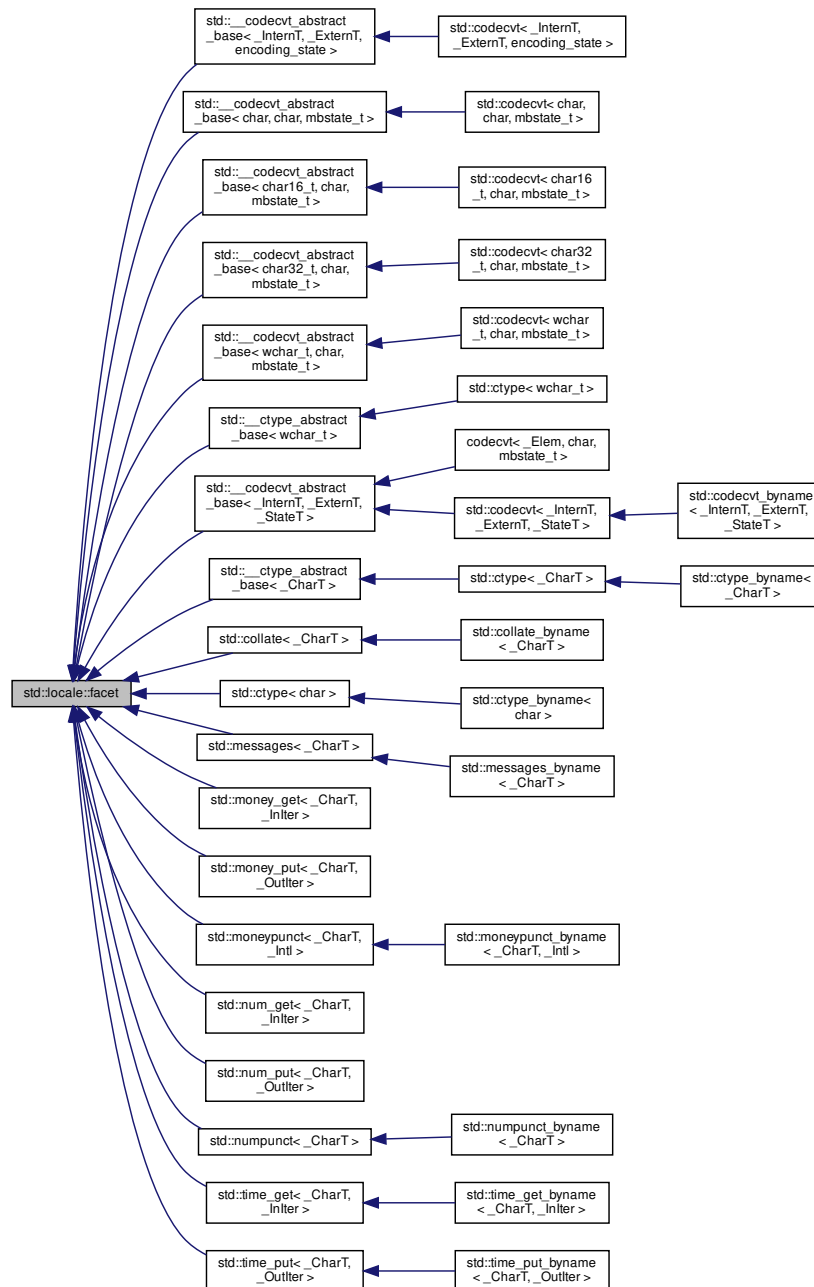

Definition at line 5214 of file random.h.

The documentation for this class was generated from the following files:

- [random.h](#)
- [bits/random.tcc](#)

## 4.483 std::locale::facet Class Reference

Inheritance diagram for std::locale::facet:

### Protected Member Functions

- [facet](#) (size\_t \_\_refs=0) throw ()

- **facet** (const facet &)=delete
- virtual ~facet ()
- **facet** & **operator=** (const facet &)=delete

#### Static Protected Member Functions

- static \_\_c\_locale **\_S\_clone\_c\_locale** (\_\_c\_locale &\_\_cloc) throw ()
- static void **\_S\_create\_c\_locale** (\_\_c\_locale &\_\_cloc, const char \*\_\_s, \_\_c\_locale \_\_old=0)
- static void **\_S\_destroy\_c\_locale** (\_\_c\_locale &\_\_cloc)
- static \_\_c\_locale **\_S\_get\_c\_locale** ()
- static const char \* **\_S\_get\_c\_name** () throw ()
- static \_\_c\_locale **\_S\_lc\_ctype\_c\_locale** (\_\_c\_locale \_\_cloc, const char \*\_\_s)

#### Friends

- class **locale**
- class **locale::\_Impl**

#### 4.483.1 Detailed Description

Localization functionality base class.

The facet class is the base class for a localization feature, such as money, time, and number printing. It provides common support for facets and reference management.

Facets may not be copied or assigned.

Definition at line 373 of file locale\_classes.h.

#### 4.483.2 Constructor & Destructor Documentation

##### 4.483.2.1 facet()

```
std::locale::facet::facet (
 size_t __refs = 0) throw () [inline], [explicit], [protected]
```

Facet constructor.

This is the constructor provided by the standard. If refs is 0, the facet is destroyed when the last referencing locale is destroyed. Otherwise the facet will never be destroyed.

#### Parameters

|                     |                                        |
|---------------------|----------------------------------------|
| <code>__refs</code> | The initial value for reference count. |
|---------------------|----------------------------------------|

Definition at line 405 of file locale\_classes.h.

#### 4.483.2.2 ~facet()

```
virtual std::locale::facet::~~facet () [protected], [virtual]
```

Facet destructor.

The documentation for this class was generated from the following file:

- [locale\\_classes.h](#)

### 4.484 std::ios\_base::failure Class Reference

Inheritance diagram for std::ios\_base::failure:

#### Public Member Functions

- **failure** (const [string](#) &\_\_str) throw ()
- **failure** (const [string](#) &\_\_s, const [error\\_code](#) &) noexcept
- **failure** (const char \*\_\_s, const [error\\_code](#) &=error\_code{})
- [error\\_code](#) **code** () const noexcept
- virtual const char \* [what](#) () const throw ()

#### 4.484.1 Detailed Description

These are thrown to indicate problems with io.

27.4.2.1.1 Class ios\_base::failure.

Definition at line 276 of file ios\_base.h.

## 4.484.2 Member Function Documentation

## 4.484.2.1 what()

```
virtual const char* std::ios_base::failure::what () const throw () [virtual]
```

Returns a C-style character string describing the general cause of the current error.

Reimplemented from [std::exception](#).

The documentation for this class was generated from the following file:

- [ios\\_base.h](#)

## 4.485 std::experimental::filesystem::v1::filesystem\_error Class Reference

Inheritance diagram for std::experimental::filesystem::v1::filesystem\_error:

## Public Member Functions

- **filesystem\_error** (const [string](#) &\_\_what\_arg, [error\\_code](#) \_\_ec)
- **filesystem\_error** (const [string](#) &\_\_what\_arg, const [path](#) &\_\_p1, [error\\_code](#) \_\_ec)
- **filesystem\_error** (const [string](#) &\_\_what\_arg, const [path](#) &\_\_p1, const [path](#) &\_\_p2, [error\\_code](#) \_\_ec)
- const [error\\_code](#) & **code** () const noexcept
- const [path](#) & **path1** () const noexcept
- const [path](#) & **path2** () const noexcept
- const char \* **what** () const noexcept

#### 4.485.1 Detailed Description

Exception type thrown by the Filesystem TS library.

Definition at line 696 of file `experimental/bits/fs_path.h`.

#### 4.485.2 Member Function Documentation

##### 4.485.2.1 `what()`

```
const char* std::experimental::filesystem::v1::filesystem_error::what () const [inline], [virtual],
[noexcept]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::runtime\\_error](#).

Definition at line 715 of file `experimental/bits/fs_path.h`.

References `std::basic_string<_CharT, _Traits, _Alloc>::c_str()`.

The documentation for this class was generated from the following file:

- [experimental/bits/fs\\_path.h](#)

#### 4.486 `__gnu_parallel::find_tag` Struct Reference

Inheritance diagram for `__gnu_parallel::find_tag`:

## 4.486.1 Detailed Description

Base class for for std::find() variants.

Definition at line 104 of file tags.h.

The documentation for this struct was generated from the following file:

- [tags.h](#)

### 4.487.1 Detailed Description

```
template<typename _RealType = double>
class std::fisher_f_distribution< _RealType >
```

A fisher\_f\_distribution random number distribution.

The formula for the normal probability mass function is

$$p(x|m, n) = \frac{\Gamma((m+n)/2)}{\Gamma(m/2)\Gamma(n/2)} \left(\frac{m}{n}\right)^{m/2} x^{(m/2)-1} \left(1 + \frac{mx}{n}\right)^{-(m+n)/2}$$

Definition at line 3062 of file random.h.

### 4.487.2 Member Typedef Documentation

#### 4.487.2.1 result\_type

```
template<typename _RealType = double>
typedef _RealType std::fisher_f_distribution< _RealType >::result_type
```

The type of the range of the distribution.

Definition at line 3065 of file random.h.

### 4.487.3 Member Function Documentation

#### 4.487.3.1 m()

```
template<typename _RealType = double>
_RealType std::fisher_f_distribution< _RealType >::m () const [inline]
```

Definition at line 3131 of file random.h.

Referenced by `std::fisher_f_distribution< _RealType >::operator()()`.

#### 4.487.3.2 max()

```
template<typename _RealType = double>
result_type std::fisher_f_distribution<_RealType>::max () const [inline]
```

Returns the least upper bound value of the distribution.

Definition at line 3164 of file random.h.

References std::numeric\_limits<\_Tp>::max().

#### 4.487.3.3 min()

```
template<typename _RealType = double>
result_type std::fisher_f_distribution<_RealType>::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

Definition at line 3157 of file random.h.

#### 4.487.3.4 operator()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::fisher_f_distribution<_RealType>::operator() (
 _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Definition at line 3172 of file random.h.

References std::fisher\_f\_distribution<\_RealType>::m().

#### 4.487.3.5 param() [1/2]

```
template<typename _RealType = double>
param_type std::fisher_f_distribution<_RealType>::param () const [inline]
```

Returns the parameter set of the distribution.

Definition at line 3142 of file random.h.

#### 4.487.3.6 param() [2/2]

```
template<typename _RealType = double>
void std::fisher_f_distribution<_RealType>::param (
 const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

#### Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

Definition at line 3150 of file random.h.

#### 4.487.3.7 reset()

```
template<typename _RealType = double>
void std::fisher_f_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

Definition at line 3121 of file random.h.

References `std::gamma_distribution< _RealType >::reset()`.

### 4.487.4 Friends And Related Function Documentation

#### 4.487.4.1 operator<<

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
 std::basic_ostream< _CharT, _Traits > & __os,
 const std::fisher_f_distribution< _RealType1 > & __x) [friend]
```

Inserts a `fisher_f_distribution` random number distribution `__x` into the output stream `__os`.

#### Parameters

|                   |                                                                  |
|-------------------|------------------------------------------------------------------|
| <code>__os</code> | An output stream.                                                |
| <code>__x</code>  | A <code>fisher_f_distribution</code> random number distribution. |

#### Returns

The output stream with the state of `__x` inserted or in an error state.

#### 4.487.4.2 operator==

```
template<typename _RealType = double>
bool operator== (
```

```
const fisher_f_distribution<_RealType> & __d1,
const fisher_f_distribution<_RealType> & __d2) [friend]
```

Return true if two Fisher f distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 3220 of file random.h.

#### 4.487.4.3 operator>>

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
 std::basic_istream<_CharT, _Traits> & __is,
 std::fisher_f_distribution<_RealType1> & __x) [friend]
```

Extracts a fisher\_f\_distribution random number distribution \_\_x from the input stream \_\_is.

##### Parameters

|                                                                                            |                                                         |
|--------------------------------------------------------------------------------------------|---------------------------------------------------------|
| <br>__is  | An input stream.                                        |
| <br>__x | A fisher_f_distribution random number generator engine. |

##### Returns

The input stream with \_\_x extracted or in an error state.

The documentation for this class was generated from the following files:

- [random.h](#)
- [bits/random.tcc](#)

#### 4.488 `__gnu_cxx::forced_error` Struct Reference

Inheritance diagram for `__gnu_cxx::forced_error`:

##### Public Member Functions

- virtual const char \* [what](#) () const noexcept

##### 4.488.1 Detailed Description

Thrown by exception safety machinery.

Definition at line 79 of file `throw_allocator.h`.

## Friends

- `template<typename _ItT, typename _SeqT, typename _CatT >`  
`class ::__gnu_debug::_Safe_iterator`

### 4.490.1 Detailed Description

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
class std::__debug::forward_list<_Tp, _Alloc >
```

Class `std::forward_list` with safety/checking/debug instrumentation.

Definition at line 36 of file `debug/forward_list`.

### 4.490.2 Member Function Documentation

#### 4.490.2.1 `_M_detach_all()`

```
void __gnu_debug::_Safe_sequence_base::_M_detach_all () [protected], [inherited]
```

Detach all iterators, leaving them singular.

Referenced by `__gnu_debug::_Safe_sequence_base::~~_Safe_sequence_base()`.

#### 4.490.2.2 `_M_detach_singular()`

```
void __gnu_debug::_Safe_sequence_base::_M_detach_singular () [protected], [inherited]
```

Detach all singular iterators.

## Postcondition

for all iterators `i` attached to this sequence, `i->_M_version == _M_version`.

#### 4.490.2.3 `_M_get_mutex()`

```
__gnu_cxx::__mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex () throw () [protected],
[inherited]
```

For use in `_Safe_sequence`.

Referenced by `__gnu_debug::_Safe_sequence< map<_Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

## 4.490.2.4 \_M\_invalidate\_all()

```
void __gnu_debug::_Safe_sequence_base::_M_invalidate_all () const [inline], [protected], [inherited]
```

Invalidates all iterators.

Definition at line 256 of file safe\_base.h.

References `__gnu_debug::_Safe_sequence_base::_M_version`.

## 4.490.2.5 \_M\_invalidate\_if()

```
void __gnu_debug::_Safe_sequence< forward_list< _Tp, _Alloc > >::_M_invalidate_if (
 _Predicate __pred) [inherited]
```

Invalidates all iterators `x` that reference this sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

Definition at line 38 of file safe\_sequence.tcc.

## 4.490.2.6 \_M\_revalidate\_singular()

```
void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular () [protected], [inherited]
```

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

## 4.490.2.7 \_M\_transfer\_from\_if()

```
void __gnu_debug::_Safe_sequence< forward_list< _Tp, _Alloc > >::_M_transfer_from_if (
 _Safe_sequence< forward_list< _Tp, _Alloc > > & __from,
 _Predicate __pred) [inherited]
```

Transfers all iterators `x` that reference `from` sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

Definition at line 69 of file safe\_sequence.tcc.

## 4.490.3 Member Data Documentation

#### 4.490.3.1 `_M_const_iterators`

```
_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_iterators [inherited]
```

The list of constant iterators that reference this container.

Definition at line 197 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

#### 4.490.3.2 `_M_iterators`

```
_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators [inherited]
```

The list of mutable iterators that reference this container.

Definition at line 194 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

#### 4.490.3.3 `_M_version`

```
unsigned int __gnu_debug::_Safe_sequence_base::_M_version [mutable], [inherited]
```

The container version number. This number may never be 0.

Definition at line 200 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence_base::_M_invalidate_all()`.

## 4.491.1 Detailed Description

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
class std::forward_list< _Tp, _Alloc >
```

A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

## Template Parameters

|                     |                                                                 |
|---------------------|-----------------------------------------------------------------|
| <code>_Tp</code>    | Type of element.                                                |
| <code>_Alloc</code> | Allocator type, defaults to <code>allocator&lt;_Tp&gt;</code> . |

Meets the requirements of a [container](#), a [sequence](#), including the [optional sequence requirements](#) with the exception of `at` and `operator[]`.

This is a *singly linked* list. Traversal up the list requires linear time, but adding and removing elements (or *nodes*) is done in constant time, regardless of where the change takes place. Unlike `std::vector` and `std::deque`, random-access iterators are not provided, so subscripting ( `[]` ) access is not allowed. For algorithms which only need sequential access, this lack makes no difference.

Also unlike the other standard containers, `std::forward_list` provides specialized algorithms unique to linked lists, such as splicing, sorting, and in-place reversal.

Definition at line 423 of file `forward_list.h`.

## 4.491.2 Constructor &amp; Destructor Documentation

**4.491.2.1 forward\_list()** [1/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list () [default]
```

Creates a forward\_list with no elements.

**4.491.2.2 forward\_list()** [2/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
 const _Alloc & __al) [inline], [explicit], [noexcept]
```

Creates a forward\_list with no elements.

**Parameters**

|                   |                      |
|-------------------|----------------------|
| <code>__al</code> | An allocator object. |
|-------------------|----------------------|

Definition at line 466 of file forward\_list.h.

**4.491.2.3 forward\_list()** [3/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
 const forward_list< _Tp, _Alloc > & __list,
 const _Alloc & __al) [inline]
```

Copy constructor with allocator argument.

**Parameters**

|                     |                      |
|---------------------|----------------------|
| <code>__list</code> | Input list to copy.  |
| <code>__al</code>   | An allocator object. |

Definition at line 475 of file forward\_list.h.

References `std::forward_list< _Tp, _Alloc >::begin()`, and `std::forward_list< _Tp, _Alloc >::end()`.

**4.491.2.4 forward\_list()** [4/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
```

```
forward_list<_Tp, _Alloc > && __list,
const _Alloc & __al) [inline], [noexcept]
```

Move constructor with allocator argument.

#### Parameters

|                     |                      |
|---------------------|----------------------|
| <code>__list</code> | Input list to move.  |
| <code>__al</code>   | An allocator object. |

Definition at line 503 of file forward\_list.h.

#### 4.491.2.5 forward\_list() [5/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list<_Tp, _Alloc >::forward_list (
 size_type __n,
 const _Alloc & __al = _Alloc()) [inline], [explicit]
```

Creates a forward\_list with default constructed elements.

#### Parameters

|                   |                                             |
|-------------------|---------------------------------------------|
| <code>__n</code>  | The number of elements to initially create. |
| <code>__al</code> | An allocator object.                        |

This constructor creates the forward\_list with `__n` default constructed elements.

Definition at line 518 of file forward\_list.h.

#### 4.491.2.6 forward\_list() [6/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list<_Tp, _Alloc >::forward_list (
 size_type __n,
 const _Tp & __value,
 const _Alloc & __al = _Alloc()) [inline]
```

Creates a forward\_list with copies of an exemplar element.

#### Parameters

|                      |                                             |
|----------------------|---------------------------------------------|
| <code>__n</code>     | The number of elements to initially create. |
| <code>__value</code> | An element to copy.                         |
| <code>__al</code>    | An allocator object.                        |

This constructor fills the `forward_list` with `__n` copies of `__value`.

Definition at line 531 of file `forward_list.h`.

#### 4.491.2.7 `forward_list()` [7/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
std::forward_list<_Tp, _Alloc>::forward_list (
 _InputIterator __first,
 _InputIterator __last,
 const _Alloc & __al = _Alloc()) [inline]
```

Builds a `forward_list` from a range.

##### Parameters

|                      |                      |
|----------------------|----------------------|
| <code>__first</code> | An input iterator.   |
| <code>__last</code>  | An input iterator.   |
| <code>__al</code>    | An allocator object. |

Create a `forward_list` consisting of copies of the elements from `[__first,__last)`. This is linear in `N` (where `N` is distance(`↵`  
`__first,__last`)).

Definition at line 548 of file `forward_list.h`.

#### 4.491.2.8 `forward_list()` [8/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list<_Tp, _Alloc>::forward_list (
 const forward_list<_Tp, _Alloc> & __list) [inline]
```

The `forward_list` copy constructor.

##### Parameters

|                     |                                                                       |
|---------------------|-----------------------------------------------------------------------|
| <code>__list</code> | A <code>forward_list</code> of identical element and allocator types. |
|---------------------|-----------------------------------------------------------------------|

Definition at line 558 of file `forward_list.h`.

References `std::forward_list<_Tp, _Alloc>::begin()`, and `std::forward_list<_Tp, _Alloc>::end()`.

## 4.491.2.9 forward\_list() [9/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
 forward_list< _Tp, _Alloc > &&) [default]
```

The forward\_list move constructor.

## Parameters

|                     |                                                          |
|---------------------|----------------------------------------------------------|
| <code>__list</code> | A forward_list of identical element and allocator types. |
|---------------------|----------------------------------------------------------|

The newly-created forward\_list contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified forward\_list.

## 4.491.2.10 forward\_list() [10/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
 std::initializer_list< _Tp > __il,
 const _Alloc & __al = _Alloc()) [inline]
```

Builds a forward\_list from an initializer\_list.

## Parameters

|                   |                                    |
|-------------------|------------------------------------|
| <code>__il</code> | An initializer_list of value_type. |
| <code>__al</code> | An allocator object.               |

Create a forward\_list consisting of copies of the elements in the initializer\_list `__il`. This is linear in `__il.size()`.

Definition at line 582 of file forward\_list.h.

## 4.491.2.11 ~forward\_list()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::~~forward_list () [inline], [noexcept]
```

The forward\_list dtor.

Definition at line 590 of file forward\_list.h.

## 4.491.3 Member Function Documentation

**4.491.3.1 assign()** [1/3]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>>
void std::forward_list<_Tp, _Alloc>::assign (
 _InputIterator __first,
 _InputIterator __last) [inline]
```

Assigns a range to a forward\_list.

**Parameters**

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

This function fills a forward\_list with copies of the elements in the range [`__first`,`__last`).

Note that the assignment completely changes the forward\_list and that the number of elements of the resulting forward\_list is the same as the number of elements assigned.

Definition at line 658 of file forward\_list.h.

Referenced by `std::forward_list<_Tp, _Alloc>::assign()`, and `std::forward_list<_Tp, _Alloc>::operator=()`.

**4.491.3.2 assign()** [2/3]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list<_Tp, _Alloc>::assign (
 size_type __n,
 const _Tp & __val) [inline]
```

Assigns a given value to a forward\_list.

**Parameters**

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Number of elements to be assigned. |
| <code>__val</code> | Value to be assigned.              |

This function fills a forward\_list with `__n` copies of the given value. Note that the assignment completely changes the forward\_list, and that the resulting forward\_list has `__n` elements.

Definition at line 675 of file forward\_list.h.

## 4.491.3.3 assign() [3/3]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::assign (
 std::initializer_list< _Tp > __il) [inline]
```

Assigns an initializer\_list to a forward\_list.

## Parameters

|                                                                                   |                                    |
|-----------------------------------------------------------------------------------|------------------------------------|
|  | An initializer_list of value_type. |
|-----------------------------------------------------------------------------------|------------------------------------|

Replace the contents of the forward\_list with copies of the elements in the initializer\_list \_\_il. This is linear in il.size().

Definition at line 687 of file forward\_list.h.

References std::forward\_list< \_Tp, \_Alloc >::assign().

## 4.491.3.4 before\_begin() [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::before_begin () [inline], [noexcept]
```

Returns a read/write iterator that points before the first element in the forward\_list. Iteration is done in ordinary element order.

Definition at line 702 of file forward\_list.h.

Referenced by std::forward\_list< \_Tp, \_Alloc >::insert\_after().

## 4.491.3.5 before\_begin() [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list< _Tp, _Alloc >::before_begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points before the first element in the forward\_list. Iteration is done in ordinary element order.

Definition at line 711 of file forward\_list.h.

**4.491.3.6 begin()** [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::begin () [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 719 of file `forward_list.h`.

Referenced by `std::forward_list< _Tp, _Alloc >::forward_list()`.

**4.491.3.7 begin()** [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list< _Tp, _Alloc >::begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 728 of file `forward_list.h`.

**4.491.3.8 cbefore\_begin()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list< _Tp, _Alloc >::cbefore_begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points before the first element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 764 of file `forward_list.h`.

Referenced by `std::forward_list< _Tp, _Alloc >::emplace_front()`, and `std::forward_list< _Tp, _Alloc >::push_front()`.

**4.491.3.9 cbegin()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list< _Tp, _Alloc >::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 755 of file `forward_list.h`.

Referenced by `std::operator<()`, `std::forward_list< _Tp, _Alloc >::operator=()`, and `std::operator==(())`.

## 4.491.3.10 cend()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list< _Tp, _Alloc >::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the forward\_list. Iteration is done in ordinary element order.

Definition at line 773 of file forward\_list.h.

Referenced by std::operator<(), std::forward\_list< \_Tp, \_Alloc >::operator=(), and std::operator==( ).

## 4.491.3.11 clear()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::clear () [inline], [noexcept]
```

Erases all the elements.

Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1086 of file forward\_list.h.

## 4.491.3.12 emplace\_after()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename... _Args>
iterator std::forward_list< _Tp, _Alloc >::emplace_after (
 const_iterator __pos,
 _Args &&... __args) [inline]
```

Constructs object in forward\_list after the specified iterator.

## Parameters

|                     |                                         |
|---------------------|-----------------------------------------|
| <code>__pos</code>  | A const_iterator into the forward_list. |
| <code>__args</code> | Arguments.                              |

## Returns

An iterator that points to the inserted data.

This function will insert an object of type T constructed with T(std::forward<Args>(args)...) after the specified location. Due to the nature of a forward\_list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 895 of file forward\_list.h.

#### 4.491.3.13 `emplace_front()`

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename... _Args>
void std::forward_list<_Tp, _Alloc>::emplace_front (
 _Args &&... __args) [inline]
```

Constructs object in forward\_list at the front of the list.

##### Parameters

|                     |            |
|---------------------|------------|
| <code>__args</code> | Arguments. |
|---------------------|------------|

This function will insert an object of type `Tp` constructed with `Tp(std::forward<Args>(args)...)`  at the front of the list. Due to the nature of a `forward_list` this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 834 of file forward\_list.h.

References `std::forward_list<_Tp, _Alloc>::cbefore_begin()`, and `std::forward_list<_Tp, _Alloc>::front()`.

#### 4.491.3.14 `empty()`

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
bool std::forward_list<_Tp, _Alloc>::empty () const [inline], [noexcept]
```

Returns true if the `forward_list` is empty. (Thus `begin()` would equal `end()`.)

Definition at line 781 of file forward\_list.h.

Referenced by `std::forward_list<_Tp, _Alloc>::insert_after()`.

#### 4.491.3.15 `end()` [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list<_Tp, _Alloc>::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 737 of file forward\_list.h.

Referenced by `std::forward_list<_Tp, _Alloc>::forward_list()`, and `std::forward_list<_Tp, _Alloc>::insert_after()`.

**4.491.3.16** end() [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list< _Tp, _Alloc >::end () const [inline], [noexcept]
```

Returns a read-only iterator that points one past the last element in the forward\_list. Iteration is done in ordinary element order.

Definition at line 746 of file forward\_list.h.

**4.491.3.17** erase\_after() [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::erase_after (
 const_iterator __pos) [inline]
```

Removes the element pointed to by the iterator following pos.

**Parameters**

|                    |                                                |
|--------------------|------------------------------------------------|
| <code>__pos</code> | Iterator pointing before element to be erased. |
|--------------------|------------------------------------------------|

**Returns**

An iterator pointing to the element following the one that was erased, or end() if no such element exists.

This function will erase the element at the given position and thus shorten the forward\_list by one.

Due to the nature of a forward\_list this operation can be done in constant time, and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 998 of file forward\_list.h.

**4.491.3.18** erase\_after() [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::erase_after (
 const_iterator __pos,
 const_iterator __last) [inline]
```

Remove a range of elements.

**Parameters**

|                     |                                                              |
|---------------------|--------------------------------------------------------------|
| <code>__pos</code>  | Iterator pointing before the first element to be erased.     |
| <code>__last</code> | Iterator pointing to one past the last element to be erased. |

**Returns**

@ \_\_last.

This function will erase the elements in the range ( \_\_pos, \_\_last) and shorten the forward\_list accordingly.

This operation is linear time in the size of the range and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1021 of file forward\_list.h.

**4.491.3.19 front()** [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
reference std::forward_list< _Tp, _Alloc >::front () [inline]
```

Returns a read/write reference to the data at the first element of the forward\_list.

Definition at line 798 of file forward\_list.h.

Referenced by std::forward\_list< \_Tp, \_Alloc >::emplace\_front().

**4.491.3.20 front()** [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_reference std::forward_list< _Tp, _Alloc >::front () const [inline]
```

Returns a read-only (constant) reference to the data at the first element of the forward\_list.

Definition at line 809 of file forward\_list.h.

**4.491.3.21 get\_allocator()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
allocator_type std::forward_list< _Tp, _Alloc >::get_allocator () const [inline], [noexcept]
```

Get a copy of the memory allocation object.

Definition at line 692 of file forward\_list.h.

**4.491.3.22 insert\_after()** [1/5]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::insert_after (
 const_iterator __pos,
 const _Tp & __val) [inline]
```

Inserts given value into forward\_list after specified iterator.

## Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__pos</code> | An iterator into the forward_list. |
| <code>__val</code> | Data to be inserted.               |

## Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value after the specified location. Due to the nature of a forward\_list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 912 of file forward\_list.h.

Referenced by std::forward\_list< \_Tp, \_Alloc >::insert\_after().

## 4.491.3.23 insert\_after() [2/5]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::insert_after (
 const_iterator __pos,
 _Tp && __val) [inline]
```

Definition at line 919 of file forward\_list.h.

References std::move().

## 4.491.3.24 insert\_after() [3/5]

```
template<typename _Tp, typename _Alloc >
forward_list< _Tp, _Alloc >::iterator forward_list::insert_after (
 const_iterator __pos,
 size_type __n,
 const _Tp & __val)
```

Inserts a number of copies of given data into the forward\_list.

## Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__pos</code> | An iterator into the forward_list. |
| <code>__n</code>   | Number of elements to be inserted. |
| <code>__val</code> | Data to be inserted.               |

**Returns**

An iterator pointing to the last inserted copy of *val* or *pos* if *n* == 0.

This function will insert a specified number of copies of the given data after the location specified by *pos*.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 256 of file `forward_list.tcc`.

References `std::forward_list< _Tp, _Alloc >::before_begin()`, and `std::forward_list< _Tp, _Alloc >::end()`.

**4.491.3.25 insert\_after()** [4/5]

```
template<typename _Tp , typename _Alloc >
template<typename _InputIterator , typename >
forward_list< _Tp, _Alloc >::iterator forward_list::insert_after (
 const_iterator __pos,
 _InputIterator __first,
 _InputIterator __last)
```

Inserts a range into the `forward_list`.

**Parameters**

|                      |                                                  |
|----------------------|--------------------------------------------------|
| <code>__pos</code>   | An iterator into the <code>forward_list</code> . |
| <code>__first</code> | An input iterator.                               |
| <code>__last</code>  | An input iterator.                               |

**Returns**

An iterator pointing to the last inserted element or `__pos` if `__first == __last`.

This function will insert copies of the data in the range `[__first,__last)` into the `forward_list` after the location specified by `__pos`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 271 of file `forward_list.tcc`.

References `std::forward_list< _Tp, _Alloc >::before_begin()`, `std::forward_list< _Tp, _Alloc >::empty()`, and `std::forward_list< _Tp, _Alloc >::end()`.

**4.491.3.26 insert\_after()** [5/5]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::insert_after (
 const_iterator __pos,
 std::initializer_list< _Tp > __il) [inline]
```

Inserts the contents of an `initializer_list` into `forward_list` after the specified iterator.

## Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__pos</code> | An iterator into the forward_list. |
| <code>__il</code>  | An initializer_list of value_type. |

## Returns

An iterator pointing to the last inserted element or `__pos` if `__il` is empty.

This function will insert copies of the data in the initializer\_list `__il` into the forward\_list before the location specified by `__pos`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 977 of file forward\_list.h.

References `std::forward_list< _Tp, _Alloc >::insert_after()`.

## 4.491.3.27 max\_size()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
size_type std::forward_list< _Tp, _Alloc >::max_size () const [inline], [noexcept]
```

Returns the largest possible number of elements of forward\_list.

Definition at line 788 of file forward\_list.h.

References `std::allocator_traits< _Alloc >::max_size()`.

## 4.491.3.28 merge() [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::merge (
 forward_list< _Tp, _Alloc > && __list) [inline]
```

Merge sorted lists.

## Parameters

|                     |                       |
|---------------------|-----------------------|
| <code>__list</code> | Sorted list to merge. |
|---------------------|-----------------------|

Assumes that both `list` and this list are sorted according to operator<(). Merges elements of `__list` into this list in sorted order, leaving `__list` empty when complete. Elements in this list precede elements in `__list` that are equal.

Definition at line 1242 of file forward\_list.h.

References `std::move()`.

#### 4.491.3.29 `merge()` [2/2]

```
template<typename _Tp , typename _Alloc >
template<typename _Comp >
void forward_list::merge (
 forward_list< _Tp, _Alloc > && __list,
 _Comp __comp)
```

Merge sorted lists according to comparison function.

##### Parameters

|                     |                                          |
|---------------------|------------------------------------------|
| <code>__list</code> | Sorted list to merge.                    |
| <code>__comp</code> | Comparison function defining sort order. |

Assumes that both `__list` and this list are sorted according to `comp`. Merges elements of `__list` into this list in sorted order, leaving `__list` empty when complete. Elements in this list precede elements in `__list` that are equivalent according to `comp()`.

Definition at line 373 of file `forward_list.tcc`.

References `std::move()`.

#### 4.491.3.30 `operator=()` [1/3]

```
template<typename _Tp , typename _Alloc >
forward_list< _Tp, _Alloc > & forward_list::operator= (
 const forward_list< _Tp, _Alloc > & __list)
```

The `forward_list` assignment operator.

##### Parameters

|                     |                                                                       |
|---------------------|-----------------------------------------------------------------------|
| <code>__list</code> | A <code>forward_list</code> of identical element and allocator types. |
|---------------------|-----------------------------------------------------------------------|

All the elements of `__list` are copied.

Whether the allocator is copied depends on the allocator traits.

Definition at line 140 of file `forward_list.tcc`.

References `std::__addressof()`, `std::forward_list< _Tp, _Alloc >::cbegin()`, and `std::forward_list< _Tp, _Alloc >::cend()`.

## 4.491.3.31 operator=() [2/3]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
forward_list& std::forward_list< _Tp, _Alloc >::operator= (
 forward_list< _Tp, _Alloc > && __list) [inline], [noexcept]
```

The forward\_list move assignment operator.

## Parameters

|                     |                                                          |
|---------------------|----------------------------------------------------------|
| <code>__list</code> | A forward_list of identical element and allocator types. |
|---------------------|----------------------------------------------------------|

The contents of `__list` are moved into this forward\_list (without copying, if the allocators permit it).

Afterwards `__list` is a valid, but unspecified forward\_list

Whether the allocator is moved depends on the allocator traits.

Definition at line 618 of file forward\_list.h.

References std::move().

## 4.491.3.32 operator=() [3/3]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
forward_list& std::forward_list< _Tp, _Alloc >::operator= (
 std::initializer_list< _Tp > __il) [inline]
```

The forward\_list initializer list assignment operator.

## Parameters

|                   |                                    |
|-------------------|------------------------------------|
| <code>__il</code> | An initializer_list of value_type. |
|-------------------|------------------------------------|

Replace the contents of the forward\_list with copies of the elements in the initializer\_list `__il`. This is linear in `__il.size()`.

Definition at line 637 of file forward\_list.h.

References std::forward\_list< \_Tp, \_Alloc >::assign().

## 4.491.3.33 pop\_front()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::pop_front () [inline]
```

Removes first element.

This is a typical stack operation. It shrinks the `forward_list` by one. Due to the nature of a `forward_list` this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop_front()` is called.

Definition at line 877 of file `forward_list.h`.

#### 4.491.3.34 `push_front()` [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::push_front (
 const _Tp & __val) [inline]
```

Add data to the front of the `forward_list`.

##### Parameters

|                    |                   |
|--------------------|-------------------|
| <code>__val</code> | Data to be added. |
|--------------------|-------------------|

This is a typical stack operation. The function creates an element at the front of the `forward_list` and assigns the given data to it. Due to the nature of a `forward_list` this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 854 of file `forward_list.h`.

References `std::forward_list< _Tp, _Alloc >::cbefore_begin()`.

#### 4.491.3.35 `push_front()` [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::push_front (
 _Tp && __val) [inline]
```

Definition at line 861 of file `forward_list.h`.

References `std::forward_list< _Tp, _Alloc >::cbefore_begin()`, and `std::move()`.

#### 4.491.3.36 `remove()`

```
template<typename _Tp, typename _Alloc >
auto forward_list::remove (
 const _Tp & __val)
```

Remove all elements equal to value.

## Parameters

|                    |                      |
|--------------------|----------------------|
| <code>__val</code> | The value to remove. |
|--------------------|----------------------|

Removes every element in the list equal to `__val`. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 290 of file `forward_list.tcc`.

References `std::__addressof()`.

## 4.491.3.37 remove\_if()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename _Pred >
__remove_return_type std::forward_list< _Tp, _Alloc >::remove_if (
 _Pred __pred)
```

Remove all elements satisfying a predicate.

## Parameters

|                     |                                     |
|---------------------|-------------------------------------|
| <code>__pred</code> | Unary predicate function or object. |
|---------------------|-------------------------------------|

Removes every element in the list for which the predicate returns true. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

## 4.491.3.38 resize() [1/2]

```
template<typename _Tp , typename _Alloc >
void forward_list::resize (
 size_type __sz)
```

Resizes the `forward_list` to the specified number of elements.

## Parameters

|                   |                                                                  |
|-------------------|------------------------------------------------------------------|
| <code>__sz</code> | Number of elements the <code>forward_list</code> should contain. |
|-------------------|------------------------------------------------------------------|

This function will resize the `forward_list` to the specified number of elements. If the number is smaller than the `forward_list`'s current number of elements the `forward_list` is truncated, otherwise the `forward_list` is extended and the new elements are default constructed.

Definition at line 182 of file `forward_list.tcc`.

References `std::initializer_list<_E>::end()`.

#### 4.491.3.39 `resize()` [2/2]

```
template<typename _Tp, typename _Alloc >
void forward_list::resize (
 size_type __sz,
 const value_type & __val)
```

Resizes the `forward_list` to the specified number of elements.

##### Parameters

|                    |                                                                  |
|--------------------|------------------------------------------------------------------|
| <code>__sz</code>  | Number of elements the <code>forward_list</code> should contain. |
| <code>__val</code> | Data with which new elements should be populated.                |

This function will resize the `forward_list` to the specified number of elements. If the number is smaller than the `forward_list`'s current number of elements the `forward_list` is truncated, otherwise the `forward_list` is extended and new elements are populated with given data.

Definition at line 201 of file `forward_list.tcc`.

References `std::initializer_list<_E>::end()`.

#### 4.491.3.40 `reverse()`

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list<_Tp, _Alloc>::reverse () [inline], [noexcept]
```

Reverse the elements in list.

Reverse the order of elements in the list in linear time.

Definition at line 1295 of file `forward_list.h`.

#### 4.491.3.41 `sort()` [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list<_Tp, _Alloc>::sort () [inline]
```

Sort the elements of the list.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

Definition at line 1276 of file `forward_list.h`.

## 4.491.3.42 sort() [2/2]

```
template<typename _Tp , class _Alloc >
template<typename _Comp >
void forward_list::sort (
 _Comp __comp)
```

Sort the forward\_list using a comparison function.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

Definition at line 417 of file forward\_list.tcc.

## 4.491.3.43 splice\_after() [1/4]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::splice_after (
 const_iterator __pos,
 forward_list< _Tp, _Alloc > && __list) [inline], [noexcept]
```

Insert contents of another forward\_list.

## Parameters

|                     |                                                   |
|---------------------|---------------------------------------------------|
| <code>__pos</code>  | Iterator referencing the element to insert after. |
| <code>__list</code> | Source list.                                      |

The elements of *list* are inserted in constant time after the element referenced by *pos*. *list* becomes an empty list.

Requires this != x.

Definition at line 1103 of file forward\_list.h.

## 4.491.3.44 splice\_after() [2/4]

```
template<typename _Tp , typename _Alloc >
void forward_list::splice_after (
 const_iterator __pos,
 forward_list< _Tp, _Alloc > && __list,
 const_iterator __i) [noexcept]
```

Insert element from another forward\_list.

## Parameters

|                     |                                                              |
|---------------------|--------------------------------------------------------------|
| <code>__pos</code>  | Iterator referencing the element to insert after.            |
| <code>__list</code> | Source list.                                                 |
| <code>__i</code>    | Iterator referencing the element before the element to move. |

Removes the element in list *list* referenced by *i* and inserts it into the current list after *pos*.

Definition at line 239 of file forward\_list.tcc.

#### 4.491.3.45 splice\_after() [3/4]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::splice_after (
 const_iterator __pos,
 forward_list< _Tp, _Alloc > && ,
 const_iterator __before,
 const_iterator __last) [inline], [noexcept]
```

Insert range from another forward\_list.

##### Parameters

|                       |                                                         |
|-----------------------|---------------------------------------------------------|
| <code>__pos</code>    | Iterator referencing the element to insert after.       |
| <code>__list</code>   | Source list.                                            |
| <code>__before</code> | Iterator referencing before the start of range in list. |
| <code>__last</code>   | Iterator referencing the end of range in list.          |

Removes elements in the range (`__before`,`__last`) and inserts them after `__pos` in constant time.

Undefined if `__pos` is in (`__before`,`__last`).

Definition at line 1147 of file forward\_list.h.

#### 4.491.3.46 splice\_after() [4/4]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::splice_after (
 const_iterator __pos,
 forward_list< _Tp, _Alloc > & ,
 const_iterator __before,
 const_iterator __last) [inline], [noexcept]
```

Insert range from another forward\_list.

##### Parameters

|                       |                                                         |
|-----------------------|---------------------------------------------------------|
| <code>__pos</code>    | Iterator referencing the element to insert after.       |
| <code>__list</code>   | Source list.                                            |
| <code>__before</code> | Iterator referencing before the start of range in list. |
| <code>__last</code>   | Iterator referencing the end of range in list.          |

Removes elements in the range (`__before`,`__last`) and inserts them after `__pos` in constant time.

Undefined if `__pos` is in (`__before`,`__last`).

Definition at line 1152 of file `forward_list.h`.

#### 4.491.3.47 swap()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::swap (
 forward_list< _Tp, _Alloc > & __list) [inline], [noexcept]
```

Swaps data with another `forward_list`.

##### Parameters

|                     |                                                                      |
|---------------------|----------------------------------------------------------------------|
| <code>__list</code> | A <code>forward_list</code> of the same element and allocator types. |
|---------------------|----------------------------------------------------------------------|

This exchanges the elements between two lists in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(l1,l2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

Definition at line 1040 of file `forward_list.h`.

#### 4.491.3.48 unique() [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
__remove_return_type std::forward_list< _Tp, _Alloc >::unique () [inline]
```

Remove consecutive duplicate elements.

For each consecutive set of elements with the same value, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1211 of file `forward_list.h`.

#### 4.491.3.49 unique() [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename _BinPred >
__remove_return_type std::forward_list< _Tp, _Alloc >::unique (
 _BinPred __binary_pred)
```

Remove consecutive elements satisfying a predicate.

## Parameters

|                            |                                      |
|----------------------------|--------------------------------------|
| <code>__binary_pred</code> | Binary predicate function or object. |
|----------------------------|--------------------------------------|

For each consecutive set of elements `[first,last)` that satisfy `predicate(first,i)` where `i` is an iterator in `[first,last)`, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

The documentation for this class was generated from the following files:

- [forward\\_list.tcc](#)

#### 4.492 `std::fpos<_StateT>` Class Template Reference

## Public Member Functions

- [fpos](#) ([streamoff](#) \_\_off)
- **fpos** (const [fpos](#) &)=default
- [operator streamoff](#) () const
- [fpos](#) [operator+](#) ([streamoff](#) \_\_off) const
- [fpos](#) & [operator+=](#) ([streamoff](#) \_\_off)
- [fpos](#) [operator-](#) ([streamoff](#) \_\_off) const
- [streamoff](#) [operator-](#) (const [fpos](#) &\_\_other) const
- [fpos](#) & [operator-=](#) ([streamoff](#) \_\_off)
- [fpos](#) & **operator=** (const [fpos](#) &)=default
- void [state](#) (\_StateT \_\_st)
- \_StateT [state](#) () const

##### 4.492.1 Detailed Description

```
template<typename _StateT>
class std::fpos<_StateT>
```

Class representing stream positions.

The standard places no requirements upon the template parameter `StateT`. In this implementation `StateT` must be `DefaultConstructible`, `CopyConstructible` and `Assignable`. The standard only requires that `fpos` should contain a member of type `StateT`. In this implementation it also contains an offset stored as a signed integer.

## Parameters

|                     |                                                         |
|---------------------|---------------------------------------------------------|
| <code>StateT</code> | Type passed to and returned from <code>state()</code> . |
|---------------------|---------------------------------------------------------|

Definition at line 112 of file postypes.h.

#### 4.492.2 Constructor & Destructor Documentation

##### 4.492.2.1 fpos()

```
template<typename _StateT>
std::fpos< _StateT >::fpos (
 streamoff __off) [inline]
```

Construct position from offset.

Definition at line 133 of file postypes.h.

#### 4.492.3 Member Function Documentation

##### 4.492.3.1 operator streamoff()

```
template<typename _StateT>
std::fpos< _StateT >::operator streamoff () const [inline]
```

Convert to streamoff.

Definition at line 143 of file postypes.h.

##### 4.492.3.2 operator+()

```
template<typename _StateT>
fpos std::fpos< _StateT >::operator+ (
 streamoff __off) const [inline]
```

Add position and offset.

Definition at line 184 of file postypes.h.

#### 4.492.3.3 operator+=()

```
template<typename _StateT>
fpos& std::fpos< _StateT >::operator+= (
 streamoff __off) [inline]
```

Add offset to this position.

Definition at line 160 of file postypes.h.

#### 4.492.3.4 operator-() [1/2]

```
template<typename _StateT>
fpos std::fpos< _StateT >::operator- (
 streamoff __off) const [inline]
```

Subtract offset from position.

Definition at line 198 of file postypes.h.

#### 4.492.3.5 operator-() [2/2]

```
template<typename _StateT>
streamoff std::fpos< _StateT >::operator- (
 const fpos< _StateT > & __other) const [inline]
```

Subtract position to return offset.

Definition at line 211 of file postypes.h.

#### 4.492.3.6 operator-=()

```
template<typename _StateT>
fpos& std::fpos< _StateT >::operator-= (
 streamoff __off) [inline]
```

Subtract offset from this position.

Definition at line 171 of file postypes.h.

## 4.492.3.7 state() [1/2]

```
template<typename _StateT>
void std::fpos< _StateT >::state (
 _StateT __st) [inline]
```

Remember the value of *st*.

Definition at line 147 of file postypes.h.

## 4.492.3.8 state() [2/2]

```
template<typename _StateT>
_StateT std::fpos< _StateT >::state () const [inline]
```

Return the last set value of *st*.

Definition at line 152 of file postypes.h.

The documentation for this class was generated from the following file:

- [postypes.h](#)

## 4.493 \_\_gnu\_cxx::free\_list Class Reference

Inheritance diagram for \_\_gnu\_cxx::free\_list:

## Public Types

- typedef \_\_mutex **\_\_mutex\_type**
- typedef vector\_type::iterator **iterator**
- typedef std::size\_t \* **value\_type**
- typedef [\\_\\_detail::\\_\\_mini\\_vector](#)< value\_type > **vector\_type**

## Public Member Functions

- void [\\_M\\_clear](#) ()
- std::size\_t \* [\\_M\\_get](#) (std::size\_t \_\_sz)
- void [\\_M\\_insert](#) (std::size\_t \* \_\_addr) throw ()

### 4.493.1 Detailed Description

The free list class for managing chunks of memory to be given to and returned by the `bitmap_allocator`.

Definition at line 516 of file `bitmap_allocator.h`.

### 4.493.2 Member Function Documentation

#### 4.493.2.1 [\\_M\\_clear\(\)](#)

```
void __gnu_cxx::free_list::_M_clear ()
```

This function just clears the internal Free List, and gives back all the memory to the OS.

#### 4.493.2.2 [\\_M\\_get\(\)](#)

```
std::size_t* __gnu_cxx::free_list::_M_get (
 std::size_t __sz)
```

This function gets a block of memory of the specified size from the free list.

#### Parameters

|                   |                                           |
|-------------------|-------------------------------------------|
| <code>__sz</code> | The size in bytes of the memory required. |
|-------------------|-------------------------------------------|

#### Returns

A pointer to the new memory block of size at least equal to that requested.

#### 4.493.2.3 [\\_M\\_insert\(\)](#)

```
void __gnu_cxx::free_list::_M_insert (
 std::size_t * __addr) throw () [inline]
```

This function returns the block of memory to the internal free list.

## Parameters

|                     |                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------|
| <code>__addr</code> | The pointer to the memory block that was given by a call to the <code>_M_get</code> function. |
|---------------------|-----------------------------------------------------------------------------------------------|

Definition at line 626 of file `bitmap_allocator.h`.

The documentation for this class was generated from the following file:

- [bitmap\\_allocator.h](#)

## 4.494 std::from\_chars\_result Struct Reference

## Public Attributes

- `errc` **ec**
- `const char *` **ptr**

## 4.494.1 Detailed Description

Result type of `std::from_chars`.

Definition at line 67 of file `charconv`.

The documentation for this struct was generated from the following file:

- [charconv](#)

## 4.495 std::front\_insert\_iterator&lt;\_Container&gt; Class Template Reference

Inheritance diagram for `std::front_insert_iterator<_Container>`:

### Public Types

- typedef `_Container` `container_type`
- typedef void `difference_type`
- typedef `output_iterator_tag` `iterator_category`
- typedef void `pointer`
- typedef void `reference`
- typedef void `value_type`

### Public Member Functions

- constexpr `front_insert_iterator` (`_Container` &\_\_x)
- constexpr `front_insert_iterator` & `operator*` ()
- constexpr `front_insert_iterator` & `operator++` ()
- constexpr `front_insert_iterator` `operator++` (int)
- constexpr `front_insert_iterator` & `operator=` (const typename `_Container::value_type` &\_\_value)
- constexpr `front_insert_iterator` & **`operator=`** (typename `_Container::value_type` &&\_\_value)

### Protected Attributes

- `_Container` \* **`container`**

#### 4.495.1 Detailed Description

```
template<typename _Container>
class std::front_insert_iterator< _Container >
```

Turns assignment into insertion.

These are output iterators, constructed from a container-of-T. Assigning a T to the iterator prepends it to the container using `push_front`.

Tip: Using the `front_inserter` function to create these iterators can save typing.

Definition at line 699 of file `bits/stl_iterator.h`.

#### 4.495.2 Member Typedef Documentation

##### 4.495.2.1 `container_type`

```
template<typename _Container >
typedef _Container std::front_insert_iterator< _Container >::container_type
```

A nested typedef for the type of whatever container you used.

Definition at line 707 of file `bits/stl_iterator.h`.

#### 4.495.2.2 difference\_type

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::difference_type
[inherited]
```

Distance between iterators is represented as this type.

Definition at line 134 of file stl\_iterator\_base\_types.h.

#### 4.495.2.3 iterator\_category

```
typedef output_iterator_tag std::iterator< output_iterator_tag , void , void , void , void >↵
::iterator_category [inherited]
```

One of the [tag types](#).

Definition at line 130 of file stl\_iterator\_base\_types.h.

#### 4.495.2.4 pointer

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::pointer [inherited]
```

This type represents a pointer-to-value\_type.

Definition at line 136 of file stl\_iterator\_base\_types.h.

#### 4.495.2.5 reference

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::reference [inherited]
```

This type represents a reference-to-value\_type.

Definition at line 138 of file stl\_iterator\_base\_types.h.

#### 4.495.2.6 value\_type

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::value_type [inherited]
```

The type "pointed to" by the iterator.

Definition at line 132 of file stl\_iterator\_base\_types.h.

#### 4.495.3 Constructor & Destructor Documentation

##### 4.495.3.1 front\_insert\_iterator()

```
template<typename _Container >
constexpr std::front_insert_iterator< _Container >::front_insert_iterator (
 _Container & __x) [inline], [explicit]
```

The only way to create this iterator is with a container.

Definition at line 716 of file bits/stl\_iterator.h.

#### 4.495.4 Member Function Documentation

##### 4.495.4.1 operator\*()

```
template<typename _Container >
constexpr front_insert_iterator& std::front_insert_iterator< _Container >::operator* () [inline]
```

Simply returns \*this.

Definition at line 758 of file bits/stl\_iterator.h.

##### 4.495.4.2 operator++() [1/2]

```
template<typename _Container >
constexpr front_insert_iterator& std::front_insert_iterator< _Container >::operator++ () [inline]
```

Simply returns \*this. (This iterator does not *move*.)

Definition at line 764 of file bits/stl\_iterator.h.

##### 4.495.4.3 operator++() [2/2]

```
template<typename _Container >
constexpr front_insert_iterator std::front_insert_iterator< _Container >::operator++ (
 int) [inline]
```

Simply returns \*this. (This iterator does not *move*.)

Definition at line 770 of file bits/stl\_iterator.h.

##### 4.495.4.4 operator=()

```
template<typename _Container >
constexpr front_insert_iterator& std::front_insert_iterator< _Container >::operator= (
 const typename _Container::value_type & __value) [inline]
```

## Parameters

|                      |                                                                                                                                                       |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__value</code> | An instance of whatever type <code>container_type::const_reference</code> is; presumably a reference-to-const T for <code>container&lt;T&gt;</code> . |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|

## Returns

This iterator, for chained operations.

This kind of iterator doesn't really have a *position* in the container (you can think of the position as being permanently at the front, if you like). Assigning a value to the iterator will always prepend the value to the front of the container.

Definition at line 740 of file `bits/stl_iterator.h`.

The documentation for this class was generated from the following file:

- [bits/stl\\_iterator.h](#)

4.496 `std::function<_Res(_ArgTypes...)>` Class Template Reference

#### 4.496.1 Detailed Description

```
template<typename _Res, typename... _ArgTypes>
class std::function< _Res(_ArgTypes...)>
```

Primary class template for std::function.

Polymorphic function wrapper.

Definition at line 303 of file std\_function.h.

#### 4.496.2 Constructor & Destructor Documentation

##### 4.496.2.1 function() [1/5]

```
template<typename _Res , typename... _ArgTypes>
std::function< _Res(_ArgTypes...)>::function () [inline], [noexcept]
```

Default construct creates an empty function call wrapper.

##### Postcondition

!(bool)\*this

Definition at line 330 of file std\_function.h.

##### 4.496.2.2 function() [2/5]

```
template<typename _Res , typename... _ArgTypes>
std::function< _Res(_ArgTypes...)>::function (
 nullptr_t) [inline], [noexcept]
```

Creates an empty function call wrapper.

##### Postcondition

!(bool)\*this

Definition at line 337 of file std\_function.h.

##### 4.496.2.3 function() [3/5]

```
template<typename _Res , typename... _ArgTypes>
std::function< _Res(_ArgTypes...)>::function (
 const function< _Res(_ArgTypes...)> & __x)
```

Function copy constructor.

**Parameters**

|                   |                                                  |
|-------------------|--------------------------------------------------|
| $\leftrightarrow$ | A function object with identical call signature. |
| <code>__x</code>  |                                                  |

**Postcondition**

```
bool(*this) == bool(__x)
```

The newly-created function contains a copy of the target of `__x` (if it has one).

Definition at line 588 of file `std_function.h`.

**4.496.2.4 function()** [ 4/5]

```
template<typename _Res , typename... _ArgTypes>
std::function< _Res(_ArgTypes...)>::function (
 function< _Res(_ArgTypes...)> && __x) [inline], [noexcept]
```

Function move constructor.

**Parameters**

|                   |                                                         |
|-------------------|---------------------------------------------------------|
| $\leftrightarrow$ | A function object rvalue with identical call signature. |
| <code>__x</code>  |                                                         |

The newly-created function contains the target of `__x` (if it has one).

Definition at line 357 of file `std_function.h`.

**4.496.2.5 function()** [ 5/5]

```
template<typename _Res , typename... _ArgTypes>
template<typename _Functor , typename , typename >
std::function< _Res(_ArgTypes...)>::function (
 _Functor __f)
```

Builds a function that targets a copy of the incoming function object.

**Parameters**

|              |                                                                                                                    |
|--------------|--------------------------------------------------------------------------------------------------------------------|
| $\leftarrow$ | A function object that is callable with parameters of type T1, T2, ..., TN and returns a value convertible to Res. |
| $\_f$        |                                                                                                                    |
| $\leftarrow$ |                                                                                                                    |
| $\_f$        |                                                                                                                    |

The newly-created function object will target a copy of  $\_f$ . If  $\_f$  is `reference_wrapper<F>`, then this function object will contain a reference to the function object `__f.get()`. If  $\_f$  is a NULL function pointer or NULL pointer-to-member, the newly-created object will be empty.

If  $\_f$  is a non-NULL function pointer or an object of type `reference_wrapper<F>`, this function will not throw.

Definition at line 602 of file `std_function.h`.

References `std::move()`.

**4.496.3 Member Function Documentation****4.496.3.1 operator bool()**

```
template<typename _Res , typename... _ArgTypes>
std::function< _Res(_ArgTypes...)>::operator bool () const [inline], [explicit], [noexcept]
```

Determine if the function wrapper has a target.

**Returns**

`true` when this function object contains a target, or `false` when it is empty.

This function will not throw an exception.

Definition at line 498 of file `std_function.h`.

**4.496.3.2 operator()()**

```
template<typename _Res , typename... _ArgTypes>
_Res std::function< _Res(_ArgTypes...)>::operator() (
 _ArgTypes... __args) const
```

Invokes the function targeted by `*this`.

**Returns**

the result of the target.

**Exceptions**

|                          |                                |
|--------------------------|--------------------------------|
| <i>bad_function_call</i> | when <code>!(bool)*this</code> |
|--------------------------|--------------------------------|

The function call operator invokes the target function object stored by `this`.

Definition at line 618 of file `std_function.h`.

**4.496.3.3 operator=()** [1/5]

```
template<typename _Res , typename... _ArgTypes>
function& std::function< _Res(_ArgTypes...)>::operator= (
 const function< _Res(_ArgTypes...)> & __x) [inline]
```

Function assignment operator.

**Parameters**

|                  |                                           |
|------------------|-------------------------------------------|
| <code>__x</code> | A function with identical call signature. |
|------------------|-------------------------------------------|

**Postcondition**

`(bool)*this == (bool)x`

**Returns**

`*this`

The target of `__x` is copied to `*this`. If `__x` has no target, then `*this` will be empty.

If `__x` targets a function pointer or a reference to a function object, then this operation will not throw an exception.

Definition at line 396 of file `std_function.h`.

**4.496.3.4 operator=()** [2/5]

```
template<typename _Res , typename... _ArgTypes>
function& std::function< _Res(_ArgTypes...)>::operator= (
 function< _Res(_ArgTypes...)> && __x) [inline], [noexcept]
```

Function move-assignment operator.

## Parameters

|                  |                                                  |
|------------------|--------------------------------------------------|
| <code>__x</code> | A function rvalue with identical call signature. |
|------------------|--------------------------------------------------|

## Returns

`*this`

The target of `__x` is moved to `*this`. If `__x` has no target, then `*this` will be empty.

If `__x` targets a function pointer or a reference to a function object, then this operation will not throw an exception.

Definition at line 414 of file `std_function.h`.

References `std::move()`.

## 4.496.3.5 operator=() [3/5]

```
template<typename _Res , typename... _ArgTypes>
function& std::function<_Res(_ArgTypes...)>::operator= (
 nullptr_t) [inline], [noexcept]
```

Function assignment to zero.

## Postcondition

`!(bool)*this`

## Returns

`*this`

The target of `*this` is deallocated, leaving it empty.

Definition at line 428 of file `std_function.h`.

## 4.496.3.6 operator=() [4/5]

```
template<typename _Res , typename... _ArgTypes>
template<typename _Functor >
_requires<_Callable<typename decay<_Functor>::type>, function&> std::function<_Res(_ArgTypes...)>::operator= (
 _Functor && __f) [inline]
```

Function assignment to a new target.

**Parameters**

|                 |                                                                                                                    |
|-----------------|--------------------------------------------------------------------------------------------------------------------|
| $\leftarrow$    | A function object that is callable with parameters of type T1, T2, ..., TN and returns a value convertible to Res. |
| $\_ \leftarrow$ |                                                                                                                    |
| $\leftarrow$    |                                                                                                                    |
| $\_ \leftarrow$ |                                                                                                                    |
| $f$             |                                                                                                                    |

**Returns**

`*this`

This function object wrapper will target a copy of `__f`. If `__f` is `reference_wrapper<F>`, then this function object will contain a reference to the function object `__f.get()`. If `__f` is a NULL function pointer or NULL pointer-to-member, `this` object will be empty.

If `__f` is a non-NULL function pointer or an object of type `reference_wrapper<F>`, this function will not throw.

Definition at line 457 of file `std_function.h`.

**4.496.3.7 operator=()** [5/5]

```
template<typename _Res , typename... _ArgTypes>
template<typename _Functor >
function& std::function< _Res(_ArgTypes...)>::operator= (
 reference_wrapper< _Functor > __f) [inline], [noexcept]
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

Definition at line 466 of file `std_function.h`.

**4.496.3.8 swap()**

```
template<typename _Res , typename... _ArgTypes>
void std::function< _Res(_ArgTypes...)>::swap (
 function< _Res(_ArgTypes...)> & __x) [inline], [noexcept]
```

Swap the targets of two function objects.

**Parameters**

|                 |                                           |
|-----------------|-------------------------------------------|
| $\_ \leftarrow$ | A function with identical call signature. |
| $\_x$           |                                           |

Swap the targets of `this` function object and `__f`. This function will not throw an exception.

Definition at line 481 of file `std_function.h`.

#### 4.496.3.9 target() [1/2]

```
template<typename _Res , typename... _ArgTypes>
template<typename _Functor >
_Functor * std::function< _Res(_ArgTypes...)>::target () [noexcept]
```

Access the stored target function object.

##### Returns

Returns a pointer to the stored target function object, if `typeid(_Functor).equals(target_type())`; otherwise, a NULL pointer.

This function does not throw exceptions.

Definition at line 645 of file `std_function.h`.

#### 4.496.3.10 target() [2/2]

```
template<typename _Res , typename... _ArgTypes>
template<typename _Functor >
const _Functor * std::function< _Res(_ArgTypes...)>::target () const [noexcept]
```

Access the stored target function object.

##### Returns

Returns a pointer to the stored target function object, if `typeid(_Functor).equals(target_type())`; otherwise, a NULL pointer.

This function does not throw exceptions.

Definition at line 656 of file `std_function.h`.

#### 4.496.3.11 `target_type()`

```
template<typename _Res , typename... _ArgTypes>
const type_info & std::function< _Res(_ArgTypes...)>::target_type () const [noexcept]
```

Determine the type of the target of this function object wrapper.

##### Returns

the type identifier of the target function object, or `typeid(void)` if `!(bool)*this`.

This function will not throw an exception.

Definition at line 629 of file `std_function.h`.

## 4.501.1 Detailed Description

```
template<typename _RealType = double>
class std::gamma_distribution< _RealType >
```

A gamma continuous distribution for random numbers.

The formula for the gamma probability density function is:

$$p(x|\alpha, \beta) = \frac{1}{\beta\Gamma(\alpha)} (x/\beta)^{\alpha-1} e^{-x/\beta}$$

Definition at line 2402 of file random.h.

## 4.501.2 Member Typedef Documentation

## 4.501.2.1 result\_type

```
template<typename _RealType = double>
typedef _RealType std::gamma_distribution< _RealType >::result_type
```

The type of the range of the distribution.

Definition at line 2405 of file random.h.

## 4.501.3 Constructor &amp; Destructor Documentation

## 4.501.3.1 gamma\_distribution() [1/2]

```
template<typename _RealType = double>
std::gamma_distribution< _RealType >::gamma_distribution () [inline]
```

Constructs a gamma distribution with parameters 1 and 1.

Definition at line 2458 of file random.h.

#### 4.501.3.2 `gamma_distribution()` [2/2]

```
template<typename _RealType = double>
std::gamma_distribution< _RealType >::gamma_distribution (
 _RealType __alpha_val,
 _RealType __beta_val = _RealType(1)) [inline], [explicit]
```

Constructs a gamma distribution with parameters  $\alpha$  and  $\beta$ .

Definition at line 2465 of file random.h.

#### 4.501.4 Member Function Documentation

##### 4.501.4.1 `alpha()`

```
template<typename _RealType = double>
_RealType std::gamma_distribution< _RealType >::alpha () const [inline]
```

Returns the  $\alpha$  of the distribution.

Definition at line 2486 of file random.h.

##### 4.501.4.2 `beta()`

```
template<typename _RealType = double>
_RealType std::gamma_distribution< _RealType >::beta () const [inline]
```

Returns the  $\beta$  of the distribution.

Definition at line 2493 of file random.h.

##### 4.501.4.3 `max()`

```
template<typename _RealType = double>
result_type std::gamma_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

Definition at line 2522 of file random.h.

## 4.501.4.4 min()

```
template<typename _RealType = double>
result_type std::gamma_distribution<_RealType>::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

Definition at line 2515 of file random.h.

## 4.501.4.5 operator() [1/2]

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::gamma_distribution<_RealType>::operator() (
 _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Definition at line 2530 of file random.h.

Referenced by std::gamma\_distribution<result\_type>::operator()().

## 4.501.4.6 operator() [2/2]

```
template<typename _RealType >
template<typename _UniformRandomNumberGenerator >
gamma_distribution<_RealType>::result_type std::gamma_distribution<_RealType>::operator() (
 _UniformRandomNumberGenerator & __urng,
 const param_type & __param)
```

Marsaglia, G. and Tsang, W. W. "A Simple Method for Generating Gamma Variables" ACM Transactions on Mathematical Software, 26, 3, 363-372, 2000.

Definition at line 2321 of file bits/random.tcc.

## 4.501.4.7 param() [1/2]

```
template<typename _RealType = double>
param_type std::gamma_distribution<_RealType>::param () const [inline]
```

Returns the parameter set of the distribution.

Definition at line 2500 of file random.h.

Referenced by std::chi\_squared\_distribution<\_RealType>::param().

## 4.501.4.8 param() [2/2]

```
template<typename _RealType = double>
void std::gamma_distribution<_RealType>::param (
 const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

#### Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

Definition at line 2508 of file random.h.

#### 4.501.4.9 `reset()`

```
template<typename _RealType = double>
void std::gamma_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

Definition at line 2479 of file random.h.

Referenced by `std::chi_squared_distribution< _RealType >::reset()`, `std::fisher_f_distribution< _RealType >::reset()`, `std::student_t_distribution< _RealType >::reset()`, and `std::negative_binomial_distribution< _IntType >::reset()`.

#### 4.501.5 Friends And Related Function Documentation

##### 4.501.5.1 `operator<<`

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
 std::basic_ostream< _CharT, _Traits > & __os,
 const std::gamma_distribution< _RealType1 > & __x) [friend]
```

Inserts a `gamma_distribution` random number distribution `__x` into the output stream `__os`.

#### Parameters

|                   |                                                               |
|-------------------|---------------------------------------------------------------|
| <code>__os</code> | An output stream.                                             |
| <code>__x</code>  | A <code>gamma_distribution</code> random number distribution. |

#### Returns

The output stream with the state of `__x` inserted or in an error state.

## 4.501.5.2 operator==

```
template<typename _RealType = double>
bool operator== (
 const gamma_distribution< _RealType > & __d1,
 const gamma_distribution< _RealType > & __d2) [friend]
```

Return true if two gamma distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 2566 of file random.h.

## 4.501.5.3 operator&gt;&gt;

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
 std::basic_istream< _CharT, _Traits > & __is,
 std::gamma_distribution< _RealType1 > & __x) [friend]
```

Extracts a [gamma\\_distribution](#) random number distribution \_\_x from the input stream \_\_is.

## Parameters

|                      |                                                                      |
|----------------------|----------------------------------------------------------------------|
| <a href="#">__is</a> | An input stream.                                                     |
| <a href="#">__x</a>  | A <a href="#">gamma_distribution</a> random number generator engine. |

## Returns

The input stream with \_\_x extracted or in an error state.

### 4.502.1 Detailed Description

```
template<typename _IntType = int>
class std::geometric_distribution< _IntType >
```

A discrete geometric random number distribution.

The formula for the geometric probability density function is  $p(i|p) = p(1 - p)^i$  where  $p$  is the parameter of the distribution.

Definition at line 3978 of file random.h.

### 4.502.2 Member Typedef Documentation

#### 4.502.2.1 result\_type

```
template<typename _IntType = int>
typedef _IntType std::geometric_distribution< _IntType >::result_type
```

The type of the range of the distribution.

Definition at line 3981 of file random.h.

#### 4.502.3 Member Function Documentation

##### 4.502.3.1 max()

```
template<typename _IntType = int>
result_type std::geometric_distribution< _IntType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

Definition at line 4080 of file random.h.

References std::numeric\_limits< \_Tp >::max().

##### 4.502.3.2 min()

```
template<typename _IntType = int>
result_type std::geometric_distribution< _IntType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

Definition at line 4073 of file random.h.

##### 4.502.3.3 operator()()

```
template<typename _IntType = int>
template<typename _UniformRandomNumberGenerator >
result_type std::geometric_distribution< _IntType >::operator() (
 _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Definition at line 4088 of file random.h.

#### 4.502.3.4 p()

```
template<typename _IntType = int>
double std::geometric_distribution< _IntType >::p () const [inline]
```

Returns the distribution parameter p.

Definition at line 4051 of file random.h.

#### 4.502.3.5 param() [1/2]

```
template<typename _IntType = int>
param_type std::geometric_distribution< _IntType >::param () const [inline]
```

Returns the parameter set of the distribution.

Definition at line 4058 of file random.h.

Referenced by std::operator>>().

#### 4.502.3.6 param() [2/2]

```
template<typename _IntType = int>
void std::geometric_distribution< _IntType >::param (
 const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

##### Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

Definition at line 4066 of file random.h.

#### 4.502.3.7 reset()

```
template<typename _IntType = int>
void std::geometric_distribution< _IntType >::reset () [inline]
```

Resets the distribution state.

Does nothing for the geometric distribution.

Definition at line 4045 of file random.h.

#### 4.502.4 Friends And Related Function Documentation

##### 4.502.4.1 `operator==`

```
template<typename _IntType = int>
bool operator== (
 const geometric_distribution< _IntType > & __d1,
 const geometric_distribution< _IntType > & __d2) [friend]
```

Return true if two geometric distributions have the same parameters.

Definition at line 4123 of file random.h.

## 4.503.1 Detailed Description

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<Key>::type, typename Eq_Fn
= typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn = detail::default_comb_hash_fn::type, typename Probe_Fn
= typename detail::default_probe_fn<Comb_Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
class __gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy, Store_Hash, _Alloc >
```

A general-probing hash-based associative container.

## Template Parameters

|                      |                                                                                                                                                                                                  |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Key</i>           | Key type.                                                                                                                                                                                        |
| <i>Mapped</i>        | Map type.                                                                                                                                                                                        |
| <i>Hash_Fn</i>       | Hashing functor.                                                                                                                                                                                 |
| <i>Eq_Fn</i>         | Equal functor.                                                                                                                                                                                   |
| <i>Comb_Probe_Fn</i> | Combining probe functor. If Hash_Fn is not null_type, then this is the ranged-probe functor; otherwise, this is the range-hashing functor. XXX See Design::Hash-Based Containers::Hash Policies. |
| <i>Probe_Fn</i>      | Probe functor.                                                                                                                                                                                   |
| <i>Resize_Policy</i> | Resizes hash.                                                                                                                                                                                    |
| <i>Store_Hash</i>    | Indicates whether the hash value will be stored along with each key. If Hash_Fn is null_type, then the container will not compile if this value is true                                          |
| <i>_Alloc</i>        | Allocator type.                                                                                                                                                                                  |

Base tag choices are: `gp_hash_tag`.

Base is `basic_hash_table`.

Definition at line 368 of file `assoc_container.hpp`.

#### 4.503.2 Constructor & Destructor Documentation

##### 4.503.2.1 `gp_hash_table()` [1/12]

```
template<typename Key , typename Mapped , typename Hash_Fn = typename detail::default_hash_fn<↵
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =

Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>↵
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table () [inline]
```

Default constructor.

Definition at line 382 of file `assoc_container.hpp`.

##### 4.503.2.2 `gp_hash_table()` [2/12]

```
template<typename Key , typename Mapped , typename Hash_Fn = typename detail::default_hash_fn<↵
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_↵
Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>↵
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
 const hash_fn & h) [inline]
```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `hash_fn` object of the container object.

Definition at line 386 of file `assoc_container.hpp`.

4.503.2.3 `gp_hash_table()` [3/12]

```
template<typename Key , typename Mapped , typename Hash_Fn = typename detail::default_hash_fn<↵
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_↵
Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>↵
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
 const hash_fn & h,
 const eq_fn & e) [inline]
```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `hash_fn` object of the container object, and `r_eq_fn` will be copied by the `eq_fn` object of the container object.

Definition at line 393 of file `assoc_container.hpp`.

4.503.2.4 `gp_hash_table()` [4/12]

```
template<typename Key , typename Mapped , typename Hash_Fn = typename detail::default_hash_fn<↵
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_↵
Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>↵
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
 const hash_fn & h,
 const eq_fn & e,
 const comb_probe_fn & cp) [inline]
```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `hash_fn` object of the container object, `r_eq_fn` will be copied by the `eq_fn` object of the container object, and `r_comb_probe_fn` will be copied by the `comb_probe_fn` object of the container object.

Definition at line 401 of file `assoc_container.hpp`.

4.503.2.5 `gp_hash_table()` [5/12]

```
template<typename Key , typename Mapped , typename Hash_Fn = typename detail::default_hash_fn<↵
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =

#### 4.505.1 Detailed Description

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool Store_Hash, typename
Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
class __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Probe_Fn, Probe_Fn, Resize_Policy
>
```

A general-probing hash-based container.

##### Template Parameters

|                      |                                                                                                                                                                                                                                                          |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Key</i>           | Key type.                                                                                                                                                                                                                                                |
| <i>Mapped</i>        | Map type.                                                                                                                                                                                                                                                |
| <i>Hash_Fn</i>       | Hashing functor. Default is <code>__gnu_cxx::hash</code> .                                                                                                                                                                                               |
| <i>Eq_Fn</i>         | Equal functor. Default <code>std::equal_to&lt;Key&gt;</code>                                                                                                                                                                                             |
| <i>_Alloc</i>        | Allocator type.                                                                                                                                                                                                                                          |
| <i>Store_Hash</i>    | If key type stores extra metadata. Defaults to false.                                                                                                                                                                                                    |
| <i>Comb_Probe_Fn</i> | Combining probe functor. If <i>Hash_Fn</i> is not null_type, then this is the ranged-probe functor; otherwise, this is the range-hashing functor. XXX See Design::Hash-Based Containers::Hash Policies. Default <code>direct_mask_range_hashing</code> . |
| <i>Probe_Fn</i>      | Probe functor. Defaults to <code>linear_probe_fn</code> , also <code>quadratic_probe_fn</code> .                                                                                                                                                         |
| <i>Resize_Policy</i> | Resizes hash. Defaults to <code>hash_standard_resize_policy</code> , using <code>hash_exponential_size_policy</code> and <code>hash_load_check_resize_trigger</code> .                                                                                   |

Bases are: `detail::hash_eq_fn`, `Resize_Policy`, `detail::ranged_probe_fn`, `detail::types_traits`. (Optional: `detail::debug_↵map_base`.)

#### 4.505.2 Member Enumeration Documentation

##### 4.505.2.1 anonymous enum

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
anonymous enum
```

Value stores hash, true or false.

Definition at line 209 of file `gp_ht_map.hpp`.

#### 4.505.3 Member Function Documentation

#### 4.505.3.1 empty()

```
template<typename Key , typename Mapped , typename Hash_Fn , typename Eq_Fn , typename _Alloc ,
bool Store_Hash, typename Comb_Probe_Fn , typename Probe_Fn , typename Resize_Policy >
bool __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Probe_Fn, Probe_Fn, Resize_Policy >::empty () const [inline]
```

True if size() == 0.

Definition at line 61 of file gp\_ht\_map.hpp.

#### 4.505.3.2 get\_comb\_probe\_fn() [1/2]

```
template<typename Key , typename Mapped , typename Hash_Fn , typename Eq_Fn , typename _Alloc ,
bool Store_Hash, typename Comb_Probe_Fn , typename Probe_Fn , typename Resize_Policy >
Comb_Probe_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash,
Comb_Probe_Fn, Probe_Fn, Resize_Policy >::get_comb_probe_fn ()
```

Return current comb\_probe\_fn.

Definition at line 84 of file gp\_ht\_map.hpp.

#### 4.505.3.3 get\_comb\_probe\_fn() [2/2]

```
template<typename Key , typename Mapped , typename Hash_Fn , typename Eq_Fn , typename _Alloc ,
bool Store_Hash, typename Comb_Probe_Fn , typename Probe_Fn , typename Resize_Policy >
const Comb_Probe_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Probe_Fn, Probe_Fn, Resize_Policy >::get_comb_probe_fn () const
```

Return current const comb\_probe\_fn.

Definition at line 90 of file gp\_ht\_map.hpp.

#### 4.505.3.4 get\_eq\_fn() [1/2]

```
template<typename Key , typename Mapped , typename Hash_Fn , typename Eq_Fn , typename _Alloc ,
bool Store_Hash, typename Comb_Probe_Fn , typename Probe_Fn , typename Resize_Policy >
Eq_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Probe_Fn, Probe_Fn, Resize_Policy >::get_eq_fn ()
```

Return current eq\_fn.

Definition at line 60 of file gp\_ht\_map.hpp.

#### 4.505.3.5 `get_eq_fn()` [2/2]

```

##### Friends

- `template<typename _Tp >`  
class **[valarray](#)**

#### 4.512.1 Detailed Description

Class defining multi-dimensional subset of an array.

The slice class represents a multi-dimensional subset of an array, specified by three parameter sets: start offset, size array, and stride array. The start offset is the index of the first element of the array that is part of the subset. The size and stride array describe each dimension of the slice. Size is the number of elements in that dimension, and stride is the distance in the array between successive elements in that dimension. Each dimension's size and stride is taken to begin at an array element described by the previous dimension. The size array and stride array must be the same size.

For example, if you have `offset==3`, `stride[0]==11`, `size[1]==3`, `stride[1]==3`, then `slice[0,0]==array[3]`, `slice[0,1]==array[6]`, `slice[0,2]==array[9]`, `slice[1,0]==array[14]`, `slice[1,1]==array[17]`, `slice[1,2]==array[20]`.

## Friends

- class `valarray< _Tp >`

#### 4.513.1 Detailed Description

```
template<typename _Tp>
class std::gslice_array< _Tp >
```

Reference to multi-dimensional subset of an array.

A `gslice_array` is a reference to the actual elements of an array specified by a `gslice`. The way to get a `gslice_array` is to call `operator[]`(`gslice`) on a `valarray`. The returned `gslice_array` then permits carrying operations out on the referenced subset of elements in the original `valarray`. For example, `operator+=(valarray)` will add values to the subset of elements in the underlying `valarray` this `gslice_array` refers to.

##### Parameters

|           |               |
|-----------|---------------|
| <i>Tp</i> | Element type. |
|-----------|---------------|

Specialization for `double`.

Definition at line 243 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

### 4.531 `std::hash< error_code >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

#### Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

#### Public Member Functions

- `size_t operator()` (`const error\_code &__e`) `const noexcept`

## 4.531.1 Detailed Description

```
template<>
struct std::hash< error_code >
```

`std::hash` specialization for `error_code`.

Definition at line 479 of file `system_error`.

The documentation for this struct was generated from the following file:

- [system\\_error](#)

4.532 `std::hash< experimental::optional< _Tp > >` Struct Template Reference

## Public Types

- using **argument\_type** = `experimental::optional< _Tp >`
- using **result\_type** = `size_t`

## Public Member Functions

- `size_t` **operator()** (const `experimental::optional< _Tp > &__t`) const noexcept(noexcept([hash< \\_Tp > {}](#)(\*\_\_t)))

## 4.532.1 Detailed Description

```
template<typename _Tp>
struct std::hash< experimental::optional< _Tp > >
```

`std::hash` partial specialization for `experimental::optional`

Definition at line 922 of file `experimental/optional`.

The documentation for this struct was generated from the following file:

- [experimental/optional](#)

4.533 `std::hash< experimental::shared_ptr< _Tp > >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

## Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

### Public Member Functions

- `size_t operator()` (const experimental::shared\_ptr< \_Tp > &\_\_s) const noexcept

#### 4.533.1 Detailed Description

```
template<typename _Tp>
struct std::hash< experimental::shared_ptr< _Tp > >
```

std::hash specialization for shared\_ptr.

Definition at line 671 of file experimental/bits/shared\_ptr.h.

The documentation for this struct was generated from the following file:

- [experimental/bits/shared\\_ptr.h](#)

#### 4.534 std::hash< float > Struct Template Reference

Inherits std::\_\_hash\_base< \_Result, \_Arg >.

### Public Types

- typedef \_Arg **argument\_type**
- typedef \_Result **result\_type**

### Public Member Functions

- `size_t operator()` (float \_\_val) const noexcept

#### 4.534.1 Detailed Description

```
template<>
struct std::hash< float >
```

Specialization for float.

Definition at line 231 of file functional\_hash.h.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

## 4.535 `std::hash< int >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

### Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

### Public Member Functions

- `size_t operator() (int __val) const` noexcept

#### 4.535.1 Detailed Description

```
template<>
struct std::hash< int >
```

Explicit specialization for `int`.

Definition at line 153 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

## 4.536 `std::hash< long >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

### Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

### Public Member Functions

- `size_t operator() (long __val) const` noexcept

#### 4.536.1 Detailed Description

```
template<>
struct std::hash< long >
```

Explicit specialization for long.

Definition at line 156 of file functional\_hash.h.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

#### 4.537 std::hash< long double > Struct Template Reference

Inherits std::\_\_hash\_base< \_Result, \_Arg >.

##### Public Types

- typedef \_Arg **argument\_type**
- typedef \_Result **result\_type**

##### Public Member Functions

- size\_t **operator() (long double \_\_val)** const noexcept

#### 4.537.1 Detailed Description

```
template<>
struct std::hash< long double >
```

Specialization for long double.

Definition at line 255 of file functional\_hash.h.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

#### 4.538 std::hash< long long > Struct Template Reference

Inherits std::\_\_hash\_base< \_Result, \_Arg >.

#### Public Types

- typedef \_Arg **argument\_type**
- typedef \_Result **result\_type**

#### Public Member Functions

- size\_t **operator()** (long long \_\_val) const noexcept

##### 4.538.1 Detailed Description

```
template<>
struct std::hash< long long >
```

Explicit specialization for long long.

Definition at line 159 of file functional\_hash.h.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

## 4.539 std::hash< shared\_ptr< \_Tp > > Struct Template Reference

Inherits std::\_\_hash\_base< \_Result, \_Arg >.

#### Public Types

- typedef \_Arg **argument\_type**
- typedef \_Result **result\_type**

#### Public Member Functions

- size\_t **operator()** (const [shared\\_ptr](#)< \_Tp > &\_\_s) const noexcept

##### 4.539.1 Detailed Description

```
template<typename _Tp>
struct std::hash< shared_ptr< _Tp > >
```

std::hash specialization for shared\_ptr.

Definition at line 881 of file bits/shared\_ptr.h.

The documentation for this struct was generated from the following file:

- [bits/shared\\_ptr.h](#)

#### 4.540 `std::hash< short >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

##### Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

##### Public Member Functions

- `size_t operator() (short __val) const` noexcept

##### 4.540.1 Detailed Description

```
template<>
struct std::hash< short >
```

Explicit specialization for short.

Definition at line 150 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

#### 4.541 `std::hash< signed char >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

##### Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

##### Public Member Functions

- `size_t operator() (signed char __val) const` noexcept

## 4.541.1 Detailed Description

```
template<>
struct std::hash< signed char >
```

Explicit specialization for signed char.

Definition at line 130 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

4.542 `std::hash< string >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

## Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

## Public Member Functions

- `size_t operator()` (const [string](#) &\_\_s) const noexcept

## 4.542.1 Detailed Description

```
template<>
struct std::hash< string >
```

`std::hash` specialization for string.

Definition at line 6808 of file `basic_string.h`.

The documentation for this struct was generated from the following file:

- [basic\\_string.h](#)

4.543 `std::hash< thread::id >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

#### Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

#### Public Member Functions

- `size_t operator()` (const [thread::id](#) &\_\_id) const noexcept

##### 4.543.1 Detailed Description

```
template<>
struct std::hash< thread::id >
```

std::hash specialization for thread::id.

Definition at line 338 of file thread.

The documentation for this struct was generated from the following file:

- [thread](#)

#### 4.544 std::hash< type\_index > Struct Template Reference

##### Public Types

- typedef [type\\_index](#) **argument\_type**
- typedef `size_t` **result\_type**

##### Public Member Functions

- `size_t operator()` (const [type\\_index](#) &\_\_ti) const noexcept

##### 4.544.1 Detailed Description

```
template<>
struct std::hash< type_index >
```

std::hash specialization for type\_index.

Definition at line 114 of file typeindex.

The documentation for this struct was generated from the following file:

- [typeindex](#)

## 4.545 `std::hash< u16string >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

### Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

### Public Member Functions

- `size_t operator() (const u16string &__s) const` noexcept

#### 4.545.1 Detailed Description

```
template<>
struct std::hash< u16string >
```

`std::hash` specialization for `u16string`.

Definition at line 6857 of file `basic_string.h`.

The documentation for this struct was generated from the following file:

- [basic\\_string.h](#)

## 4.546 `std::hash< u32string >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

### Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

### Public Member Functions

- `size_t operator() (const u32string &__s) const` noexcept

#### 4.546.1 Detailed Description

```
template<>
struct std::hash< u32string >
```

std::hash specialization for u32string.

Definition at line 6872 of file basic\_string.h.

The documentation for this struct was generated from the following file:

- [basic\\_string.h](#)

#### 4.547 std::hash< unique\_ptr< \_Tp, \_Dp > > Struct Template Reference

Inherits std::\_\_hash\_base< \_Result, \_Arg >, and \_\_uniq\_ptr\_hash< unique\_ptr< \_Tp, \_Dp > >.

##### Public Types

- typedef \_Arg **argument\_type**
- typedef \_Result **result\_type**

#### 4.547.1 Detailed Description

```
template<typename _Tp, typename _Dp>
struct std::hash< unique_ptr< _Tp, _Dp > >
```

std::hash specialization for unique\_ptr.

Definition at line 933 of file unique\_ptr.h.

The documentation for this struct was generated from the following file:

- [unique\\_ptr.h](#)

#### 4.548 std::hash< unsigned char > Struct Template Reference

Inherits std::\_\_hash\_base< \_Result, \_Arg >.

##### Public Types

- typedef \_Arg **argument\_type**
- typedef \_Result **result\_type**

#### Public Member Functions

- `size_t operator()` (unsigned char \_\_val) const noexcept

##### 4.548.1 Detailed Description

`template<>`  
`struct std::hash< unsigned char >`

Explicit specialization for unsigned char.

Definition at line 133 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

#### 4.549 `std::hash< unsigned int >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

#### Public Types

- `typedef _Arg argument_type`
- `typedef _Result result_type`

#### Public Member Functions

- `size_t operator()` (unsigned int \_\_val) const noexcept

##### 4.549.1 Detailed Description

`template<>`  
`struct std::hash< unsigned int >`

Explicit specialization for unsigned int.

Definition at line 165 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

#### 4.550 `std::hash< unsigned long >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

##### Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

##### Public Member Functions

- `size_t operator() (unsigned long __val) const` noexcept

##### 4.550.1 Detailed Description

```
template<>
struct std::hash< unsigned long >
```

Explicit specialization for unsigned long.

Definition at line 168 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

#### 4.551 `std::hash< unsigned long long >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

##### Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

##### Public Member Functions

- `size_t operator() (unsigned long long __val) const` noexcept

## 4.551.1 Detailed Description

```
template<>
struct std::hash< unsigned long long >
```

Explicit specialization for unsigned long long.

Definition at line 171 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

4.552 `std::hash< unsigned short >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

## Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

## Public Member Functions

- `size_t` **operator()** (`unsigned short __val`) `const noexcept`

## 4.552.1 Detailed Description

```
template<>
struct std::hash< unsigned short >
```

Explicit specialization for unsigned short.

Definition at line 162 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

4.553 `std::hash< wchar_t >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

#### Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

#### Public Member Functions

- `size_t operator()` (`wchar_t __val`) `const noexcept`

##### 4.553.1 Detailed Description

```
template<>
struct std::hash< wchar_t >
```

Explicit specialization for `wchar_t`.

Definition at line 136 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

#### 4.554 `std::hash< wstring >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

#### Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

#### Public Member Functions

- `size_t operator()` (`const wstring &__s`) `const noexcept`

##### 4.554.1 Detailed Description

```
template<>
struct std::hash< wstring >
```

`std::hash` specialization for `wstring`.

Definition at line 6823 of file `basic_string.h`.

The documentation for this struct was generated from the following file:

- [basic\\_string.h](#)

#### 4.555 `std::hash<::bitset<_Nb>>` Struct Template Reference

Inherits `std::__hash_base<_Result, _Arg>`.

##### Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

##### Public Member Functions

- `size_t operator()` (`const ::bitset<_Nb> &__b`) `const noexcept`

##### 4.555.1 Detailed Description

```
template<size_t _Nb>
struct std::hash<::bitset<_Nb>>
```

`std::hash` specialization for `bitset`.

Definition at line 1569 of file `bitset`.

The documentation for this struct was generated from the following file:

- [bitset](#)

#### 4.556 `std::hash<::vector<bool, _Alloc>>` Struct Template Reference

Inherits `std::__hash_base<_Result, _Arg>`.

##### Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

##### Public Member Functions

- `size_t operator()` (`const ::vector<bool, _Alloc> &`) `const noexcept`

#### 4.556.1 Detailed Description

```
template<typename _Alloc>
struct std::hash<::vector< bool, _Alloc > >
```

std::hash specialization for vector<bool>.

Definition at line 1351 of file stl\_bvector.h.

The documentation for this struct was generated from the following files:

- [stl\\_bvector.h](#)
- [vector.tcc](#)

#### 4.557 \_\_gnu\_pbds::detail::hash\_eq\_fn< Key, Eq\_Fn, \_Alloc, Store\_Hash > Struct Template Reference

Inheritance diagram for \_\_gnu\_pbds::detail::hash\_eq\_fn< Key, Eq\_Fn, \_Alloc, Store\_Hash >:

#### 4.557.1 Detailed Description

```
template<typename Key, typename Eq_Fn, typename _Alloc, bool Store_Hash>
struct __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, Store_Hash >
```

Primary template.

Definition at line 55 of file hash\_eq\_fn.hpp.

The documentation for this struct was generated from the following file:

- [hash\\_eq\\_fn.hpp](#)

4.558 `__gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, false >` Struct Template Reference

Inherits `Eq_Fn`.

## Public Types

- typedef `Eq_Fn` **eq\_fn\_base**
- typedef `rebind_traits< _Alloc, Key >::const_reference` **key\_const\_reference**

## Public Member Functions

- **hash\_eq\_fn** (const `Eq_Fn` &r\_eq\_fn)
- bool **operator()** (key\_const\_reference r\_lhs\_key, key\_const\_reference r\_rhs\_key) const
- void **swap** (const `hash_eq_fn` &other)

## 4.558.1 Detailed Description

```
template<typename Key, typename Eq_Fn, typename _Alloc>
struct __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, false >
```

Specialization 1 - The client requests that hash values not be stored.

Definition at line 59 of file `hash_eq_fn.hpp`.

The documentation for this struct was generated from the following file:

- `hash_eq_fn.hpp`

4.559 `__gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, true >` Struct Template Reference

Inherits `Eq_Fn`.

## Public Types

- typedef `Eq_Fn` **eq\_fn\_base**
- typedef `rebind_traits< _Alloc, Key >::const_reference` **key\_const\_reference**
- typedef `_Alloc::size_type` **size\_type**

## Public Member Functions

- **hash\_eq\_fn** (const `Eq_Fn` &r\_eq\_fn)
- bool **operator()** (key\_const\_reference r\_lhs\_key, size\_type lhs\_hash, key\_const\_reference r\_rhs\_key, size\_type rhs\_hash) const
- void **swap** (const `hash_eq_fn` &other)

#### 4.559.1 Detailed Description

```
template<typename Key, class Eq_Fn, class _Alloc>
struct __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, true >
```

Specialization 2 - The client requests that hash values be stored.

Definition at line 82 of file hash\_eq\_fn.hpp.

The documentation for this struct was generated from the following file:

- [hash\\_eq\\_fn.hpp](#)

#### 4.560 \_\_gnu\_pbds::hash\_exponential\_size\_policy< Size\_Type > Class Template Reference

##### Public Types

- typedef Size\_Type **size\_type**

##### Public Member Functions

- [hash\\_exponential\\_size\\_policy](#) (size\_type start\_size=8, size\_type grow\_factor=2)
- void **swap** ([hash\\_exponential\\_size\\_policy](#)< Size\_Type > &other)

##### Protected Member Functions

- size\_type **get\_nearest\_larger\_size** (size\_type size) const
- size\_type **get\_nearest\_smaller\_size** (size\_type size) const

#### 4.560.1 Detailed Description

```
template<typename Size_Type = std::size_t>
class __gnu_pbds::hash_exponential_size_policy< Size_Type >
```

A size policy whose sequence of sizes form an exponential sequence (typically powers of 2).

Definition at line 413 of file hash\_policy.hpp.

#### 4.560.2 Constructor & Destructor Documentation

#### 4.560.2.1 `hash_exponential_size_policy()`

```
template<typename Size_Type >
__gnu_pbds::hash_exponential_size_policy< Size_Type >::hash_exponential_size_policy (
 size_type start_size = 8,
 size_type grow_factor = 2)
```

Default constructor, or onstructor taking a start\_size, or constructor taking a start size and grow\_factor. The policy will use the sequence of sizes start\_size, start\_size\* grow\_factor, start\_size\* grow\_factor^2, ...

Definition at line 46 of file hash\_policy.hpp.

The documentation for this class was generated from the following file:

- [hash\\_policy.hpp](#)

#### 4.561 `__gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >` Class Template Reference

Inheritance diagram for `__gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >`:

#### Public Types

- enum { [external\\_load\\_access](#) }
- typedef Size\_Type **size\_type**

#### Public Member Functions

- [hash\\_load\\_check\\_resize\\_trigger](#) (float load\_min=0.125, float load\_max=0.5)
- `std::pair< float, float >` [get\\_loads](#) () const
- void [set\\_loads](#) (`std::pair< float, float >` load\_pair)
- void **swap** ([hash\\_load\\_check\\_resize\\_trigger](#) &other)

## Protected Member Functions

- bool **is\_grow\_needed** (size\_type size, size\_type num\_entries) const
- bool **is\_resize\_needed** () const
- void **notify\_cleared** ()
- void **notify\_erase\_search\_collision** ()
- void **notify\_erase\_search\_end** ()
- void **notify\_erase\_search\_start** ()
- void **notify\_erased** (size\_type num\_entries)
- void **notify\_externally\_resized** (size\_type new\_size)
- void **notify\_find\_search\_collision** ()
- void **notify\_find\_search\_end** ()
- void **notify\_find\_search\_start** ()
- void **notify\_insert\_search\_collision** ()
- void **notify\_insert\_search\_end** ()
- void **notify\_insert\_search\_start** ()
- void **notify\_inserted** (size\_type num\_entries)
- void **notify\_resized** (size\_type new\_size)

### 4.561.1 Detailed Description

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
class __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >
```

A resize trigger policy based on a load check. It keeps the load factor between some load factors `load_min` and `load_max`.

Definition at line 175 of file `hash_policy.hpp`.

### 4.561.2 Member Enumeration Documentation

#### 4.561.2.1 anonymous enum

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
anonymous enum
```

#### Enumerator

|                                   |                                                                                                                                                                 |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>external_load_access</code> | Specifies whether the load factor can be accessed externally. The two options have different trade-offs in terms of flexibility, genericity, and encapsulation. |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|

Definition at line 180 of file `hash_policy.hpp`.

#### 4.561.3 Constructor & Destructor Documentation

##### 4.561.3.1 `hash_load_check_resize_trigger()`

```
template<bool External_Load_Access, typename Size_Type >
__gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::hash_load_check_resize_trigger
(
 float load_min = 0.125,
 float load_max = 0.5)
```

Default constructor, or constructor taking `load_min` and `load_max` load factors between which this policy will keep the actual load.

Definition at line 49 of file `hash_policy.hpp`.

#### 4.561.4 Member Function Documentation

##### 4.561.4.1 `get_loads()`

```
template<bool External_Load_Access, typename Size_Type >
std::pair< float, float > __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::get_loads () const [inline]
```

Returns a pair of the minimal and maximal loads, respectively.

Definition at line 238 of file `hash_policy.hpp`.

##### 4.561.4.2 `notify_cleared()`

```
template<bool External_Load_Access, typename Size_Type >
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::notify_cleared () [protected]
```

Notifies the table was cleared.

Definition at line 208 of file `hash_policy.hpp`.

#### 4.561.4.3 notify\_inserted()

```
template<bool External_Load_Access, typename Size_Type >
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::notify_↵
inserted (
 size_type num_entries) [inline], [protected]
```

Notifies an element was inserted. The total number of entries in the table is num\_entries.

Definition at line 111 of file hash\_policy.hpp.

#### 4.561.4.4 notify\_resized()

```
template<bool External_Load_Access, typename Size_Type >
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::notify_↵
resized (
 size_type new_size) [protected]
```

Notifies the table was resized as a result of this object's signifying that a resize is needed.

Definition at line 153 of file hash\_policy.hpp.

#### 4.561.4.5 set\_loads()

```
template<bool External_Load_Access, typename Size_Type >
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::set_loads (
 std::pair< float, float > load_pair)
```

Sets the loads through a pair of the minimal and maximal loads, respectively.

Definition at line 247 of file hash\_policy.hpp.

The documentation for this class was generated from the following file:

- [hash\\_policy.hpp](#)

### 4.562 \_\_gnu\_pbds::detail::hash\_load\_check\_resize\_trigger\_size\_base< Size\_Type, Hold\_Size > Class Template Reference

#### 4.562.1 Detailed Description

```
template<typename Size_Type, bool Hold_Size>
class __gnu_pbds::detail::hash_load_check_resize_trigger_size_base< Size_Type, Hold_Size >
```

Primary template.

Definition at line 50 of file hash\_load\_check\_resize\_trigger\_size\_base.hpp.

The documentation for this class was generated from the following file:

- [hash\\_load\\_check\\_resize\\_trigger\\_size\\_base.hpp](#)

## 4.563 `__gnu_pbds::detail::hash_load_check_resize_trigger_size_base< Size_Type, true >` Class Template Reference

### Protected Types

- typedef `Size_Type` **size\_type**

#### 4.567.1 Detailed Description

A size policy whose sequence of sizes form a nearly-exponential sequence of primes.

Definition at line 450 of file `hash_policy.hpp`.

#### 4.567.2 Member Typedef Documentation

##### 4.567.2.1 `size_type`

```
typedef std::size_t __gnu_pbds::hash_prime_size_policy::size_type
```

Size type.

Definition at line 454 of file `hash_policy.hpp`.

#### 4.567.3 Constructor & Destructor Documentation

#### 4.567.3.1 hash\_prime\_size\_policy()

```
__gnu_pbds::hash_prime_size_policy::hash_prime_size_policy (
 size_type start_size = 8) [inline]
```

Default constructor, or onstructor taking a start\_size The policy will use the sequence of sizes approximately start\_size, start\_size\* 2, start\_size\* 2^2, ...

Definition at line 129 of file hash\_policy.hpp.

The documentation for this class was generated from the following file:

- [hash\\_policy.hpp](#)

#### 4.569.1 Detailed Description

```
template<typename Size_Policy = hash_exponential_size_policy<>, typename Trigger_Policy = hash_load_check_resize_↵
trigger<>, bool External_Size_Access = false, typename Size_Type = std::size_t>
class __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size_Type >
```

A resize policy which delegates operations to size and trigger policies.

Definition at line 489 of file `hash_policy.hpp`.

#### 4.569.2 Constructor & Destructor Documentation

##### 4.569.2.1 `hash_standard_resize_policy()` [1/3]

```
template<typename Size_Policy , typename Trigger_Policy , bool External_Size_Access, typename
Size_Type >
__gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size_↵
_Type >::hash_standard_resize_policy ()
```

Default constructor.

Definition at line 46 of file `hash_policy.hpp`.

##### 4.569.2.2 `hash_standard_resize_policy()` [2/3]

```
template<typename Size_Policy, typename Trigger_Policy , bool External_Size_Access, typename
Size_Type >
__gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size_↵
_Type >::hash_standard_resize_policy (
 const Size_Policy & r_size_policy)
```

constructor taking some policies `r_size_policy` will be copied by the `Size_Policy` object of this object.

Definition at line 52 of file `hash_policy.hpp`.

##### 4.569.2.3 `hash_standard_resize_policy()` [3/3]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size_↵
_Type >
__gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size_↵
_Type >::hash_standard_resize_policy (
 const Size_Policy & r_size_policy,
 const Trigger_Policy & r_trigger_policy)
```

constructor taking some policies. `r_size_policy` will be copied by the `Size_Policy` object of this object. `r_trigger_policy` will be copied by the `Trigger_Policy` object of this object.

Definition at line 58 of file `hash_policy.hpp`.

### 4.569.3 Member Function Documentation

#### 4.569.3.1 `get_actual_size()`

```
template<typename Size_Policy , typename Trigger_Policy , bool External_Size_Access, typename
Size_Type >
hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size_Type >↵
::size_type __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_↵
Access, Size_Type >::get_actual_size () const [inline]
```

Returns the actual size of the container.

Definition at line 179 of file `hash_policy.hpp`.

#### 4.569.3.2 `get_new_size()`

```
template<typename Size_Policy , typename Trigger_Policy , bool External_Size_Access, typename
Size_Type >
hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size_Type >↵
::size_type __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_↵
Access, Size_Type >::get_new_size (
 size_type size,
 size_type num_used_e) const [protected]
```

Queries what the new size should be, when the container is resized naturally. The current `__size` of the container is `size`, and the number of used entries within the container is `num_used_e`.

Definition at line 160 of file `hash_policy.hpp`.

#### 4.569.3.3 `get_size_policy()` [1/2]

```
template<typename Size_Policy , typename Trigger_Policy , bool External_Size_Access, typename
Size_Type >
Size_Policy & __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_↵
Size_Access, Size_Type >::get_size_policy ()
```

Access to the `Size_Policy` object used.

Definition at line 244 of file `hash_policy.hpp`.

#### 4.569.3.4 `get_size_policy()` [2/2]

```
template<typename Size_Policy , typename Trigger_Policy , bool External_Size_Access, typename
Size_Type >
const Size_Policy & __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_↵
_Size_Access, Size_Type >::get_size_policy () const
```

Const access to the `Size_Policy` object used.

Definition at line 250 of file `hash_policy.hpp`.

#### 4.569.3.5 `get_trigger_policy()` [1/2]

```
template<typename Size_Policy , typename Trigger_Policy , bool External_Size_Access, typename
Size_Type >
Trigger_Policy & __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_↵
_Size_Access, Size_Type >::get_trigger_policy ()
```

Access to the `Trigger_Policy` object used.

Definition at line 232 of file `hash_policy.hpp`.

#### 4.569.3.6 `get_trigger_policy()` [2/2]

```
template<typename Size_Policy , typename Trigger_Policy , bool External_Size_Access, typename
Size_Type >
const Trigger_Policy & __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy,
External_Size_Access, Size_Type >::get_trigger_policy () const
```

Access to the `Trigger_Policy` object used.

Definition at line 238 of file `hash_policy.hpp`.

#### 4.569.3.7 `resize()`

```
template<typename Size_Policy , typename Trigger_Policy , bool External_Size_Access, typename
Size_Type >
void __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access,
Size_Type >::resize (
 size_type suggested_new_size)
```

Resizes the container to `suggested_new_size`, a suggested size (the actual size will be determined by the `Size_Policy` object).

Definition at line 188 of file `hash_policy.hpp`.

The documentation for this class was generated from the following file:

## 4.571 `std::locale::id` Class Reference

### Public Member Functions

- `id` ()
- `size_t _M_id` () const throw ()

### Friends

- template<typename `_Facet` >  
bool `has_facet` (const `locale` &) throw ()
- class `locale`
- class `locale::_Impl`
- template<typename `_Facet` >  
const `_Facet` & `use_facet` (const `locale` &)

#### 4.571.1 Detailed Description

Facet ID class.

The ID class provides facets with an index used to identify them. Every facet class must define a public static member `locale::id`, or be derived from a facet that provides this member, otherwise the facet cannot be used in a locale. The `locale::id` ensures that each class type gets a unique identifier.

Definition at line 485 of file `locale_classes.h`.

#### 4.571.2 Constructor & Destructor Documentation

##### 4.571.2.1 id()

```
std::locale::id::id () [inline]
```

Constructor.

Definition at line 516 of file `locale_classes.h`.

#### 4.571.3 Friends And Related Function Documentation

##### 4.571.3.1 has\_facet

```
template<typename _Facet >
bool has_facet (
 const locale &) throw () [friend]
```

Test for the presence of a facet.

`has_facet` tests the locale argument for the presence of the facet type provided as the template parameter. Facets derived from the facet parameter will also return true.

##### Template Parameters

|                     |                                         |
|---------------------|-----------------------------------------|
| <code>_Facet</code> | The facet type to test the presence of. |
|---------------------|-----------------------------------------|

##### Parameters

|                    |                     |
|--------------------|---------------------|
| <code>__loc</code> | The locale to test. |
|--------------------|---------------------|

**Returns**

true if `__loc` contains a facet of type `_Facet`, else false.

Definition at line 104 of file `locale_classes.tcc`.

**4.571.3.2 use\_facet**

```
template<typename _Facet >
const _Facet& use_facet (
 const locale &) [friend]
```

Return a facet.

`use_facet` looks for and returns a reference to a facet of type `Facet` where `Facet` is the template parameter. If `has_facet(locale)` is true, there is a suitable facet to return. It throws `std::bad_cast` if the locale doesn't contain a facet of type `Facet`.

**Template Parameters**

|                     |                           |
|---------------------|---------------------------|
| <code>_Facet</code> | The facet type to access. |
|---------------------|---------------------------|

**Parameters**

|                    |                    |
|--------------------|--------------------|
| <code>__loc</code> | The locale to use. |
|--------------------|--------------------|

**Returns**

Reference to facet of type `Facet`.

**Exceptions**

|                            |                                                                             |
|----------------------------|-----------------------------------------------------------------------------|
| <code>std::bad_cast</code> | if <code>__loc</code> doesn't contain a facet of type <code>_Facet</code> . |
|----------------------------|-----------------------------------------------------------------------------|

Definition at line 132 of file `locale_classes.tcc`.

#### 4.573.1 Detailed Description

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
class std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType >
```

Produces random numbers by combining random numbers from some base engine to produce random numbers with a specifies number of bits `__w`.

Definition at line 1105 of file `random.h`.

### 4.573.2 Member Typedef Documentation

#### 4.573.2.1 result\_type

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
typedef _UIntType std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::result_type
```

The type of the generated random value.

Definition at line 1118 of file random.h.

### 4.573.3 Constructor & Destructor Documentation

#### 4.573.3.1 independent\_bits\_engine() [1/5]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine ()
[inline]
```

Constructs a default `independent_bits_engine` engine.

The underlying engine is default constructed as well.

Definition at line 1125 of file random.h.

#### 4.573.3.2 independent\_bits\_engine() [2/5]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine (
 const _RandomNumberEngine & __rng) [inline], [explicit]
```

Copy constructs a `independent_bits_engine` engine.

Copies an existing base class random number generator.

##### Parameters

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__rng</code> | An existing (base class) engine object. |
|--------------------|-----------------------------------------|

Definition at line 1135 of file random.h.

## 4.573.3.3 independent\_bits\_engine() [3/5]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType >::independent_bits_engine (
 _RandomNumberEngine && __rng) [inline], [explicit]
```

Move constructs a independent\_bits\_engine engine.

Copies an existing base class random number generator.

## Parameters

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__rng</code> | An existing (base class) engine object. |
|--------------------|-----------------------------------------|

Definition at line 1145 of file random.h.

## 4.573.3.4 independent\_bits\_engine() [4/5]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType >::independent_bits_engine (
 result_type __s) [inline], [explicit]
```

Seed constructs a independent\_bits\_engine engine.

Constructs the underlying generator engine seeded with \_\_s.

## Parameters

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__s</code> | A seed value for the base class engine. |
|------------------|-----------------------------------------|

Definition at line 1155 of file random.h.

## 4.573.3.5 independent\_bits\_engine() [5/5]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType >::independent_bits_engine (
 _Sseq & __q) [inline], [explicit]
```

Generator construct a independent\_bits\_engine engine.

#### Parameters

|                       |                  |
|-----------------------|------------------|
| <code>↔<br/>_q</code> | A seed sequence. |
|-----------------------|------------------|

Definition at line 1165 of file random.h.

### 4.573.4 Member Function Documentation

#### 4.573.4.1 base()

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
const _RandomNumberEngine& std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >↔
::base () const [inline], [noexcept]
```

Gets a const reference to the underlying generator engine object.

Definition at line 1200 of file random.h.

#### 4.573.4.2 discard()

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
void std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::discard (
 unsigned long long __z) [inline]
```

Discard a sequence of random numbers.

Definition at line 1221 of file random.h.

#### 4.573.4.3 max()

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
static constexpr result_type std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType
>::max () [inline], [static]
```

Gets the maximum value in the generated random number range.

Definition at line 1214 of file random.h.

#### 4.573.4.4 `min()`

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
static constexpr result_type std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType
>::min () [inline], [static]
```

Gets the minimum value in the generated random number range.

Definition at line 1207 of file `random.h`.

#### 4.573.4.5 `operator()()`

```
template<typename _RandomNumberEngine , size_t __w, typename _UIntType >
independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::result_type std::independent_bits_engine<
_RandomNumberEngine, __w, _UIntType >::operator() ()
```

Gets the next value in the generated random number sequence.

Definition at line 737 of file `bits/random.tcc`.

References `std::__lg()`, `std::numeric_limits<_Tp>::max()`, and `std::numeric_limits<_Tp>::min()`.

#### 4.573.4.6 `seed()` [1/3]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
void std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::seed () [inline]
```

Reseeds the `independent_bits_engine` object with the default seed for the underlying base class generator engine.

Definition at line 1174 of file `random.h`.

#### 4.573.4.7 `seed()` [2/3]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
void std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::seed (
 result_type __s) [inline]
```

Reseeds the `independent_bits_engine` object with the default seed for the underlying base class generator engine.

Definition at line 1182 of file `random.h`.

#### 4.573.4.8 `seed()` [3/3]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
template<typename _Sseq >
_If_seed_seq<_Sseq> std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::seed (
 _Sseq & __q) [inline]
```

Reseeds the `independent_bits_engine` object with the given seed sequence.

**Parameters**

|                 |                            |
|-----------------|----------------------------|
| <code>_↵</code> | A seed generator function. |
| <code>_q</code> |                            |

Definition at line 1192 of file random.h.

**4.573.5 Friends And Related Function Documentation****4.573.5.1 operator==**

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
bool operator== (
 const independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & __lhs,
 const independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & __rhs) [friend]
```

Compares two independent\_bits\_engine random number generator objects of the same type for equality.

**Parameters**

|                    |                                                                 |
|--------------------|-----------------------------------------------------------------|
| <code>__lhs</code> | A independent_bits_engine random number generator object.       |
| <code>__rhs</code> | Another independent_bits_engine random number generator object. |

**Returns**

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 1246 of file random.h.

**4.573.5.2 operator>>**

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
template<typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
 std::basic_istream< _CharT, _Traits > & __is,
 std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & __x) [friend]
```

Extracts the current state of a % subtract\_with\_carry\_engine random number generator engine \_\_x from the input stream \_\_is.

## Parameters

|                                                                                                                       |                                                           |
|-----------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|
| <a href="#"></a><br><code>_is</code> | An input stream.                                          |
| <a href="#"></a><br><code>_x</code>  | A independent_bits_engine random number generator engine. |

## Returns

The input stream with the state of `__x` extracted or in an error state.

Definition at line 1264 of file random.h.

The documentation for this class was generated from the following files:

- [random.h](#)
- [bits/random.tcc](#)

#### Friends

- class `gslice_array`<\_Tp>
- class `valarray`<\_Tp>

#### 4.574.1 Detailed Description

```
template<class _Tp>
class std::indirect_array<_Tp>
```

Reference to arbitrary subset of an array.

An `indirect_array` is a reference to the actual elements of an array specified by an ordered array of indices. The way to get an `indirect_array` is to call `operator[]`(`valarray`<size\_t>) on a `valarray`. The returned `indirect_array` then permits carrying operations out on the referenced subset of elements in the original `valarray`.

For example, if an `indirect_array` is obtained using the array (4,2,0) as an argument, and then assigned to an array containing (1,2,3), then the underlying array will have `array[0]==3`, `array[2]==2`, and `array[4]==1`.

#### Parameters

|           |               |
|-----------|---------------|
| <i>Tp</i> | Element type. |
|-----------|---------------|

Definition at line 95 of file `valarray`.

The documentation for this class was generated from the following files:

- `valarray`
- `indirect_array.h`

- constexpr [insert\\_iterator](#) & [operator=](#) (typename `_Container::value_type` &&\_\_value)

## Protected Attributes

- `_Container * container`
- `_Iter iter`

### 4.578.1 Detailed Description

```
template<typename _Container>
class std::insert_iterator< _Container >
```

Turns assignment into insertion.

These are output iterators, constructed from a container-of-T. Assigning a T to the iterator inserts it in the container at the iterator's position, rather than overwriting the value at that position.

(Sequences will actually insert a *copy* of the value before the iterator's position.)

Tip: Using the inserter function to create these iterators can save typing.

Definition at line 806 of file `bits/stl_iterator.h`.

### 4.578.2 Member Typedef Documentation

#### 4.578.2.1 `container_type`

```
template<typename _Container >
typedef _Container std::insert_iterator< _Container >::container_type
```

A nested typedef for the type of whatever container you used.

Definition at line 825 of file `bits/stl_iterator.h`.

#### 4.578.2.2 `difference_type`

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::difference_type
[inherited]
```

Distance between iterators is represented as this type.

Definition at line 134 of file `stl_iterator_base_types.h`.

#### 4.578.2.3 iterator\_category

```
typedef output_iterator_tag std::iterator< output_iterator_tag , void , void , void , void >↵
::iterator_category [inherited]
```

One of the [tag types](#).

Definition at line 130 of file stl\_iterator\_base\_types.h.

#### 4.578.2.4 pointer

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::pointer [inherited]
```

This type represents a pointer-to-value\_type.

Definition at line 136 of file stl\_iterator\_base\_types.h.

#### 4.578.2.5 reference

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::reference [inherited]
```

This type represents a reference-to-value\_type.

Definition at line 138 of file stl\_iterator\_base\_types.h.

#### 4.578.2.6 value\_type

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::value_type [inherited]
```

The type "pointed to" by the iterator.

Definition at line 132 of file stl\_iterator\_base\_types.h.

### 4.578.3 Constructor & Destructor Documentation

#### 4.578.3.1 insert\_iterator()

```
template<typename _Container >
constexpr std::insert_iterator< _Container >::insert_iterator (
 _Container & __x,
 _Iter __i) [inline]
```

The only way to create this iterator is with a container and an initial position (a normal iterator into the container).

Definition at line 838 of file bits/stl\_iterator.h.

#### 4.578.4 Member Function Documentation

##### 4.578.4.1 `operator*()`

```
template<typename _Container >
constexpr insert_iterator& std::insert_iterator< _Container >::operator* () [inline]
```

Simply returns `*this`.

Definition at line 895 of file `bits/stl_iterator.h`.

##### 4.578.4.2 `operator++()` [1/2]

```
template<typename _Container >
constexpr insert_iterator& std::insert_iterator< _Container >::operator++ () [inline]
```

Simply returns `*this`. (This iterator does not *move*.)

Definition at line 901 of file `bits/stl_iterator.h`.

##### 4.578.4.3 `operator++()` [2/2]

```
template<typename _Container >
constexpr insert_iterator& std::insert_iterator< _Container >::operator++ (
 int) [inline]
```

Simply returns `*this`. (This iterator does not *move*.)

Definition at line 907 of file `bits/stl_iterator.h`.

##### 4.578.4.4 `operator=()`

```
template<typename _Container >
constexpr insert_iterator& std::insert_iterator< _Container >::operator= (
 const typename _Container::value_type & __value) [inline]
```

###### Parameters

|                      |                                                                                                                                                       |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__value</code> | An instance of whatever type <code>container_type::const_reference</code> is; presumably a reference-to-const T for <code>container&lt;T&gt;</code> . |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|

### Returns

This iterator, for chained operations.

This kind of iterator maintains its own position in the container. Assigning a value to the iterator will insert the value into the container at the place before the iterator.

The position is maintained such that subsequent assignments will insert values immediately after one another. For example,

```
// vector v contains A and Z
insert_iterator i (v, ++v.begin());
i = 1;
i = 2;
i = 3;
// vector v contains A, 1, 2, 3, and Z
```

Definition at line 875 of file `bits/stl_iterator.h`.

- [invalid\\_argument](#) & **operator=** ([invalid\\_argument](#) &&)=default
- virtual const char \* [what](#) () const noexcept

### 4.581.1 Detailed Description

Thrown to report invalid arguments to functions.

Definition at line 168 of file stdexcept.

### 4.581.2 Member Function Documentation

#### 4.581.2.1 what()

```
virtual const char* std::logic_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

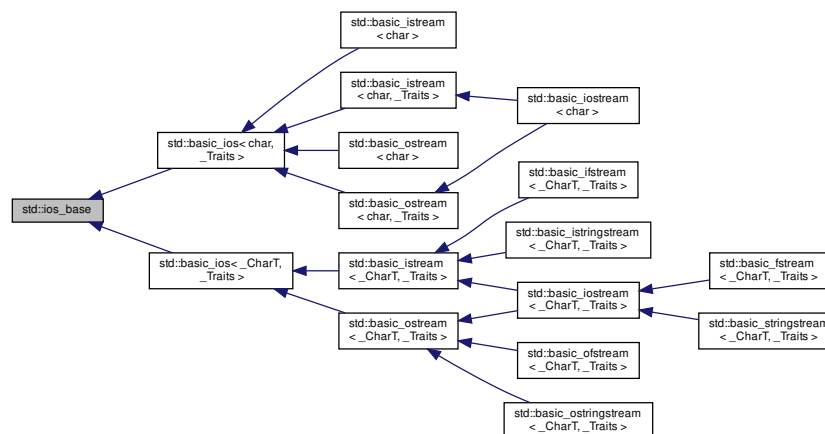

Reimplemented in [std::future\\_error](#).

The documentation for this class was generated from the following file:

- [stdexcept](#)

- `int _M_word_size`
- `_Words _M_word_zero`

## 4.582.1 Detailed Description

The base of the I/O class hierarchy.

This class defines everything that can be defined about I/O that does not depend on the type of characters being input or output. Most people will only see `ios_base` when they need to specify the full name of the various I/O flags (e.g., the openmodes).

Definition at line 228 of file `ios_base.h`.

## 4.582.2 Member Typedef Documentation

## 4.582.2.1 event\_callback

```
typedef void(* std::ios_base::event_callback) (event __e, ios_base &__b, int __i)
```

The type of an event callback function.

## Parameters

|                  |                                                        |
|------------------|--------------------------------------------------------|
| <code>__e</code> | One of the members of the event enum.                  |
| <code>__b</code> | Reference to the <code>ios_base</code> object.         |
| <code>__i</code> | The integer provided when the callback was registered. |

Event callbacks are user defined functions that get called during several `ios_base` and `basic_ios` functions, specifically `imbue()`, `copyfmt()`, and `~ios()`.

Definition at line 529 of file `ios_base.h`.

#### 4.582.2.2 fmtflags

```
typedef _Ios_Fmtflags std::ios_base::fmtflags
```

This is a bitmask type.

`_Ios_Fmtflags` is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type `fmtflags` are:

- `boolalpha`
- `dec`
- `fixed`
- `hex`
- `internal`
- `left`
- `oct`
- `right`
- `scientific`
- `showbase`
- `showpoint`
- `showpos`
- `skipws`
- `unitbuf`
- `uppercase`
- `adjustfield`
- `basefield`
- `floatfield`

Definition at line 341 of file `ios_base.h`.

#### 4.582.2.3 iostate

```
typedef _Ios_Iostate std::ios_base::iostate
```

This is a bitmask type.

`_Ios_Iostate` is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type `iostate` are:

- `badbit`
- `eofbit`
- `failbit`
- `goodbit`

Definition at line 416 of file `ios_base.h`.

#### 4.582.2.4 openmode

```
typedef _Ios_Openmode std::ios_base::openmode
```

This is a bitmask type.

`_Ios_Openmode` is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type `openmode` are:

- `app`
- `ate`
- `binary`
- `in`
- `out`
- `trunc`

Definition at line 447 of file `ios_base.h`.

#### 4.582.2.5 seekdir

```
typedef _Ios_Seekdir std::ios_base::seekdir
```

This is an enumerated type.

`_Ios_Seekdir` is implementation-defined. Defined values of type `seekdir` are:

- `beg`
- `cur`, equivalent to `SEEK_CUR` in the C standard library.
- `end`, equivalent to `SEEK_END` in the C standard library.

Definition at line 479 of file `ios_base.h`.

### 4.582.3 Member Enumeration Documentation

#### 4.582.3.1 event

```
enum std::ios_base::event
```

The set of events that may be passed to an event callback.

`erase_event` is used during `~ios()` and `copyfmt()`. `imbue_event` is used during `imbue()`. `copyfmt_event` is used during `copyfmt()`.

Definition at line 512 of file `ios_base.h`.

#### 4.582.4 Constructor & Destructor Documentation

##### 4.582.4.1 ~ios\_base()

```
virtual std::ios_base::~~ios_base () [virtual]
```

Invokes each callback with `erase_event`. Destroys local storage.

Note that the `ios_base` object for the standard streams never gets destroyed. As a result, any callbacks registered with the standard streams will not get invoked with `erase_event` (unless `copyfmt` is used).

#### 4.582.5 Member Function Documentation

##### 4.582.5.1 \_M\_getloc()

```
const locale& std::ios_base::_M_getloc () const [inline]
```

Locale access.

Returns

A reference to the current locale.

Like `getloc` above, but returns a reference instead of generating a copy.

Definition at line 804 of file `ios_base.h`.

Referenced by `std::time_get< _CharT, _Inlter >::do_get()`, `std::money_get< _CharT, _Inlter >::do_get()`, `std::num_get< _CharT, _Inlter >::do_get()`, `std::time_get< _CharT, _Inlter >::do_get_date()`, `std::time_get< _CharT, _Inlter >::do_get_monthname()`, `std::time_get< _CharT, _Inlter >::do_get_time()`, `std::time_get< _CharT, _Inlter >::do_get_weekday()`, `std::time_put< _CharT, _Outlter >::do_put()`, `std::num_put< _CharT, _Outlter >::do_put()`, `std::time_get< _CharT, _Inlter >::get()`, and `std::time_put< _CharT, _Outlter >::put()`.

##### 4.582.5.2 flags() [1/2]

```
fmtflags std::ios_base::flags () const [inline]
```

Access to format flags.

Returns

The format control flags for both input and output.

Definition at line 649 of file `ios_base.h`.

Referenced by `std::basic_ios< char, _Traits >::copyfmt()`, `std::num_get< _CharT, _Inlter >::do_get()`, `std::num_put< _CharT, _Outlter >::do_put()`, `std::basic_ostream< char >::operator<<()`, `std::operator<<()`, `std::__detail::operator>>()`, and `std::operator>>()`.

##### 4.582.5.3 flags() [2/2]

```
fmtflags std::ios_base::flags (
 fmtflags __fmtfl) [inline]
```

Setting new format flags all at once.

## Parameters

|                      |                       |
|----------------------|-----------------------|
| <code>__fmtfl</code> | The new flags to set. |
|----------------------|-----------------------|

## Returns

The previous format control flags.

This function overwrites all the format flags with `__fmtfl`.

Definition at line 660 of file `ios_base.h`.

## 4.582.5.4 getloc()

```
locale std::ios_base::getloc () const [inline]
```

Locale access.

## Returns

A copy of the current locale.

If `imbue(loc)` has previously been called, then this function returns `loc`. Otherwise, it returns a copy of `std::locale()`, the global C++ locale.

Definition at line 793 of file `ios_base.h`.

Referenced by `std::basic_ios<char, _Traits>::copyfmt()`, `std::money_put<_CharT, _OutIter>::do_put()`, and `std::ws()`.

## 4.582.5.5 imbue()

```
locale std::ios_base::imbue (
 const locale & __loc) throw ()
```

Setting a new locale.

## Parameters

|                    |                 |
|--------------------|-----------------|
| <code>__loc</code> | The new locale. |
|--------------------|-----------------|

## Returns

The previous locale.

Sets the new locale for this stream, and then invokes each callback with `imbue_event`.

Referenced by `std::basic_ios< char, _Traits >::imbue()`.

#### 4.582.5.6 `iword()`

```
long& std::ios_base::iword (
 int __ix) [inline]
```

Access to integer array.

##### Parameters

|                   |                       |
|-------------------|-----------------------|
| <code>__ix</code> | Index into the array. |
|-------------------|-----------------------|

##### Returns

A reference to an integer associated with the index.

The `iword` function provides access to an array of integers that can be used for any purpose. The array grows as required to hold the supplied index. All integers in the array are initialized to 0.

The implementation reserves several indices. You should use `xalloc` to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.

Definition at line 839 of file `ios_base.h`.

#### 4.582.5.7 `precision()` [1/2]

```
streamsize std::ios_base::precision () const [inline]
```

Flags access.

##### Returns

The precision to generate on certain output operations.

Be careful if you try to give a definition of *precision* here; see DR 189.

Definition at line 719 of file `ios_base.h`.

Referenced by `std::basic_ios< char, _Traits >::copyfmt()`, and `std::operator<<()`.

#### 4.582.5.8 `precision()` [2/2]

```
streamsize std::ios_base::precision (
 streamsize __prec) [inline]
```

Changing flags.

## Parameters

|                     |                          |
|---------------------|--------------------------|
| <code>__prec</code> | The new precision value. |
|---------------------|--------------------------|

## Returns

The previous value of precision().

Definition at line 728 of file ios\_base.h.

## 4.582.5.9 pword()

```
void*& std::ios_base::pword (
 int __ix) [inline]
```

Access to void pointer array.

## Parameters

|                   |                       |
|-------------------|-----------------------|
| <code>__ix</code> | Index into the array. |
|-------------------|-----------------------|

## Returns

A reference to a void\* associated with the index.

The pword function provides access to an array of pointers that can be used for any purpose. The array grows as required to hold the supplied index. All pointers in the array are initialized to 0.

The implementation reserves several indices. You should use xalloc to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.

Definition at line 860 of file ios\_base.h.

## 4.582.5.10 register\_callback()

```
void std::ios_base::register_callback (
 event_callback __fn,
 int __index)
```

Add the callback \_\_fn with parameter \_\_index.

**Parameters**

|                      |                                                   |
|----------------------|---------------------------------------------------|
| <code>__fn</code>    | The function to add.                              |
| <code>__index</code> | The integer to pass to the function when invoked. |

Registers a function as an event callback with an integer parameter to be passed to the function when invoked. Multiple copies of the function are allowed. If there are multiple callbacks, they are invoked in the order they were registered.

**4.582.5.11** `setf()` [1/2]

```
fmtflags std::ios_base::setf (
 fmtflags __fmtfl) [inline]
```

Setting new format flags.

**Parameters**

|                      |                          |
|----------------------|--------------------------|
| <code>__fmtfl</code> | Additional flags to set. |
|----------------------|--------------------------|

**Returns**

The previous format control flags.

This function sets additional flags in format control. Flags that were previously set remain set.

Definition at line 676 of file `ios_base.h`.

Referenced by `std::__detail::operator>>()`.

**4.582.5.12** `setf()` [2/2]

```
fmtflags std::ios_base::setf (
 fmtflags __fmtfl,
 fmtflags __mask) [inline]
```

Setting new format flags.

**Parameters**

|                      |                                   |
|----------------------|-----------------------------------|
| <code>__fmtfl</code> | Additional flags to set.          |
| <code>__mask</code>  | The flags mask for <i>fmtfl</i> . |

**Returns**

The previous format control flags.

This function clears *mask* in the format flags, then sets *fmtfl* & *mask*. An example mask is `ios_base::adjustfield`.

Definition at line 693 of file `ios_base.h`.

#### 4.582.5.13 sync\_with\_stdio()

```
static bool std::ios_base::sync_with_stdio (
 bool __sync = true) [static]
```

Interaction with the standard C I/O objects.

##### Parameters

|                     |                                |
|---------------------|--------------------------------|
| <code>__sync</code> | Whether to synchronize or not. |
|---------------------|--------------------------------|

##### Returns

True if the standard streams were previously synchronized.

The synchronization referred to is *only* that between the standard C facilities (e.g., `stdout`) and the standard C++ objects (e.g., `cout`). User-declared streams are unaffected. See <https://gcc.gnu.org/onlinedocs/libstdc++/manual/fstreams.html#std.io.filestreams.binary>

#### 4.582.5.14 unsetf()

```
void std::ios_base::unsetf (
 fmtflags __mask) [inline]
```

Clearing format flags.

##### Parameters

|                     |                     |
|---------------------|---------------------|
| <code>__mask</code> | The flags to unset. |
|---------------------|---------------------|

This function clears `__mask` in the format flags.

Definition at line 708 of file `ios_base.h`.

#### 4.582.5.15 width() [1/2]

```
streamsize std::ios_base::width () const [inline]
```

Flags access.

**Returns**

The minimum field width to generate on output operations.

*Minimum field width* refers to the number of characters.

Definition at line 742 of file ios\_base.h.

Referenced by `std::basic_ios< char, _Traits >::copyfmt()`, and `std::num_put< _CharT, _OutIter >::do_put()`.

**4.582.5.16 width()** [2/2]

```
streamsize std::ios_base::width (
 streamsize __wide) [inline]
```

Changing flags.

**Parameters**

|                     |                      |
|---------------------|----------------------|
| <code>__wide</code> | The new width value. |
|---------------------|----------------------|

**Returns**

The previous value of `width()`.

Definition at line 751 of file ios\_base.h.

**4.582.5.17 xalloc()**

```
static int std::ios_base::xalloc () throw () [static]
```

Access to unique indices.

**Returns**

An integer different from all previous calls.

This function returns a unique integer every time it is called. It can be used for any purpose, but is primarily intended to be a unique index for the `iword` and `pword` functions. The expectation is that an application calls `xalloc` in order to obtain an index in the `iword` and `pword` arrays that can be used without fear of conflict.

The implementation maintains a static variable that is incremented and returned on each invocation. `xalloc` is guaranteed to return an index that is safe to use in the `iword` and `pword` arrays.

#### 4.582.6 Member Data Documentation

##### 4.582.6.1 adjustfield

```
const fmtflags std::ios_base::adjustfield [static]
```

A mask of left|right|internal. Useful for the 2-arg form of `setf`.

Definition at line 396 of file `ios_base.h`.

Referenced by `std::num_put<_CharT, _OutIter>::do_put()`, `std::internal()`, `std::left()`, and `std::right()`.

##### 4.582.6.2 app

```
const openmode std::ios_base::app [static]
```

Seek to end before each write.

Definition at line 450 of file `ios_base.h`.

##### 4.582.6.3 ate

```
const openmode std::ios_base::ate [static]
```

Open and seek to end immediately after opening.

Definition at line 453 of file `ios_base.h`.

##### 4.582.6.4 badbit

```
const iostate std::ios_base::badbit [static]
```

Indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file).

Definition at line 420 of file `ios_base.h`.

Referenced by `std::basic_ios<char, _Traits>::bad()`, `std::basic_ios<char, _Traits>::fail()`, and `std::operator<<()`.

#### 4.582.6.5 basefield

```
const fmtflags std::ios_base::basefield [static]
```

A mask of dec|oct|hex. Useful for the 2-arg form of `setf`.

Definition at line 399 of file `ios_base.h`.

Referenced by `std::dec()`, `std::num_get< _CharT, _InIter >::do_get()`, `std::num_put< _CharT, _OutIter >::do_put()`, `std::hex()`, `std::oct()`, and `std::basic_ostream< char >::operator<<()`.

#### 4.582.6.6 beg

```
const seekdir std::ios_base::beg [static]
```

Request a seek relative to the beginning of the stream.

Definition at line 482 of file `ios_base.h`.

#### 4.582.6.7 binary

```
const openmode std::ios_base::binary [static]
```

Perform input and output in binary mode (as opposed to text mode). This is probably not what you think it is; see [https://gcc.gnu.org/onlinedocs/libstdc++/manual/fstreams.html#std.io.↵filestreams.binary](https://gcc.gnu.org/onlinedocs/libstdc++/manual/fstreams.html#std.io.filestreams.binary).

Definition at line 458 of file `ios_base.h`.

#### 4.582.6.8 boolalpha

```
const fmtflags std::ios_base::boolalpha [static]
```

Insert/extract `bool` in alphabetic rather than numeric format.

Definition at line 344 of file `ios_base.h`.

Referenced by `std::boolalpha()`, `std::num_get< _CharT, _InIter >::do_get()`, `std::num_put< _CharT, _OutIter >::do_↵put()`, and `std::noboolalpha()`.

#### 4.582.6.9 cur

```
const seekdir std::ios_base::cur [static]
```

Request a seek relative to the current position within the sequence.

Definition at line 485 of file ios\_base.h.

Referenced by std::basic\_stringbuf< \_CharT, \_Traits, \_Alloc >::seekoff().

#### 4.582.6.10 dec

```
const fmtflags std::ios_base::dec [static]
```

Converts integer input or generates integer output in decimal base.

Definition at line 347 of file ios\_base.h.

Referenced by std::dec().

#### 4.582.6.11 end

```
const seekdir std::ios_base::end [static]
```

Request a seek relative to the current end of the sequence.

Definition at line 488 of file ios\_base.h.

Referenced by std::basic\_stringbuf< \_CharT, \_Traits, \_Alloc >::seekoff().

#### 4.582.6.12 eofbit

```
const iostate std::ios_base::eofbit [static]
```

Indicates that an input operation reached the end of an input sequence.

Definition at line 423 of file ios\_base.h.

Referenced by std::time\_get< \_CharT, \_InIter >::do\_get(), std::num\_get< \_CharT, \_InIter >::do\_get(), std::time\_get< \_CharT, \_InIter >::do\_get\_date(), std::time\_get< \_CharT, \_InIter >::do\_get\_monthname(), std::time\_get< \_CharT, \_InIter >::do\_get\_time(), std::time\_get< \_CharT, \_InIter >::do\_get\_weekday(), std::time\_get< \_CharT, \_InIter >::do\_get\_year(), std::basic\_ios< char, \_Traits >::eof(), std::time\_get< \_CharT, \_InIter >::get(), std::basic\_istream< char >::putback(), std::basic\_istream< char >::seekg(), std::basic\_istream< char >::unget(), and std::ws().

#### 4.582.6.13 failbit

```
const iostate std::ios_base::failbit [static]
```

Indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters.

Definition at line 428 of file `ios_base.h`.

Referenced by `std::num_get< _CharT, _InIter >::do_get()`, `std::time_get< _CharT, _InIter >::do_get_monthname()`, `std::time_get< _CharT, _InIter >::do_get_weekday()`, `std::time_get< _CharT, _InIter >::do_get_year()`, `std::basic_ios< char, _Traits >::fail()`, `std::time_get< _CharT, _InIter >::get()`, and `std::basic_ostream< _CharT, _Traits >::sentry↵::sentry()`.

#### 4.582.6.14 fixed

```
const fmtflags std::ios_base::fixed [static]
```

Generate floating-point output in fixed-point notation.

Definition at line 350 of file `ios_base.h`.

Referenced by `std::fixed()`, and `std::hexfloat()`.

#### 4.582.6.15 floatfield

```
const fmtflags std::ios_base::floatfield [static]
```

A mask of scientific|fixed. Useful for the 2-arg form of `setf`.

Definition at line 402 of file `ios_base.h`.

Referenced by `std::defaultfloat()`, `std::fixed()`, `std::hexfloat()`, and `std::scientific()`.

#### 4.582.6.16 goodbit

```
const iostate std::ios_base::goodbit [static]
```

Indicates all is well.

Definition at line 431 of file `ios_base.h`.

Referenced by `std::time_get< _CharT, _InIter >::do_get()`, `std::num_get< _CharT, _InIter >::do_get()`, `std::time↵_get< _CharT, _InIter >::do_get_monthname()`, `std::time_get< _CharT, _InIter >::do_get_weekday()`, `std::time_get< _CharT, _InIter >::do_get_year()`, `std::basic_ostream< char >::flush()`, `std::basic_istream< char >::get()`, `std::time↵_get< _CharT, _InIter >::get()`, `std::basic_istream< char >::getline()`, `std::basic_istream< char >::ignore()`, `std::basic↵_ostream< char >::operator<<()`, `std::basic_istream< char >::operator>>()`, `std::operator>>()`, `std::basic_istream< char >::peek()`, `std::basic_ostream< char >::put()`, `std::basic_istream< char >::putback()`, `std::basic_istream< char >::read()`, `std::basic_istream< char >::readsom↵e()`, `std::basic_istream< char >::seekg()`, `std::basic_ostream< char >::seekp()`, `std::basic_istream< _CharT, _Traits >::sentry::sentry()`, `std::basic_istream< char >::sync()`, and `std↵::basic_istream< char >::unget()`.

#### 4.582.6.17 hex

```
const fmtflags std::ios_base::hex [static]
```

Converts integer input or generates integer output in hexadecimal base.

Definition at line 353 of file ios\_base.h.

Referenced by std::num\_get< \_CharT, \_InIter >::do\_get(), std::num\_put< \_CharT, \_OutIter >::do\_put(), std::hex(), and std::basic\_ostream< char >::operator<<().

#### 4.582.6.18 in

```
const openmode std::ios_base::in [static]
```

Open for input. Default for ifstream and fstream.

Definition at line 461 of file ios\_base.h.

Referenced by std::basic\_stringbuf< \_CharT, \_Traits, \_Alloc >::overflow(), std::basic\_stringbuf< \_CharT, \_Traits, \_Alloc >::seekoff(), std::basic\_stringbuf< \_CharT, \_Traits, \_Alloc >::seekpos(), and std::basic\_stringbuf< \_CharT, \_Traits, \_Alloc >::underflow().

#### 4.582.6.19 internal

```
const fmtflags std::ios_base::internal [static]
```

Adds fill characters at a designated internal point in certain generated output, or identical to right if no such point is designated.

Definition at line 358 of file ios\_base.h.

Referenced by std::internal().

#### 4.582.6.20 left

```
const fmtflags std::ios_base::left [static]
```

Adds fill characters on the right (final positions) of certain generated output. (I.e., the thing you print is flush left.)

Definition at line 362 of file ios\_base.h.

Referenced by std::num\_put< \_CharT, \_OutIter >::do\_put(), and std::left().

**4.582.6.21 oct**

```
const fmtflags std::ios_base::oct [static]
```

Converts integer input or generates integer output in octal base.

Definition at line 365 of file `ios_base.h`.

Referenced by `std::oct()`, and `std::basic_ostream< char >::operator<<()`.

**4.582.6.22 out**

```
const openmode std::ios_base::out [static]
```

Open for output. Default for `ofstream` and `fstream`.

Definition at line 464 of file `ios_base.h`.

Referenced by `std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::pbackfail()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`, and `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos()`.

**4.582.6.23 right**

```
const fmtflags std::ios_base::right [static]
```

Adds fill characters on the left (initial positions) of certain generated output. (I.e., the thing you print is flush right.)

Definition at line 369 of file `ios_base.h`.

Referenced by `std::right()`.

**4.582.6.24 scientific**

```
const fmtflags std::ios_base::scientific [static]
```

Generates floating-point output in scientific notation.

Definition at line 372 of file `ios_base.h`.

Referenced by `std::hexfloat()`, and `std::scientific()`.

#### 4.582.6.25 showbase

```
const fmtflags std::ios_base::showbase [static]
```

Generates a prefix indicating the numeric base of generated integer output.

Definition at line 376 of file ios\_base.h.

Referenced by std::num\_put< \_CharT, \_OutIter >::do\_put(), std::noshowbase(), and std::showbase().

#### 4.582.6.26 showpoint

```
const fmtflags std::ios_base::showpoint [static]
```

Generates a decimal-point character unconditionally in generated floating-point output.

Definition at line 380 of file ios\_base.h.

Referenced by std::noshowpoint(), and std::showpoint().

#### 4.582.6.27 showpos

```
const fmtflags std::ios_base::showpos [static]
```

Generates a + sign in non-negative generated numeric output.

Definition at line 383 of file ios\_base.h.

Referenced by std::noshowpos(), and std::showpos().

#### 4.582.6.28 skipws

```
const fmtflags std::ios_base::skipws [static]
```

Skips leading white space before certain input operations.

Definition at line 386 of file ios\_base.h.

Referenced by std::noskipws(), and std::skipws().

#### 4.582.6.29 trunc

```
const openmode std::ios_base::trunc [static]
```

Truncate an existing stream when opening. Default for `ofstream`.

Definition at line 467 of file `ios_base.h`.

#### 4.582.6.30 unitbuf

```
const fmtflags std::ios_base::unitbuf [static]
```

Flushes output after each output operation.

Definition at line 389 of file `ios_base.h`.

Referenced by `std::nounitbuf()`, and `std::unitbuf()`.

#### 4.582.6.31 uppercase

```
const fmtflags std::ios_base::uppercase [static]
```

Replaces certain lowercase letters with their uppercase equivalents in generated output.

Definition at line 393 of file `ios_base.h`.

Referenced by `std::num_put<_CharT, _OutIter >::do_put()`, `std::nouppercase()`, and `std::uppercase()`.

The documentation for this class was generated from the following file:

### 4.583 std::is\_abstract<\_Tp> Struct Template Reference

Inheritance diagram for `std::is_abstract<_Tp>`:

## Public Types

- typedef [integral\\_constant](#)< bool, \_\_v > **type**
- typedef bool **value\_type**

## Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

## Static Public Attributes

- static constexpr bool **value**

## 4.583.1 Detailed Description

```
template<typename _Tp>
struct std::is_abstract< _Tp >
```

`is_abstract`

Definition at line 736 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

4.584 `std::is_arithmetic< _Tp >` Struct Template Reference

Inherits type< `is_integral< _Tp >`, `is_floating_point< _Tp >` >.

## 4.584.1 Detailed Description

```
template<typename _Tp>
struct std::is_arithmetic< _Tp >
```

`is_arithmetic`

Definition at line 534 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 4.585 `std::is_array< typename >` Struct Template Reference

Inheritance diagram for `std::is_array< typename >`:

##### Public Types

- typedef [integral\\_constant](#)< `_Tp`, `__v` > **type**
- typedef `_Tp` **value\_type**

##### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

##### Static Public Attributes

- static constexpr `_Tp` **value**

##### 4.585.1 Detailed Description

```
template<typename>
struct std::is_array< typename >
```

`is_array`

Definition at line 399 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.586 std::is\_assignable&lt; \_Tp, \_Up &gt; Struct Template Reference

Inheritance diagram for std::is\_assignable< \_Tp, \_Up >:

## Public Types

- typedef [integral\\_constant](#)< \_Tp, \_\_v > **type**
- typedef \_Tp **value\_type**

## Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

## Static Public Attributes

- static constexpr \_Tp **value**

## 4.586.1 Detailed Description

```
template<typename _Tp, typename _Up>
struct std::is_assignable< _Tp, _Up >
```

is\_assignable

Definition at line 1069 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 4.587 std::is\_base\_of<\_Base, \_Derived> Struct Template Reference

Inheritance diagram for std::is\_base\_of<\_Base, \_Derived>:

##### Public Types

- typedef [integral\\_constant](#)< bool, \_\_v > **type**
- typedef bool **value\_type**

##### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

##### Static Public Attributes

- static constexpr bool **value**

##### 4.587.1 Detailed Description

```
template<typename _Base, typename _Derived>
struct std::is_base_of<_Base, _Derived>
```

is\_base\_of

Definition at line 1411 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.588 std::is\_bind\_expression&lt; \_Tp &gt; Struct Template Reference

Inheritance diagram for std::is\_bind\_expression< \_Tp >:

## Public Types

- typedef [integral\\_constant](#)< \_Tp, \_\_v > **type**
- typedef \_Tp **value\_type**

## Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

## Static Public Attributes

- static constexpr \_Tp **value**

## 4.588.1 Detailed Description

```
template<typename _Tp>
struct std::is_bind_expression< _Tp >
```

Determines if the given type \_Tp is a function object that should be treated as a subexpression when evaluating calls to function objects returned by bind().

C++11 [func.bind.isbind].

Definition at line 184 of file functional.

The documentation for this struct was generated from the following file:

- [functional](#)

#### 4.589 `std::is_bind_expression<_Bind<_Signature>>` Struct Template Reference

Inheritance diagram for `std::is_bind_expression<_Bind<_Signature>>`:

##### Public Types

- typedef [integral\\_constant](#)<\_Tp, \_\_v> **type**
- typedef \_Tp **value\_type**

##### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

##### Static Public Attributes

- static constexpr \_Tp **value**

#### 4.589.1 Detailed Description

```
template<typename _Signature>
struct std::is_bind_expression<_Bind<_Signature>>
```

Class template `_Bind` is always a bind expression.

Definition at line 670 of file `functional`.

The documentation for this struct was generated from the following file:

- [functional](#)

4.590 `std::is_bind_expression< _Bind_result< _Result, _Signature > >` Struct Template Reference

Inheritance diagram for `std::is_bind_expression< _Bind_result< _Result, _Signature > >`:

template<typename _Tp>
struct std::is_copy_assignable<_Tp>
```

`is_copy_assignable`

Definition at line 1090 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 4.603 `std::is_copy_constructible<_Tp>` Struct Template Reference

Inherits `std::__is_copy_constructible_impl<_Tp, bool>`.

Inherited by `std::__is_copy_insertable< allocator<_Tp>>`.

##### 4.603.1 Detailed Description

```
template<typename _Tp>
struct std::is_copy_constructible<_Tp>
```

`is_copy_constructible`

Definition at line 936 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 4.604 `std::is_default_constructible<_Tp>` Struct Template Reference

Inherits `type<_Tp>`.

## 4.604.1 Detailed Description

```
template<typename _Tp>
struct std::is_default_constructible< _Tp >
```

is\_default\_constructible

Definition at line 915 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.605 std::is\_destructible&lt; \_Tp &gt; Struct Template Reference

Inherits type< \_Tp >.

## 4.605.1 Detailed Description

```
template<typename _Tp>
struct std::is_destructible< _Tp >
```

is\_destructible

Definition at line 841 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.606 std::is\_empty&lt; \_Tp &gt; Struct Template Reference

Inheritance diagram for std::is\_empty< \_Tp >:

#### Public Types

- typedef [integral\\_constant](#)< bool, \_\_v > **type**
- typedef bool **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

#### Static Public Attributes

- static constexpr bool **value**

#### 4.606.1 Detailed Description

```
template<typename _Tp>
struct std::is_empty< _Tp >
```

is\_empty

Definition at line 715 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 4.607 std::is\_enum< \_Tp > Struct Template Reference

Inheritance diagram for std::is\_enum< \_Tp >:

## Public Types

- typedef [integral\\_constant](#)< bool, \_\_v > **type**
- typedef bool **value\_type**

## Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

## Static Public Attributes

- static constexpr bool **value**

## 4.607.1 Detailed Description

```
template<typename _Tp>
struct std::is_enum< _Tp >
```

is\_enum

Definition at line 472 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.608 std::is\_error\_code\_enum&lt; \_Tp &gt; Struct Template Reference

Inheritance diagram for std::is\_error\_code\_enum< \_Tp >:

#### Public Types

- typedef [integral\\_constant](#)< \_Tp, \_\_v > **type**
- typedef \_Tp **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

#### Static Public Attributes

- static constexpr \_Tp **value**

#### 4.608.1 Detailed Description

```
template<typename _Tp>
struct std::is_error_code_enum< _Tp >
```

is\_error\_code\_enum

Definition at line 60 of file system\_error.

The documentation for this struct was generated from the following file:

- [system\\_error](#)

#### 4.609 std::is\_error\_code\_enum< future\_errc > Struct Template Reference

Inheritance diagram for std::is\_error\_code\_enum< future\_errc >:

## Public Types

- typedef [integral\\_constant](#)< \_Tp, \_\_v > **type**
- typedef \_Tp **value\_type**

## Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

## Static Public Attributes

- static constexpr \_Tp **value**

## 4.609.1 Detailed Description

```
template<>
struct std::is_error_code_enum< future_errc >
```

Specialization.

Definition at line 76 of file future.

The documentation for this struct was generated from the following file:

- [future](#)

4.610 `std::is_error_condition_enum< _Tp >` Struct Template Reference

Inheritance diagram for `std::is_error_condition_enum< _Tp >`:

#### Public Types

- typedef [integral\\_constant](#)< \_Tp, \_\_v > **type**
- typedef \_Tp **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

#### Static Public Attributes

- static constexpr \_Tp **value**

#### 4.610.1 Detailed Description

```
template<typename _Tp>
struct std::is_error_condition_enum< _Tp >
```

is\_error\_condition\_enum

Definition at line 64 of file system\_error.

The documentation for this struct was generated from the following file:

- [system\\_error](#)

#### 4.611 std::is\_final< \_Tp > Struct Template Reference

Inheritance diagram for std::is\_final< \_Tp >:

## Public Types

- typedef [integral\\_constant](#)< bool, \_\_v > **type**
- typedef bool **value\_type**

## Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

## Static Public Attributes

- static constexpr bool **value**

## 4.611.1 Detailed Description

```
template<typename _Tp>
struct std::is_final< _Tp >
```

is\_final

Definition at line 729 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

4.612 `std::is_floating_point< _Tp >` Struct Template Reference

Inherits `type< __remove_cv_t< _Tp > >`.

## 4.612.1 Detailed Description

```
template<typename _Tp>
struct std::is_floating_point< _Tp >
```

is\_floating\_point

Definition at line 393 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 4.613 `std::is_function<_Tp>` Struct Template Reference

Inheritance diagram for `std::is_function<_Tp>`:

##### Public Types

- typedef [integral\\_constant](#)<\_Tp, \_\_v> **type**
- typedef \_Tp **value\_type**

##### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

##### Static Public Attributes

- static constexpr \_Tp **value**

##### 4.613.1 Detailed Description

```
template<typename _Tp>
struct std::is_function<_Tp>
```

`is_function`

Definition at line 191 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.614 std::is\_fundamental< \_Tp > Struct Template Reference

Inherits type< is\_arithmetic< \_Tp >, is\_void< \_Tp >, is\_null\_pointer< \_Tp > >.

### 4.614.1 Detailed Description

```
template<typename _Tp>
struct std::is_fundamental< _Tp >
```

is\_fundamental

Definition at line 540 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.615 std::is\_integral< \_Tp > Struct Template Reference

Inheritance diagram for std::is\_integral< \_Tp >:

### Public Types

- typedef [integral\\_constant](#)< \_Tp, \_\_v > **type**
- typedef \_Tp **value\_type**

### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

#### Static Public Attributes

- static constexpr `_Tp` **value**

#### 4.615.1 Detailed Description

```
template<typename _Tp>
struct std::is_integral<_Tp>
```

`is_integral`

Definition at line 365 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 4.616 `std::is_literal_type<_Tp>` Struct Template Reference

Inheritance diagram for `std::is_literal_type<_Tp>`:

#### Public Types

- typedef [integral\\_constant](#)< bool, `__v` > **type**
- typedef bool **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

## Static Public Attributes

- static constexpr bool **value**

## 4.616.1 Detailed Description

```
template<typename _Tp>
struct std::is_literal_type< _Tp >
```

is\_literal\_type

Definition at line 706 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.617 std::is\_lvalue\_reference&lt; typename &gt; Struct Template Reference

Inheritance diagram for std::is\_lvalue\_reference< typename >:

## Public Types

- typedef [integral\\_constant](#)< \_Tp, \_\_v > **type**
- typedef \_Tp **value\_type**

## Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

#### Static Public Attributes

- static constexpr `_Tp` **value**

#### 4.617.1 Detailed Description

```
template<typename>
struct std::is_lvalue_reference< typename >
```

`is_lvalue_reference`

Definition at line 426 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 4.618 `std::is_member_function_pointer< _Tp >` Struct Template Reference

Inheritance diagram for `std::is_member_function_pointer< _Tp >`:

#### Public Types

- typedef [integral\\_constant](#)< `_Tp`, `__v` > **type**
- typedef `_Tp` **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

## Static Public Attributes

- static constexpr `_Tp` **value**

## 4.618.1 Detailed Description

```
template<typename _Tp>
struct std::is_member_function_pointer< _Tp >
```

is\_member\_function\_pointer

Definition at line 466 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.619 std::is\_member\_object\_pointer&lt; \_Tp &gt; Struct Template Reference

Inherits type< \_\_remove\_cv\_t< \_Tp > >.

## 4.619.1 Detailed Description

```
template<typename _Tp>
struct std::is_member_object_pointer< _Tp >
```

is\_member\_object\_pointer

Definition at line 452 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.620 std::is\_member\_pointer&lt; \_Tp &gt; Struct Template Reference

Inheritance diagram for std::is\_member\_pointer< \_Tp >:

#### Public Types

- typedef [integral\\_constant](#)< \_Tp, \_\_v > **type**
- typedef \_Tp **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

#### Static Public Attributes

- static constexpr \_Tp **value**

#### 4.620.1 Detailed Description

```
template<typename _Tp>
struct std::is_member_pointer< _Tp >
```

is\_member\_pointer

Definition at line 553 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 4.621 std::is\_move\_assignable< \_Tp > Struct Template Reference

Inherits type< \_Tp >.

#### 4.621.1 Detailed Description

```
template<typename _Tp>
struct std::is_move_assignable< _Tp >
```

is\_move\_assignable

Definition at line 1111 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.622 `std::is_move_constructible< _Tp >` Struct Template Reference

Inherits `std::__is_move_constructible_impl< _Tp, bool >`.

Inherited by `std::__is_move_insertable< allocator< _Tp > >`.

### 4.622.1 Detailed Description

```
template<typename _Tp>
struct std::is_move_constructible< _Tp >
```

`is_move_constructible`

Definition at line 957 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.623 `std::is_nothrow_assignable< _Tp, _Up >` Struct Template Reference

Inherits `std::__is_nothrow_assignable_impl< _Tp, _Up >`.

### 4.623.1 Detailed Description

```
template<typename _Tp, typename _Up>
struct std::is_nothrow_assignable< _Tp, _Up >
```

`is_nothrow_assignable`

Definition at line 1131 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 4.624 `std::is_nothrow_constructible<_Tp, _Args>` Struct Template Reference

Inheritance diagram for `std::is_nothrow_constructible<_Tp, _Args>`:

##### Public Types

- typedef [integral\\_constant](#)<\_Tp, \_\_v> **type**
- typedef \_Tp **value\_type**

##### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

##### Static Public Attributes

- static constexpr \_Tp **value**

##### 4.624.1 Detailed Description

```
template<typename _Tp, typename... _Args>
struct std::is_nothrow_constructible<_Tp, _Args>
```

`is_nothrow_constructible`

Definition at line 1008 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.625 std::is\_nothrow\_copy\_assignable< \_Tp > Struct Template Reference

Inherits std::\_\_is\_nt\_copy\_assignable\_impl< \_Tp, bool >.

### 4.625.1 Detailed Description

```
template<typename _Tp>
struct std::is_nothrow_copy_assignable< _Tp >
```

is\_nothrow\_copy\_assignable

Definition at line 1152 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.626 std::is\_nothrow\_copy\_constructible< \_Tp > Struct Template Reference

Inherits type< \_Tp >.

### 4.626.1 Detailed Description

```
template<typename _Tp>
struct std::is_nothrow_copy_constructible< _Tp >
```

is\_nothrow\_copy\_constructible

Definition at line 1039 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.627 std::is\_nothrow\_default\_constructible< \_Tp > Struct Template Reference

Inheritance diagram for std::is\_nothrow\_default\_constructible< \_Tp >:

#### Public Types

- typedef [integral\\_constant](#)< \_Tp, \_\_v > **type**
- typedef \_Tp **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

#### Static Public Attributes

- static constexpr \_Tp **value**

#### 4.627.1 Detailed Description

```
template<typename _Tp>
struct std::is_nothrow_default_constructible< _Tp >
```

is\_nothrow\_default\_constructible

Definition at line 1017 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 4.628 std::is\_nothrow\_destructible< \_Tp > Struct Template Reference

Inherits type< \_Tp >.

#### 4.628.1 Detailed Description

```
template<typename _Tp>
struct std::is_nothrow_destructible< _Tp >
```

is\_nothrow\_destructible

Definition at line 892 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.629 `std::is_nothrow_move_assignable< _Tp >` Struct Template Reference

Inherits `std::__is_nt_move_assignable_impl< _Tp, bool >`.

### 4.629.1 Detailed Description

```
template<typename _Tp>
struct std::is_nothrow_move_assignable< _Tp >
```

`is_nothrow_move_assignable`

Definition at line 1173 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.630 `std::is_nothrow_move_constructible< _Tp >` Struct Template Reference

Inherits `type< _Tp >`.

### 4.630.1 Detailed Description

```
template<typename _Tp>
struct std::is_nothrow_move_constructible< _Tp >
```

`is_nothrow_move_constructible`

Definition at line 1060 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.631 `std::is_nothrow_swappable< _Tp >` Struct Template Reference

Inherits `type< _Tp >`.

#### 4.631.1 Detailed Description

```
template<typename _Tp>
struct std::is_nothrow_swappable< _Tp >
```

is\_nothrow\_swappable

Definition at line 2729 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 4.632 std::is\_nothrow\_swappable\_with< \_Tp, \_Up > Struct Template Reference

Inherits type< \_Tp, \_Up >.

##### 4.632.1 Detailed Description

```
template<typename _Tp, typename _Up>
struct std::is_nothrow_swappable_with< _Tp, _Up >
```

is\_nothrow\_swappable\_with

Definition at line 2816 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 4.633 std::is\_null\_pointer< \_Tp > Struct Template Reference

Inheritance diagram for std::is\_null\_pointer< \_Tp >:

## 4.633.1 Detailed Description

```
template<typename _Tp>
struct std::is_null_pointer< _Tp >
```

is\_null\_pointer (LWG 2247).

Definition at line 513 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.634 std::is\_object&lt; \_Tp &gt; Struct Template Reference

Inheritance diagram for std::is\_object< \_Tp >:

## Public Types

- typedef [integral\\_constant](#)< \_Tp, \_\_v > **type**
- typedef \_Tp **value\_type**

## Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

## Static Public Attributes

- static constexpr \_Tp **value**

#### 4.634.1 Detailed Description

```
template<typename _Tp>
struct std::is_object< _Tp >
```

is\_object

Definition at line 547 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 4.635 std::is\_placeholder< \_Tp > Struct Template Reference

Inheritance diagram for std::is\_placeholder< \_Tp >:

#### Public Types

- typedef [integral\\_constant](#)< int, \_\_v > **type**
- typedef int **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

#### Static Public Attributes

- static constexpr int **value**

## 4.635.1 Detailed Description

```
template<typename _Tp>
struct std::is_placeholder<_Tp>
```

Determines if the given type `_Tp` is a placeholder in a `bind()` expression and, if so, which placeholder it is.

C++11 [func.bind.isplace].

Definition at line 195 of file `functional`.

The documentation for this struct was generated from the following file:

- [functional](#)

4.636 `std::is_placeholder<_Placeholder<_Num>>` Struct Template Reference

Inheritance diagram for `std::is_placeholder<_Placeholder<_Num>>`:

## Public Types

- typedef `integral_constant<int, __v>` **type**
- typedef `int` **value\_type**

## Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr `value_type` **operator()** () const noexcept

### Static Public Attributes

- static constexpr int **value**

#### 4.636.1 Detailed Description

```
template<int _Num>
struct std::is_placeholder< _Placeholder< _Num > >
```

Partial specialization of `is_placeholder` that provides the placeholder number for the placeholder objects defined by `libstdc++`.

Definition at line 258 of file `functional`.

The documentation for this struct was generated from the following file:

- [functional](#)

#### 4.637 `std::is_pod< _Tp >` Struct Template Reference

Inheritance diagram for `std::is_pod< _Tp >`:

### Public Types

- typedef [integral\\_constant](#)< bool, \_\_v > **type**
- typedef bool **value\_type**

### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

## Static Public Attributes

- static constexpr bool **value**

## 4.637.1 Detailed Description

```
template<typename _Tp>
struct std::is_pod< _Tp >
```

is\_pod (deprecated in C++20)

Definition at line 695 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.638 std::is\_pointer&lt; \_Tp &gt; Struct Template Reference

Inherits type< \_\_remove\_cv\_t< \_Tp > >.

## 4.638.1 Detailed Description

```
template<typename _Tp>
struct std::is_pointer< _Tp >
```

is\_pointer

Definition at line 420 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.639 std::is\_polymorphic&lt; \_Tp &gt; Struct Template Reference

Inheritance diagram for std::is\_polymorphic< \_Tp >:

#### Public Types

- typedef [integral\\_constant](#)< bool, \_\_v > **type**
- typedef bool **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

#### Static Public Attributes

- static constexpr bool **value**

#### 4.639.1 Detailed Description

```
template<typename _Tp>
struct std::is_polymorphic< _Tp >
```

is\_polymorphic

Definition at line 721 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 4.640 std::is\_reference< \_Tp > Struct Template Reference

Inherits type< is\_lvalue\_reference< \_Tp >, is\_rvalue\_reference< \_Tp > >.

#### 4.640.1 Detailed Description

```
template<typename _Tp>
struct std::is_reference< _Tp >
```

is\_reference

Definition at line 189 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

4.641 `std::is_rvalue_reference< typename >` Struct Template Reference

Inheritance diagram for `std::is_rvalue_reference< typename >`:

**Public Types**

- typedef [integral\\_constant](#)< `_Tp`, `__v` > **type**
- typedef `_Tp` **value\_type**

**Public Member Functions**

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

**Static Public Attributes**

- static constexpr `_Tp` **value**

## 4.641.1 Detailed Description

```
template<typename>
struct std::is_rvalue_reference< typename >
```

`is_rvalue_reference`

Definition at line 435 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 4.642 `std::is_same<_Tp, _Up>` Struct Template Reference

Inheritance diagram for `std::is_same<_Tp, _Up>`:

##### Public Types

- typedef [integral\\_constant](#)<\_Tp, \_\_v> **type**
- typedef \_Tp **value\_type**

##### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

##### Static Public Attributes

- static constexpr \_Tp **value**

##### 4.642.1 Detailed Description

```
template<typename _Tp, typename _Up>
struct std::is_same<_Tp, _Up>
```

`is_same`

Definition at line 582 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.643 std::is\_scalar&lt; \_Tp &gt; Struct Template Reference

Inherits type< is\_arithmetic< \_Tp >, is\_enum< \_Tp >, is\_pointer< \_Tp >, is\_member\_pointer< \_Tp >, is\_null\_pointer< \_Tp > >.

## 4.643.1 Detailed Description

```
template<typename _Tp>
struct std::is_scalar< _Tp >
```

is\_scalar

Definition at line 557 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 4.644 std::is\_standard\_layout&lt; \_Tp &gt; Struct Template Reference

Inheritance diagram for std::is\_standard\_layout< \_Tp >:

## Public Types

- typedef [integral\\_constant](#)< bool, \_\_v > **type**
- typedef bool **value\_type**

## Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

#### Static Public Attributes

- static constexpr bool **value**

##### 4.644.1 Detailed Description

```
template<typename _Tp>
struct std::is_standard_layout< _Tp >
```

is\_standard\_layout

Definition at line 685 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 4.645 std::is\_swappable< \_Tp > Struct Template Reference

Inherits type< \_Tp >.

##### 4.645.1 Detailed Description

```
template<typename _Tp>
struct std::is_swappable< _Tp >
```

Metafunctions used for detecting swappable types: p0185r1.

is\_swappable

Definition at line 2720 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 4.646 std::is\_swappable\_with< \_Tp, \_Up > Struct Template Reference

Inherits type< \_Tp, \_Up >.

## 4.646.1 Detailed Description

```
template<typename _Tp, typename _Up>
struct std::is_swappable_with< _Tp, _Up >
```

is\_swappable\_with

Definition at line 2810 of file type\_traits.

The documentation for this struct was generated from the following file:

#### 4.659 std::istream\_iterator< \_Tp, \_CharT, \_Traits, \_Dist > Class Template Reference

Inheritance diagram for std::istream\_iterator< \_Tp, \_CharT, \_Traits, \_Dist >:

#### Public Types

- typedef `_CharT` **char\_type**
- typedef `_Dist` [difference\\_type](#)
- typedef [basic\\_istream](#)< `_CharT`, `_Traits` > **istream\_type**
- typedef [input\\_iterator\\_tag](#) `iterator_category`
- typedef `const _Tp *` [pointer](#)
- typedef `const _Tp &` [reference](#)
- typedef `_Traits` **traits\_type**
- typedef `_Tp` [value\\_type](#)

## Public Member Functions

- constexpr `istream_iterator` ()
- `istream_iterator` (`istream_type` &\_\_s)
- `istream_iterator` (const `istream_iterator` &\_\_obj)
- const `_Tp` & `operator*` () const
- `istream_iterator` & `operator++` ()
- `istream_iterator` `operator++` (int)
- const `_Tp` \* `operator->` () const
- `istream_iterator` & `operator=` (const `istream_iterator` &)=default

## Friends

- bool `operator!=` (const `istream_iterator` &\_\_x, const `istream_iterator` &\_\_y)
- bool `operator==` (const `istream_iterator` &\_\_x, const `istream_iterator` &\_\_y)

## 4.659.1 Detailed Description

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename _Dist = ptrdiff_t>
class std::istream_iterator<_Tp, _CharT, _Traits, _Dist>
```

Provides input iterator semantics for streams.

Definition at line 49 of file `stream_iterator.h`.

## 4.659.2 Member Typedef Documentation

4.659.2.1 `difference_type`

```
typedef _Dist std::iterator< input_iterator_tag , _Tp, _Dist , const _Tp * , const _Tp & >↔
::difference_type [inherited]
```

Distance between iterators is represented as this type.

Definition at line 134 of file `stl_iterator_base_types.h`.

4.659.2.2 `iterator_category`

```
typedef input_iterator_tag std::iterator< input_iterator_tag , _Tp, _Dist , const _Tp * , const ↵
_Tp & >::iterator_category [inherited]
```

One of the [tag types](#).

Definition at line 130 of file `stl_iterator_base_types.h`.

#### 4.659.2.3 pointer

```
typedef const _Tp * std::iterator< input_iterator_tag , _Tp, _Dist , const _Tp * , const _Tp &
>::pointer [inherited]
```

This type represents a pointer-to-value\_type.

Definition at line 136 of file `stl_iterator_base_types.h`.

#### 4.659.2.4 reference

```
typedef const _Tp & std::iterator< input_iterator_tag , _Tp, _Dist , const _Tp * , const _Tp &
>::reference [inherited]
```

This type represents a reference-to-value\_type.

Definition at line 138 of file `stl_iterator_base_types.h`.

#### 4.659.2.5 value\_type

```
typedef _Tp std::iterator< input_iterator_tag , _Tp, _Dist , const _Tp * , const _Tp & >::value_type
[inherited]
```

The type "pointed to" by the iterator.

Definition at line 132 of file `stl_iterator_base_types.h`.

### 4.659.3 Constructor & Destructor Documentation

#### 4.659.3.1 `istream_iterator()` [1/2]

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>, typename
_Dist = ptrdiff_t>
constexpr std::istream_iterator< _Tp, _CharT, _Traits, _Dist >::istream_iterator () [inline]
```

Construct end of input stream iterator.

Definition at line 67 of file `stream_iterator.h`.

### 4.659.3.2 istream\_iterator() [2/2]

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>, typename
_Dist = ptrdiff_t>
std::istream_iterator< _Tp, _CharT, _Traits, _Dist >::istream_iterator (
 istream_type & __s) [inline]
```

Construct start of input stream iterator.

Definition at line 71 of file stream\_iterator.h.

## 4.659.4 Friends And Related Function Documentation

### 4.659.4.1 operator!=

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>, typename
_Dist = ptrdiff_t>
bool operator!= (
 const istream_iterator< _Tp, _CharT, _Traits, _Dist > & __x,
 const istream_iterator< _Tp, _CharT, _Traits, _Dist > & __y) [friend]
```

Return true if the iterators refer to different streams, or if one is at end-of-stream and the other is not.

Definition at line 153 of file stream\_iterator.h.

### 4.659.4.2 operator==

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>, typename
_Dist = ptrdiff_t>
bool operator== (
 const istream_iterator< _Tp, _CharT, _Traits, _Dist > & __x,
 const istream_iterator< _Tp, _CharT, _Traits, _Dist > & __y) [friend]
```

Return true if the iterators refer to the same stream, or are both at end-of-stream.

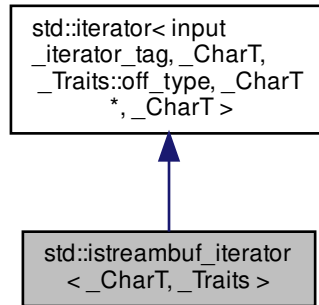

Definition at line 147 of file stream\_iterator.h.

The documentation for this class was generated from the following file:

- [stream\\_iterator.h](#)

#### 4.660 `std::istreambuf_iterator<_CharT, _Traits>` Class Template Reference

## 4.660.1 Detailed Description

```
template<typename _CharT, typename _Traits>
class std::istreambuf_iterator< _CharT, _Traits >
```

Provides input iterator semantics for streambufs.

Definition at line 125 of file iosfwd.

## 4.660.2 Member Typedef Documentation

## 4.660.2.1 char\_type

```
template<typename _CharT , typename _Traits >
typedef _CharT std::istreambuf_iterator< _CharT, _Traits >::char_type
```

Public typedefs.

Definition at line 66 of file streambuf\_iterator.h.

## 4.660.2.2 difference\_type

```
typedef _Traits::off_type std::iterator< input_iterator_tag , _CharT , _Traits::off_type , _CharT
* , _CharT >::difference_type [inherited]
```

Distance between iterators is represented as this type.

Definition at line 134 of file stl\_iterator\_base\_types.h.

#### 4.660.2.3 int\_type

```
template<typename _CharT , typename _Traits >
typedef _Traits::int_type std::istreambuf_iterator< _CharT, _Traits >::int_type
```

Public typedefs.

Definition at line 68 of file streambuf\_iterator.h.

#### 4.660.2.4 istream\_type

```
template<typename _CharT , typename _Traits >
typedef basic_istream<_CharT, _Traits> std::istreambuf_iterator< _CharT, _Traits >::istream_type
```

Public typedefs.

Definition at line 70 of file streambuf\_iterator.h.

#### 4.660.2.5 iterator\_category

```
typedef input_iterator_tag std::iterator< input_iterator_tag , _CharT , _Traits::off_type , _↵
CharT * , _CharT >::iterator_category [inherited]
```

One of the [tag types](#).

Definition at line 130 of file stl\_iterator\_base\_types.h.

#### 4.660.2.6 pointer

```
typedef _CharT * std::iterator< input_iterator_tag , _CharT , _Traits::off_type , _CharT * , _↵
CharT >::pointer [inherited]
```

This type represents a pointer-to-value\_type.

Definition at line 136 of file stl\_iterator\_base\_types.h.

#### 4.660.2.7 reference

```
typedef _CharT std::iterator< input_iterator_tag , _CharT , _Traits::off_type , _CharT * , _CharT
>::reference [inherited]
```

This type represents a reference-to-value\_type.

Definition at line 138 of file stl\_iterator\_base\_types.h.

#### 4.660.2.8 streambuf\_type

```
template<typename _CharT , typename _Traits >
typedef basic_streambuf<_CharT, _Traits> std::istreambuf_iterator< _CharT, _Traits >::streambuf_type
```

Public typedefs.

Definition at line 69 of file streambuf\_iterator.h.

#### 4.660.2.9 traits\_type

```
template<typename _CharT , typename _Traits >
typedef _Traits std::istreambuf_iterator< _CharT, _Traits >::traits_type
```

Public typedefs.

Definition at line 67 of file streambuf\_iterator.h.

#### 4.660.2.10 value\_type

```
typedef _CharT std::iterator< input_iterator_tag , _CharT , _Traits::off_type , _CharT * , _CharT
>::value_type [inherited]
```

The type "pointed to" by the iterator.

Definition at line 132 of file stl\_iterator\_base\_types.h.

### 4.660.3 Constructor & Destructor Documentation

#### 4.660.3.1 istreambuf\_iterator() [1/3]

```
template<typename _CharT , typename _Traits >
constexpr std::istreambuf_iterator< _CharT, _Traits >::istreambuf_iterator () [inline], [noexcept]
```

Construct end of input stream iterator.

Definition at line 115 of file streambuf\_iterator.h.

#### 4.660.3.2 `istreambuf_iterator()` [2/3]

```
template<typename _CharT , typename _Traits >
std::istreambuf_iterator< _CharT, _Traits >::istreambuf_iterator (
 istream_type & __s) [inline], [noexcept]
```

Construct start of input stream iterator.

Definition at line 130 of file `streambuf_iterator.h`.

#### 4.660.3.3 `istreambuf_iterator()` [3/3]

```
template<typename _CharT , typename _Traits >
std::istreambuf_iterator< _CharT, _Traits >::istreambuf_iterator (
 streambuf_type * __s) [inline], [noexcept]
```

Construct start of streambuf iterator.

Definition at line 134 of file `streambuf_iterator.h`.

### 4.660.4 Member Function Documentation

#### 4.660.4.1 `equal()`

```
template<typename _CharT , typename _Traits >
bool std::istreambuf_iterator< _CharT, _Traits >::equal (
 const istreambuf_iterator< _CharT, _Traits > & __b) const [inline]
```

Return true both iterators are end or both are not end.

Definition at line 194 of file `streambuf_iterator.h`.

#### 4.660.4.2 `operator*()`

```
template<typename _CharT , typename _Traits >
char_type std::istreambuf_iterator< _CharT, _Traits >::operator* () const [inline]
```

Return the current character pointed to by iterator. This returns `streambuf.sgetc()`. It cannot be assigned. NB: The result of `operator*()` on an end of stream is undefined.

Definition at line 146 of file `streambuf_iterator.h`.

## 4.660.4.3 operator++() [1/2]

```
template<typename _CharT , typename _Traits >
istreambuf_iterator& std::istreambuf_iterator< _CharT, _Traits >::operator++ () [inline]
```

Advance the iterator. Calls streambuf.sbumpc().

Definition at line 162 of file streambuf\_iterator.h.

## 4.660.4.4 operator++() [2/2]

```
template<typename _CharT , typename _Traits >
istreambuf_iterator std::istreambuf_iterator< _CharT, _Traits >::operator++ (
 int) [inline]
```

Advance the iterator. Calls streambuf.sbumpc().

Definition at line 176 of file streambuf\_iterator.h.

The documentation for this class was generated from the following files:

- [iosfwd](#)
- [streambuf\\_iterator.h](#)

## 4.661 std::experimental::filesystem::v1::path::iterator Class Reference

- **bool operator==** (const [iterator](#) &other) const

## Public Attributes

- **node\_pointer\_pointer m\_p\_p\_cur**
- **node\_pointer\_pointer m\_p\_p\_end**

## 4.662.1 Detailed Description

```
template<typename ATraits, typename Metadata>
struct __gnu_pbds::detail::pat_trie_base::_Inode< ATraits, Metadata >::iterator
```

Child iterator.

Definition at line 320 of file `pat_trie_base.hpp`.

The documentation for this struct was generated from the following file:

- [pat\\_trie\\_base.hpp](#)

4.663 `std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >` Struct Template Reference

## Public Types

- **typedef \_Distance** [difference\\_type](#)
- **typedef \_Category** [iterator\\_category](#)
- **typedef \_Pointer** [pointer](#)
- **typedef \_Reference** [reference](#)
- **typedef \_Tp** [value\\_type](#)

#### 4.663.1 Detailed Description

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename _Reference =
_Tp&>
struct std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >
```

Common iterator class.

This class does nothing but define nested typedefs. Iterator classes can inherit from this class to save some work. The typedefs are then used in specializations and overloading.

In particular, there are no default implementations of requirements such as `operator++` and the like. (How could there be?)

Definition at line 127 of file `stl_iterator_base_types.h`.

#### 4.663.2 Member Typedef Documentation

##### 4.663.2.1 `difference_type`

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _↵
_Tp*, typename _Reference = _Tp&>
typedef _Distance std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::difference_type
```

Distance between iterators is represented as this type.

Definition at line 134 of file `stl_iterator_base_types.h`.

##### 4.663.2.2 `iterator_category`

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _↵
_Tp*, typename _Reference = _Tp&>
typedef _Category std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::iterator_category
```

One of the [tag types](#).

Definition at line 130 of file `stl_iterator_base_types.h`.

#### 4.663.2.3 `pointer`

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*,
 typename _Reference = _Tp&>
typedef _Pointer std::iterator<_Category, _Tp, _Distance, _Pointer, _Reference >::pointer
```

This type represents a pointer-to-value\_type.

Definition at line 136 of file `stl_iterator_base_types.h`.

#### 4.663.2.4 `reference`

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*,
 typename _Reference = _Tp&>
typedef _Reference std::iterator<_Category, _Tp, _Distance, _Pointer, _Reference >::reference
```

This type represents a reference-to-value\_type.

Definition at line 138 of file `stl_iterator_base_types.h`.

#### 4.663.2.5 `value_type`

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*,
 typename _Reference = _Tp&>
typedef _Tp std::iterator<_Category, _Tp, _Distance, _Pointer, _Reference >::value_type
```

The type "pointed to" by the iterator.

Definition at line 132 of file `stl_iterator_base_types.h`.

The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

### 4.664 `std::iterator_traits<_Iterator>` Struct Template Reference

Inherits `std::__iterator_traits<_Iterator, typename>`.

#### 4.664.1 Detailed Description

```
template<typename _Iterator>
struct std::iterator_traits< _Iterator >
```

Traits class for iterators.

This class does nothing but define nested typedefs. The general version simply *forwards* the nested typedefs from the `Iterator` argument. Specialized versions for pointers and pointers-to-const provide tighter, more correct semantics.

Definition at line 423 of file `cpp_type_traits.h`.

The documentation for this struct was generated from the following file:

- [cpp\\_type\\_traits.h](#)

#### 4.665 `std::iterator_traits< _Tp * >` Struct Template Reference

##### Public Types

- typedef ptrdiff\_t **difference\_type**
- typedef [random\\_access\\_iterator\\_tag](#) **iterator\_category**
- typedef \_Tp \* **pointer**
- typedef \_Tp & **reference**
- typedef \_Tp **value\_type**

#### 4.665.1 Detailed Description

```
template<typename _Tp>
struct std::iterator_traits< _Tp * >
```

Partial specialization for pointer types.

Definition at line 210 of file `stl_iterator_base_types.h`.

The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

#### 4.666 `std::iterator_traits< const _Tp * >` Struct Template Reference

##### Public Types

- typedef ptrdiff\_t **difference\_type**
- typedef [random\\_access\\_iterator\\_tag](#) **iterator\_category**
- typedef const \_Tp \* **pointer**
- typedef const \_Tp & **reference**
- typedef \_Tp **value\_type**

## 4.666.1 Detailed Description

```
template<typename _Tp>
struct std::iterator_traits< const _Tp * >
```

Partial specialization for const pointer types.

Definition at line 221 of file stl\_iterator\_base\_types.h.

The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

## 4.667 \_\_gnu\_pbds::join\_error Struct Reference

Inheritance diagram for \_\_gnu\_pbds::join\_error:

## Public Member Functions

- virtual const char \* [what](#) () const noexcept

## 4.667.1 Detailed Description

A join cannot be performed logical reasons (i.e., the ranges of the two container objects being joined overlaps.

Definition at line 70 of file exception.hpp.

#### 4.667.2 Member Function Documentation

##### 4.667.2.1 what()

```
virtual const char* std::logic_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future\\_error](#).

The documentation for this struct was generated from the following file:

- [exception.hpp](#)

#### 4.668 `__gnu_pbds::detail::left_child_next_sibling_heap`< Value\_Type, Cmp\_Fn, Node\_Metadata, \_Alloc > Class Template Reference

Inherits `Cmp_Fn`.

##### Public Types

- typedef `_Alloc` **allocator\_type**
- typedef `Cmp_Fn` **cmp\_fn**
- typedef `left_child_next_sibling_heap_const_iterator_< node, _Alloc >` **const\_iterator**
- typedef `__rebind_v::const_pointer` **const\_pointer**
- typedef `__rebind_v::const_reference` **const\_reference**
- typedef `_Alloc::difference_type` **difference\_type**
- typedef `const_iterator` **iterator**

- bool `operator==` (const `left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc >` &other) const

## Public Attributes

- node\_pointer `m_p_nd`

### 4.669.1 Detailed Description

```
template<typename Node, typename _Alloc>
class __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >
```

Const point-type iterator.

Definition at line 60 of file `left_child_next_sibling_heap_/const_iterator.hpp`.

### 4.669.2 Member Typedef Documentation

#### 4.669.2.1 `const_pointer`

```
template<typename Node , typename _Alloc >
typedef base_type::const_pointer __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::const_pointer
```

Iterator's const pointer type.

Definition at line 81 of file `left_child_next_sibling_heap_/const_iterator.hpp`.

#### 4.669.2.2 `const_reference`

```
template<typename Node , typename _Alloc >
typedef base_type::const_reference __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::const_reference
```

Iterator's const reference type.

Definition at line 87 of file `left_child_next_sibling_heap_/const_iterator.hpp`.

#### 4.669.2.3 `difference_type`

```
template<typename Node , typename _Alloc >
typedef _Alloc::difference_type __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::difference_type
```

Difference type.

Definition at line 72 of file `left_child_next_sibling_heap_/const_iterator.hpp`.

#### 4.669.2.4 iterator\_category

```
template<typename Node , typename _Alloc >
typedef std::forward_iterator_tag __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::iterator_category
```

Category.

Definition at line 69 of file `left_child_next_sibling_heap_/const_iterator.hpp`.

#### 4.669.2.5 pointer

```
template<typename Node , typename _Alloc >
typedef base_type::pointer __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::pointer
```

Iterator's pointer type.

Definition at line 78 of file `left_child_next_sibling_heap_/const_iterator.hpp`.

#### 4.669.2.6 reference

```
template<typename Node , typename _Alloc >
typedef base_type::reference __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::reference
```

Iterator's reference type.

Definition at line 84 of file `left_child_next_sibling_heap_/const_iterator.hpp`.

#### 4.669.2.7 value\_type

```
template<typename Node , typename _Alloc >
typedef base_type::value_type __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::value_type
```

Iterator's value type.

Definition at line 75 of file `left_child_next_sibling_heap_/const_iterator.hpp`.

### 4.669.3 Constructor & Destructor Documentation

## 4.669.3.1 left\_child\_next\_sibling\_heap\_const\_iterator\_() [1/2]

```
template<typename Node , typename _Alloc >
__gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >::left_child_next_sibling_heap_co
() [inline]
```

Default constructor.

Definition at line 96 of file left\_child\_next\_sibling\_heap\_/const\_iterator.hpp.

## 4.669.3.2 left\_child\_next\_sibling\_heap\_const\_iterator\_() [2/2]

```
template<typename Node , typename _Alloc >
__gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >::left_child_next_sibling_heap_co
(
 const left_child_next_sibling_heap_const_iterator_< Node, _Alloc > & other) [inline]
```

Copy constructor.

Definition at line 101 of file left\_child\_next\_sibling\_heap\_/const\_iterator.hpp.

## 4.669.4 Member Function Documentation

## 4.669.4.1 operator!=(()) [1/2]

```
template<typename Node , typename _Alloc >
bool __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >::operator!=
(
 const left_child_next_sibling_heap_const_iterator_< Node, _Alloc > & other) const
[inline]
```

Compares content (negatively) to a different iterator object.

Definition at line 111 of file left\_child\_next\_sibling\_heap\_/const\_iterator.hpp.

## 4.669.4.2 operator!=(()) [2/2]

```
template<typename Node , typename _Alloc >
bool __gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc
>::operator!= (
 const left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc > &
other) const [inline], [inherited]
```

Compares content (negatively) to a different iterator object.

Definition at line 127 of file left\_child\_next\_sibling\_heap\_/point\_const\_iterator.hpp.

#### 4.669.4.3 operator\*()

```
template<typename Node , typename _Alloc >
const_reference __gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_<
Node, _Alloc >::operator* () const [inline], [inherited]
```

Access.

Definition at line 114 of file `left_child_next_sibling_heap_/point_const_iterator.hpp`.

#### 4.669.4.4 operator->()

```
template<typename Node , typename _Alloc >
const_pointer __gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_< Node,
_Alloc >::operator-> () const [inline], [inherited]
```

Access.

Definition at line 106 of file `left_child_next_sibling_heap_/point_const_iterator.hpp`.

#### 4.669.4.5 operator==( ) [1/2]

```
template<typename Node , typename _Alloc >
bool __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >::operator==
(
 const left_child_next_sibling_heap_const_iterator_< Node, _Alloc > & other) const
[inline]
```

Compares content to a different iterator object.

Definition at line 106 of file `left_child_next_sibling_heap_/const_iterator.hpp`.

#### 4.669.4.6 operator==( ) [2/2]

```
template<typename Node , typename _Alloc >
bool __gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc
>::operator== (
 const left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc > &
other) const [inline], [inherited]
```

Compares content to a different iterator object.

Definition at line 122 of file `left_child_next_sibling_heap_/point_const_iterator.hpp`.

The documentation for this class was generated from the following file:

- [left\\_child\\_next\\_sibling\\_heap\\_/const\\_iterator.hpp](#)

## 4.670 `__gnu_pbds::detail::left_child_next_sibling_heap_node_<_Value, _Metadata, _Alloc >` Struct Template Reference

### Public Types

- typedef `_Metadata` **metadata\_type**
- typedef `rebind_traits<_Alloc, this_type>::pointer` **node\_pointer**
- typedef `_Alloc::size_type` **size\_type**
- typedef `_Value` **value\_type**

### Public Attributes

- `metadata_type` **m\_metadata**
- `node_pointer` **m\_p\_l\_child**
- `node_pointer` **m\_p\_next\_sibling**
- `node_pointer` **m\_p\_prev\_or\_parent**
- `value_type` **m\_value**

#### 4.670.1 Detailed Description

```
template<typename _Value, typename _Metadata, typename _Alloc>
struct __gnu_pbds::detail::left_child_next_sibling_heap_node_<_Value, _Metadata, _Alloc >
```

Node.

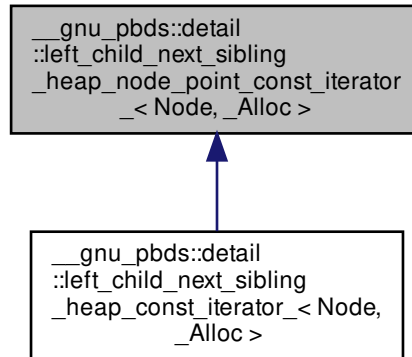

Definition at line 52 of file `left_child_next_sibling_heap_/node.hpp`.

The documentation for this struct was generated from the following file:

- [left\\_child\\_next\\_sibling\\_heap\\_/node.hpp](#)

#### 4.671 `__gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc >` Class Template Reference

Inheritance diagram for `__gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc >`:

#### Public Types

- typedef `rebind_traits< _Alloc, value_type >::const_pointer` `const_pointer`
- typedef `rebind_traits< _Alloc, value_type >::const_reference` `const_reference`
- typedef `trivial_iterator_difference_type` `difference_type`
- typedef `trivial_iterator_tag` `iterator_category`
- typedef `rebind_traits< _Alloc, value_type >::pointer` `pointer`
- typedef `rebind_traits< _Alloc, value_type >::reference` `reference`
- typedef `Node::value_type` `value_type`

#### Public Member Functions

- `left_child_next_sibling_heap_node_point_const_iterator_` (`node_pointer p_nd`)
- `left_child_next_sibling_heap_node_point_const_iterator_` ()
- `left_child_next_sibling_heap_node_point_const_iterator_` (`const left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc > &other`)
- `bool operator!=` (`const left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc > &other`) `const`
- `const_reference operator*` () `const`
- `const_pointer operator->` () `const`
- `bool operator==` (`const left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc > &other`) `const`

#### Public Attributes

- `node_pointer` `m_p_nd`

## Protected Types

- typedef `rebind_traits<_Alloc, Node >::pointer` `node_pointer`

### 4.671.1 Detailed Description

```
template<typename Node, typename _Alloc>
class __gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc >
```

Const point-type iterator.

Definition at line 61 of file `left_child_next_sibling_heap_/point_const_iterator.hpp`.

### 4.671.2 Member Typedef Documentation

#### 4.671.2.1 `const_pointer`

```
template<typename Node , typename _Alloc >
typedef rebind_traits<_Alloc, value_type>::const_pointer __gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_<
Node, _Alloc >::const_pointer
```

Iterator's const pointer type.

Definition at line 81 of file `left_child_next_sibling_heap_/point_const_iterator.hpp`.

#### 4.671.2.2 `const_reference`

```
template<typename Node , typename _Alloc >
typedef rebind_traits<_Alloc, value_type>::const_reference __gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_<
Node, _Alloc >::const_reference
```

Iterator's const reference type.

Definition at line 88 of file `left_child_next_sibling_heap_/point_const_iterator.hpp`.

#### 4.671.2.3 `difference_type`

```
template<typename Node , typename _Alloc >
typedef trivial_iterator_difference_type __gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_<
Node, _Alloc >::difference_type
```

Difference type.

Definition at line 71 of file `left_child_next_sibling_heap_/point_const_iterator.hpp`.

#### 4.671.2.4 iterator\_category

```
template<typename Node , typename _Alloc >
typedef trivial_iterator_tag __gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_<
Node, _Alloc >::iterator_category
```

Category.

Definition at line 68 of file left\_child\_next\_sibling\_heap\_/point\_const\_iterator.hpp.

#### 4.671.2.5 pointer

```
template<typename Node , typename _Alloc >
typedef rebind_traits<_Alloc, value_type>::pointer __gnu_pbds::detail::left_child_next_sibling_heap_node_point_co
Node, _Alloc >::pointer
```

Iterator's pointer type.

Definition at line 77 of file left\_child\_next\_sibling\_heap\_/point\_const\_iterator.hpp.

#### 4.671.2.6 reference

```
template<typename Node , typename _Alloc >
typedef rebind_traits<_Alloc, value_type>::reference __gnu_pbds::detail::left_child_next_sibling_heap_node_point_
Node, _Alloc >::reference
```

Iterator's reference type.

Definition at line 84 of file left\_child\_next\_sibling\_heap\_/point\_const\_iterator.hpp.

#### 4.671.2.7 value\_type

```
template<typename Node , typename _Alloc >
typedef Node::value_type __gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_<
Node, _Alloc >::value_type
```

Iterator's value type.

Definition at line 74 of file left\_child\_next\_sibling\_heap\_/point\_const\_iterator.hpp.

### 4.671.3 Constructor & Destructor Documentation

#### 4.671.3.1 `left_child_next_sibling_heap_node_point_const_iterator_()` [1/2]

```
template<typename Node , typename _Alloc >
__gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc >↔
::left_child_next_sibling_heap_node_point_const_iterator_ () [inline]
```

Default constructor.

Definition at line 96 of file `left_child_next_sibling_heap_/point_const_iterator.hpp`.

#### 4.671.3.2 `left_child_next_sibling_heap_node_point_const_iterator_()` [2/2]

```
template<typename Node , typename _Alloc >
__gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc >↔
::left_child_next_sibling_heap_node_point_const_iterator_ (
 const left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc > &
 other) [inline]
```

Copy constructor.

Definition at line 101 of file `left_child_next_sibling_heap_/point_const_iterator.hpp`.

### 4.671.4 Member Function Documentation

#### 4.671.4.1 `operator!=(())`

```
template<typename Node , typename _Alloc >
bool __gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc
>::operator!=(
 const left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc > &
 other) const [inline]
```

Compares content (negatively) to a different iterator object.

Definition at line 127 of file `left_child_next_sibling_heap_/point_const_iterator.hpp`.

#### 4.671.4.2 `operator*()`

```
template<typename Node , typename _Alloc >
const_reference __gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_<
Node, _Alloc >::operator* () const [inline]
```

Access.

Definition at line 114 of file `left_child_next_sibling_heap_/point_const_iterator.hpp`.

#### 4.671.4.3 operator->()

```
template<typename Node , typename _Alloc >
const_pointer __gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_< Node,
_Alloc >::operator-> () const [inline]
```

Access.

Definition at line 106 of file `left_child_next_sibling_heap_/point_const_iterator.hpp`.

#### 4.671.4.4 operator==()

```
template<typename Node , typename _Alloc >
bool __gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc
>::operator== (
 const left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc > &
 other) const [inline]
```

Compares content to a different iterator object.

Definition at line 122 of file `left_child_next_sibling_heap_/point_const_iterator.hpp`.

The documentation for this class was generated from the following file:

- [left\\_child\\_next\\_sibling\\_heap\\_/point\\_const\\_iterator.hpp](#)

### 4.672 std::length\_error Class Reference

Inheritance diagram for `std::length_error`:

## Public Member Functions

- `length_error` (const [string](#) &\_\_arg) `_GLIBCXX_TXN_SAFE`
- `length_error` (const char \*) `_GLIBCXX_TXN_SAFE`
- `length_error` (const [length\\_error](#) &)=default
- `length_error` ([length\\_error](#) &&)=default
- `length_error` & `operator=` (const [length\\_error](#) &)=default
- `length_error` & `operator=` ([length\\_error](#) &&)=default
- virtual const char \* `what` () const noexcept

## 4.672.1 Detailed Description

Thrown when an object is constructed that would exceed its maximum permitted size (e.g., a `basic_string` instance).

Definition at line 184 of file `stdexcept`.

## 4.672.2 Member Function Documentation

4.672.2.1 `what()`

```
virtual const char* std::logic_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future\\_error](#).

The documentation for this class was generated from the following file:

- [stdexcept](#)

4.673 `std::less<_Tp>` Struct Template Reference

Inheritance diagram for `std::less<_Tp>`:

### Public Types

- typedef `_Tp` [first\\_argument\\_type](#)
- typedef `bool` [result\\_type](#)
- typedef `_Tp` [second\\_argument\\_type](#)

### Public Member Functions

- constexpr `bool` **operator()** (`const _Tp &__x`, `const _Tp &__y`) `const`

#### 4.673.1 Detailed Description

```
template<typename _Tp>
struct std::less<_Tp >
```

One of the [comparison functors](#).

Definition at line 340 of file `stl_function.h`.

#### 4.673.2 Member Typedef Documentation

##### 4.673.2.1 first\_argument\_type

```
typedef _Tp std::binary_function<_Tp , _Tp , bool >::first_argument_type [inherited]
```

`first_argument_type` is the type of the first argument

Definition at line 121 of file `stl_function.h`.

##### 4.673.2.2 result\_type

```
typedef bool std::binary_function<_Tp , _Tp , bool >::result_type [inherited]
```

`result_type` is the return type

Definition at line 127 of file `stl_function.h`.

4.673.2.3 `second_argument_type`

```
typedef _Tp std::binary_function< _Tp , _Tp , bool >::second_argument_type [inherited]
```

`second_argument_type` is the type of the second argument

Definition at line 124 of file `stl_function.h`.

The documentation for this struct was generated from the following file:

- [stl\\_function.h](#)

4.674 `std::less< void >` Struct Template Reference

## Public Types

- typedef `__is_transparent` **is\_transparent**

## Public Member Functions

- template<typename `_Tp` , typename `_Up` >  
constexpr auto **operator()** (`_Tp` &&`__t`, `_Up` &&`__u`) const noexcept(noexcept([std::forward](#)< `_Tp` >(`__t`)<[std::forward](#)< `_Up` >(`__u`))) -> decltype([std::forward](#)< `_Tp` >(`__t`)< [std::forward](#)< `_Up` >(`__u`))
- template<typename `_Tp` , typename `_Up` >  
constexpr bool **operator()** (`_Tp` \*`__t`, `_Up` \*`__u`) const noexcept

## 4.674.1 Detailed Description

```
template<>
struct std::less< void >
```

One of the [comparison functors](#).

Definition at line 578 of file `stl_function.h`.

The documentation for this struct was generated from the following file:

- [stl\\_function.h](#)

#### 4.675 `std::less_equal<_Tp>` Struct Template Reference

Inheritance diagram for `std::less_equal<_Tp>`:

##### Public Types

- typedef `_Tp` [first\\_argument\\_type](#)

### 4.679.1 Detailed Description

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
class std::linear_congruential_engine< _UIntType, __a, __c, __m >
```

A model of a linear congruential random number generator.

A random number generator that produces pseudorandom numbers via linear function:

$$x_{i+1} \leftarrow (ax_i + c) \bmod m$$

The template parameter `_UIntType` must be an unsigned integral type large enough to store values up to `(__m-1)`. If the template parameter `__m` is 0, the modulus `__m` used is `std::numeric_limits<_UIntType>::max()` plus 1. Otherwise, the template parameters `__a` and `__c` must be less than `__m`.

The size of the state is 1.

Definition at line 255 of file `random.h`.

### 4.679.2 Member Typedef Documentation

#### 4.679.2.1 `result_type`

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
typedef _UIntType std::linear_congruential_engine< _UIntType, __a, __c, __m >::result_type
```

The type of the generated random value.

Definition at line 268 of file `random.h`.

## 4.679.3 Constructor &amp; Destructor Documentation

## 4.679.3.1 linear\_congruential\_engine() [1/3]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
std::linear_congruential_engine< _UIntType, __a, __c, __m >::linear_congruential_engine () [inline]
```

Constructs a linear\_congruential\_engine random number generator engine with seed 1.

Definition at line 282 of file random.h.

## 4.679.3.2 linear\_congruential\_engine() [2/3]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
std::linear_congruential_engine< _UIntType, __a, __c, __m >::linear_congruential_engine (
 result_type __s) [inline], [explicit]
```

Constructs a linear\_congruential\_engine random number generator engine with seed \_\_s. The default seed value is 1.

## Parameters

|                  |                         |
|------------------|-------------------------|
| <code>__s</code> | The initial seed value. |
|------------------|-------------------------|

Definition at line 293 of file random.h.

References std::linear\_congruential\_engine< \_UIntType, \_\_a, \_\_c, \_\_m >::seed().

## 4.679.3.3 linear\_congruential\_engine() [3/3]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
std::linear_congruential_engine< _UIntType, __a, __c, __m >::linear_congruential_engine (
 _Sseq & __q) [inline], [explicit]
```

Constructs a linear\_congruential\_engine random number generator engine seeded from the seed sequence \_\_q.

## Parameters

|                  |                    |
|------------------|--------------------|
| <code>__q</code> | the seed sequence. |
|------------------|--------------------|

Definition at line 304 of file random.h.

References `std::linear_congruential_engine<_UIntType, __a, __c, __m >::seed()`.

#### 4.679.4 Member Function Documentation

##### 4.679.4.1 `discard()`

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
void std::linear_congruential_engine<_UIntType, __a, __c, __m >::discard (
 unsigned long long __z) [inline]
```

Discard a sequence of random numbers.

Definition at line 348 of file random.h.

##### 4.679.4.2 `max()`

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
static constexpr result_type std::linear_congruential_engine<_UIntType, __a, __c, __m >::max ()
[inline], [static]
```

Gets the largest possible value in the output range.

Definition at line 341 of file random.h.

##### 4.679.4.3 `min()`

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
static constexpr result_type std::linear_congruential_engine<_UIntType, __a, __c, __m >::min ()
[inline], [static]
```

Gets the smallest possible value in the output range.

The minimum depends on the `__c` parameter: if it is zero, the minimum generated must be  $> 0$ , otherwise 0 is allowed.

Definition at line 334 of file random.h.

## 4.679.4.4 operator()

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::operator() () [inline]
```

Gets the next random number in the sequence.

Definition at line 358 of file random.h.

## 4.679.4.5 seed() [1/3]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _Sseq >
auto std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed (
 _Sseq & __q) -> _If_seed_seq<_Sseq>
```

Seeds the LCR engine with a value generated by \_\_q.

Definition at line 133 of file bits/random.tcc.

References std::\_\_lg().

## 4.679.4.6 seed() [2/3]

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
void std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed (
 result_type __s = default_seed)
```

Reseeds the linear\_congruential\_engine random number generator engine sequence to the seed \_\_s.

## Parameters

|                                                                                         |               |
|-----------------------------------------------------------------------------------------|---------------|
|  __s | The new seed. |
|-----------------------------------------------------------------------------------------|---------------|

Seeds the LCR with integral value \_\_s, adjusted so that the ring identity is never a member of the convergence set.

Definition at line 117 of file bits/random.tcc.

Referenced by std::linear\_congruential\_engine< \_UIntType, \_\_a, \_\_c, \_\_m >::linear\_congruential\_engine().

**4.679.4.7 seed()** [3/3]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _Sseq >
_if_seed_seq<_Sseq> std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed (
 _Sseq & __q)
```

Reseeds the linear\_congruential\_engine random number generator engine sequence using values from the seed sequence \_\_q.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>__q</code> | the seed sequence. |
|------------------|--------------------|

**4.679.5 Friends And Related Function Documentation****4.679.5.1 operator<<**

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _UIntType1, _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT
, typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
 std::basic_ostream< _CharT, _Traits > & __os,
 const std::linear_congruential_engine< _UIntType1, __a1, __c1, __m1 > & __lcr)
[friend]
```

Writes the textual representation of the state x(i) of x to \_\_os.

**Parameters**

|                    |                                                         |
|--------------------|---------------------------------------------------------|
| <code>__os</code>  | The output stream.                                      |
| <code>__lcr</code> | A % linear_congruential_engine random number generator. |

**Returns**

`__os`.

**4.679.5.2 operator==**

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
bool operator== (
 const linear_congruential_engine< _UIntType, __a, __c, __m > & __lhs,
 const linear_congruential_engine< _UIntType, __a, __c, __m > & __rhs) [friend]
```

Compares two linear congruential random number generator objects of the same type for equality.

## Parameters

|                    |                                                             |
|--------------------|-------------------------------------------------------------|
| <code>__lhs</code> | A linear congruential random number generator object.       |
| <code>__rhs</code> | Another linear congruential random number generator object. |

## Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 376 of file random.h.

## 4.679.5.3 operator&gt;&gt;

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _UIntType1, _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT
, typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
 std::basic_istream<_CharT, _Traits > & __is,
 std::linear_congruential_engine< _UIntType1, __a1, __c1, __m1 > & __lcr) [friend]
```

Sets the state of the engine by reading its textual representation from `__is`.

The textual representation must have been previously written using an output stream whose imbued locale and whose type's template specialization arguments `_CharT` and `_Traits` were the same as those of `__is`.

## Parameters

|                    |                                                         |
|--------------------|---------------------------------------------------------|
| <code>__is</code>  | The input stream.                                       |
| <code>__lcr</code> | A % linear_congruential_engine random number generator. |

## Returns

`__is`.

## 4.679.6 Member Data Documentation

## 4.679.6.1 increment

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
constexpr _UIntType std::linear_congruential_engine< _UIntType, __a, __c, __m >::increment [static]
```

An increment.

Definition at line 273 of file random.h.

#### 4.679.6.2 modulus

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
constexpr _UIntType std::linear_congruential_engine< _UIntType, __a, __c, __m >::modulus [static]
```

The modulus.

Definition at line 275 of file random.h.

#### 4.679.6.3 multiplier

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
constexpr _UIntType std::linear_congruential_engine< _UIntType, __a, __c, __m >::multiplier [static]
```

The multiplier.

Definition at line 271 of file random.h.

#### 4.681.1 Detailed Description

```
template<typename _Tp, typename _Allocator = std::allocator<_Tp>>
class std::__debug::list<_Tp, _Allocator>
```

Class std::list with safety/checking/debug instrumentation.

Definition at line 36 of file debug/list.

#### 4.681.2 Member Function Documentation

##### 4.681.2.1 \_M\_detach\_all()

```
void __gnu_debug::_Safe_sequence_base::_M_detach_all () [protected], [inherited]
```

Detach all iterators, leaving them singular.

Referenced by \_\_gnu\_debug::\_Safe\_sequence\_base::~~\_Safe\_sequence\_base().

##### 4.681.2.2 \_M\_detach\_singular()

```
void __gnu_debug::_Safe_sequence_base::_M_detach_singular () [protected], [inherited]
```

Detach all singular iterators.

##### Postcondition

for all iterators *i* attached to this sequence, *i*->\_M\_version == \_M\_version.

##### 4.681.2.3 \_M\_get\_mutex()

```
__gnu_cxx::__mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex () throw () [protected],
[inherited]
```

For use in \_Safe\_sequence.

Referenced by \_\_gnu\_debug::\_Safe\_sequence< map< \_Key, \_Tp, \_Compare, \_Allocator > >::\_M\_transfer\_from\_if().

#### 4.681.2.4 \_M\_invalidate\_all()

```
void __gnu_debug::_Safe_sequence_base::_M_invalidate_all () const [inline], [protected], [inherited]
```

Invalidates all iterators.

Definition at line 256 of file safe\_base.h.

References `__gnu_debug::_Safe_sequence_base::_M_version`.

#### 4.681.2.5 \_M\_invalidate\_if()

```
void __gnu_debug::_Safe_sequence< list< _Tp, _Allocator > >::_M_invalidate_if (
 _Predicate __pred) [inherited]
```

Invalidates all iterators `x` that reference this sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

Definition at line 38 of file safe\_sequence.tcc.

#### 4.681.2.6 \_M\_revalidate\_singular()

```
void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular () [protected], [inherited]
```

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

#### 4.681.2.7 \_M\_swap()

```
void __gnu_debug::_Safe_sequence_base::_M_swap (
 _Safe_sequence_base & __x) [protected], [noexcept], [inherited]
```

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

#### 4.681.2.8 \_M\_transfer\_from\_if()

```
void __gnu_debug::_Safe_sequence< list< _Tp, _Allocator > >::_M_transfer_from_if (
 _Safe_sequence< list< _Tp, _Allocator > > & __from,
 _Predicate __pred) [inherited]
```

Transfers all iterators `x` that reference `from` sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

Definition at line 69 of file safe\_sequence.tcc.

### 4.681.3 Member Data Documentation

#### 4.681.3.1 `_M_const_iterators`

`_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_iterators` [inherited]

The list of constant iterators that reference this container.

Definition at line 197 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

#### 4.681.3.2 `_M_iterators`

`_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators` [inherited]

The list of mutable iterators that reference this container.

Definition at line 194 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

#### 4.681.3.3 `_M_version`

`unsigned int __gnu_debug::_Safe_sequence_base::_M_version` [mutable], [inherited]

The container version number. This number may never be 0.

Definition at line 200 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence_base::_M_invalidate_all()`.

#### 4.682.1 Detailed Description

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
class std::list< _Tp, _Alloc >
```

A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

#### Template Parameters

|                     |                                                                 |
|---------------------|-----------------------------------------------------------------|
| <code>_Tp</code>    | Type of element.                                                |
| <code>_Alloc</code> | Allocator type, defaults to <code>allocator&lt;_Tp&gt;</code> . |

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#) with the exception of `at` and `operator[]`.

This is a *doubly linked* list. Traversal up and down the list requires linear time, but adding and removing elements (or *nodes*) is done in constant time, regardless of where the change takes place. Unlike `std::vector` and `std::deque`,

random-access iterators are not provided, so subscripting ( `[]` ) access is not allowed. For algorithms which only need sequential access, this lack makes no difference.

Also unlike the other standard containers, `std::list` provides specialized algorithms unique to linked lists, such as splicing, sorting, and in-place reversal.

A couple points on memory allocation for `list<Tp>`:

First, we never actually allocate a `Tp`, we allocate `List_node<Tp>`'s and trust [20.1.5]/4 to DTRT. This is to ensure that after elements from `list<X,Alloc1>` are spliced into `list<X,Alloc2>`, destroying the memory of the second list is a valid operation, i.e., `Alloc1` giveth and `Alloc2` taketh away.

Second, a list conceptually represented as

A <--> B <--> C <--> D

is actually circular; a link exists between A and D. The list class holds (as its only data member) a private `list::iterator` pointing to *D*, not to *A*! To get to the head of the list, we start at the tail and move forward by one. When this member iterator's `next/previous` pointers refer to itself, the list is empty.

Definition at line 556 of file `stl_list.h`.

## 4.682.2 Constructor & Destructor Documentation

### 4.682.2.1 list() [1/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list () [default]
```

Creates a list with no elements.

### 4.682.2.2 list() [2/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list (
 const allocator_type & __a) [inline], [explicit], [noexcept]
```

Creates a list with no elements.

#### Parameters

|                  |                      |
|------------------|----------------------|
| <code>__a</code> | An allocator object. |
|------------------|----------------------|

Definition at line 683 of file `stl_list.h`.

**4.682.2.3 list()** [3/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list<_Tp, _Alloc >::list (
 size_type __n,
 const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Creates a list with default constructed elements.

**Parameters**

|                                                                                              |                                             |
|----------------------------------------------------------------------------------------------|---------------------------------------------|
|  <b>__n</b> | The number of elements to initially create. |
|  <b>__a</b> | An allocator object.                        |

This constructor fills the list with **\_\_n** default constructed elements.

Definition at line 696 of file stl\_list.h.

**4.682.2.4 list()** [4/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list<_Tp, _Alloc >::list (
 size_type __n,
 const value_type & __value,
 const allocator_type & __a = allocator_type()) [inline]
```

Creates a list with copies of an exemplar element.

**Parameters**

|                |                                             |
|----------------|---------------------------------------------|
| <b>__n</b>     | The number of elements to initially create. |
| <b>__value</b> | An element to copy.                         |
| <b>__a</b>     | An allocator object.                        |

This constructor fills the list with **\_\_n** copies of **\_\_value**.

Definition at line 708 of file stl\_list.h.

**4.682.2.5 list()** [5/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list<_Tp, _Alloc >::list (
 const list<_Tp, _Alloc > & __x) [inline]
```

List copy constructor.

## Parameters

|                  |                                                  |
|------------------|--------------------------------------------------|
| <code>__x</code> | A list of identical element and allocator types. |
|------------------|--------------------------------------------------|

The newly-created list uses a copy of the allocation object used by `__x` (unless the allocator traits dictate a different object).

Definition at line 735 of file `stl_list.h`.

## 4.682.2.6 list() [6/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list (
 list< _Tp, _Alloc > &&) [default]
```

List move constructor.

The newly-created list contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified list.

## 4.682.2.7 list() [7/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list (
 initializer_list< value_type > __l,
 const allocator_type & __a = allocator_type()) [inline]
```

Builds a list from an `initializer_list`.

## Parameters

|                  |                                                               |
|------------------|---------------------------------------------------------------|
| <code>__l</code> | An <code>initializer_list</code> of <code>value_type</code> . |
| <code>__a</code> | An allocator object.                                          |

Create a list consisting of copies of the elements in the `initializer_list __l`. This is linear in `__l.size()`.

Definition at line 758 of file `stl_list.h`.

## 4.682.2.8 list() [8/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>>
```

```
std::list< _Tp, _Alloc >::list (
 _InputIterator __first,
 _InputIterator __last,
 const allocator_type & __a = allocator_type()) [inline]
```

Builds a list from a range.

#### Parameters

|                      |                      |
|----------------------|----------------------|
| <code>__first</code> | An input iterator.   |
| <code>__last</code>  | An input iterator.   |
| <code>__a</code>     | An allocator object. |

Create a list consisting of copies of the elements from `[__first,__last)`. This is linear in N (where N is `distance(__first, __last)`).

Definition at line 803 of file `stl_list.h`.

#### 4.682.2.9 ~list()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::~~list () [default]
```

No explicit dtor needed as the `_Base` dtor takes care of things. The `_Base` dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

#### 4.682.3 Member Function Documentation

##### 4.682.3.1 \_M\_create\_node()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename... _Args>
_Node* std::list< _Tp, _Alloc >::_M_create_node (
 _Args &&... __args) [inline], [protected]
```

#### Parameters

|                     |                           |
|---------------------|---------------------------|
| <code>__args</code> | An instance of user data. |
|---------------------|---------------------------|

Allocates space for a new node and constructs a copy of `__args` in it.

Definition at line 632 of file `stl_list.h`.

### 4.682.3.2 assign() [1/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::assign (
 size_type __n,
 const value_type & __val) [inline]
```

Assigns a given value to a list.

#### Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Number of elements to be assigned. |
| <code>__val</code> | Value to be assigned.              |

This function fills a list with `__n` copies of the given value. Note that the assignment completely changes the list and that the resulting list's size is the same as the number of elements assigned.

Definition at line 889 of file `stl_list.h`.

Referenced by `std::list< __inp, __rebind_inp >::operator=()`.

### 4.682.3.3 assign() [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>>>
void std::list< _Tp, _Alloc >::assign (
 _InputIterator __first,
 _InputIterator __last) [inline]
```

Assigns a range to a list.

#### Parameters

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

This function fills a list with copies of the elements in the range `[__first,__last)`.

Note that the assignment completely changes the list and that the resulting list's size is the same as the number of elements assigned.

Definition at line 908 of file `stl_list.h`.

**4.682.3.4 assign()** [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::assign (
 initializer_list< value_type > __l) [inline]
```

Assigns an initializer\_list to a list.

**Parameters**

|   |                                    |
|---|------------------------------------|
| ↩ | An initializer_list of value_type. |
| ↩ |                                    |
| ↩ |                                    |
| ↩ |                                    |
| / |                                    |

Replace the contents of the list with copies of the elements in the initializer\_list \_\_l. This is linear in \_\_l.size().

Definition at line 930 of file stl\_list.h.

**4.682.3.5 back()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::list< _Tp, _Alloc >::back () [inline], [noexcept]
```

Returns a read/write reference to the data at the last element of the list.

Definition at line 1130 of file stl\_list.h.

**4.682.3.6 back()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::list< _Tp, _Alloc >::back () const [inline], [noexcept]
```

Returns a read-only (constant) reference to the data at the last element of the list.

Definition at line 1142 of file stl\_list.h.

#### 4.682.3.7 begin() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::list< _Tp, _Alloc >::begin () [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the list. Iteration is done in ordinary element order.

Definition at line 945 of file stl\_list.h.

Referenced by std::list< \_\_inp, \_\_rebind\_inp >::crend(), std::list< \_\_inp, \_\_rebind\_inp >::front(), std::list< \_\_inp, \_\_rebind\_inp >::insert(), std::list< \_\_inp, \_\_rebind\_inp >::list(), std::list< \_\_inp, \_\_rebind\_inp >::merge(), std::operator<(), std::list< \_\_inp, \_\_rebind\_inp >::operator=(), std::operator==( ), std::list< \_\_inp, \_\_rebind\_inp >::pop\_front(), std::list< \_\_inp, \_\_rebind\_inp >::push\_front(), std::list< \_\_inp, \_\_rebind\_inp >::rend(), and std::list< \_\_inp, \_\_rebind\_inp >::splice().

#### 4.682.3.8 begin() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::list< _Tp, _Alloc >::begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the list. Iteration is done in ordinary element order.

Definition at line 954 of file stl\_list.h.

#### 4.682.3.9 cbegin()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::list< _Tp, _Alloc >::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the list. Iteration is done in ordinary element order.

Definition at line 1018 of file stl\_list.h.

#### 4.682.3.10 cend()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::list< _Tp, _Alloc >::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the list. Iteration is done in ordinary element order.

Definition at line 1027 of file stl\_list.h.

#### 4.682.3.11 clear()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::clear () [inline], [noexcept]
```

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1498 of file `stl_list.h`.

#### 4.682.3.12 crbegin()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list< _Tp, _Alloc >::crbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

Definition at line 1036 of file `stl_list.h`.

#### 4.682.3.13 crend()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list< _Tp, _Alloc >::crend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

Definition at line 1045 of file `stl_list.h`.

#### 4.682.3.14 emplace()

```
template<typename _Tp , typename _Alloc >
template<typename... _Args>
list< _Tp, _Alloc >::iterator list::emplace (
 const_iterator __position,
 _Args &&... __args)
```

Constructs object in list before specified iterator.

##### Parameters

|                         |                                              |
|-------------------------|----------------------------------------------|
| <code>__position</code> | A <code>const_iterator</code> into the list. |
| <code>__args</code>     | Arguments.                                   |

**Returns**

An iterator that points to the inserted data.

This function will insert an object of type T constructed with T(std::forward<Args>(args)...) before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 90 of file list.tcc.

Referenced by std::list< \_\_inp, \_\_rebind\_inp >::insert().

**4.682.3.15 empty()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
bool std::list< _Tp, _Alloc >::empty () const [inline], [noexcept]
```

Returns true if the list is empty. (Thus begin() would equal end().)

Definition at line 1055 of file stl\_list.h.

Referenced by std::list< \_\_inp, \_\_rebind\_inp >::insert(), and std::list< \_\_inp, \_\_rebind\_inp >::splice().

**4.682.3.16 end()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::list< _Tp, _Alloc >::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the list. Iteration is done in ordinary element order.

Definition at line 963 of file stl\_list.h.

Referenced by std::list< \_\_inp, \_\_rebind\_inp >::back(), std::list< \_\_inp, \_\_rebind\_inp >::cbegin(), std::list< \_\_inp, \_\_rebind\_inp >::list(), std::list< \_\_inp, \_\_rebind\_inp >::merge(), std::operator<(), std::list< \_\_inp, \_\_rebind\_inp >::operator=(), std::operator==( ), std::list< \_\_inp, \_\_rebind\_inp >::push\_back(), std::list< \_\_inp, \_\_rebind\_inp >::rbegin(), and std::list< \_\_inp, \_\_rebind\_inp >::splice().

**4.682.3.17 end()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::list< _Tp, _Alloc >::end () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the list. Iteration is done in ordinary element order.

Definition at line 972 of file stl\_list.h.

**4.682.3.18 erase()** [1/2]

```
template<typename _Tp , typename _Alloc >
list< _Tp, _Alloc >::iterator list::erase (
 const_iterator __position) [noexcept]
```

Remove element at given position.

**Parameters**

|                         |                                            |
|-------------------------|--------------------------------------------|
| <code>__position</code> | Iterator pointing to element to be erased. |
|-------------------------|--------------------------------------------|

**Returns**

An iterator pointing to the next element (or `end()`).

This function will erase the element at the given position and thus shorten the list by one.

Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 152 of file `list.tcc`.

Referenced by `std::list< __inp, __rebind_inp >::erase()`.

**4.682.3.19 erase()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::list< _Tp, _Alloc >::erase (
 const_iterator __first,
 const_iterator __last) [inline], [noexcept]
```

Remove a range of elements.

**Parameters**

|                      |                                                              |
|----------------------|--------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the first element to be erased.         |
| <code>__last</code>  | Iterator pointing to one past the last element to be erased. |

**Returns**

An iterator pointing to the element pointed to by *last* prior to erasing (or `end()`).

This function will erase the elements in the range `[first,last)` and shorten the list accordingly.

This operation is linear time in the size of the range and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1456 of file `stl_list.h`.

**4.682.3.20 front()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::list< _Tp, _Alloc >::front () [inline], [noexcept]
```

Returns a read/write reference to the data at the first element of the list.

Definition at line 1114 of file stl\_list.h.

**4.682.3.21 front()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::list< _Tp, _Alloc >::front () const [inline], [noexcept]
```

Returns a read-only (constant) reference to the data at the first element of the list.

Definition at line 1122 of file stl\_list.h.

**4.682.3.22 get\_allocator()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
allocator_type std::list< _Tp, _Alloc >::get_allocator () const [inline], [noexcept]
```

Get a copy of the memory allocation object.

Definition at line 936 of file stl\_list.h.

**4.682.3.23 insert()** [1/5]

```
template<typename _Tp , typename _Alloc >
list< _Tp, _Alloc >::iterator list::insert (
 const_iterator __position,
 const value_type & __x)
```

Inserts given value into list before specified iterator.

**Parameters**

|                         |                                 |
|-------------------------|---------------------------------|
| <code>__position</code> | A const_iterator into the list. |
| <code>__x</code>        | Data to be inserted.            |

**Returns**

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 103 of file list.tcc.

Referenced by `std::list< __inp, __rebind_inp >::insert()`.

**4.682.3.24 insert()** [2/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::list< _Tp, _Alloc >::insert (
 const_iterator __position,
 value_type && __x) [inline]
```

Inserts given rvalue into list before specified iterator.

**Parameters**

|                         |                                 |
|-------------------------|---------------------------------|
| <code>__position</code> | A const_iterator into the list. |
| <code>__x</code>        | Data to be inserted.            |

**Returns**

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 1308 of file stl\_list.h.

**4.682.3.25 insert()** [3/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::list< _Tp, _Alloc >::insert (
 const_iterator __p,
 initializer_list< value_type > __l) [inline]
```

Inserts the contents of an initializer\_list into list before specified const\_iterator.

## Parameters

|                                 |                                    |
|---------------------------------|------------------------------------|
| $\leftarrow$<br><code>_p</code> | A const_iterator into the list.    |
| $\leftarrow$<br><code>_l</code> | An initializer_list of value_type. |

## Returns

An iterator pointing to the first element inserted (or `__position`).

This function will insert copies of the data in the initializer\_list `l` into the list before the location specified by `p`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 1327 of file `stl_list.h`.

## 4.682.3.26 insert() [4/5]

```
template<typename _Tp , typename _Alloc >
list< _Tp, _Alloc >::iterator list::insert (
 const_iterator __position,
 size_type __n,
 const value_type & __x)
```

Inserts a number of copies of given data into the list.

## Parameters

|                         |                                    |
|-------------------------|------------------------------------|
| <code>__position</code> | A const_iterator into the list.    |
| <code>__n</code>        | Number of elements to be inserted. |
| <code>__x</code>        | Data to be inserted.               |

## Returns

An iterator pointing to the first element inserted (or `__position`).

This function will insert a specified number of copies of the given data before the location specified by *position*.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 118 of file `list.tcc`.

**4.682.3.27 insert()** [5/5]

```
template<typename _Tp , typename _Alloc >
template<typename _InputIterator , typename >
list< _Tp, _Alloc >::iterator list::insert (
 const_iterator __position,
 _InputIterator __first,
 _InputIterator __last)
```

Inserts a range into the list.

**Parameters**

|                         |                                 |
|-------------------------|---------------------------------|
| <code>__position</code> | A const_iterator into the list. |
| <code>__first</code>    | An input iterator.              |
| <code>__last</code>     | An input iterator.              |

**Returns**

An iterator pointing to the first element inserted (or `__position`).

This function will insert copies of the data in the range *[first,last)* into the list before the location specified by *position*.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 134 of file list.tcc.

**4.682.3.28 max\_size()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::list< _Tp, _Alloc >::max_size () const [inline], [noexcept]
```

Returns the size() of the largest possible list.

Definition at line 1065 of file stl\_list.h.

**4.682.3.29 merge()** [1/2]

```
template<typename _Tp , typename _Alloc >
void list::merge (
 list< _Tp, _Alloc > && __x)
```

Merge sorted lists.

## Parameters

|                  |                       |
|------------------|-----------------------|
| <code>_↵</code>  | Sorted list to merge. |
| <code>__x</code> |                       |

Assumes that both `__x` and this list are sorted according to `operator<()`. Merges elements of `__x` into this list in sorted order, leaving `__x` empty when complete. Elements in this list precede elements in `__x` that are equal.

Definition at line 394 of file list.tcc.

## 4.682.3.30 merge() [2/2]

```
template<typename _Tp , typename _Alloc >
template<typename _StrictWeakOrdering >
void list::merge (
 list< _Tp, _Alloc > && __x,
 _StrictWeakOrdering __comp)
```

Merge sorted lists according to comparison function.

## Template Parameters

|                                   |                                          |
|-----------------------------------|------------------------------------------|
| <code>__StrictWeakOrdering</code> | Comparison function defining sort order. |
|-----------------------------------|------------------------------------------|

## Parameters

|                     |                       |
|---------------------|-----------------------|
| <code>__x</code>    | Sorted list to merge. |
| <code>__comp</code> | Comparison functor.   |

Assumes that both `__x` and this list are sorted according to `StrictWeakOrdering`. Merges elements of `__x` into this list in sorted order, leaving `__x` empty when complete. Elements in this list precede elements in `__x` that are equivalent according to `StrictWeakOrdering()`.

Definition at line 441 of file list.tcc.

## 4.682.3.31 operator=() [1/3]

```
template<typename _Tp , typename _Alloc >
list< _Tp, _Alloc > & list::operator= (
 const list< _Tp, _Alloc > & __x)
```

List assignment operator.

**Parameters**

|                  |                                                  |
|------------------|--------------------------------------------------|
| <code>__l</code> | A list of identical element and allocator types. |
| <code>__x</code> |                                                  |

All the elements of `__x` are copied.

Whether the allocator is copied depends on the allocator traits.

Definition at line 268 of file `list.tcc`.

**4.682.3.32 operator=()** [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
list& std::list< _Tp, _Alloc >::operator= (
 list< _Tp, _Alloc > && __x) [inline], [noexcept]
```

List move assignment operator.

**Parameters**

|                  |                                                  |
|------------------|--------------------------------------------------|
| <code>__l</code> | A list of identical element and allocator types. |
| <code>__x</code> |                                                  |

The contents of `__x` are moved into this list (without copying).

Afterwards `__x` is a valid, but unspecified list

Whether the allocator is moved depends on the allocator traits.

Definition at line 853 of file `stl_list.h`.

**4.682.3.33 operator=()** [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
list& std::list< _Tp, _Alloc >::operator= (
 initializer_list< value_type > __l) [inline]
```

List initializer list assignment operator.

## Parameters

|   |                                    |
|---|------------------------------------|
| ↵ | An initializer_list of value_type. |
| ↵ |                                    |
| ↵ |                                    |
| ↵ |                                    |
| / |                                    |

Replace the contents of the list with copies of the elements in the initializer\_list \_\_l. This is linear in l.size().

Definition at line 871 of file stl\_list.h.

## 4.682.3.34 pop\_back()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::pop_back () [inline], [noexcept]
```

Removes last element.

This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before pop\_back() is called.

Definition at line 1246 of file stl\_list.h.

## 4.682.3.35 pop\_front()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::pop_front () [inline], [noexcept]
```

Removes first element.

This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop\_front() is called.

Definition at line 1197 of file stl\_list.h.

## 4.682.3.36 push\_back()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::push_back (
 const value_type & __x) [inline]
```

Add data to the end of the list.

**Parameters**

|                         |                   |
|-------------------------|-------------------|
| $\leftrightarrow$<br>_X | Data to be added. |
|-------------------------|-------------------|

This is a typical stack operation. The function creates an element at the end of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 1211 of file `stl_list.h`.

**4.682.3.37 push\_front()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::push_front (
 const value_type & __x) [inline]
```

Add data to the front of the list.

**Parameters**

|                         |                   |
|-------------------------|-------------------|
| $\leftrightarrow$<br>_X | Data to be added. |
|-------------------------|-------------------|

This is a typical stack operation. The function creates an element at the front of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 1161 of file `stl_list.h`.

**4.682.3.38 rbegin()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::list< _Tp, _Alloc >::rbegin () [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

Definition at line 981 of file `stl_list.h`.

**4.682.3.39 rbegin()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list< _Tp, _Alloc >::rbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

Definition at line 990 of file `stl_list.h`.

## 4.682.3.40 remove()

```
template<typename _Tp, typename _Alloc >
list< _Tp, _Alloc >::__remove_return_type list::remove (
 const _Tp & __value)
```

Remove all elements equal to *value*.

## Parameters

|                      |                      |
|----------------------|----------------------|
| <code>__value</code> | The value to remove. |
|----------------------|----------------------|

Removes every element in the list equal to *value*. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 332 of file list.tcc.

## 4.682.3.41 remove\_if()

```
template<typename _Tp , typename _Alloc >
template<typename _Predicate >
list< _Tp, _Alloc >::__remove_return_type list::remove_if (
 _Predicate __pred)
```

Remove all elements satisfying a predicate.

## Template Parameters

|                         |                                     |
|-------------------------|-------------------------------------|
| <code>_Predicate</code> | Unary predicate function or object. |
|-------------------------|-------------------------------------|

Removes every element in the list for which the predicate returns true. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 534 of file list.tcc.

## 4.682.3.42 rend() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::list< _Tp, _Alloc >::rend () [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

Definition at line 999 of file stl\_list.h.

**4.682.3.43** `rend()` [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list< _Tp, _Alloc >::rend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

Definition at line 1008 of file `stl_list.h`.

**4.682.3.44** `resize()` [1/2]

```
template<typename _Tp , typename _Alloc >
void list::resize (
 size_type __new_size)
```

Resizes the list to the specified number of elements.

**Parameters**

|                         |                                             |
|-------------------------|---------------------------------------------|
| <code>__new_size</code> | Number of elements the list should contain. |
|-------------------------|---------------------------------------------|

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size the list is truncated, otherwise default constructed elements are appended.

Definition at line 231 of file `list.tcc`.

**4.682.3.45** `resize()` [2/2]

```
template<typename _Tp , typename _Alloc >
void list::resize (
 size_type __new_size,
 const value_type & __x)
```

Resizes the list to the specified number of elements.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__new_size</code> | Number of elements the list should contain.       |
| <code>__x</code>        | Data with which new elements should be populated. |

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size the list is truncated, otherwise the list is extended and new elements are populated with given data.

Definition at line 243 of file `list.tcc`.

**4.682.3.46 reverse()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::reverse () [inline], [noexcept]
```

Reverse the elements in list.

Reverse the order of elements in the list in linear time.

Definition at line 1798 of file stl\_list.h.

**4.682.3.47 size()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::list< _Tp, _Alloc >::size () const [inline], [noexcept]
```

Returns the number of elements in the list.

Definition at line 1060 of file stl\_list.h.

Referenced by std::list< \_\_inp, \_\_rebind\_inp >::merge(), and std::operator==().

**4.682.3.48 sort()** [1/2]

```
template<typename _Tp , typename _Alloc >
void list::sort ()
```

Sort the elements.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

Definition at line 487 of file list.tcc.

**4.682.3.49 sort()** [2/2]

```
template<typename _Tp , typename _Alloc >
template<typename _StrictWeakOrdering >
void list::sort (
 _StrictWeakOrdering __comp)
```

Sort the elements according to comparison function.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

Definition at line 585 of file list.tcc.

**4.682.3.50 splice()** [1/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (
 const_iterator __position,
 list< _Tp, _Alloc > && __x) [inline], [noexcept]
```

Insert contents of another list.

**Parameters**

|                         |                                                    |
|-------------------------|----------------------------------------------------|
| <code>__position</code> | Iterator referencing the element to insert before. |
| <code>__x</code>        | Source list.                                       |

The elements of `__x` are inserted in constant time in front of the element referenced by `__position`. `__x` becomes an empty list.

Requires this `!= __x`.

Definition at line 1518 of file `stl_list.h`.

Referenced by `std::list< __inp, __rebind_inp >::splice()`.

**4.682.3.51 splice()** [2/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (
 const_iterator __position,
 list< _Tp, _Alloc > && __x,
 const_iterator __i) [inline], [noexcept]
```

Insert element from another list.

**Parameters**

|                         |                                                          |
|-------------------------|----------------------------------------------------------|
| <code>__position</code> | Const_iterator referencing the element to insert before. |
| <code>__x</code>        | Source list.                                             |
| <code>__i</code>        | Const_iterator referencing the element to move.          |

Removes the element in list `__x` referenced by `__i` and inserts it into the current list before `__position`.

Definition at line 1553 of file `stl_list.h`.

**4.682.3.52 splice()** [3/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (
 const_iterator __position,
 list< _Tp, _Alloc > & __x,
 const_iterator __i) [inline], [noexcept]
```

Insert element from another list.

## Parameters

|                         |                                                          |
|-------------------------|----------------------------------------------------------|
| <code>__position</code> | Const_iterator referencing the element to insert before. |
| <code>__x</code>        | Source list.                                             |
| <code>__i</code>        | Const_iterator referencing the element to move.          |

Removes the element in list `__x` referenced by `__i` and inserts it into the current list before `__position`.

Definition at line 1595 of file `stl_list.h`.

## 4.682.3.53 splice() [4/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (
 const_iterator __position,
 list< _Tp, _Alloc > && __x,
 const_iterator __first,
 const_iterator __last) [inline], [noexcept]
```

Insert range from another list.

## Parameters

|                         |                                                          |
|-------------------------|----------------------------------------------------------|
| <code>__position</code> | Const_iterator referencing the element to insert before. |
| <code>__x</code>        | Source list.                                             |
| <code>__first</code>    | Const_iterator referencing the start of range in x.      |
| <code>__last</code>     | Const_iterator referencing the end of range in x.        |

Removes elements in the range `[__first,__last)` and inserts them before `__position` in constant time.

Undefined if `__position` is in `[__first,__last)`.

Definition at line 1614 of file `stl_list.h`.

## 4.682.3.54 splice() [5/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (
 const_iterator __position,
 list< _Tp, _Alloc > & __x,
 const_iterator __first,
 const_iterator __last) [inline], [noexcept]
```

Insert range from another list.

## Parameters

|                         |                                                          |
|-------------------------|----------------------------------------------------------|
| <code>__position</code> | Const_iterator referencing the element to insert before. |
| <code>__x</code>        | Source list.                                             |
| <code>__first</code>    | Const_iterator referencing the start of range in x.      |
| <code>__last</code>     | Const_iterator referencing the end of range in x.        |

Removes elements in the range `[__first,__last)` and inserts them before `__position` in constant time.

Undefined if `__position` is in `[__first,__last)`.

Definition at line 1664 of file `stl_list.h`.

4.682.3.55 `swap()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::swap (
 list< _Tp, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another list.

## Parameters

|                  |                                                 |
|------------------|-------------------------------------------------|
| <code>__x</code> | A list of the same element and allocator types. |
|------------------|-------------------------------------------------|

This exchanges the elements between two lists in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(l1,l2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

Definition at line 1478 of file `stl_list.h`.

4.682.3.56 `unique()` [1/2]

```
template<typename _Tp , typename _Alloc >
list< _Tp, _Alloc >::__remove_return_type list::unique ()
```

Remove consecutive duplicate elements.

For each consecutive set of elements with the same value, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 368 of file `list.tcc`.

4.683.3.57 `unique()` [2/2]

```
template<typename _Tp , typename _Alloc >
template<typename _BinaryPredicate >
list< _Tp, _Alloc >::__remove_return_type list::unique (
 _BinaryPredicate __binary_pred)
```

Remove consecutive elements satisfying a predicate.

## Template Parameters

|                               |                                      |
|-------------------------------|--------------------------------------|
| <code>_BinaryPredicate</code> | Binary predicate function or object. |
|-------------------------------|--------------------------------------|

For each consecutive set of elements  $[first, last)$  that satisfy  $predicate(first, i)$  where  $i$  is an iterator in  $[first, last)$ , remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 557 of file `list.tcc`.

4.683 `__gnu_pbds::list_update< Key, Mapped, Eq_Fn, Update_Policy, _Alloc >` Class Template Reference

Inherits type< Key, Mapped, \_Alloc, list\_update\_tag, \_\_gnu\_cxx::typelist::create2< Eq\_Fn, Update\_Policy >::type >.

## Public Types

- typedef [list\\_update\\_tag](#) **container\_category**
- typedef Eq\_Fn **eq\_fn**
- typedef Update\_Policy **update\_policy**

## Public Member Functions

- template<typename It >  
[list\\_update](#) (It first, It last)
- **list\_update** (const [list\\_update](#) &other)
- [list\\_update](#) & **operator=** (const [list\\_update](#) &other)
- void **swap** ([list\\_update](#) &other)

## 4.683.1 Detailed Description

```
template<typename Key, typename Mapped, class Eq_Fn = typename detail::default_eq_fn<Key>::type, class Update_Policy =
detail::default_update_policy::type, class _Alloc = std::allocator<char>>
class __gnu_pbds::list_update< Key, Mapped, Eq_Fn, Update_Policy, _Alloc >
```

A list-update based associative container.

**Template Parameters**

|                      |                                                                                   |
|----------------------|-----------------------------------------------------------------------------------|
| <i>Key</i>           | Key type.                                                                         |
| <i>Mapped</i>        | Map type.                                                                         |
| <i>Eq_Fn</i>         | Equal functor.                                                                    |
| <i>Update_Policy</i> | Update policy, determines when an element will be moved to the front of the list. |
| <i>_Alloc</i>        | Allocator type.                                                                   |

Base is detail::lu\_map.

Definition at line 815 of file assoc\_container.hpp.

**4.683.2 Constructor & Destructor Documentation****4.683.2.1 list\_update()**

```
template<typename Key , typename Mapped , class Eq_Fn = typename detail::default_eq_fn<Key>↵
::type, class Update_Policy = detail::default_update_policy::type, class _Alloc = std::allocator<char>>
template<typename It >
__gnu_pbds::list_update< Key, Mapped, Eq_Fn, Update_Policy, _Alloc >::list_update (
 It first,
 It last) [inline]
```

Constructor taking \_\_iterators to a range of value\_types. The value\_types between first\_it and last\_it will be inserted into the container object.

Definition at line 831 of file assoc\_container.hpp.

## 4.685.1 Detailed Description

Container class for localization functionality.

The locale class is first a class wrapper for C library locales. It is also an extensible container for user-defined localization. A locale is a collection of facets that implement various localization features such as money, time, and number printing.

Constructing C++ locales does not change the C library locale.

This library supports efficient construction and copying of locales through a reference counting implementation of the locale class.

Definition at line 62 of file locale\_classes.h.

## 4.685.2 Member Typedef Documentation

## 4.685.2.1 category

```
typedef int std::locale::category
```

Definition of locale::category.

Definition at line 67 of file locale\_classes.h.

## 4.685.3 Constructor &amp; Destructor Documentation

## 4.685.3.1 locale() [1/8]

```
std::locale::locale () throw ()
```

Default constructor.

Constructs a copy of the global locale. If no locale has been explicitly set, this is the C locale.

## 4.685.3.2 locale() [2/8]

```
std::locale::locale (
 const locale & __other) throw ()
```

Copy constructor.

Constructs a copy of *other*.

**Parameters**

|                      |                     |
|----------------------|---------------------|
| <code>__other</code> | The locale to copy. |
|----------------------|---------------------|

**4.685.3.3 locale()** [3/8]

```
std::locale::locale (
 const char * __s) [explicit]
```

Named locale constructor.

Constructs a copy of the named C library locale.

**Parameters**

|                  |                                  |
|------------------|----------------------------------|
| <code>__s</code> | Name of the locale to construct. |
|------------------|----------------------------------|

**Exceptions**

|                                 |                                                     |
|---------------------------------|-----------------------------------------------------|
| <code>std::runtime_error</code> | if <code>__s</code> is null or an undefined locale. |
|---------------------------------|-----------------------------------------------------|

**4.685.3.4 locale()** [4/8]

```
std::locale::locale (
 const locale & __base,
 const char * __s,
 category __cat)
```

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale named by *s*. If *base* is named, this locale instance will also be named.

**Parameters**

|                     |                                                                      |
|---------------------|----------------------------------------------------------------------|
| <code>__base</code> | The locale to copy.                                                  |
| <code>__s</code>    | Name of the locale to use facets from.                               |
| <code>__cat</code>  | Set of categories defining the facets to use from <code>__s</code> . |

**Exceptions**

|                                 |                                                     |
|---------------------------------|-----------------------------------------------------|
| <code>std::runtime_error</code> | if <code>__s</code> is null or an undefined locale. |
|---------------------------------|-----------------------------------------------------|

## 4.685.3.5 locale() [5/8]

```
std::locale::locale (
 const std::string & __s) [inline], [explicit]
```

Named locale constructor.

Constructs a copy of the named C library locale.

## Parameters

|                  |                                  |
|------------------|----------------------------------|
| <code>__s</code> | Name of the locale to construct. |
|------------------|----------------------------------|

## Exceptions

|                                 |                                             |
|---------------------------------|---------------------------------------------|
| <code>std::runtime_error</code> | if <code>__s</code> is an undefined locale. |
|---------------------------------|---------------------------------------------|

Definition at line 163 of file locale\_classes.h.

## 4.685.3.6 locale() [6/8]

```
std::locale::locale (
 const locale & __base,
 const std::string & __s,
 category __cat) [inline]
```

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale named by *s*. If *base* is named, this locale instance will also be named.

## Parameters

|                     |                                                                      |
|---------------------|----------------------------------------------------------------------|
| <code>__base</code> | The locale to copy.                                                  |
| <code>__s</code>    | Name of the locale to use facets from.                               |
| <code>__cat</code>  | Set of categories defining the facets to use from <code>__s</code> . |

## Exceptions

|                                 |                                             |
|---------------------------------|---------------------------------------------|
| <code>std::runtime_error</code> | if <code>__s</code> is an undefined locale. |
|---------------------------------|---------------------------------------------|

Definition at line 177 of file locale\_classes.h.

**4.685.3.7 locale()** [7/8]

```
std::locale::locale (
 const locale & __base,
 const locale & __add,
 category __cat)
```

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale *add*. If *base* and *add* are named, this locale instance will also be named.

**Parameters**

|                     |                                                        |
|---------------------|--------------------------------------------------------|
| <code>__base</code> | The locale to copy.                                    |
| <code>__add</code>  | The locale to use facets from.                         |
| <code>__cat</code>  | Set of categories defining the facets to use from add. |

**4.685.3.8 locale()** [8/8]

```
template<typename _Facet >
std::locale::locale (
 const locale & __other,
 _Facet * __f)
```

Construct locale with another facet.

Constructs a copy of the locale *\_\_other*. The facet *\_\_f* is added to *\_\_other*, replacing an existing facet of type *Facet* if there is one. If *\_\_f* is null, this locale is a copy of *\_\_other*.

**Parameters**

|                      |                      |
|----------------------|----------------------|
| <code>__other</code> | The locale to copy.  |
| <code>__f</code>     | The facet to add in. |

Definition at line 45 of file locale\_classes.tcc.

**4.685.3.9 ~locale()**

```
std::locale::~~locale () throw ()
```

Locale destructor.

## 4.685.4 Member Function Documentation

## 4.685.4.1 classic()

```
static const locale& std::locale::classic () [static]
```

Return reference to the C locale.

## 4.685.4.2 combine()

```
template<typename _Facet >
locale std::locale::combine (
 const locale & __other) const
```

Construct locale with another facet.

Constructs and returns a new copy of this locale. Adds or replaces an existing facet of type `Facet` from the locale *other* into the new locale.

## Template Parameters

|                     |                                   |
|---------------------|-----------------------------------|
| <code>_Facet</code> | The facet type to copy from other |
|---------------------|-----------------------------------|

## Parameters

|                      |                          |
|----------------------|--------------------------|
| <code>__other</code> | The locale to copy from. |
|----------------------|--------------------------|

## Returns

Newly constructed locale.

## Exceptions

|                                 |                                                                    |
|---------------------------------|--------------------------------------------------------------------|
| <code>std::runtime_error</code> | if <code>__other</code> has no facet of type <code>_Facet</code> . |
|---------------------------------|--------------------------------------------------------------------|

Definition at line 63 of file `locale_classes.tcc`.

## 4.685.4.3 global()

```
static locale std::locale::global (
 const locale & __loc) [static]
```

Set global locale.

This function sets the global locale to the argument and returns a copy of the previous global locale. If the argument has a name, it will also call `std::setlocale(LC_ALL, loc.name())`.

#### Parameters

|                    |                                |
|--------------------|--------------------------------|
| <code>__loc</code> | The new locale to make global. |
|--------------------|--------------------------------|

#### Returns

Copy of the old global locale.

#### 4.685.4.4 `name()`

```
_GLIBCXX_DEFAULT_ABI_TAG string std::locale::name () const
```

Return locale name.

#### Returns

Locale name or "\*" if unnamed.

#### 4.685.4.5 `operator!=( )`

```
bool std::locale::operator!= (
 const locale & __other) const throw () [inline]
```

Locale inequality.

#### Parameters

|                      |                                |
|----------------------|--------------------------------|
| <code>__other</code> | The locale to compare against. |
|----------------------|--------------------------------|

#### Returns

`! (*this == __other)`

Definition at line 265 of file `locale_classes.h`.

References `operator==( )`.

## 4.685.4.6 operator()

```
template<typename _Char , typename _Traits , typename _Alloc >
bool std::locale::operator() (
 const basic_string< _Char, _Traits, _Alloc > & __s1,
 const basic_string< _Char, _Traits, _Alloc > & __s2) const
```

Compare two strings according to collate.

Template operator to compare two strings using the compare function of the collate facet in this locale. One use is to provide the locale to the sort function. For example, a vector *v* of strings could be sorted according to locale *loc* by doing:

```
std::sort(v.begin(), v.end(), loc);
```

## Parameters

|                   |                           |
|-------------------|---------------------------|
| <code>__s1</code> | First string to compare.  |
| <code>__s2</code> | Second string to compare. |

## Returns

True if `collate<_Char>` facet compares `__s1 < __s2`, else false.

## 4.685.4.7 operator=()

```
const locale& std::locale::operator= (
 const locale & __other) throw ()
```

Assignment operator.

Set this locale to be a copy of *other*.

## Parameters

|                      |                     |
|----------------------|---------------------|
| <code>__other</code> | The locale to copy. |
|----------------------|---------------------|

## Returns

A reference to this locale.

## 4.685.4.8 operator==()

```
bool std::locale::operator== (
 const locale & __other) const throw ()
```

Locale equality.

**Parameters**

|                      |                                |
|----------------------|--------------------------------|
| <code>__other</code> | The locale to compare against. |
|----------------------|--------------------------------|

**Returns**

True if other and this refer to the same locale instance, are copies, or have the same name. False otherwise.

Referenced by operator!=().

**4.685.5 Friends And Related Function Documentation****4.685.5.1 has\_facet**

```
template<typename _Facet >
bool has_facet (
 const locale &) throw () [friend]
```

Test for the presence of a facet.

has\_facet tests the locale argument for the presence of the facet type provided as the template parameter. Facets derived from the facet parameter will also return true.

**Template Parameters**

|                     |                                         |
|---------------------|-----------------------------------------|
| <code>_Facet</code> | The facet type to test the presence of. |
|---------------------|-----------------------------------------|

**Parameters**

|                    |                     |
|--------------------|---------------------|
| <code>__loc</code> | The locale to test. |
|--------------------|---------------------|

**Returns**

true if `__loc` contains a facet of type `_Facet`, else false.

Definition at line 104 of file locale\_classes.tcc.

**4.685.5.2 use\_facet**

```
template<typename _Facet >
const _Facet& use_facet (
 const locale &) [friend]
```

Return a facet.

`use_facet` looks for and returns a reference to a facet of type `Facet` where `Facet` is the template parameter. If `has_facet(locale)` is true, there is a suitable facet to return. It throws `std::bad_cast` if the locale doesn't contain a facet of type `Facet`.

#### Template Parameters

|                     |                           |
|---------------------|---------------------------|
| <code>_Facet</code> | The facet type to access. |
|---------------------|---------------------------|

#### Parameters

|                    |                    |
|--------------------|--------------------|
| <code>__loc</code> | The locale to use. |
|--------------------|--------------------|

#### Returns

Reference to facet of type `Facet`.

#### Exceptions

|                            |                                                                             |
|----------------------------|-----------------------------------------------------------------------------|
| <code>std::bad_cast</code> | if <code>__loc</code> doesn't contain a facet of type <code>_Facet</code> . |
|----------------------------|-----------------------------------------------------------------------------|

Definition at line 132 of file `locale_classes.tcc`.

### 4.685.6 Member Data Documentation

#### 4.685.6.1 all

```
const category std::locale::all [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 105 of file `locale_classes.h`.

#### 4.685.6.2 collate

```
const category std::locale::collate [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 101 of file `locale_classes.h`.

#### 4.685.6.3 ctype

```
const category std::locale::ctype [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 99 of file `locale_classes.h`.

#### 4.685.6.4 messages

```
const category std::locale::messages [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 104 of file `locale_classes.h`.

#### 4.685.6.5 monetary

```
const category std::locale::monetary [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 103 of file `locale_classes.h`.

#### 4.685.6.6 none

```
const category std::locale::none [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 98 of file `locale_classes.h`.

#### 4.685.6.7 numeric

```
const category std::locale::numeric [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 100 of file `locale_classes.h`.

#### 4.685.6.8 time

```
const category std::locale::time [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 102 of file `locale_classes.h`.

## 4.686 std::lock\_guard< \_Mutex > Class Template Reference

### Public Types

- typedef \_Mutex **mutex\_type**

### Public Member Functions

- **lock\_guard** (mutex\_type &\_\_m)
- **lock\_guard** (mutex\_type &\_\_m, [adopt\\_lock\\_t](#)) noexcept
- **lock\_guard** (const [lock\\_guard](#) &)=delete
- [lock\\_guard](#) & **operator=** (const [lock\\_guard](#) &)=delete

### 4.686.1 Detailed Description

```
template<typename _Mutex>
class std::lock_guard< _Mutex >
```

A simple scoped lock type.

A lock\_guard controls mutex ownership within a scope, releasing ownership in the destructor.

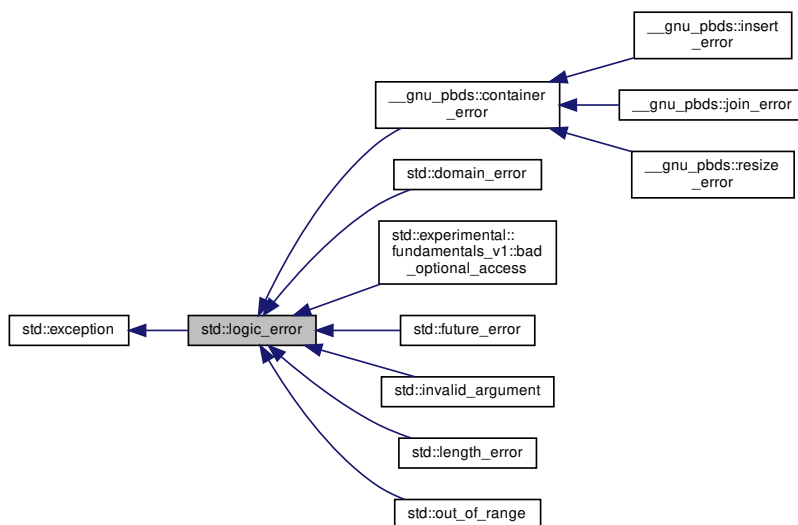

Definition at line 153 of file std\_mutex.h.

The documentation for this class was generated from the following file:

- [std\\_mutex.h](#)

## 4.687 std::logic\_error Class Reference

Inheritance diagram for std::logic\_error:

## Public Member Functions

- [logic\\_error](#) (const [string](#) &\_\_arg) \_GLIBCXX\_TXN\_SAFE
- [logic\\_error](#) (const char \*) \_GLIBCXX\_TXN\_SAFE
- [logic\\_error](#) ([logic\\_error](#) &&) noexcept
- [logic\\_error](#) (const [logic\\_error](#) &)=default
- [logic\\_error](#) & [operator=](#) ([logic\\_error](#) &&) noexcept
- [logic\\_error](#) & [operator=](#) (const [logic\\_error](#) &)=default
- virtual const char \* [what](#) () const noexcept

### 4.687.1 Detailed Description

One of two subclasses of exception.

Logic errors represent problems in the internal logic of a program; in theory, these are preventable, and even detectable before the program runs (e.g., violations of class invariants).

Definition at line 113 of file stdexcept.

### 4.687.2 Constructor & Destructor Documentation

#### 4.687.2.1 [logic\\_error](#)()

```
std::logic_error::logic_error (
 const string & __arg) [explicit]
```

Takes a character string describing the error.

### 4.687.3 Member Function Documentation

#### 4.687.3.1 [what](#)()

```
virtual const char* std::logic_error::what () const [virtual], [noexcept]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future\\_error](#).

The documentation for this class was generated from the following file:

- [stdexcept](#)

#### 4.688 `std::logical_and< _Tp >` Struct Template Reference

Inheritance diagram for `std::logical_and< _Tp >`:

##### Public Types

- typedef `_Tp` [first\\_argument\\_type](#)
- typedef `bool` [result\\_type](#)
- typedef `_Tp` [second\\_argument\\_type](#)

##### Public Member Functions

- constexpr `bool` **operator()** (`const _Tp &__x`, `const _Tp &__y`) `const`

##### 4.688.1 Detailed Description

```
template<typename _Tp>
struct std::logical_and< _Tp >
```

One of the [Boolean operations functors](#).

Definition at line 775 of file `stl_function.h`.

##### 4.688.2 Member Typedef Documentation

## 4.688.2.1 first\_argument\_type

```
typedef _Tp std::binary_function< _Tp , _Tp , bool >::first_argument_type [inherited]
```

first\_argument\_type is the type of the first argument

Definition at line 121 of file stl\_function.h.

## 4.688.2.2 result\_type

```
typedef bool std::binary_function< _Tp , _Tp , bool >::result_type [inherited]
```

result\_type is the return type

Definition at line 127 of file stl\_function.h.

## 4.688.2.3 second\_argument\_type

```
typedef _Tp std::binary_function< _Tp , _Tp , bool >::second_argument_type [inherited]
```

second\_argument\_type is the type of the second argument

Definition at line 124 of file stl\_function.h.

## 4.694.1 Detailed Description

```
template<typename _RealType = double>
class std::lognormal_distribution<_RealType>
```

A lognormal\_distribution random number distribution.

The formula for the normal probability mass function is

$$p(x|m, s) = \frac{1}{sx\sqrt{2\pi}} \exp - \frac{(\ln x - m)^2}{2s^2}$$

Definition at line 2191 of file random.h.

## 4.694.2 Member Typedef Documentation

## 4.694.2.1 result\_type

```
template<typename _RealType = double>
typedef _RealType std::lognormal_distribution<_RealType>::result_type
```

The type of the range of the distribution.

Definition at line 2194 of file random.h.

## 4.694.3 Member Function Documentation

## 4.694.3.1 m()

```
template<typename _RealType = double>
_RealType std::lognormal_distribution<_RealType>::m () const [inline]
```

Definition at line 2256 of file random.h.

#### 4.694.3.2 max()

```
template<typename _RealType = double>
result_type std::lognormal_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

Definition at line 2289 of file random.h.

References `std::numeric_limits< _Tp >::max()`.

#### 4.694.3.3 min()

```
template<typename _RealType = double>
result_type std::lognormal_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

Definition at line 2282 of file random.h.

#### 4.694.3.4 operator>()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::lognormal_distribution< _RealType >::operator() (
 _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Definition at line 2297 of file random.h.

#### 4.694.3.5 param() [1/2]

```
template<typename _RealType = double>
param_type std::lognormal_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

Definition at line 2267 of file random.h.

#### 4.694.3.6 param() [2/2]

```
template<typename _RealType = double>
void std::lognormal_distribution< _RealType >::param (
 const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

## Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

Definition at line 2275 of file `random.h`.

4.694.3.7 `reset()`

```
template<typename _RealType = double>
void std::lognormal_distribution<_RealType>::reset () [inline]
```

Resets the distribution state.

Definition at line 2249 of file `random.h`.

References `std::normal_distribution<_RealType>::reset()`.

## 4.694.4 Friends And Related Function Documentation

4.694.4.1 `operator<<`

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
 std::basic_ostream<_CharT, _Traits> & __os,
 const std::lognormal_distribution<_RealType1> & __x) [friend]
```

Inserts a `lognormal_distribution` random number distribution `__x` into the output stream `__os`.

## Parameters

|                   |                                                                   |
|-------------------|-------------------------------------------------------------------|
| <code>__os</code> | An output stream.                                                 |
| <code>__x</code>  | A <code>lognormal_distribution</code> random number distribution. |

## Returns

The output stream with the state of `__x` inserted or in an error state.

#### 4.694.4.2 operator==

```
template<typename _RealType = double>
bool operator== (
 const lognormal_distribution< _RealType > & __d1,
 const lognormal_distribution< _RealType > & __d2) [friend]
```

Return true if two lognormal distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 2334 of file random.h.

#### 4.694.4.3 operator>>

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
 std::basic_istream< _CharT, _Traits > & __is,
 std::lognormal_distribution< _RealType1 > & __x) [friend]
```

Extracts a `lognormal_distribution` random number distribution `__x` from the input stream `__is`.

##### Parameters

|                   |                                                                       |
|-------------------|-----------------------------------------------------------------------|
| <code>__is</code> | An input stream.                                                      |
| <code>__x</code>  | A <code>lognormal_distribution</code> random number generator engine. |

##### Returns

The input stream with `__x` extracted or in an error state.

The documentation for this class was generated from the following files:

- [random.h](#)
- [bits/random.tcc](#)

### 4.695 `__gnu_pbds::detail::lu_counter_metadata< Size_Type >` Class Template Reference

##### Public Types

- typedef `Size_Type` **size\_type**

## Friends

- class **lu\_counter\_policy\_base**< **size\_type** >

## 4.695.1 Detailed Description

```
template<typename Size_Type = std::size_t>
class __gnu_pbds::detail::lu_counter_metadata< Size_Type >
```

A list-update metadata type that moves elements to the front of the list based on the counter algorithm.

Definition at line 51 of file `lu_counter_metadata.hpp`.

The documentation for this class was generated from the following file:

- [lu\\_counter\\_metadata.hpp](#)

## 4.696 \_\_gnu\_pbds::lu\_counter\_policy&lt; Max\_Count, \_Alloc &gt; Class Template Reference

Inheritance diagram for \_\_gnu\_pbds::lu\_counter\_policy< Max\_Count, \_Alloc >:

## Public Types

- enum { **max\_count** }
- typedef `_Alloc` **allocator\_type**
- typedef `detail::rebind_traits< _Alloc, metadata_type >::reference` **metadata\_reference**
- typedef `detail::lu_counter_metadata< size_type >` **metadata\_type**
- typedef `allocator_type::size_type` **size\_type**

## 4.696.1 Detailed Description

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
class __gnu_pbds::lu_counter_policy< Max_Count, _Alloc >
```

A list-update policy that moves elements to the front of the list based on the counter algorithm.

Definition at line 91 of file `list_update_policy.hpp`.

## 4.696.2 Member Typedef Documentation

### 4.696.2.1 metadata\_reference

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
typedef detail::rebind_traits<_Alloc, metadata_type>::reference __gnu_pbds::lu_counter_policy<
Max_Count, _Alloc >::metadata_reference
```

Reference to metadata on which this functor operates.

Definition at line 114 of file `list_update_policy.hpp`.

### 4.696.2.2 metadata\_type

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
typedef detail::lu_counter_metadata<size_type> __gnu_pbds::lu_counter_policy< Max_Count, _Alloc
>::metadata_type
```

Metadata on which this functor operates.

Definition at line 106 of file `list_update_policy.hpp`.

## 4.696.3 Member Enumeration Documentation

### 4.696.3.1 anonymous enum

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
anonymous enum
```

## Enumerator

|                        |                                                                                                |
|------------------------|------------------------------------------------------------------------------------------------|
| <code>max_count</code> | When some element is accessed this number of times, it will be moved to the front of the list. |
|------------------------|------------------------------------------------------------------------------------------------|

Definition at line 98 of file `list_update_policy.hpp`.

## 4.696.4 Member Function Documentation

4.696.4.1 `operator()()` [1/2]

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
metadata_type __gnu_pbds::lu_counter_policy< Max_Count, _Alloc >::operator() () const [inline]
```

Creates a metadata object.

Definition at line 118 of file `list_update_policy.hpp`.

References `__gnu_pbds::lu_counter_policy< Max_Count, _Alloc >::max_count`.

4.696.4.2 `operator()()` [2/2]

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
bool __gnu_pbds::lu_counter_policy< Max_Count, _Alloc >::operator() (
 metadata_reference r_data) const [inline]
```

Decides whether a metadata object should be moved to the front of the list.

Definition at line 124 of file `list_update_policy.hpp`.

References `__gnu_pbds::lu_counter_policy< Max_Count, _Alloc >::max_count`.

The documentation for this class was generated from the following file:

- [list\\_update\\_policy.hpp](#)

4.697 `__gnu_pbds::detail::lu_counter_policy_base< Size_Type >` Class Template Reference

## Protected Types

- typedef `Size_Type` **size\_type**

## Protected Member Functions

### 4.698.1 Detailed Description

```
template<typename Key, typename Mapped, typename Eq_Fn, typename _Alloc, typename Update_Policy>
class __gnu_pbds::detail::lu_map< Key, Mapped, Eq_Fn, _Alloc, Update_Policy >
```

list-based (with updates) associative container. Skip to the lu, my darling.

Definition at line 91 of file lu\_map\_.hpp.

The documentation for this class was generated from the following file:

- [lu\\_map\\_.hpp](#)

### 4.699 \_\_gnu\_pbds::lu\_move\_to\_front\_policy< \_Alloc > Class Template Reference

#### Public Types

- typedef \_Alloc **allocator\_type**
- typedef [detail::rebind\\_traits](#)< \_Alloc, [metadata\\_type](#) >::reference [metadata\\_reference](#)
- typedef [null\\_type](#) [metadata\\_type](#)

#### Public Member Functions

- [metadata\\_type](#) [operator\(\)](#) () const
- bool [operator\(\)](#) ([metadata\\_reference](#) r\_metadata) const

#### 4.699.1 Detailed Description

```
template<typename _Alloc = std::allocator<char>>
class __gnu_pbds::lu_move_to_front_policy<_Alloc>
```

A list-update policy that unconditionally moves elements to the front of the list. A null type means that each link in a list-based container does not actually need metadata.

Definition at line 58 of file list\_update\_policy.hpp.

#### 4.699.2 Member Typedef Documentation

##### 4.699.2.1 metadata\_reference

```
template<typename _Alloc = std::allocator<char>>
typedef detail::rebind_traits<_Alloc, metadata_type>::reference __gnu_pbds::lu_move_to_front_policy<
_Alloc>::metadata_reference
```

Reference to metadata on which this functor operates.

Definition at line 69 of file list\_update\_policy.hpp.

##### 4.699.2.2 metadata\_type

```
template<typename _Alloc = std::allocator<char>>
typedef null_type __gnu_pbds::lu_move_to_front_policy<_Alloc>::metadata_type
```

Metadata on which this functor operates.

Definition at line 64 of file list\_update\_policy.hpp.

#### 4.699.3 Member Function Documentation

##### 4.699.3.1 operator>() [1/2]

```
template<typename _Alloc = std::allocator<char>>
metadata_type __gnu_pbds::lu_move_to_front_policy<_Alloc>::operator() () const [inline]
```

Creates a metadata object.

Definition at line 73 of file list\_update\_policy.hpp.

#### 4.699.3.2 `operator()` [2/2]

```
template<typename _Alloc = std::allocator<char>>
bool __gnu_pbds::lu_move_to_front_policy< _Alloc >::operator() (
 metadata_reference r_metadata) const [inline]
```

Decides whether a metadata object should be moved to the front of the list.

Definition at line 79 of file `list_update_policy.hpp`.

The documentation for this class was generated from the following file:

- [list\\_update\\_policy.hpp](#)

### 4.700 `std::make_signed< _Tp >` Struct Template Reference

#### Public Types

- typedef `__make_signed_selector< _Tp >::__type` **type**

#### 4.700.1 Detailed Description

```
template<typename _Tp>
struct std::make_signed< _Tp >
```

`make_signed`

Definition at line 1951 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

### 4.701 `std::make_unsigned< _Tp >` Struct Template Reference

#### Public Types

- typedef `__make_unsigned_selector< _Tp >::__type` **type**

## 4.701.1 Detailed Description

```
template<typename _Tp>
struct std::make_unsigned< _Tp >
```

make\_unsigned

Definition at line 1825 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

4.702 `__gnu_cxx::malloc_allocator<_Tp>` Class Template Reference

## Public Types

constexpr bool **operator==** (const [malloc\\_allocator](#) &, const [malloc\\_allocator](#)<\_Up > &) noexcept

#### 4.702.1 Detailed Description

```
template<typename _Tp>
class __gnu_cxx::malloc_allocator< _Tp >
```

An allocator that uses malloc.

This is precisely the allocator defined in the C++ Standard.

- all allocation calls malloc
- all deallocation calls free

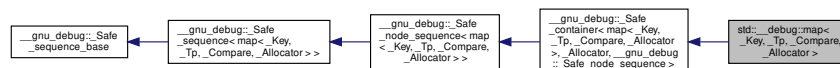

Definition at line 54 of file malloc\_allocator.h.

The documentation for this class was generated from the following file:

- [malloc\\_allocator.h](#)

## 4.703.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Allocator = std::allocator<std::pair<const _Key, _Tp>>>>
class std::__debug::map< _Key, _Tp, _Compare, _Allocator >
```

Class std::map with safety/checking/debug instrumentation.

Definition at line 44 of file map.h.

## 4.703.2 Member Function Documentation

## 4.703.2.1 \_M\_detach\_all()

```
void __gnu_debug::_Safe_sequence_base::_M_detach_all () [protected], [inherited]
```

Detach all iterators, leaving them singular.

Referenced by \_\_gnu\_debug::\_Safe\_sequence\_base::~~\_Safe\_sequence\_base().

## 4.703.2.2 \_M\_detach\_singular()

```
void __gnu_debug::_Safe_sequence_base::_M_detach_singular () [protected], [inherited]
```

Detach all singular iterators.

## Postcondition

for all iterators *i* attached to this sequence, *i*->\_M\_version == \_M\_version.

## 4.703.2.3 \_M\_get\_mutex()

```
__gnu_cxx::__mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex () throw () [protected],
[inherited]
```

For use in \_Safe\_sequence.

Referenced by \_\_gnu\_debug::\_Safe\_sequence< map< \_Key, \_Tp, \_Compare, \_Allocator > >::\_M\_transfer\_from\_if().

#### 4.703.2.4 `_M_invalidate_all()`

```
void __gnu_debug::_Safe_sequence_base::_M_invalidate_all () const [inline], [protected], [inherited]
```

Invalidates all iterators.

Definition at line 256 of file `safe_base.h`.

References `__gnu_debug::_Safe_sequence_base::_M_version`.

#### 4.703.2.5 `_M_invalidate_if()`

```
void __gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_invalidate_if (
 _Predicate __pred) [inherited]
```

Invalidates all iterators `x` that reference this sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

Definition at line 38 of file `safe_sequence.tcc`.

#### 4.703.2.6 `_M_revalidate_singular()`

```
void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular () [protected], [inherited]
```

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

#### 4.703.2.7 `_M_swap()`

```
void __gnu_debug::_Safe_sequence_base::_M_swap (
 _Safe_sequence_base & __x) [protected], [noexcept], [inherited]
```

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

#### 4.703.2.8 `_M_transfer_from_if()`

```
void __gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if
(
 _Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > > & __from,
 _Predicate __pred) [inherited]
```

Transfers all iterators `x` that reference `from` sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

Definition at line 69 of file `safe_sequence.tcc`.

### 4.703.3 Member Data Documentation

#### 4.703.3.1 \_M\_const\_iterators

`_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_iterators` [inherited]

The list of constant iterators that reference this container.

Definition at line 197 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

#### 4.703.3.2 \_M\_iterators

`_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators` [inherited]

The list of mutable iterators that reference this container.

Definition at line 194 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

#### 4.703.3.3 \_M\_version

`unsigned int __gnu_debug::_Safe_sequence_base::_M_version` [mutable], [inherited]

The container version number. This number may never be 0.

Definition at line 200 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence_base::_M_invalidate_all()`.

The documentation for this class was generated from the following file:

- `template<typename _K1, typename _T1, typename _C1, typename _A1 >`  
`bool operator== (const map< _K1, _T1, _C1, _A1 > &, const map< _K1, _T1, _C1, _A1 > &)`

## 4.704.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp> >>>
class std::map< _Key, _Tp, _Compare, _Alloc >
```

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time.

## Template Parameters

|                       |                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------|
| <code>_Key</code>     | Type of key objects.                                                                |
| <code>_Tp</code>      | Type of mapped objects.                                                             |
| <code>_Compare</code> | Comparison function object type, defaults to <code>less&lt;_Key&gt;</code> .        |
| <code>_Alloc</code>   | Allocator type, defaults to <code>allocator&lt;pair&lt;const _Key, _Tp&gt;</code> . |

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using unique keys). For a `map<Key, T>` the `key_type` is `Key`, the `mapped_type` is `T`, and the `value_type` is `std::pair<const Key, T>`.

Maps support bidirectional iterators.

The private tree data is declared exactly the same way for `map` and `multimap`; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

Definition at line 100 of file `stl_map.h`.

## 4.704.2 Constructor &amp; Destructor Documentation

4.704.2.1 `map()` [1/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>>
std::map< _Key, _Tp, _Compare, _Alloc >::map () [default]
```

Default constructor creates no elements.

#### 4.704.2.2 map() [2/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
 const _Compare & __comp,
 const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Creates a map with no elements.

##### Parameters

|                     |                      |
|---------------------|----------------------|
| <code>__comp</code> | A comparison object. |
| <code>__a</code>    | An allocator object. |

Definition at line 194 of file `stl_map.h`.

#### 4.704.2.3 map() [3/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
 const map< _Key, _Tp, _Compare, _Alloc > &) [default]
```

Map copy constructor.

Whether the allocator is copied depends on the allocator traits.

#### 4.704.2.4 map() [4/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
 map< _Key, _Tp, _Compare, _Alloc > &&) [default]
```

Map move constructor.

The newly-created map contains the exact contents of the moved instance. The moved instance is a valid, but unspecified, map.

#### 4.704.2.5 map() [5/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
 initializer_list< value_type > __l,
 const _Compare & __comp = _Compare(),
 const allocator_type & __a = allocator_type()) [inline]
```

Builds a map from an `initializer_list`.

## Parameters

|                     |                      |
|---------------------|----------------------|
| <code>__l</code>    | An initializer_list. |
| <code>__comp</code> | A comparison object. |
| <code>__a</code>    | An allocator object. |

Create a map consisting of copies of the elements in the initializer\_list `__l`. This is linear in N if the range is already sorted, and NlogN otherwise (where N is `__l.size()`).

Definition at line 228 of file `stl_map.h`.

## 4.704.2.6 map() [6/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
 const allocator_type & __a) [inline], [explicit]
```

Allocator-extended default constructor.

Definition at line 236 of file `stl_map.h`.

## 4.704.2.7 map() [7/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
 const map< _Key, _Tp, _Compare, _Alloc > & __m,
 const allocator_type & __a) [inline]
```

Allocator-extended copy constructor.

Definition at line 240 of file `stl_map.h`.

## 4.704.2.8 map() [8/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
 map< _Key, _Tp, _Compare, _Alloc > && __m,
 const allocator_type & __a) [inline], [noexcept]
```

Allocator-extended move constructor.

Definition at line 244 of file `stl_map.h`.

**4.704.2.9 map()** [9/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
 initializer_list< value_type > __l,
 const allocator_type & __a) [inline]
```

Allocator-extended initialier-list constructor.

Definition at line 250 of file stl\_map.h.

**4.704.2.10 map()** [10/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator >
std::map< _Key, _Tp, _Compare, _Alloc >::map (
 _InputIterator __first,
 _InputIterator __last,
 const allocator_type & __a) [inline]
```

Allocator-extended range constructor.

Definition at line 256 of file stl\_map.h.

**4.704.2.11 map()** [11/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator >
std::map< _Key, _Tp, _Compare, _Alloc >::map (
 _InputIterator __first,
 _InputIterator __last) [inline]
```

Builds a map from a range.

**Parameters**

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

Create a map consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first`,`__last`)).

Definition at line 273 of file stl\_map.h.

## 4.704.2.12 map() [12/12]

```

template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator >
std::map< _Key, _Tp, _Compare, _Alloc >::map (
 _InputIterator __first,
 _InputIterator __last,
 const _Compare & __comp,
 const allocator_type & __a = allocator_type()) [inline]

```

Builds a map from a range.

## Parameters

|                      |                       |
|----------------------|-----------------------|
| <code>__first</code> | An input iterator.    |
| <code>__last</code>  | An input iterator.    |
| <code>__comp</code>  | A comparison functor. |
| <code>__a</code>     | An allocator object.  |

Create a map consisting of copies of the elements from [`__first`,`__last`). This is linear in *N* if the range is already sorted, and *N*log*N* otherwise (where *N* is distance(`__first`,`__last`)).

Definition at line 290 of file `stl_map.h`.

## 4.704.2.13 ~map()

```

template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::~~map () [default]

```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

## 4.704.3 Member Function Documentation

## 4.704.3.1 at()

```

template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
mapped_type& std::map< _Key, _Tp, _Compare, _Alloc >::at (
 const key_type & __k) [inline]

```

Access to map data.

**Parameters**

|                  |                                             |
|------------------|---------------------------------------------|
| <code>__k</code> | The key for which data should be retrieved. |
|------------------|---------------------------------------------|

**Returns**

A reference to the data whose key is equivalent to `__k`, if such a data is present in the map.

**Exceptions**

|                                |                             |
|--------------------------------|-----------------------------|
| <code>std::out_of_range</code> | If no such data is present. |
|--------------------------------|-----------------------------|

Definition at line 537 of file `stl_map.h`.

References `std::map<_Key, _Tp, _Compare, _Alloc>::end()`, `std::map<_Key, _Tp, _Compare, _Alloc>::key_comp()`, and `std::map<_Key, _Tp, _Compare, _Alloc>::lower_bound()`.

**4.704.3.2 `begin()`** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
iterator std::map<_Key, _Tp, _Compare, _Alloc>::begin () [inline], [noexcept]
```

Returns a read/write iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 356 of file `stl_map.h`.

**4.704.3.3 `begin()`** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 365 of file `stl_map.h`.

#### 4.704.3.4 cbegin()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 429 of file stl\_map.h.

#### 4.704.3.5 cend()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 438 of file stl\_map.h.

#### 4.704.3.6 clear()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::map< _Key, _Tp, _Compare, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in a map. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1133 of file stl\_map.h.

#### 4.704.3.7 count() [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::map< _Key, _Tp, _Compare, _Alloc >::count (
 const key_type & __x) const [inline]
```

Finds the number of elements with given key.

**Parameters**

|                                                                                   |                                          |
|-----------------------------------------------------------------------------------|------------------------------------------|
|  | Key of (key, value) pairs to be located. |
|  |                                          |

**Returns**

Number of elements with specified key.

This function only makes sense for multimaps; for map the result will either be 0 (not present) or 1 (present).

Definition at line 1215 of file stl\_map.h.

**4.704.3.8 count()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::map< _Key, _Tp, _Compare, _Alloc >::count (
 const _Kt & __x) const -> decltype(_M_t._M_count_tr(__x)) [inline]
```

Finds the number of elements with given key.

**Parameters**

|                                                                                     |                                          |
|-------------------------------------------------------------------------------------|------------------------------------------|
|  | Key of (key, value) pairs to be located. |
|  |                                          |

**Returns**

Number of elements with specified key.

This function only makes sense for multimaps; for map the result will either be 0 (not present) or 1 (present).

Definition at line 1221 of file stl\_map.h.

**4.704.3.9 crbegin()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::crbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

Definition at line 447 of file stl\_map.h.

## 4.704.3.10 crend()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::crend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

Definition at line 456 of file stl\_map.h.

## 4.704.3.11 emplace()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename... _Args>
std::pair<iterator, bool> std::map< _Key, _Tp, _Compare, _Alloc >::emplace (
 _Args &&... __args) [inline]
```

Attempts to build and insert a std::pair into the map.

## Parameters

|                     |                                                                                                                                           |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__args</code> | Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor). |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------|

## Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

Definition at line 576 of file stl\_map.h.

## 4.704.3.12 emplace\_hint()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename... _Args>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::emplace_hint (
 const_iterator __pos,
 _Args &&... __args) [inline]
```

Attempts to build and insert a std::pair into the map.

## Parameters

|                     |                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the pair should be inserted.                                                                             |
| <code>__args</code> | Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor). |

## Returns

An iterator that points to the element with key of the `std::pair` built from `__args` (may or may not be that `std::pair`).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 606 of file `stl_map.h`.

4.704.3.13 `empty()`

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
bool std::map<_Key, _Tp, _Compare, _Alloc >::empty () const [inline], [noexcept]
```

Returns true if the map is empty. (Thus `begin()` would equal `end()`.)

Definition at line 465 of file `stl_map.h`.

4.704.3.14 `end()` [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map<_Key, _Tp, _Compare, _Alloc >::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 374 of file `stl_map.h`.

Referenced by `std::map<_Key, _Tp, _Compare, _Alloc >::at()`.

## 4.704.3.15 end() [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::end () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 383 of file stl\_map.h.

## 4.704.3.16 equal\_range() [1/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::pair<iterator, iterator> std::map< _Key, _Tp, _Compare, _Alloc >::equal_range (
 const key_type & __x) [inline]
```

Finds a subsequence matching given key.

## Parameters

|                  |                                          |
|------------------|------------------------------------------|
| <code>__x</code> | Key of (key, value) pairs to be located. |
|------------------|------------------------------------------|

## Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

Definition at line 1352 of file stl\_map.h.

## 4.704.3.17 equal\_range() [2/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::map< _Key, _Tp, _Compare, _Alloc >::equal_range (
 const _Kt & __x) -> decltype(pair<iterator, iterator>(_M_t._M_equal_range_tr(__x)))
[inline]
```

Finds a subsequence matching given key.

**Parameters**

|                 |                                          |
|-----------------|------------------------------------------|
| <code>_↵</code> | Key of (key, value) pairs to be located. |
| <code>_X</code> |                                          |

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
 c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

Definition at line 1358 of file `stl_map.h`.

**4.704.3.18 equal\_range()** [3/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::pair<const_iterator, const_iterator> std::map< _Key, _Tp, _Compare, _Alloc >::equal_range (
 const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                 |                                          |
|-----------------|------------------------------------------|
| <code>_↵</code> | Key of (key, value) pairs to be located. |
| <code>_X</code> |                                          |

**Returns**

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
 c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

Definition at line 1381 of file `stl_map.h`.

## 4.704.3.19 equal\_range() [4/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
template<typename _Kt >
auto std::map< _Key, _Tp, _Compare, _Alloc >::equal_range (
 const _Kt & __x) const -> decltype(pair<const_iterator, const_iterator>(_M_t._M_↵
equal_range_tr(__x))) [inline]
```

Finds a subsequence matching given key.

## Parameters

|                 |                                          |
|-----------------|------------------------------------------|
| <code>↵</code>  | Key of (key, value) pairs to be located. |
| <code>_X</code> |                                          |

## Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
 c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

Definition at line 1387 of file stl\_map.h.

## 4.704.3.20 erase() [1/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::erase (
 const_iterator __position) [inline]
```

Erases an element from a map.

## Parameters

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

## Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1031 of file `stl_map.h`.

#### 4.704.3.21 `erase()` [2/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
_GLIBCXX_ABI_TAG_CXX11 iterator std::map< _Key, _Tp, _Compare, _Alloc >::erase (
 iterator __position) [inline]
```

Erases an element from a map.

##### Parameters

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

##### Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1037 of file `stl_map.h`.

#### 4.704.3.22 `erase()` [3/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::map< _Key, _Tp, _Compare, _Alloc >::erase (
 const key_type & __x) [inline]
```

Erases elements according to the provided key.

##### Parameters

|                  |                              |
|------------------|------------------------------|
| <code>__x</code> | Key of element to be erased. |
|------------------|------------------------------|

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1068 of file stl\_map.h.

**4.704.3.23 erase()** [4/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::erase (
 const_iterator __first,
 const_iterator __last) [inline]
```

Erases a [first,last) range of elements from a map.

**Parameters**

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

**Returns**

The iterator `__last`.

This function erases a sequence of elements from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1088 of file stl\_map.h.

**4.704.3.24 find()** [1/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::find (
 const key_type & __x) [inline]
```

Tries to locate an element in a map.

**Parameters**

|                 |                                         |
|-----------------|-----------------------------------------|
| <code>_↵</code> | Key of (key, value) pair to be located. |
| <code>_X</code> |                                         |

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 1169 of file `stl_map.h`.

**4.704.3.25 find()** [2/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::map< _Key, _Tp, _Compare, _Alloc >::find (
 const _Kt & __x) -> decltype(_M_t._M_find_tr(__x)) [inline]
```

Tries to locate an element in a map.

**Parameters**

|                 |                                         |
|-----------------|-----------------------------------------|
| <code>_↵</code> | Key of (key, value) pair to be located. |
| <code>_X</code> |                                         |

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 1175 of file `stl_map.h`.

**4.704.3.26 find()** [3/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::find (
 const key_type & __x) const [inline]
```

Tries to locate an element in a map.

## Parameters

|                 |                                         |
|-----------------|-----------------------------------------|
| <code>_↵</code> | Key of (key, value) pair to be located. |
| <code>_X</code> |                                         |

## Returns

Read-only (constant) iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 1194 of file `stl_map.h`.

## 4.704.3.27 find() [4/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::map< _Key, _Tp, _Compare, _Alloc >::find (
 const _Kt & __x) const -> decltype(_M_t._M_find_tr(__x)) [inline]
```

Tries to locate an element in a map.

## Parameters

|                 |                                         |
|-----------------|-----------------------------------------|
| <code>_↵</code> | Key of (key, value) pair to be located. |
| <code>_X</code> |                                         |

## Returns

Read-only (constant) iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 1200 of file `stl_map.h`.

## 4.704.3.28 get\_allocator()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
allocator_type std::map< _Key, _Tp, _Compare, _Alloc >::get_allocator () const [inline], [noexcept]
```

Get a copy of the memory allocation object.

Definition at line 346 of file `stl_map.h`.

**4.704.3.29** `insert()` [1/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::pair<iterator, bool> std::map<_Key, _Tp, _Compare, _Alloc >::insert (
 const value_type & __x) [inline]
```

Attempts to insert a `std::pair` into the map.

**Parameters**

|                  |                                                                                   |
|------------------|-----------------------------------------------------------------------------------|
| <code>__x</code> | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |
|------------------|-----------------------------------------------------------------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

Definition at line 803 of file `stl_map.h`.

Referenced by `std::map<_Key, _Tp, _Compare, _Alloc >::insert()`.

**4.704.3.30** `insert()` [2/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::pair<iterator, bool> std::map<_Key, _Tp, _Compare, _Alloc >::insert (
 value_type && __x) [inline]
```

Attempts to insert a `std::pair` into the map.

**Parameters**

|                  |                                                                                   |
|------------------|-----------------------------------------------------------------------------------|
| <code>__x</code> | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |
|------------------|-----------------------------------------------------------------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

Definition at line 810 of file stl\_map.h.

References `std::move()`.

#### 4.704.3.31 insert() [3/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Pair >
__enable_if_t<is_constructible<value_type, _Pair>::value, pair<iterator, bool> > std::map< _↵
Key, _Tp, _Compare, _Alloc >::insert (
 _Pair && __x) [inline]
```

Attempts to insert a `std::pair` into the map.

##### Parameters

|                  |                                                                                   |
|------------------|-----------------------------------------------------------------------------------|
| <code>__x</code> | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |
|------------------|-----------------------------------------------------------------------------------|

##### Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

Definition at line 816 of file stl\_map.h.

#### 4.704.3.32 insert() [4/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::map< _Key, _Tp, _Compare, _Alloc >::insert (
 std::initializer_list< value_type > __list) [inline]
```

Attempts to insert a list of `std::pairs` into the map.

## Parameters

|                     |                                                                                 |
|---------------------|---------------------------------------------------------------------------------|
| <code>__list</code> | A <code>std::initializer_list&lt;value_type&gt;</code> of pairs to be inserted. |
|---------------------|---------------------------------------------------------------------------------|

Complexity similar to that of the range constructor.

Definition at line 830 of file `stl_map.h`.

References `std::map<_Key, _Tp, _Compare, _Alloc >::insert()`.

4.704.3.33 `insert()` [5/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map<_Key, _Tp, _Compare, _Alloc >::insert (
 const_iterator __position,
 const value_type & __x) [inline]
```

Attempts to insert a `std::pair` into the map.

## Parameters

|                         |                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------|
| <code>__position</code> | An iterator that serves as a hint as to where the pair should be inserted.        |
| <code>__x</code>        | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |

## Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 860 of file `stl_map.h`.

4.704.3.34 `insert()` [6/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map<_Key, _Tp, _Compare, _Alloc >::insert (
 const_iterator __position,
 value_type && __x) [inline]
```

Attempts to insert a `std::pair` into the map.

## Parameters

|                         |                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------|
| <code>__position</code> | An iterator that serves as a hint as to where the pair should be inserted.        |
| <code>__x</code>        | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |

## Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 870 of file `stl_map.h`.

References `std::move()`.

## 4.704.3.35 insert() [7/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
template<typename _Pair >
__enable_if_t<is_constructible<value_type, _Pair>::value, iterator> std::map< _Key, _Tp, _↵
_Compare, _Alloc >::insert (
 const_iterator __position,
 _Pair && __x) [inline]
```

Attempts to insert a `std::pair` into the map.

## Parameters

|                         |                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------|
| <code>__position</code> | An iterator that serves as a hint as to where the pair should be inserted.        |
| <code>__x</code>        | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |

## Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 875 of file `stl_map.h`.

#### 4.704.3.36 `insert()` [8/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator >
void std::map< _Key, _Tp, _Compare, _Alloc >::insert (
 _InputIterator __first,
 _InputIterator __last) [inline]
```

Template function that attempts to insert a range of elements.

##### Parameters

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

Definition at line 893 of file `stl_map.h`.

#### 4.704.3.37 `key_comp()`

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
key_compare std::map< _Key, _Tp, _Compare, _Alloc >::key_comp () const [inline]
```

Returns the key comparison object out of which the map was constructed.

Definition at line 1142 of file `stl_map.h`.

Referenced by `std::map< _Key, _Tp, _Compare, _Alloc >::at()`.

#### 4.704.3.38 `lower_bound()` [1/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound (
 const key_type & __x) [inline]
```

Finds the beginning of a subsequence matching given key.

## Parameters

|                                                                                   |                                         |
|-----------------------------------------------------------------------------------|-----------------------------------------|
|  | Key of (key, value) pair to be located. |
|  |                                         |

## Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 1258 of file stl\_map.h.

Referenced by std::map< \_Key, \_Tp, \_Compare, \_Alloc >::at().

## 4.704.3.39 lower\_bound() [2/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound (
 const _Kt & __x) -> decltype(iterator(_M_t._M_lower_bound_tr(__x))) [inline]
```

Finds the beginning of a subsequence matching given key.

## Parameters

|                                                                                     |                                         |
|-------------------------------------------------------------------------------------|-----------------------------------------|
|  | Key of (key, value) pair to be located. |
|  |                                         |

## Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 1264 of file stl\_map.h.

## 4.704.3.40 lower\_bound() [3/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound (
 const key_type & __x) const [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|                                                                                   |                                         |
|-----------------------------------------------------------------------------------|-----------------------------------------|
|  | Key of (key, value) pair to be located. |
|  |                                         |

**Returns**

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 1283 of file stl\_map.h.

**4.704.3.41 lower\_bound()** [4/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound (
 const _Kt & __x) const -> decltype(const_iterator(_M_t._M_lower_bound_tr(__x)))
[inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|                                                                                     |                                         |
|-------------------------------------------------------------------------------------|-----------------------------------------|
|  | Key of (key, value) pair to be located. |
|  |                                         |

**Returns**

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 1289 of file stl\_map.h.

**4.704.3.42 max\_size()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::map< _Key, _Tp, _Compare, _Alloc >::max_size () const [inline], [noexcept]
```

Returns the maximum size of the map.

Definition at line 475 of file stl\_map.h.

## 4.704.3.43 operator=() [1/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
map& std::map<_Key, _Tp, _Compare, _Alloc >::operator= (
 const map<_Key, _Tp, _Compare, _Alloc > &) [default]
```

Map assignment operator.

Whether the allocator is copied depends on the allocator traits.

## 4.704.3.44 operator=() [2/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
map& std::map<_Key, _Tp, _Compare, _Alloc >::operator= (
 map<_Key, _Tp, _Compare, _Alloc > &&) [default]
```

Move assignment operator.

## 4.704.3.45 operator=() [3/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
map& std::map<_Key, _Tp, _Compare, _Alloc >::operator= (
 initializer_list< value_type > __l) [inline]
```

Map list assignment operator.

## Parameters

|   |                      |
|---|----------------------|
| ↩ | An initializer_list. |
| ↩ |                      |
| ↩ |                      |
| ↩ |                      |
| / |                      |

This function fills a map with copies of the elements in the initializer list \_\_l.

Note that the assignment completely changes the map and that the resulting map's size is the same as the number of elements assigned.

Definition at line 337 of file stl\_map.h.

**4.704.3.46 operator[]()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
mapped_type& std::map<_Key, _Tp, _Compare, _Alloc >::operator[] (
 const key_type & __k) [inline]
```

Subscript ( [] ) access to map data.

**Parameters**

|                  |                                             |
|------------------|---------------------------------------------|
| <code>__k</code> | The key for which data should be retrieved. |
|------------------|---------------------------------------------|

**Returns**

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ( [] ) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires logarithmic time.

Definition at line 492 of file stl\_map.h.

**4.704.3.47 rbegin()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc >::rbegin () [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

Definition at line 392 of file stl\_map.h.

**4.704.3.48 rbegin()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc >::rbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

Definition at line 401 of file stl\_map.h.

**4.704.3.49** `rend()` [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rend () [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

Definition at line 410 of file `stl_map.h`.

**4.704.3.50** `rend()` [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

Definition at line 419 of file `stl_map.h`.

**4.704.3.51** `size()`

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::map< _Key, _Tp, _Compare, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the map.

Definition at line 470 of file `stl_map.h`.

**4.704.3.52** `swap()`

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::map< _Key, _Tp, _Compare, _Alloc >::swap (
 map< _Key, _Tp, _Compare, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another map.

**Parameters**

|                  |                                                |
|------------------|------------------------------------------------|
| <code>__x</code> | A map of the same element and allocator types. |
|------------------|------------------------------------------------|

This exchanges the elements between two maps in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

Definition at line 1122 of file `stl_map.h`.

#### 4.704.3.53 `upper_bound()` [1/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::upper_bound (
 const key_type & __x) [inline]
```

Finds the end of a subsequence matching given key.

##### Parameters

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__x</code> | Key of (key, value) pair to be located. |
|------------------|-----------------------------------------|

##### Returns

Iterator pointing to the first element greater than key, or `end()`.

Definition at line 1303 of file `stl_map.h`.

#### 4.704.3.54 `upper_bound()` [2/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::map< _Key, _Tp, _Compare, _Alloc >::upper_bound (
 const _Kt & __x) -> decltype(iterator(_M.t._M_upper_bound_tr(__x))) [inline]
```

Finds the end of a subsequence matching given key.

##### Parameters

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__x</code> | Key of (key, value) pair to be located. |
|------------------|-----------------------------------------|

**Returns**

Iterator pointing to the first element greater than key, or end().

Definition at line 1309 of file stl\_map.h.

**4.704.3.55 upper\_bound()** [3/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::upper_bound (
 const key_type & __x) const [inline]
```

Finds the end of a subsequence matching given key.

**Parameters**

|                         |                                         |
|-------------------------|-----------------------------------------|
| <b><code>__x</code></b> | Key of (key, value) pair to be located. |
|-------------------------|-----------------------------------------|

**Returns**

Read-only (constant) iterator pointing to first iterator greater than key, or end().

Definition at line 1323 of file stl\_map.h.

**4.704.3.56 upper\_bound()** [4/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::map< _Key, _Tp, _Compare, _Alloc >::upper_bound (
 const _Kt & __x) const -> decltype(const_iterator(_M_t._M_upper_bound_tr(__x)))
[inline]
```

Finds the end of a subsequence matching given key.

**Parameters**

|                         |                                         |
|-------------------------|-----------------------------------------|
| <b><code>__x</code></b> | Key of (key, value) pair to be located. |
|-------------------------|-----------------------------------------|

**Returns**

Read-only (constant) iterator pointing to first iterator greater than key, or end().

Definition at line 1329 of file `stl_map.h`.

#### 4.704.3.57 `value_comp()`

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
value_compare std::map< _Key, _Tp, _Compare, _Alloc >::value_comp () const [inline]
```

Returns a value comparison object, built from the key comparison object out of which the map was constructed.

Definition at line 1150 of file `stl_map.h`.

#### 4.705.1 Detailed Description

```
template<class _Tp>
class std::mask_array< _Tp >
```

Reference to selected subset of an array.

A `mask_array` is a reference to the actual elements of an array specified by a bitmask in the form of an array of `bool`. The way to get a `mask_array` is to call `operator[]`(`valarray<bool>`) on a `valarray`. The returned `mask_array` then permits carrying operations out on the referenced subset of elements in the original `valarray`.

For example, if a `mask_array` is obtained using the array `(false, true, false, true)` as an argument, the mask array has two elements referring to `array[1]` and `array[3]` in the underlying array.

#### Parameters

|           |               |
|-----------|---------------|
| <i>Tp</i> | Element type. |
|-----------|---------------|

Definition at line 94 of file `valarray`.

## 4.707.1 Detailed Description

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
class std::match_results< _Bi_iter, _Alloc >
```

The results of a match or search operation.

A collection of character sequences representing the result of a regular expression match. Storage for the collection is allocated and freed as necessary by the member functions of class template match\_results.

This class satisfies the Sequence requirements, with the exception that only the operations defined for a const-qualified Sequence are supported.

The sub\_match object stored at index 0 represents sub-expression 0, i.e. the whole match. In this case the sub\_↵ match member matched is always true. The sub\_match object stored at index n denotes what matched the marked sub-expression n within the matched expression. If the sub-expression n participated in a regular expression match then the sub\_match member matched evaluates to true, and members first and second denote the range of characters [first, second) which formed that match. Otherwise matched is false, and members first and second point to the end of the sequence that was searched.

Definition at line 39 of file regex.h.

## 4.707.2 Constructor &amp; Destructor Documentation

## 4.707.2.1 match\_results() [1/4]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results () [inline]
```

Constructs a default match\_results container.

**Postcondition**

size() returns 0 and str() returns an empty string.

Definition at line 1728 of file regex.h.

## 4.707.2.2 match\_results() [2/4]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results (
 const _Alloc & __a) [inline], [explicit], [noexcept]
```

Constructs a default match\_results container.

**Postcondition**

size() returns 0 and str() returns an empty string.

Definition at line 1735 of file regex.h.

#### 4.707.2.3 match\_results() [3/4]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results (
 const match_results< _Bi_iter, _Alloc > &) [default]
```

Copy constructs a match\_results.

#### 4.707.2.4 match\_results() [4/4]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results (
 match_results< _Bi_iter, _Alloc > &&) [default], [noexcept]
```

Move constructs a match\_results.

#### 4.707.2.5 ~match\_results()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::~~match_results () [default]
```

Destroys a match\_results object.

### 4.707.3 Member Function Documentation

#### 4.707.3.1 begin()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_iterator std::match_results< _Bi_iter, _Alloc >::begin () const [inline], [noexcept]
```

Gets an iterator to the start of the sub\_match collection.

Definition at line 1908 of file regex.h.

Referenced by std::match\_results< \_Bi\_iter >::cbegin(), and std::operator==( ).

#### 4.707.3.2 cbegin()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_iterator std::match_results< _Bi_iter, _Alloc >::cbegin () const [inline], [noexcept]
```

Gets an iterator to the start of the sub\_match collection.

Definition at line 1915 of file regex.h.

#### 4.707.3.3 cend()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_iterator std::match_results< _Bi_iter, _Alloc >::cend () const [inline], [noexcept]
```

Gets an iterator to one-past-the-end of the collection.

Definition at line 1929 of file regex.h.

#### 4.707.3.4 empty()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
bool std::match_results< _Bi_iter, _Alloc >::empty () const [inline], [noexcept]
```

Indicates if the match\_results contains no results.

##### Return values

|              |                                        |
|--------------|----------------------------------------|
| <i>true</i>  | The match_results object is empty.     |
| <i>false</i> | The match_results object is not empty. |

Definition at line 1804 of file regex.h.

Referenced by std::match\_results< \_Bi\_iter >::end(), and std::operator==( ).

#### 4.707.3.5 end()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_iterator std::match_results< _Bi_iter, _Alloc >::end () const [inline], [noexcept]
```

Gets an iterator to one-past-the-end of the collection.

Definition at line 1922 of file regex.h.

Referenced by std::match\_results< \_Bi\_iter >::cend(), and std::operator==( ).

#### 4.707.3.6 format() [1/4]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
template<typename _Out_iter >
_Out_iter std::match_results< _Bi_iter, _Alloc >::format (
 _Out_iter __out,
 const char_type * __fmt_first,
 const char_type * __fmt_last,
 match_flag_type __flags = regex_constants::format_default) const
```

##### Precondition

ready() == true

Referenced by std::match\_results< \_Bi\_iter >::format().

**4.707.3.7 format()** [2/4]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
template<typename _Out_iter, typename _St, typename _Sa >
_Out_iter std::match_results< _Bi_iter, _Alloc >::format (
 _Out_iter __out,
 const basic_string< char_type, _St, _Sa > & __fmt,
 match_flag_type __flags = regex_constants::format_default) const [inline]
```

**Precondition**

ready() == true

Definition at line 1958 of file regex.h.

**4.707.3.8 format()** [3/4]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
template<typename _St, typename _Sa >
basic_string<char_type, _St, _Sa> std::match_results< _Bi_iter, _Alloc >::format (
 const basic_string< char_type, _St, _Sa > & __fmt,
 match_flag_type __flags = regex_constants::format_default) const [inline]
```

**Precondition**

ready() == true

Definition at line 1970 of file regex.h.

**4.707.3.9 format()** [4/4]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
string_type std::match_results< _Bi_iter, _Alloc >::format (
 const char_type * __fmt,
 match_flag_type __flags = regex_constants::format_default) const [inline]
```

**Precondition**

ready() == true

Definition at line 1982 of file regex.h.

#### 4.707.3.10 get\_allocator()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
allocator_type std::match_results<_Bi_iter, _Alloc >::get_allocator () const [inline], [noexcept]
```

Gets a copy of the allocator.

Definition at line 2004 of file regex.h.

#### 4.707.3.11 length()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
difference_type std::match_results<_Bi_iter, _Alloc >::length (
 size_type __sub = 0) const [inline]
```

Gets the length of the indicated submatch.

##### Parameters

|                    |                         |
|--------------------|-------------------------|
| <code>__sub</code> | indicates the submatch. |
|--------------------|-------------------------|

##### Precondition

`ready() == true`

This function returns the length of the indicated submatch, or the length of the entire match if `__sub` is zero (the default).

Definition at line 1823 of file regex.h.

#### 4.707.3.12 max\_size()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
size_type std::match_results<_Bi_iter, _Alloc >::max_size () const [inline], [noexcept]
```

Gets the number of matches and submatches.

The number of matches for a given regular expression will be either 0 if there was no match or `mark_count() + 1` if a match was successful. Some matches may be empty.

##### Returns

the number of matches found.

Definition at line 1795 of file regex.h.

**4.707.3.13 operator=()** [1/2]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
match_results& std::match_results< _Bi_iter, _Alloc >::operator= (
 const match_results< _Bi_iter, _Alloc > &) [default]
```

Assigns rhs to \*this.

**4.707.3.14 operator=()** [2/2]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
match_results& std::match_results< _Bi_iter, _Alloc >::operator= (
 match_results< _Bi_iter, _Alloc > &&) [default]
```

Move-assigns rhs to \*this.

**4.707.3.15 operator[]()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_reference std::match_results< _Bi_iter, _Alloc >::operator[] (
 size_type __sub) const [inline]
```

Gets a sub\_match reference for the match or submatch.

**Parameters**

|                    |                         |
|--------------------|-------------------------|
| <code>__sub</code> | indicates the submatch. |
|--------------------|-------------------------|

**Precondition**

ready() == true

This function gets a reference to the indicated submatch, or the entire match if \_\_sub is zero.

If \_\_sub >= size() then this function returns a sub\_match with a special value indicating no submatch.

Definition at line 1866 of file regex.h.

**4.707.3.16 position()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
difference_type std::match_results< _Bi_iter, _Alloc >::position (
 size_type __sub = 0) const [inline]
```

Gets the offset of the beginning of the indicated submatch.

## Parameters

|                    |                         |
|--------------------|-------------------------|
| <code>__sub</code> | indicates the submatch. |
|--------------------|-------------------------|

## Precondition

`ready() == true`

This function returns the offset from the beginning of the target sequence to the beginning of the submatch, unless the value of `__sub` is zero (the default), in which case this function returns the offset from the beginning of the target sequence to the beginning of the match.

Definition at line 1838 of file `regex.h`.

4.707.3.17 `prefix()`

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_reference std::match_results< _Bi_iter, _Alloc >::prefix () const [inline]
```

Gets a `sub_match` representing the match prefix.

## Precondition

`ready() == true`

This function gets a reference to a `sub_match` object representing the part of the target range between the start of the target range and the start of the match.

Definition at line 1883 of file `regex.h`.

Referenced by `std::operator==()`.

4.707.3.18 `ready()`

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
bool std::match_results< _Bi_iter, _Alloc >::ready () const [inline], [noexcept]
```

Indicates if the `match_results` is ready.

## Return values

|              |                                                  |
|--------------|--------------------------------------------------|
| <i>true</i>  | The object has a fully-established result state. |
| <i>false</i> | The object is not ready.                         |

Definition at line 1774 of file regex.h.

Referenced by `std::operator==()`.

#### 4.707.3.19 `size()`

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
size_type std::match_results< _Bi_iter, _Alloc >::size () const [inline], [noexcept]
```

Gets the number of matches and submatches.

The number of matches for a given regular expression will be either 0 if there was no match or `mark_count()` + 1 if a match was successful. Some matches may be empty.

##### Returns

the number of matches found.

Definition at line 1791 of file regex.h.

Referenced by `std::match_results< _Bi_iter >::empty()`, and `std::operator==()`.

#### 4.707.3.20 `str()`

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
string_type std::match_results< _Bi_iter, _Alloc >::str (
 size_type __sub = 0) const [inline]
```

Gets the match or submatch converted to a string type.

##### Parameters

|                    |                         |
|--------------------|-------------------------|
| <code>__sub</code> | indicates the submatch. |
|--------------------|-------------------------|

##### Precondition

`ready() == true`

This function gets the submatch (or match, if `__sub` is zero) extracted from the target range and converted to the associated string type.

Definition at line 1851 of file regex.h.

## 4.707.3.21 suffix()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_reference std::match_results< _Bi_iter, _Alloc >::suffix () const [inline]
```

Gets a sub\_match representing the match suffix.

**Precondition**

ready() == true

This function gets a reference to a sub\_match object representing the part of the target range between the end of the match and the end of the target range.

Definition at line 1898 of file regex.h.

Referenced by std::operator==( ).

## 4.707.3.22 swap()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
void std::match_results< _Bi_iter, _Alloc >::swap (
 match_results< _Bi_iter, _Alloc > & __that) [inline], [noexcept]
```

Swaps the contents of two match\_results.

Definition at line 2018 of file regex.h.

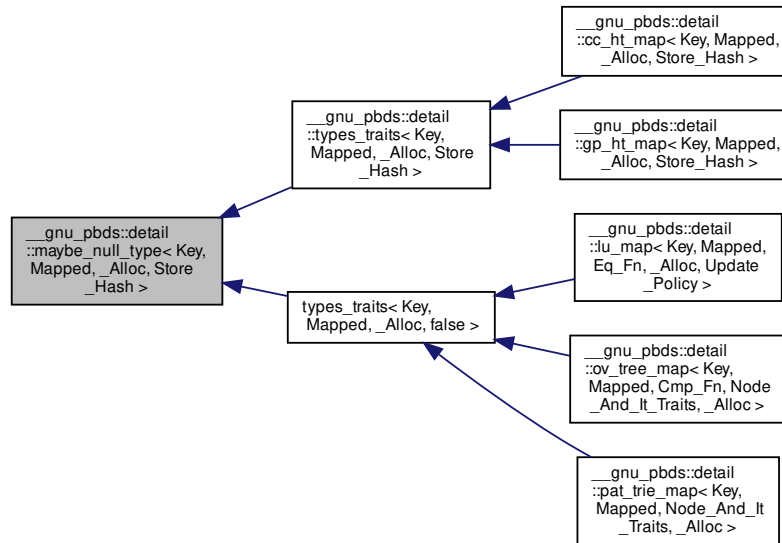

Referenced by std::match\_results< \_Bi\_iter >::swap( ).

### 4.714.1 Detailed Description

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s,
 _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
class std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >
```

A generalized feedback shift register discrete random number generator.

This algorithm avoids multiplication and division and is designed to be friendly to a pipelined architecture. If the parameters are chosen correctly, this generator will produce numbers with a very long period and fairly good apparent entropy, although still not cryptographically strong.

The best way to use this generator is with the predefined mt19937 class.

This algorithm was originally invented by Makoto Matsumoto and Takuji Nishimura.

#### Template Parameters

|                        |                                                                    |
|------------------------|--------------------------------------------------------------------|
| <code>↵<br/>__w</code> | Word size, the number of bits in each element of the state vector. |
| <code>↵<br/>__n</code> | The degree of recursion.                                           |
| <code>↵<br/>__m</code> | The period parameter.                                              |
| <code>↵<br/>__r</code> | The separation point bit index.                                    |
| <code>↵<br/>__a</code> | The last row of the twist matrix.                                  |
| <code>↵<br/>__u</code> | The first right-shift tempering matrix parameter.                  |
| <code>↵<br/>__d</code> | The first right-shift tempering matrix mask.                       |
| <code>↵<br/>__s</code> | The first left-shift tempering matrix parameter.                   |
| <code>↵<br/>__b</code> | The first left-shift tempering matrix mask.                        |
| <code>↵<br/>__t</code> | The second left-shift tempering matrix parameter.                  |
| <code>↵<br/>__c</code> | The second left-shift tempering matrix mask.                       |
| <code>↵<br/>__l</code> | The second right-shift tempering matrix parameter.                 |
| <code>↵<br/>__f</code> | Initialization multiplier.                                         |

Definition at line 472 of file random.h.

#### 4.714.2 Member Typedef Documentation

##### 4.714.2.1 `result_type`

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
typedef _UIntType std::mersenne_twister_engine<_UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f>::result_type
```

The type of the generated random value.

Definition at line 507 of file random.h.

### 4.714.3 Constructor & Destructor Documentation

#### 4.714.3.1 mersenne\_twister\_engine()

```
template<typename UIntType, size_t __w, size_t __n, size_t __m, size_t __r, UIntType __a, size_t __u,
 UIntType __d, size_t __s, UIntType __b, size_t __t, UIntType __c, size_t __l, UIntType __f>
template<typename Sseq, typename = _If_seed_seq<Sseq>>
std::mersenne_twister_engine< UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __f >::mersenne_twister_engine (
 Sseq & __q) [inline], [explicit]
```

Constructs a mersenne\_twister\_engine random number generator engine seeded from the seed sequence \_\_q.

#### Parameters

|                  |                    |
|------------------|--------------------|
| <code>__q</code> | the seed sequence. |
|------------------|--------------------|

Definition at line 541 of file random.h.

### 4.714.4 Member Function Documentation

#### 4.714.4.1 discard()

```
template<typename UIntType, size_t __w, size_t __n, size_t __m, size_t __r, UIntType __a,
 size_t __u, UIntType __d, size_t __s, UIntType __b, size_t __t, UIntType __c, size_t __l, UIntType __f>
void std::mersenne_twister_engine< UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::discard (
 unsigned long long __z)
```

Discard a sequence of random numbers.

Definition at line 432 of file bits/random.tcc.

#### 4.714.4.2 max()

```
template<typename UIntType, size_t __w, size_t __n, size_t __m, size_t __r, UIntType __a, size_t __u,
 UIntType __d, size_t __s, UIntType __b, size_t __t, UIntType __c, size_t __l, UIntType __f>
static constexpr result_type std::mersenne_twister_engine< UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::max () [inline], [static]
```

Gets the largest possible value in the output range.

Definition at line 562 of file random.h.

#### 4.714.4.3 min()

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
static constexpr result_type std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::min () [inline], [static]
```

Gets the smallest possible value in the output range.

Definition at line 555 of file random.h.

### 4.714.5 Friends And Related Function Documentation

#### 4.714.5.1 operator<<

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
template<typename _UIntType1 , size_t __w1, size_t __n1, size_t __m1, size_t __r1, _UIntType1 __a1, size_t __u1, _UIntType1 __d1, size_t __s1, _UIntType1 __b1, size_t __t1, _UIntType1 __c1, size_t __l1, _UIntType1 __f1, typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
 std::basic_ostream< _CharT, _Traits > & __os,
 const std::mersenne_twister_engine< _UIntType1, __w1, __n1, __m1, __r1, __a1, __u1, __d1, __s1, __b1, __t1, __c1, __l1, __f1 > & __x) [friend]
```

Inserts the current state of a % mersenne\_twister\_engine random number generator engine \_\_x into the output stream \_\_os.

#### Parameters

|      |                                                             |
|------|-------------------------------------------------------------|
| __os | An output stream.                                           |
| __x  | A % mersenne_twister_engine random number generator engine. |

#### Returns

The output stream with the state of \_\_x inserted or in an error state.

#### 4.714.5.2 operator==

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
```

```

bool operator== (
 const mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f > & __lhs,
 const mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f > & __rhs) [friend]

```

Compares two % mersenne\_twister\_engine random number generator objects of the same type for equality.

#### Parameters

|                    |                                                                   |
|--------------------|-------------------------------------------------------------------|
| <code>__lhs</code> | A % mersenne_twister_engine random number generator object.       |
| <code>__rhs</code> | Another % mersenne_twister_engine random number generator object. |

#### Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 587 of file random.h.

#### 4.714.5.3 operator>>

```

template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
template<typename _UIntType1, size_t __w1, size_t __n1, size_t __m1, size_t __r1, _UIntType1 __a1, size_t __u1, _UIntType1 __d1, size_t __s1, _UIntType1 __b1, size_t __t1, _UIntType1 __c1, size_t __l1, _UIntType1 __f1, typename _CharT, typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
 std::basic_istream<_CharT, _Traits > & __is,
 std::mersenne_twister_engine< _UIntType1, __w1, __n1, __m1, __r1, __a1, __u1, __d1, __s1, __b1, __t1, __c1, __l1, __f1 > & __x) [friend]

```

Extracts the current state of a % mersenne\_twister\_engine random number generator engine `__x` from the input stream `__is`.

#### Parameters

|                   |                                                             |
|-------------------|-------------------------------------------------------------|
| <code>__is</code> | An input stream.                                            |
| <code>__x</code>  | A % mersenne_twister_engine random number generator engine. |

#### Returns

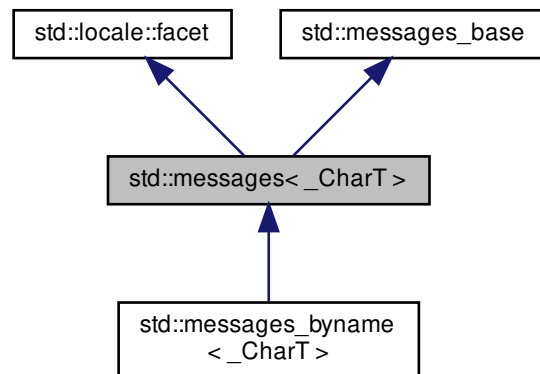

The input stream with the state of `__x` extracted or in an error state.

#### 4.715.1 Detailed Description

```
template<typename _CharT>
class std::messages< _CharT >
```

Primary class template `messages`.

This facet encapsulates the code to retrieve messages from message catalogs. The only thing defined by the standard for this facet is the interface. All underlying functionality is implementation-defined.

This library currently implements 3 versions of the message facet. The first version (gnu) is a wrapper around `gettext`, provided by `libintl`. The second version (ieee) is a wrapper around `catgets`. The final version (default) does no actual translation. These implementations are only provided for `char` and `wchar_t` instantiations.

The `messages` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `messages` facet.

Definition at line 1799 of file `locale_facets_nonio.h`.

#### 4.715.2 Member Typedef Documentation

##### 4.715.2.1 char\_type

```
template<typename _CharT >
typedef _CharT std::messages< _CharT >::char_type
```

Public typedefs.

Definition at line 1805 of file locale\_facets\_nonio.h.

##### 4.715.2.2 string\_type

```
template<typename _CharT >
typedef basic_string<_CharT> std::messages< _CharT >::string_type
```

Public typedefs.

Definition at line 1806 of file locale\_facets\_nonio.h.

#### 4.715.3 Constructor & Destructor Documentation

##### 4.715.3.1 messages() [1/2]

```
template<typename _CharT >
std::messages< _CharT >::messages (
 size_t __refs = 0) [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

Definition at line 44 of file messages\_members.h.

#### 4.715.3.2 messages() [2/2]

```
template<typename _CharT >
std::messages< _CharT >::messages (
 __c_locale __cloc,
 const char * __s,
 size_t __refs = 0) [explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

##### Parameters

|                     |                                     |
|---------------------|-------------------------------------|
| <code>__cloc</code> | The C locale.                       |
| <code>__s</code>    | The name of a locale.               |
| <code>__refs</code> | Refcount to pass to the base class. |

Definition at line 50 of file messages\_members.h.

#### 4.715.3.3 ~messages()

```
template<typename _CharT >
std::messages< _CharT >::~~messages () [protected], [virtual]
```

Destructor.

Definition at line 79 of file messages\_members.h.

### 4.715.4 Member Function Documentation

#### 4.715.4.1 do\_get()

```
template<>
string std::messages< char >::do_get (
 catalog ,
 int ,
 int ,
 const string &) const [protected]
```

Specializations for required instantiations.

#### 4.715.5 Member Data Documentation

## 4.715.5.1 id

```
template<typename _CharT >
locale::id std::messages< _CharT >::id [static]
```

Numpunct facet id.

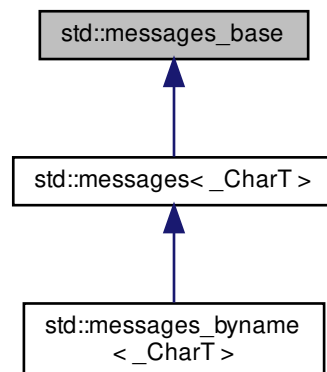

Definition at line 1817 of file locale\_facets\_nonio.h.

#### 4.723 std::money\_base Class Reference

Inheritance diagram for `std::money_base`:

##### Public Types

- enum { **\_S\_minus**, **\_S\_zero**, **\_S\_end** }
- enum **part** { **none**, **space**, **symbol**, **sign**, **value** }

##### Static Public Member Functions

- static pattern **\_S\_construct\_pattern** (char \_\_precedes, char \_\_space, char \_\_posn) throw ()

### Static Public Attributes

- static const char \* `_S_atoms`
- static const pattern `_S_default_pattern`

#### 4.723.1 Detailed Description

Money format ordering data.

This class contains an ordered array of 4 fields to represent the pattern for formatting a money amount. Each field may contain one entry from the part enum. `symbol`, `sign`, and `value` must be present and the remaining field must contain either none or space.

### See also

`moneypunct::pos_format()` and `moneypunct::neg_format()` for details of how these fields are interpreted.

Definition at line 928 of file `locale_facets_nonio.h`.

The documentation for this class was generated from the following file:

- [locale\\_facets\\_nonio.h](#)

## 4.724 `std::money_get<_CharT, _InIter>` Class Template Reference

Inheritance diagram for `std::money_get<_CharT, _InIter>`:

### Public Types

- typedef `_CharT` [char\\_type](#)
- typedef `_InIter` [iter\\_type](#)
- typedef [basic\\_string<\\_CharT>](#) [string\\_type](#)

## Public Member Functions

- static `__c_locale _S_get_c_locale` ()
- static const char \* `_S_get_c_name` () throw ()
- static `__c_locale _S_lc_ctype_c_locale` (\_\_c\_locale \_\_cloc, const char \* \_\_s)

### 4.724.1 Detailed Description

```
template<typename _CharT, typename _Intl>
class std::money_get< _CharT, _Intl >
```

Primary class template `money_get`.

This facet encapsulates the code to parse and return a monetary amount from a string.

The `money_get` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `money_get` facet.

Definition at line 1468 of file `locale_facets_nonio.h`.

#### 4.724.2 Member Typedef Documentation

##### 4.724.2.1 char\_type

```
template<typename _CharT , typename _InIter >
typedef _CharT std::money_get< _CharT, _InIter >::char_type
```

Public typedefs.

Definition at line 1474 of file locale\_facets\_nonio.h.

##### 4.724.2.2 iter\_type

```
template<typename _CharT , typename _InIter >
typedef _InIter std::money_get< _CharT, _InIter >::iter_type
```

Public typedefs.

Definition at line 1475 of file locale\_facets\_nonio.h.

##### 4.724.2.3 string\_type

```
template<typename _CharT , typename _InIter >
typedef basic_string<_CharT> std::money_get< _CharT, _InIter >::string_type
```

Public typedefs.

Definition at line 1476 of file locale\_facets\_nonio.h.

#### 4.724.3 Constructor & Destructor Documentation

##### 4.724.3.1 money\_get()

```
template<typename _CharT , typename _InIter >
std::money_get< _CharT, _InIter >::money_get (
 size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

**Parameters**

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

Definition at line 1490 of file `locale_facets_nonio.h`.

**4.724.3.2 ~money\_get()**

```
template<typename _CharT , typename _InIter >
virtual std::money_get< _CharT, _InIter >::~~money_get () [inline], [protected], [virtual]
```

Destructor.

Definition at line 1558 of file `locale_facets_nonio.h`.

**4.724.4 Member Function Documentation****4.724.4.1 do\_get()** [1/2]

```
template<typename _CharT , typename _InIter >
_InIter std::money_get< _CharT, _InIter >::do_get (
 iter_type __s,
 iter_type __end,
 bool __intl,
 ios_base & __io,
 ios_base::iostate & __err,
 long double & __units) const [protected], [virtual]
```

Read and parse a monetary value.

This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

**See also**

`get()` for details.

Definition at line 371 of file `locale_facets_nonio.tcc`.

References `std::basic_string< _CharT, _Traits, _Alloc >::c_str()`.

Referenced by `std::money_get< _CharT, _InIter >::get()`.

## 4.724.4.2 do\_get() [2/2]

```
template<typename _CharT , typename _InIter >
_InIter std::money_get< _CharT, _InIter >::do_get (
 iter_type __s,
 iter_type __end,
 bool __intl,
 ios_base & __io,
 ios_base::iostate & __err,
 string_type & __digits) const [protected], [virtual]
```

Read and parse a monetary value.

This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

## See also

get() for details.

Definition at line 384 of file locale\_facets\_nonio.tcc.

References `std::ios_base::M_getloc()`, `std::basic_string< _CharT, _Traits, _Alloc >::resize()`, and `std::__ctype_abstract_base< _CharT >::widen()`.

## 4.724.4.3 get() [1/2]

```
template<typename _CharT , typename _InIter >
iter_type std::money_get< _CharT, _InIter >::get (
 iter_type __s,
 iter_type __end,
 bool __intl,
 ios_base & __io,
 ios_base::iostate & __err,
 long double & __units) const [inline]
```

Read and parse a monetary value.

This function reads characters from `__s`, interprets them as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and returns the result in `units` as an integral value `moneypunct::frac_digits()` \* the actual amount. For example, the string \$10.01 in a US locale would store 1001 in `units`.

Any characters not part of a valid money amount are not consumed.

If a money value cannot be parsed from the input stream, sets `err=(err|io.failbit)`. If the stream is consumed before finishing parsing, sets `err=(err|io.failbit|io.eofbit)`. `units` is unchanged if parsing fails.

This function works by returning the result of `do_get()`.

**Parameters**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| <code>__s</code>     | Start of characters to parse.                                               |
| <code>__end</code>   | End of characters to parse.                                                 |
| <code>__intl</code>  | Parameter to use <code>_facet&lt;moneypunct&lt;CharT,intl&gt; &gt;</code> . |
| <code>__io</code>    | Source of facets and io state.                                              |
| <code>__err</code>   | Error field to set if parsing fails.                                        |
| <code>__units</code> | Place to store result of parsing.                                           |

**Returns**

Iterator referencing first character beyond valid money amount.

Definition at line 1520 of file `locale_facets_nonio.h`.

References `std::money_get<_CharT, _InIter >::do_get()`.

**4.724.4.4 `get()` [2/2]**

```
template<typename _CharT , typename _InIter >
iter_type std::money_get< _CharT, _InIter >::get (
 iter_type __s,
 iter_type __end,
 bool __intl,
 ios_base & __io,
 ios_base::iostate & __err,
 string_type & __digits) const [inline]
```

Read and parse a monetary value.

This function reads characters from `__s`, interprets them as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and returns the result in *digits*. For example, the string \$10.01 in a US locale would store 1001 in *digits*.

Any characters not part of a valid money amount are not consumed.

If a money value cannot be parsed from the input stream, sets `err=(err|io.failbit)`. If the stream is consumed before finishing parsing, sets `err=(err|io.failbit|io.eofbit)`.

This function works by returning the result of `do_get()`.

**Parameters**

|                       |                                                                             |
|-----------------------|-----------------------------------------------------------------------------|
| <code>__s</code>      | Start of characters to parse.                                               |
| <code>__end</code>    | End of characters to parse.                                                 |
| <code>__intl</code>   | Parameter to use <code>_facet&lt;moneypunct&lt;CharT,intl&gt; &gt;</code> . |
| <code>__io</code>     | Source of facets and io state.                                              |
| <code>__err</code>    | Error field to set if parsing fails.                                        |
| <code>__digits</code> | Place to store result of parsing.                                           |

### Returns

Iterator referencing first character beyond valid money amount.

Definition at line 1551 of file locale\_facets\_nonio.h.

References `std::money_get< _CharT, _InIter >::do_get()`.

## 4.724.5 Member Data Documentation

### 4.724.5.1 id

```
template<typename _CharT , typename _InIter >
locale::id std::money_get< _CharT, _InIter >::id [static]
```

Numpunct facet id.

Definition at line 1480 of file locale\_facets\_nonio.h.

## 4.725.1 Detailed Description

```
template<typename _CharT, typename _Outlter>
class std::money_put<_CharT, _Outlter>
```

Primary class template `money_put`.

This facet encapsulates the code to format and output a monetary amount.

The `money_put` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `money_put` facet.

Definition at line 1621 of file `locale_facets_nonio.h`.

#### 4.725.2 Member Typedef Documentation

##### 4.725.2.1 char\_type

```
template<typename _CharT , typename _OutIter >
typedef _CharT std::money_put< _CharT, _OutIter >::char_type
```

Public typedefs.

Definition at line 1626 of file locale\_facets\_nonio.h.

##### 4.725.2.2 iter\_type

```
template<typename _CharT , typename _OutIter >
typedef _OutIter std::money_put< _CharT, _OutIter >::iter_type
```

Public typedefs.

Definition at line 1627 of file locale\_facets\_nonio.h.

##### 4.725.2.3 string\_type

```
template<typename _CharT , typename _OutIter >
typedef basic_string<_CharT> std::money_put< _CharT, _OutIter >::string_type
```

Public typedefs.

Definition at line 1628 of file locale\_facets\_nonio.h.

#### 4.725.3 Constructor & Destructor Documentation

##### 4.725.3.1 money\_put()

```
template<typename _CharT , typename _OutIter >
std::money_put< _CharT, _OutIter >::money_put (
 size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

## Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

Definition at line 1642 of file `locale_facets_nonio.h`.

4.725.3.2 `~money_put()`

```
template<typename _CharT , typename _OutIter >
virtual std::money_put< _CharT, _OutIter >::~~money_put () [inline], [protected], [virtual]
```

Destructor.

Definition at line 1692 of file `locale_facets_nonio.h`.

## 4.725.4 Member Function Documentation

4.725.4.1 `do_put()` <sup>[1/2]</sup>

```
template<typename _CharT , typename _OutIter >
_OutIter std::money_put< _CharT, _OutIter >::do_put (
 iter_type __s,
 bool __intl,
 ios_base & __io,
 char_type __fill,
 long double __units) const [protected], [virtual]
```

Format and output a monetary value.

This function formats *units* as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and writes the resulting characters to `__s`. For example, the value 1001 in a US locale would write `$10.01` to `__s`.

This function is a hook for derived classes to change the value returned.

## See also

`put()`.

## Parameters

|                     |                                                                             |
|---------------------|-----------------------------------------------------------------------------|
| <code>__s</code>    | The stream to write to.                                                     |
| <code>__intl</code> | Parameter to use <code>_facet&lt;moneypunct&lt;CharT,intl&gt; &gt;</code> . |
| <code>__io</code>   | Source of facets and io state.                                              |
| <code>__fill</code> | <code>char_type</code> to use for padding.                                  |
| <code>units</code>  | Place to store result of parsing.                                           |

**Returns**

Iterator after writing.

Definition at line 577 of file locale\_facets\_nonio.tcc.

References std::ios\_base::getloc(), and std::\_\_ctype\_abstract\_base<\_CharT >::widen().

Referenced by std::money\_put<\_CharT, \_OutIter >::put().

**4.725.4.2 do\_put()** [2/2]

```
template<typename _CharT , typename _OutIter >
_OutIter std::money_put<_CharT, _OutIter >::do_put (
 iter_type __s,
 bool __intl,
 ios_base & __io,
 char_type __fill,
 const string_type & __digits) const [protected], [virtual]
```

Format and output a monetary value.

This function formats *digits* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to \_\_s. For example, the string 1001 in a US locale would write \$10.01 to \_\_s.

This function is a hook for derived classes to change the value returned.

**See also**

put().

**Parameters**

|                       |                                                  |
|-----------------------|--------------------------------------------------|
| <code>__s</code>      | The stream to write to.                          |
| <code>__intl</code>   | Parameter to use_facet<moneypunct<CharT,intl> >. |
| <code>__io</code>     | Source of facets and io state.                   |
| <code>__fill</code>   | char_type to use for padding.                    |
| <code>__digits</code> | Place to store result of parsing.                |

**Returns**

Iterator after writing.

Definition at line 615 of file locale\_facets\_nonio.tcc.

#### 4.725.4.3 put() [1/2]

```
template<typename _CharT , typename _OutIter >
iter_type std::money_put< _CharT, _OutIter >::put (
 iter_type __s,
 bool __intl,
 ios_base & __io,
 char_type __fill,
 long double __units) const [inline]
```

Format and output a monetary value.

This function formats *units* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to \_\_s. For example, the value 1001 in a US locale would write \$10.01 to \_\_s.

This function works by returning the result of do\_put().

##### Parameters

|         |                                                  |
|---------|--------------------------------------------------|
| __s     | The stream to write to.                          |
| __intl  | Parameter to use_facet<moneypunct<CharT,intl> >. |
| __io    | Source of facets and io state.                   |
| __fill  | char_type to use for padding.                    |
| __units | Place to store result of parsing.                |

##### Returns

Iterator after writing.

Definition at line 1662 of file locale\_facets\_nonio.h.

References std::money\_put< \_CharT, \_OutIter >::do\_put().

#### 4.725.4.4 put() [2/2]

```
template<typename _CharT , typename _OutIter >
iter_type std::money_put< _CharT, _OutIter >::put (
 iter_type __s,
 bool __intl,
 ios_base & __io,
 char_type __fill,
 const string_type & __digits) const [inline]
```

Format and output a monetary value.

This function formats *digits* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to \_\_s. For example, the string 1001 in a US locale would write \$10.01 to \_\_s.

This function works by returning the result of do\_put().

## Parameters

|                       |                                                  |
|-----------------------|--------------------------------------------------|
| <code>__s</code>      | The stream to write to.                          |
| <code>__intl</code>   | Parameter to use_facet<moneypunct<CharT,intl> >. |
| <code>__io</code>     | Source of facets and io state.                   |
| <code>__fill</code>   | char_type to use for padding.                    |
| <code>__digits</code> | Place to store result of parsing.                |

## Returns

Iterator after writing.

Definition at line 1685 of file locale\_facets\_nonio.h.

References std::money\_put< \_CharT, \_OutIter >::do\_put().

## 4.725.5 Member Data Documentation

## 4.725.5.1 id

```
template<typename _CharT , typename _OutIter >
locale::id std::money_put< _CharT, _OutIter >::id [static]
```

Numpunct facet id.

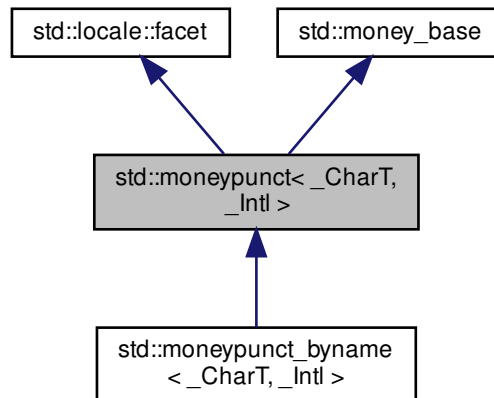

Definition at line 1632 of file locale\_facets\_nonio.h.

## 4.726.1 Detailed Description

```
template<typename _CharT, bool _Intl>
class std::moneypunct<_CharT, _Intl>
```

Primary class template moneypunct.

This facet encapsulates the punctuation, grouping and other formatting features of money amount string representations.

Definition at line 1024 of file locale\_facets\_nonio.h.

#### 4.726.2 Member Typedef Documentation

##### 4.726.2.1 char\_type

```
template<typename _CharT, bool _Intl>
typedef _CharT std::moneypunct< _CharT, _Intl >::char_type
```

Public typedefs.

Definition at line 1030 of file locale\_facets\_nonio.h.

##### 4.726.2.2 string\_type

```
template<typename _CharT, bool _Intl>
typedef basic_string<_CharT> std::moneypunct< _CharT, _Intl >::string_type
```

Public typedefs.

Definition at line 1031 of file locale\_facets\_nonio.h.

#### 4.726.3 Constructor & Destructor Documentation

##### 4.726.3.1 moneypunct() [1/3]

```
template<typename _CharT, bool _Intl>
std::moneypunct< _CharT, _Intl >::moneypunct (
 size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

Definition at line 1053 of file locale\_facets\_nonio.h.

## 4.726.3.2 moneypunct() [2/3]

```
template<typename _CharT, bool _Intl>
std::moneypunct< _CharT, _Intl >::moneypunct (
 __cache_type * __cache,
 size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is an internal constructor.

## Parameters

|                      |                                 |
|----------------------|---------------------------------|
| <code>__cache</code> | Cache for optimization.         |
| <code>__refs</code>  | Passed to the base facet class. |

Definition at line 1066 of file locale\_facets\_nonio.h.

## 4.726.3.3 moneypunct() [3/3]

```
template<typename _CharT, bool _Intl>
std::moneypunct< _CharT, _Intl >::moneypunct (
 __c_locale __cloc,
 const char * __s,
 size_t __refs = 0) [inline], [explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

## Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__cloc</code> | The C locale.                   |
| <code>__s</code>    | The name of a locale.           |
| <code>__refs</code> | Passed to the base facet class. |

Definition at line 1081 of file locale\_facets\_nonio.h.

## 4.726.3.4 ~moneypunct()

```
template<typename _CharT, bool _Intl>
virtual std::moneypunct< _CharT, _Intl >::~~moneypunct () [protected], [virtual]
```

Destructor.

#### 4.726.4 Member Function Documentation

##### 4.726.4.1 curr\_symbol()

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct< _CharT, _Intl >::curr_symbol () const [inline]
```

Return currency symbol string.

This function returns a string\_type to use as a currency symbol. It does so by returning returning moneypunct<char↵\_type>::do\_curr\_symbol().

##### Returns

*string\_type* representing a currency symbol.

Definition at line 1151 of file locale\_facets\_nonio.h.

References std::moneypunct< \_CharT, \_Intl >::do\_curr\_symbol().

##### 4.726.4.2 decimal\_point()

```
template<typename _CharT, bool _Intl>
char_type std::moneypunct< _CharT, _Intl >::decimal_point () const [inline]
```

Return decimal point character.

This function returns a char\_type to use as a decimal point. It does so by returning returning moneypunct<char↵\_type>::do\_decimal\_point().

##### Returns

*char\_type* representing a decimal point.

Definition at line 1095 of file locale\_facets\_nonio.h.

References std::moneypunct< \_CharT, \_Intl >::do\_decimal\_point().

## 4.726.4.3 do\_curr\_symbol()

```
template<typename _CharT, bool _Intl>
virtual string_type std::moneypunct< _CharT, _Intl >::do_curr_symbol () const [inline], [protected],
[virtual]
```

Return currency symbol string.

This function returns a [string\\_type](#) to use as a currency symbol. This function is a hook for derived classes to change the value returned.

**See also**

[curr\\_symbol\(\)](#) for details.

**Returns**

*string\_type* representing a currency symbol.

Definition at line 1297 of file [locale\\_facets\\_nonio.h](#).

Referenced by [std::moneypunct<\\_CharT, \\_Intl>::curr\\_symbol\(\)](#).

## 4.726.4.4 do\_decimal\_point()

```
template<typename _CharT, bool _Intl>
virtual char_type std::moneypunct< _CharT, _Intl >::do_decimal_point () const [inline], [protected],
[virtual]
```

Return decimal point character.

Returns a [char\\_type](#) to use as a decimal point. This function is a hook for derived classes to change the value returned.

**Returns**

*char\_type* representing a decimal point.

Definition at line 1259 of file [locale\\_facets\\_nonio.h](#).

Referenced by [std::moneypunct<\\_CharT, \\_Intl>::decimal\\_point\(\)](#).

#### 4.726.4.5 do\_frac\_digits()

```
template<typename _CharT, bool _Intl>
virtual int std::moneypunct< _CharT, _Intl >::do_frac_digits () const [inline], [protected],
[virtual]
```

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

##### See also

frac\_digits() for details.

##### Returns

Number of digits in amount fraction.

Definition at line 1337 of file locale\_facets\_nonio.h.

Referenced by std::moneypunct< \_CharT, \_Intl >::frac\_digits().

#### 4.726.4.6 do\_grouping()

```
template<typename _CharT, bool _Intl>
virtual string std::moneypunct< _CharT, _Intl >::do_grouping () const [inline], [protected],
[virtual]
```

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

##### See also

grouping() for details.

##### Returns

String representing grouping specification.

Definition at line 1284 of file locale\_facets\_nonio.h.

Referenced by std::moneypunct< \_CharT, \_Intl >::grouping().

#### 4.726.4.7 do\_neg\_format()

```
template<typename _CharT, bool _Intl>
virtual pattern std::moneypunct< _CharT, _Intl >::do_neg_format () const [inline], [protected],
[virtual]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

##### See also

neg\_format() for details.

##### Returns

Pattern for money values.

Definition at line 1365 of file locale\_facets\_nonio.h.

Referenced by std::moneypunct<\_CharT, \_Intl>::neg\_format().

#### 4.726.4.8 do\_negative\_sign()

```
template<typename _CharT, bool _Intl>
virtual string_type std::moneypunct< _CharT, _Intl >::do_negative_sign () const [inline], [protected],
[virtual]
```

Return negative sign string.

This function returns a string\_type to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

##### See also

negative\_sign() for details.

##### Returns

*string\_type* representing a negative sign.

Definition at line 1323 of file locale\_facets\_nonio.h.

Referenced by std::moneypunct<\_CharT, \_Intl>::negative\_sign().

#### 4.726.4.9 do\_pos\_format()

```
template<typename _CharT, bool _Intl>
virtual pattern std::moneypunct< _CharT, _Intl >::do_pos_format () const [inline], [protected],
[virtual]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

##### See also

pos\_format() for details.

##### Returns

Pattern for money values.

Definition at line 1351 of file locale\_facets\_nonio.h.

Referenced by std::moneypunct< \_CharT, \_Intl >::pos\_format().

#### 4.726.4.10 do\_positive\_sign()

```
template<typename _CharT, bool _Intl>
virtual string_type std::moneypunct< _CharT, _Intl >::do_positive_sign () const [inline], [protected],
[virtual]
```

Return positive sign string.

This function returns a string\_type to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

##### See also

positive\_sign() for details.

##### Returns

*string\_type* representing a positive sign.

Definition at line 1310 of file locale\_facets\_nonio.h.

Referenced by std::moneypunct< \_CharT, \_Intl >::positive\_sign().

## 4.726.4.11 do\_thousands\_sep()

```
template<typename _CharT, bool _Intl>
virtual char_type std::moneypunct<_CharT, _Intl>::do_thousands_sep () const [inline], [protected],
[virtual]
```

Return thousands separator character.

Returns a char\_type to use as a thousands separator. This function is a hook for derived classes to change the value returned.

**Returns**

*char\_type* representing a thousands separator.

Definition at line 1271 of file locale\_facets\_nonio.h.

Referenced by std::moneypunct<\_CharT, \_Intl>::thousands\_sep().

## 4.726.4.12 frac\_digits()

```
template<typename _CharT, bool _Intl>
int std::moneypunct<_CharT, _Intl>::frac_digits () const [inline]
```

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning returning moneypunct<char\_type>::do\_frac\_digits().

The fractional part of a money amount is optional. But if it is present, there must be frac\_digits() digits.

**Returns**

Number of digits in amount fraction.

Definition at line 1201 of file locale\_facets\_nonio.h.

References std::moneypunct<\_CharT, \_Intl>::do\_frac\_digits().

#### 4.726.4.13 grouping()

```
template<typename _CharT, bool _Intl>
string std::moneypunct< _CharT, _Intl >::grouping () const [inline]
```

Return grouping specification.

This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the grouping() returns \003\002 and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was 32, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling moneypunct<char\_type>::do\_grouping().

##### Returns

string representing grouping specification.

Definition at line 1138 of file locale\_facets\_nonio.h.

References std::moneypunct< \_CharT, \_Intl >::do\_grouping().

#### 4.726.4.14 neg\_format()

```
template<typename _CharT, bool _Intl>
pattern std::moneypunct< _CharT, _Intl >::neg_format () const [inline]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning returning moneypunct<char\_type>::do\_pos\_format() or moneypunct<char\_type>::do\_neg\_format().

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of curr\_symbol() may be present. The sign field indicates that the value of positive\_sign() or negative\_sign() must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and pos\_format() pattern {symbol,sign,value,none}, curr\_symbol() == '\$' positive\_sign() == '+', and value 10.01, and options set to force the symbol, the corresponding string is \$+10.01.

##### Returns

Pattern for money values.

Definition at line 1241 of file locale\_facets\_nonio.h.

References std::moneypunct< \_CharT, \_Intl >::do\_neg\_format().

## 4.726.4.15 negative\_sign()

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct<_CharT, _Intl>::negative_sign () const [inline]
```

Return negative sign string.

This function returns a string\_type to use as a sign for negative amounts. It does so by returning returning moneypunct<char\_type>::do\_negative\_sign().

If the return value contains more than one character, the first character appears in the position indicated by neg\_format() and the remainder appear at the end of the formatted string.

**Returns**

*string\_type* representing a negative sign.

Definition at line 1185 of file locale\_facets\_nonio.h.

References std::moneypunct<\_CharT, \_Intl>::do\_negative\_sign().

## 4.726.4.16 pos\_format()

```
template<typename _CharT, bool _Intl>
pattern std::moneypunct<_CharT, _Intl>::pos_format () const [inline]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning returning moneypunct<char\_type>::do\_pos\_format() or moneypunct<char\_type>::do\_neg\_format().

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of curr\_symbol() may be present. The sign field indicates that the value of positive\_sign() or negative\_sign() must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and pos\_format() pattern {symbol,sign,value,none}, curr\_symbol() == '\$' positive\_sign() == '+', and value 10.01, and options set to force the symbol, the corresponding string is \$+10.01.

**Returns**

Pattern for money values.

Definition at line 1237 of file locale\_facets\_nonio.h.

References std::moneypunct<\_CharT, \_Intl>::do\_pos\_format().

#### 4.726.4.17 positive\_sign()

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct< _CharT, _Intl >::positive_sign () const [inline]
```

Return positive sign string.

This function returns a `string_type` to use as a sign for positive amounts. It does so by returning `returning moneypunct<char_type>::do_positive_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `pos_format()` and the remainder appear at the end of the formatted string.

##### Returns

*string\_type* representing a positive sign.

Definition at line 1168 of file `locale_facets_nonio.h`.

References `std::moneypunct< _CharT, _Intl >::do_positive_sign()`.

#### 4.726.4.18 thousands\_sep()

```
template<typename _CharT, bool _Intl>
char_type std::moneypunct< _CharT, _Intl >::thousands_sep () const [inline]
```

Return thousands separator character.

This function returns a `char_type` to use as a thousands separator. It does so by returning `returning moneypunct<char_type>::do_thousands_sep()`.

##### Returns

`char_type` representing a thousands separator.

Definition at line 1108 of file `locale_facets_nonio.h`.

References `std::moneypunct< _CharT, _Intl >::do_thousands_sep()`.

#### 4.726.5 Member Data Documentation

## 4.726.5.1 id

```
template<typename _CharT, bool _Intl>
locale::id std::moneypunct< _CharT, _Intl >::id [static]
```

Numpunct facet id.

Definition at line 1043 of file locale\_facets\_nonio.h.

## 4.726.5.2 intl

```
template<typename _CharT, bool _Intl>
const bool std::moneypunct< _CharT, _Intl >::intl [static]
```

This value is provided by the standard, but no reason for its existence.

## 4.727.1 Detailed Description

```
template<typename _CharT, bool _Intl>
class std::moneypunct_byname<_CharT, _Intl>
```

class moneypunct\_byname [22.2.6.4].

Definition at line 1414 of file locale\_facets\_nonio.h.

## 4.727.2 Member Function Documentation

#### 4.727.2.1 curr\_symbol()

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct< _CharT, _Intl >::curr_symbol () const [inline], [inherited]
```

Return currency symbol string.

This function returns a string\_type to use as a currency symbol. It does so by returning returning moneypunct<char↵\_type>::do\_curr\_symbol().

##### Returns

*string\_type* representing a currency symbol.

Definition at line 1151 of file locale\_facets\_nonio.h.

References std::moneypunct< \_CharT, \_Intl >::do\_curr\_symbol().

#### 4.727.2.2 decimal\_point()

```
template<typename _CharT, bool _Intl>
char_type std::moneypunct< _CharT, _Intl >::decimal_point () const [inline], [inherited]
```

Return decimal point character.

This function returns a char\_type to use as a decimal point. It does so by returning returning moneypunct<char↵\_type>::do\_decimal\_point().

##### Returns

*char\_type* representing a decimal point.

Definition at line 1095 of file locale\_facets\_nonio.h.

References std::moneypunct< \_CharT, \_Intl >::do\_decimal\_point().

#### 4.727.2.3 do\_curr\_symbol()

```
template<typename _CharT, bool _Intl>
virtual string_type std::moneypunct< _CharT, _Intl >::do_curr_symbol () const [inline], [protected],
[virtual], [inherited]
```

Return currency symbol string.

This function returns a string\_type to use as a currency symbol. This function is a hook for derived classes to change the value returned.

##### See also

curr\_symbol() for details.

##### Returns

*string\_type* representing a currency symbol.

Definition at line 1297 of file locale\_facets\_nonio.h.

Referenced by std::moneypunct< \_CharT, \_Intl >::curr\_symbol().

## 4.727.2.4 do\_decimal\_point()

```
template<typename _CharT, bool _Intl>
virtual char_type std::moneypunct< _CharT, _Intl >::do_decimal_point () const [inline], [protected],
[virtual], [inherited]
```

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

**Returns**

*char\_type* representing a decimal point.

Definition at line 1259 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct< _CharT, _Intl >::decimal_point()`.

## 4.727.2.5 do\_frac\_digits()

```
template<typename _CharT, bool _Intl>
virtual int std::moneypunct< _CharT, _Intl >::do_frac_digits () const [inline], [protected],
[virtual], [inherited]
```

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

**See also**

`frac_digits()` for details.

**Returns**

Number of digits in amount fraction.

Definition at line 1337 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct< _CharT, _Intl >::frac_digits()`.

#### 4.727.2.6 do\_grouping()

```
template<typename _CharT, bool _Intl>
virtual string std::moneypunct< _CharT, _Intl >::do_grouping () const [inline], [protected],
[virtual], [inherited]
```

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

##### See also

grouping() for details.

##### Returns

String representing grouping specification.

Definition at line 1284 of file locale\_facets\_nonio.h.

Referenced by std::moneypunct< \_CharT, \_Intl >::grouping().

#### 4.727.2.7 do\_neg\_format()

```
template<typename _CharT, bool _Intl>
virtual pattern std::moneypunct< _CharT, _Intl >::do_neg_format () const [inline], [protected],
[virtual], [inherited]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

##### See also

neg\_format() for details.

##### Returns

Pattern for money values.

Definition at line 1365 of file locale\_facets\_nonio.h.

Referenced by std::moneypunct< \_CharT, \_Intl >::neg\_format().

#### 4.727.2.8 do\_negative\_sign()

```
template<typename _CharT, bool _Intl>
virtual string_type std::moneypunct< _CharT, _Intl >::do_negative_sign () const [inline], [protected],
[virtual], [inherited]
```

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

##### See also

`negative_sign()` for details.

##### Returns

*string\_type* representing a negative sign.

Definition at line 1323 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct< _CharT, _Intl >::negative_sign()`.

#### 4.727.2.9 do\_pos\_format()

```
template<typename _CharT, bool _Intl>
virtual pattern std::moneypunct< _CharT, _Intl >::do_pos_format () const [inline], [protected],
[virtual], [inherited]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

##### See also

`pos_format()` for details.

##### Returns

Pattern for money values.

Definition at line 1351 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct< _CharT, _Intl >::pos_format()`.

#### 4.727.2.10 do\_positive\_sign()

```
template<typename _CharT, bool _Intl>
virtual string_type std::moneypunct< _CharT, _Intl >::do_positive_sign () const [inline], [protected],
[virtual], [inherited]
```

Return positive sign string.

This function returns a `string_type` to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

#### See also

`positive_sign()` for details.

#### Returns

*string\_type* representing a positive sign.

Definition at line 1310 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct< _CharT, _Intl >::positive_sign()`.

#### 4.727.2.11 do\_thousands\_sep()

```
template<typename _CharT, bool _Intl>
virtual char_type std::moneypunct< _CharT, _Intl >::do_thousands_sep () const [inline], [protected],
[virtual], [inherited]
```

Return thousands separator character.

Returns a `char_type` to use as a thousands separator. This function is a hook for derived classes to change the value returned.

#### Returns

*char\_type* representing a thousands separator.

Definition at line 1271 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct< _CharT, _Intl >::thousands_sep()`.

#### 4.727.2.12 frac\_digits()

```
template<typename _CharT, bool _Intl>
int std::moneypunct<_CharT, _Intl >::frac_digits () const [inline], [inherited]
```

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning `returning moneypunct<char_type>::do_frac_digits()`.

The fractional part of a money amount is optional. But if it is present, there must be `frac_digits()` digits.

##### Returns

Number of digits in amount fraction.

Definition at line 1201 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl >::do_frac_digits()`.

#### 4.727.2.13 grouping()

```
template<typename _CharT, bool _Intl>
string std::moneypunct<_CharT, _Intl >::grouping () const [inline], [inherited]
```

Return grouping specification.

This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.

Each char in the return string is interpret as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the `grouping()` returns `\003\002` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was 32, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling `moneypunct<char_type>::do_grouping()`.

##### Returns

string representing grouping specification.

Definition at line 1138 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl >::do_grouping()`.

#### 4.727.2.14 neg\_format()

```
template<typename _CharT, bool _Intl>
pattern std::moneypunct< _CharT, _Intl >::neg_format () const [inline], [inherited]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `std::moneypunct<char_type>::do_pos_format()` or `std::moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is \$+10.01.

##### Returns

Pattern for money values.

Definition at line 1241 of file `locale_facets_nonio.h`.

References `std::moneypunct< _CharT, _Intl >::do_neg_format()`.

#### 4.727.2.15 negative\_sign()

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct< _CharT, _Intl >::negative_sign () const [inline], [inherited]
```

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. It does so by returning `std::moneypunct<char_type>::do_negative_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `neg_format()` and the remainder appear at the end of the formatted string.

##### Returns

*string\_type* representing a negative sign.

Definition at line 1185 of file `locale_facets_nonio.h`.

References `std::moneypunct< _CharT, _Intl >::do_negative_sign()`.

## 4.727.2.16 pos\_format()

```
template<typename _CharT, bool _Intl>
pattern std::moneypunct< _CharT, _Intl >::pos_format () const [inline], [inherited]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning returning moneypunct<char\_type>::do\_pos\_format() or moneypunct<char\_type>::do\_neg\_format().

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of curr\_symbol() may be present. The sign field indicates that the value of positive\_sign() or negative\_sign() must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and pos\_format() pattern {symbol,sign,value,none}, curr\_symbol() == '\$' positive\_sign() == '+', and value 10.01, and options set to force the symbol, the corresponding string is \$+10.01.

**Returns**

Pattern for money values.

Definition at line 1237 of file locale\_facets\_nonio.h.

References std::moneypunct< \_CharT, \_Intl >::do\_pos\_format().

## 4.727.2.17 positive\_sign()

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct< _CharT, _Intl >::positive_sign () const [inline], [inherited]
```

Return positive sign string.

This function returns a string\_type to use as a sign for positive amounts. It does so by returning returning moneypunct<char\_type>::do\_positive\_sign().

If the return value contains more than one character, the first character appears in the position indicated by pos\_format() and the remainder appear at the end of the formatted string.

**Returns**

*string\_type* representing a positive sign.

Definition at line 1168 of file locale\_facets\_nonio.h.

References std::moneypunct< \_CharT, \_Intl >::do\_positive\_sign().

#### 4.727.2.18 thousands\_sep()

```
template<typename _CharT, bool _Intl>
char_type std::moneypunct< _CharT, _Intl >::thousands_sep () const [inline], [inherited]
```

Return thousands separator character.

This function returns a char\_type to use as a thousands separator. It does so by returning returning moneypunct<char↵\_type>::do\_thousands\_sep().

##### Returns

char\_type representing a thousands separator.

Definition at line 1108 of file locale\_facets\_nonio.h.

References std::moneypunct< \_CharT, \_Intl >::do\_thousands\_sep().

## 4.728.1 Detailed Description

```
template<typename _Iterator>
class std::move_iterator< _Iterator >
```

Class template `move_iterator` is an iterator adapter with the same behavior as the underlying iterator except that its dereference operator implicitly converts the value returned by the underlying iterator's dereference operator to an rvalue reference. Some generic algorithms can be called with move iterators to replace copying with moving.

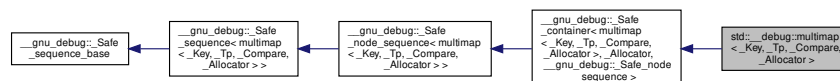

Definition at line 1283 of file `bits/stl_iterator.h`.

The documentation for this class was generated from the following file:

- [bits/stl\\_iterator.h](#)

### Friends

- `template<typename \_ItT, typename \_SeqT, typename \_CatT >  
class \_\_gnu\_debug::\_Safe\_iterator`

#### 4.729.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Allocator = std::allocator<std::pair<const _Key, _Tp>>>
class std::__debug::multimap<_Key, _Tp, _Compare, _Allocator >
```

Class `std::multimap` with safety/checking/debug instrumentation.

Definition at line 44 of file `multimap.h`.

#### 4.729.2 Member Function Documentation

##### 4.729.2.1 `_M_detach_all()`

```
void __gnu_debug::_Safe_sequence_base::_M_detach_all () [protected], [inherited]
```

Detach all iterators, leaving them singular.

Referenced by `\_\_gnu\_debug::\_Safe\_sequence\_base::~~Safe\_sequence\_base\(\)`.

## 4.729.2.2 \_M\_detach\_singular()

```
void __gnu_debug::_Safe_sequence_base::_M_detach_singular () [protected], [inherited]
```

Detach all singular iterators.

**Postcondition**

for all iterators *i* attached to this sequence, *i*->\_M\_version == \_M\_version.

## 4.729.2.3 \_M\_get\_mutex()

```
__gnu_cxx::__mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex () throw () [protected],
[inherited]
```

For use in \_Safe\_sequence.

Referenced by \_\_gnu\_debug::\_Safe\_sequence< map< \_Key, \_Tp, \_Compare, \_Allocator > >::\_M\_transfer\_from\_if().

## 4.729.2.4 \_M\_invalidate\_all()

```
void __gnu_debug::_Safe_sequence_base::_M_invalidate_all () const [inline], [protected], [inherited]
```

Invalidates all iterators.

Definition at line 256 of file safe\_base.h.

References \_\_gnu\_debug::\_Safe\_sequence\_base::\_M\_version.

## 4.729.2.5 \_M\_invalidate\_if()

```
void __gnu_debug::_Safe_sequence< multimap< _Key, _Tp, _Compare, _Allocator > >::_M_invalidate←
_if (
 _Predicate __pred) [inherited]
```

Invalidates all iterators *x* that reference this sequence, are not singular, and for which \_\_pred(*x*) returns true. \_\_pred will be invoked with the normal iterators nested in the safe ones.

Definition at line 38 of file safe\_sequence.tcc.

#### 4.729.2.6 `_M_revalidate_singular()`

```
void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular () [protected], [inherited]
```

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

#### 4.729.2.7 `_M_swap()`

```
void __gnu_debug::_Safe_sequence_base::_M_swap (
 _Safe_sequence_base & __x) [protected], [noexcept], [inherited]
```

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

#### 4.729.2.8 `_M_transfer_from_if()`

```
void __gnu_debug::_Safe_sequence< multimap< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_↵
from_if (
 _Safe_sequence< multimap< _Key, _Tp, _Compare, _Allocator > > & __from,
 _Predicate __pred) [inherited]
```

Transfers all iterators `x` that reference `from` sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

Definition at line 69 of file `safe_sequence.tcc`.

### 4.729.3 Member Data Documentation

#### 4.729.3.1 `_M_const_iterators`

```
_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_iterators [inherited]
```

The list of constant iterators that reference this container.

Definition at line 197 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

#### 4.729.3.2 `_M_iterators`

```
_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators [inherited]
```

The list of mutable iterators that reference this container.

Definition at line 194 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

4.729.3.3 `_M_version`

```
unsigned int __gnu_debug::_Safe_sequence_base::_M_version [mutable], [inherited]
```

The container version number. This number may never be 0.

Definition at line 200 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence_base::_M_invalidate_all()`.

## 4.730.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>> >>
class std::multimap< _Key, _Tp, _Compare, _Alloc >
```

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time.

## Template Parameters

|                       |                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------|
| <code>_Key</code>     | Type of key objects.                                                                |
| <code>_Tp</code>      | Type of mapped objects.                                                             |
| <code>_Compare</code> | Comparison function object type, defaults to <code>less&lt;_Key&gt;</code> .        |
| <code>_Alloc</code>   | Allocator type, defaults to <code>allocator&lt;pair&lt;const _Key, _Tp&gt;</code> . |

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using equivalent keys). For a `multimap<Key, T>` the `key_type` is `Key`, the `mapped_type` is `T`, and the `value_type` is `std::pair<const Key, T>`.

Multimaps support bidirectional iterators.

The private tree data is declared exactly the same way for `map` and `multimap`; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

Definition at line 72 of file `stl_map.h`.

#### 4.730.2 Constructor & Destructor Documentation

##### 4.730.2.1 multimap() [1/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap<_Key, _Tp, _Compare, _Alloc >::multimap () [default]
```

Default constructor creates no elements.

##### 4.730.2.2 multimap() [2/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap<_Key, _Tp, _Compare, _Alloc >::multimap (
 const _Compare & __comp,
 const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Creates a `multimap` with no elements.

##### Parameters

|                     |                      |
|---------------------|----------------------|
| <code>__comp</code> | A comparison object. |
| <code>__a</code>    | An allocator object. |

Definition at line 191 of file `stl_multimap.h`.

##### 4.730.2.3 multimap() [3/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
 const multimap< _Key, _Tp, _Compare, _Alloc > &) [default]
```

Multimap copy constructor.

Whether the allocator is copied depends on the allocator traits.

#### 4.730.2.4 multimap() [4/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
 multimap< _Key, _Tp, _Compare, _Alloc > &&) [default]
```

Multimap move constructor.

The newly-created multimap contains the exact contents of the moved instance. The moved instance is a valid, but unspecified multimap.

#### 4.730.2.5 multimap() [5/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
 initializer_list< value_type > __l,
 const _Compare & __comp = _Compare(),
 const allocator_type & __a = allocator_type()) [inline]
```

Builds a multimap from an `initializer_list`.

##### Parameters

|                     |                                    |
|---------------------|------------------------------------|
| <code>__l</code>    | An <code>initializer_list</code> . |
| <code>__comp</code> | A comparison functor.              |
| <code>__a</code>    | An allocator object.               |

Create a multimap consisting of copies of the elements from the `initializer_list`. This is linear in  $N$  if the list is already sorted, and  $N\log N$  otherwise (where  $N$  is `__l.size()`).

Definition at line 225 of file `stl_multimap.h`.

#### 4.730.2.6 multimap() [6/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
 const allocator_type & __a) [inline], [explicit]
```

Allocator-extended default constructor.

Definition at line 233 of file `stl_multimap.h`.

**4.730.2.7 multimap()** [7/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap (
 const multimap<_Key, _Tp, _Compare, _Alloc> & __m,
 const allocator_type & __a) [inline]
```

Allocator-extended copy constructor.

Definition at line 237 of file stl\_multimap.h.

**4.730.2.8 multimap()** [8/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap (
 multimap<_Key, _Tp, _Compare, _Alloc> && __m,
 const allocator_type & __a) [inline], [noexcept]
```

Allocator-extended move constructor.

Definition at line 241 of file stl\_multimap.h.

**4.730.2.9 multimap()** [9/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap (
 initializer_list<value_type> __l,
 const allocator_type & __a) [inline]
```

Allocator-extended initializer-list constructor.

Definition at line 247 of file stl\_multimap.h.

**4.730.2.10 multimap()** [10/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator>
std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap (
 _InputIterator __first,
 _InputIterator __last,
 const allocator_type & __a) [inline]
```

Allocator-extended range constructor.

Definition at line 253 of file stl\_multimap.h.

**4.730.2.11** `multimap()` [11/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator >
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
 _InputIterator __first,
 _InputIterator __last) [inline]
```

Builds a multimap from a range.

**Parameters**

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

Create a multimap consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first`,`__last`)).

Definition at line 269 of file `stl_multimap.h`.

**4.730.2.12** `multimap()` [12/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator >
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
 _InputIterator __first,
 _InputIterator __last,
 const _Compare & __comp,
 const allocator_type & __a = allocator_type()) [inline]
```

Builds a multimap from a range.

**Parameters**

|                      |                       |
|----------------------|-----------------------|
| <code>__first</code> | An input iterator.    |
| <code>__last</code>  | An input iterator.    |
| <code>__comp</code>  | A comparison functor. |
| <code>__a</code>     | An allocator object.  |

Create a multimap consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first`,`__last`)).

Definition at line 285 of file `stl_multimap.h`.

## 4.730.2.13 ~multimap()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::~~multimap () [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

## 4.730.3 Member Function Documentation

## 4.730.3.1 begin() [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::begin () [inline], [noexcept]
```

Returns a read/write iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 351 of file stl\_multimap.h.

## 4.730.3.2 begin() [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 360 of file stl\_multimap.h.

## 4.730.3.3 cbegin()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 424 of file stl\_multimap.h.

#### 4.730.3.4 cend()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 433 of file `stl_multimap.h`.

#### 4.730.3.5 clear()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::multimap<_Key, _Tp, _Compare, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 808 of file `stl_multimap.h`.

#### 4.730.3.6 count() [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::multimap<_Key, _Tp, _Compare, _Alloc >::count (
 const key_type & __x) const [inline]
```

Finds the number of elements with given key.

##### Parameters

|                  |                                          |
|------------------|------------------------------------------|
| <code>__x</code> | Key of (key, value) pairs to be located. |
|------------------|------------------------------------------|

##### Returns

Number of elements with specified key.

Definition at line 885 of file `stl_multimap.h`.

**4.730.3.7 count()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::count (
 const _Kt & __x) const -> decltype(_M_t._M_count_tr(__x)) [inline]
```

Finds the number of elements with given key.

**Parameters**

|                 |                                          |
|-----------------|------------------------------------------|
| <code>_↵</code> | Key of (key, value) pairs to be located. |
| <code>_X</code> |                                          |

**Returns**

Number of elements with specified key.

Definition at line 891 of file stl\_multimap.h.

**4.730.3.8 crbegin()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::crbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 442 of file stl\_multimap.h.

**4.730.3.9 crend()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::crend () const [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 451 of file stl\_multimap.h.

**4.730.3.10 emplace()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename... _Args>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::emplace (
 _Args &&... __args) [inline]
```

Build and insert a std::pair into the multimap.

**Parameters**

|                     |                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__args</code> | Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor). |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|

**Returns**

An iterator that points to the inserted (key,value) pair.

This function builds and inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

Definition at line 491 of file `stl_multimap.h`.

**4.730.3.11 `emplace_hint()`**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename... _Args>
iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::emplace_hint (
 const_iterator __pos,
 _Args &&... __args) [inline]
```

Builds and inserts a `std::pair` into the multimap.

**Parameters**

|                     |                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the pair should be inserted.                                                                             |
| <code>__args</code> | Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor). |

**Returns**

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert_hints)

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 518 of file `stl_multimap.h`.

**4.730.3.12 empty()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
bool std::multimap< _Key, _Tp, _Compare, _Alloc >::empty () const [inline], [noexcept]
```

Returns true if the multimap is empty.

Definition at line 458 of file stl\_multimap.h.

**4.730.3.13 end()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 369 of file stl\_multimap.h.

**4.730.3.14 end()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::end () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 378 of file stl\_multimap.h.

**4.730.3.15 equal\_range()** [1/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::pair<iterator, iterator> std::multimap< _Key, _Tp, _Compare, _Alloc >::equal_range (
 const key_type & __x) [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                                                                                                      |                                          |
|------------------------------------------------------------------------------------------------------|------------------------------------------|
|  <code>__x</code> | Key of (key, value) pairs to be located. |
|------------------------------------------------------------------------------------------------------|------------------------------------------|

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
 c.upper_bound(val))
```

(but is faster than making the calls separately).

Definition at line 1020 of file stl\_multimap.h.

**4.730.3.16 equal\_range()** [2/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::equal_range (
 const _Kt & __x) -> decltype(pair<iterator, iterator>(_M_t._M_equal_range_tr(__x)))
[inline]
```

Finds a subsequence matching given key.

**Parameters**

|       |                                          |
|-------|------------------------------------------|
| $\_x$ | Key of (key, value) pairs to be located. |
|-------|------------------------------------------|

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
 c.upper_bound(val))
```

(but is faster than making the calls separately).

Definition at line 1026 of file stl\_multimap.h.

**4.730.3.17 equal\_range()** [3/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::pair<const_iterator, const_iterator> std::multimap< _Key, _Tp, _Compare, _Alloc >::equal_
range (
 const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

## Parameters

|                                  |                                          |
|----------------------------------|------------------------------------------|
| <a href="#"><math>\_x</math></a> | Key of (key, value) pairs to be located. |
|----------------------------------|------------------------------------------|

## Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
 c.upper_bound(val))
```

(but is faster than making the calls separately).

Definition at line 1047 of file stl\_multimap.h.

## 4.730.3.18 equal\_range() [4/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::equal_range (
 const _Kt & __x) const -> decltype(pair<const_iterator, const_iterator>(_M_t._M_
equal_range_tr(__x))) [inline]
```

Finds a subsequence matching given key.

## Parameters

|                                  |                                          |
|----------------------------------|------------------------------------------|
| <a href="#"><math>\_x</math></a> | Key of (key, value) pairs to be located. |
|----------------------------------|------------------------------------------|

## Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
 c.upper_bound(val))
```

(but is faster than making the calls separately).

Definition at line 1053 of file stl\_multimap.h.

**4.730.3.19** `erase()` [1/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::erase (
 const_iterator __position) [inline]
```

Erases an element from a multimap.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 702 of file `stl_multimap.h`.

**4.730.3.20** `erase()` [2/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
_GLIBCXX_ABI_TAG_CXX11 iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::erase (
 iterator __position) [inline]
```

Erases an element from a multimap.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 708 of file `stl_multimap.h`.

**4.730.3.21 erase()** [ 3 / 4 ]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (
 const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

|                  |                              |
|------------------|------------------------------|
| <code>__x</code> | Key of element to be erased. |
|------------------|------------------------------|

**Returns**

The number of elements erased.

This function erases all elements located by the given key from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 739 of file stl\_multimap.h.

**4.730.3.22 erase()** [ 4 / 4 ]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (
 const_iterator __first,
 const_iterator __last) [inline]
```

Erases a [first,last) range of elements from a multimap.

**Parameters**

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased .  |

**Returns**

The iterator `__last`.

This function erases a sequence of elements from a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 760 of file stl\_multimap.h.

#### 4.730.3.23 find() [1/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::find (
 const key_type & __x) [inline]
```

Tries to locate an element in a multimap.

##### Parameters

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__x</code> | Key of (key, value) pair to be located. |
|------------------|-----------------------------------------|

##### Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 843 of file stl\_multimap.h.

#### 4.730.3.24 find() [2/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap<_Key, _Tp, _Compare, _Alloc >::find (
 const _Kt & __x) -> decltype(_M_t._M_find_tr(__x)) [inline]
```

Tries to locate an element in a multimap.

##### Parameters

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__x</code> | Key of (key, value) pair to be located. |
|------------------|-----------------------------------------|

##### Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 849 of file stl\_multimap.h.

#### 4.730.3.25 find() [3/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::find (
 const key_type & __x) const [inline]
```

Tries to locate an element in a multimap.

##### Parameters

|                                                                                   |                                         |
|-----------------------------------------------------------------------------------|-----------------------------------------|
|  | Key of (key, value) pair to be located. |
|  |                                         |

##### Returns

Read-only (constant) iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 867 of file stl\_multimap.h.

#### 4.730.3.26 find() [4/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::find (
 const _Kt & __x) const -> decltype(_M_t._M_find_tr(__x)) [inline]
```

Tries to locate an element in a multimap.

##### Parameters

|                                                                                     |                                         |
|-------------------------------------------------------------------------------------|-----------------------------------------|
|  | Key of (key, value) pair to be located. |
|  |                                         |

##### Returns

Read-only (constant) iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 873 of file `stl_multimap.h`.

#### 4.730.3.27 `get_allocator()`

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
allocator_type std::multimap< _Key, _Tp, _Compare, _Alloc >::get_allocator () const [inline],
[noexcept]
```

Get a copy of the memory allocation object.

Definition at line 341 of file `stl_multimap.h`.

#### 4.730.3.28 `insert()` [1/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
 const value_type & __x) [inline]
```

Inserts a `std::pair` into the multimap.

##### Parameters

|                  |                                                                                   |
|------------------|-----------------------------------------------------------------------------------|
| <code>__x</code> | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |
|------------------|-----------------------------------------------------------------------------------|

##### Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

Definition at line 539 of file `stl_multimap.h`.

Referenced by `std::multimap< _Key, _Tp, _Compare, _Alloc >::insert()`.

#### 4.730.3.29 `insert()` [2/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
 value_type && __x) [inline]
```

Inserts a `std::pair` into the multimap.

**Parameters**

|                                   |                                                                      |
|-----------------------------------|----------------------------------------------------------------------|
| <code>↔</code><br><code>_X</code> | Pair to be inserted (see std::make_pair for easy creation of pairs). |
|-----------------------------------|----------------------------------------------------------------------|

**Returns**

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

Definition at line 546 of file stl\_multimap.h.

References std::move().

**4.730.3.30 insert()** [3/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Pair >
__enable_if_t<is_constructible<value_type, _Pair>::value, iterator> std::multimap<_Key, _Tp, ↔
_Compare, _Alloc >::insert (
 _Pair && __x) [inline]
```

Inserts a std::pair into the multimap.

**Parameters**

|                                   |                                                                      |
|-----------------------------------|----------------------------------------------------------------------|
| <code>↔</code><br><code>_X</code> | Pair to be inserted (see std::make_pair for easy creation of pairs). |
|-----------------------------------|----------------------------------------------------------------------|

**Returns**

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

Definition at line 551 of file stl\_multimap.h.

**4.730.3.31** `insert()` [4/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::insert (
 const_iterator __position,
 const value_type & __x) [inline]
```

Inserts a `std::pair` into the multimap.

**Parameters**

|                         |                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------|
| <code>__position</code> | An iterator that serves as a hint as to where the pair should be inserted.        |
| <code>__x</code>        | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |

**Returns**

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 579 of file `stl_multimap.h`.

**4.730.3.32** `insert()` [5/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::insert (
 const_iterator __position,
 value_type && __x) [inline]
```

Inserts a `std::pair` into the multimap.

**Parameters**

|                         |                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------|
| <code>__position</code> | An iterator that serves as a hint as to where the pair should be inserted.        |
| <code>__x</code>        | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |

**Returns**

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert_hints)

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 589 of file `stl_multimap.h`.

References `std::move()`.

**4.730.3.33 `insert()`** [6/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Pair >
__enable_if_t<is_constructible<value_type, _Pair&&>::value, iterator> std::multimap< _Key, _Tp,
_Compare, _Alloc >::insert (
 const_iterator __position,
 _Pair && __x) [inline]
```

Inserts a `std::pair` into the multimap.

**Parameters**

|                         |                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------|
| <code>__position</code> | An iterator that serves as a hint as to where the pair should be inserted.        |
| <code>__x</code>        | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |

**Returns**

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert_hints)

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 594 of file `stl_multimap.h`.

**4.730.3.34** `insert()` [7/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator >
void std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
 _InputIterator __first,
 _InputIterator __last) [inline]
```

A template function that attempts to insert a range of elements.

**Parameters**

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

Definition at line 613 of file `stl_multimap.h`.

**4.730.3.35** `insert()` [8/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
 initializer_list< value_type > __l) [inline]
```

Attempts to insert a list of `std::pairs` into the multimap.

**Parameters**

|                         |                                                                                 |
|-------------------------|---------------------------------------------------------------------------------|
| ↔<br>_↔<br>↔<br>_↔<br>/ | A <code>std::initializer_list&lt;value_type&gt;</code> of pairs to be inserted. |
|-------------------------|---------------------------------------------------------------------------------|

Complexity similar to that of the range constructor.

Definition at line 625 of file `stl_multimap.h`.

References `std::multimap< _Key, _Tp, _Compare, _Alloc >::insert()`.

**4.730.3.36 key\_comp()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
key_compare std::multimap< _Key, _Tp, _Compare, _Alloc >::key_comp () const [inline]
```

Returns the key comparison object out of which the multimap was constructed.

Definition at line 817 of file stl\_multimap.h.

**4.730.3.37 lower\_bound()** [1/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::lower_bound (
 const key_type & __x) [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|                         |                                         |
|-------------------------|-----------------------------------------|
| <b><code>__x</code></b> | Key of (key, value) pair to be located. |
|-------------------------|-----------------------------------------|

**Returns**

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 928 of file stl\_multimap.h.

**4.730.3.38 lower\_bound()** [2/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::lower_bound (
 const _Kt & __x) -> decltype(iterator(_M_t._M_lower_bound_tr(__x))) [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|                                                                                   |                                         |
|-----------------------------------------------------------------------------------|-----------------------------------------|
|  | Key of (key, value) pair to be located. |
|  |                                         |

**Returns**

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 934 of file stl\_multimap.h.

**4.730.3.39 lower\_bound()** [3/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::lower_bound (
 const key_type & __x) const [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|                                                                                     |                                         |
|-------------------------------------------------------------------------------------|-----------------------------------------|
|  | Key of (key, value) pair to be located. |
|  |                                         |

**Returns**

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful the iterator will point to the next greatest element or, if no such greater element exists, to end().

Definition at line 953 of file stl\_multimap.h.

**4.730.3.40 lower\_bound()** [4/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::lower_bound (
 const _Kt & __x) const -> decltype(const_iterator(_M_t._M_lower_bound_tr(__x)))
[inline]
```

Finds the beginning of a subsequence matching given key.

## Parameters

|                                                                                   |                                         |
|-----------------------------------------------------------------------------------|-----------------------------------------|
|  | Key of (key, value) pair to be located. |
| <code>_X</code>                                                                   |                                         |

## Returns

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful the iterator will point to the next greatest element or, if no such greater element exists, to end().

Definition at line 959 of file stl\_multimap.h.

## 4.730.3.41 max\_size()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::max_size () const [inline], [noexcept]
```

Returns the maximum size of the multimap.

Definition at line 468 of file stl\_multimap.h.

## 4.730.3.42 operator=() [1/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
multimap& std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (
 const multimap< _Key, _Tp, _Compare, _Alloc > &) [default]
```

Multimap assignment operator.

Whether the allocator is copied depends on the allocator traits.

## 4.730.3.43 operator=() [2/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
multimap& std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (
 multimap< _Key, _Tp, _Compare, _Alloc > &&) [default]
```

Move assignment operator.

## 4.730.3.44 operator=() [3/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
multimap& std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (
 initializer_list< value_type > __l) [inline]
```

Multimap list assignment operator.

**Parameters**

|   |                      |
|---|----------------------|
| ↵ | An initializer_list. |
| ↵ |                      |
| ↵ |                      |
| ↵ |                      |
| / |                      |

This function fills a multimap with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the multimap and that the resulting multimap's size is the same as the number of elements assigned.

Definition at line 332 of file `stl_multimap.h`.

**4.730.3.45 `rbegin()`** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rbegin () [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 387 of file `stl_multimap.h`.

**4.730.3.46 `rbegin()`** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 396 of file `stl_multimap.h`.

**4.730.3.47 `rend()`** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rend () [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 405 of file `stl_multimap.h`.

**4.730.3.48** rend() [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rend () const [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 414 of file stl\_multimap.h.

**4.730.3.49** size()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the multimap.

Definition at line 463 of file stl\_multimap.h.

**4.730.3.50** swap()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::multimap< _Key, _Tp, _Compare, _Alloc >::swap (
 multimap< _Key, _Tp, _Compare, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another multimap.

**Parameters**

|                  |                                                     |
|------------------|-----------------------------------------------------|
| <code>__x</code> | A multimap of the same element and allocator types. |
|------------------|-----------------------------------------------------|

This exchanges the elements between two multimaps in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

Definition at line 797 of file stl\_multimap.h.

**4.730.3.51** `upper_bound()` [1/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::upper_bound (
 const key_type & __x) [inline]
```

Finds the end of a subsequence matching given key.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__x</code> | Key of (key, value) pair to be located. |
|------------------|-----------------------------------------|

**Returns**

Iterator pointing to the first element greater than key, or end().

Definition at line 973 of file `stl_multimap.h`.

**4.730.3.52** `upper_bound()` [2/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::upper_bound (
 const _Kt & __x) -> decltype(iterator(_M.t._M_upper_bound_tr(__x))) [inline]
```

Finds the end of a subsequence matching given key.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__x</code> | Key of (key, value) pair to be located. |
|------------------|-----------------------------------------|

**Returns**

Iterator pointing to the first element greater than key, or end().

Definition at line 979 of file `stl_multimap.h`.

**4.730.3.53** `upper_bound()` [3/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::upper_bound (
 const key_type & __x) const [inline]
```

Finds the end of a subsequence matching given key.

#### Parameters

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__x</code> | Key of (key, value) pair to be located. |
|------------------|-----------------------------------------|

#### Returns

Read-only (constant) iterator pointing to first iterator greater than key, or end().

Definition at line 993 of file stl\_multimap.h.

#### 4.730.3.54 upper\_bound() [4/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::upper_bound (
 const _Kt & __x) const -> decltype(const_iterator(_M_t._M_upper_bound_tr(__x)))
[inline]
```

Finds the end of a subsequence matching given key.

#### Parameters

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__x</code> | Key of (key, value) pair to be located. |
|------------------|-----------------------------------------|

#### Returns

Read-only (constant) iterator pointing to first iterator greater than key, or end().

Definition at line 999 of file stl\_multimap.h.

#### 4.730.3.55 value\_comp()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
value_compare std::multimap< _Key, _Tp, _Compare, _Alloc >::value_comp () const [inline]
```

Returns a value comparison object, built from the key comparison object out of which the multimap was constructed.

Definition at line 825 of file stl\_multimap.h.

The documentation for this class was generated from the following files:

- [stl\\_map.h](#)
- [stl\\_multimap.h](#)

#### 4.731 `std::multiplies<_Tp>` Struct Template Reference

Inheritance diagram for `std::multiplies<_Tp>`:

##### Public Types

- typedef `_Tp` [first\\_argument\\_type](#)
- typedef `_Tp` [result\\_type](#)
- typedef `_Tp` [second\\_argument\\_type](#)

##### Public Member Functions

- constexpr `_Tp` **operator()** (const `_Tp` &\_\_x, const `_Tp` &\_\_y) const

##### 4.731.1 Detailed Description

```
template<typename _Tp>
struct std::multiplies<_Tp>
```

One of the [math functors](#).

Definition at line 153 of file `stl_function.h`.

##### 4.731.2 Member Typedef Documentation

4.731.2.1 `first_argument_type`

```
typedef _Tp std::binary_function< _Tp , _Tp , _Tp >::first_argument_type [inherited]
```

`first_argument_type` is the type of the first argument

Definition at line 121 of file `stl_function.h`.

4.731.2.2 `result_type`

```
typedef _Tp std::binary_function< _Tp , _Tp , _Tp >::result_type [inherited]
```

`result_type` is the return type

Definition at line 127 of file `stl_function.h`.

4.731.2.3 `second_argument_type`

```
typedef _Tp std::binary_function< _Tp , _Tp , _Tp >::second_argument_type [inherited]
```

`second_argument_type` is the type of the second argument

Definition at line 124 of file `stl_function.h`.

The documentation for this struct was generated from the following file:

- [stl\\_function.h](#)

4.732 `std::multiplies< void >` Struct Template Reference

## Public Types

- typedef `__is_transparent` **is\_transparent**

## Public Member Functions

- template<typename `_Tp` , typename `_Up` >  
constexpr auto **operator()** (`_Tp` &&`_t`, `_Up` &&`_u`) const noexcept(noexcept(`std::forward`< `_Tp` >(`_t` ←  
`t`) \*`std::forward`< `_Up` >(`_u`))) -> decltype(`std::forward`< `_Tp` >(`_t`) \*`std::forward`< `_Up` >(`_u`))

#### 4.732.1 Detailed Description

```
template<>
struct std::multiplies< void >
```

One of the [math functors](#).

Definition at line 260 of file `stl_function.h`.

The documentation for this struct was generated from the following file:

`bool` **operator**== (const [multiset](#)< \_K1, \_C1, \_A1 > &, const [multiset](#)< \_K1, \_C1, \_A1 > &)

#### 4.733.1 Detailed Description

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
class std::multiset< _Key, _Compare, _Alloc >
```

A standard container made up of elements, which can be retrieved in logarithmic time.

## Template Parameters

|                       |                                                                              |
|-----------------------|------------------------------------------------------------------------------|
| <code>_Key</code>     | Type of key objects.                                                         |
| <code>_Compare</code> | Comparison function object type, defaults to <code>less&lt;_Key&gt;</code> . |
| <code>_Alloc</code>   | Allocator type, defaults to <code>allocator&lt;_Key&gt;</code> .             |

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using equivalent keys). For a `multiset<Key>` the `key_type` and `value_type` are `Key`.

Multisets support bidirectional iterators.

The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

Definition at line 96 of file `stl_multiset.h`.

## 4.733.2 Constructor &amp; Destructor Documentation

## 4.733.2.1 multiset() [1/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset () [default]
```

Default constructor creates no elements.

## 4.733.2.2 multiset() [2/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
 const _Compare & __comp,
 const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Creates a multiset with no elements.

## Parameters

|                     |                      |
|---------------------|----------------------|
| <code>__comp</code> | Comparator to use.   |
| <code>__a</code>    | An allocator object. |

Definition at line 173 of file `stl_multiset.h`.

**4.733.2.3** `multiset()` [3/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator >
std::multiset< _Key, _Compare, _Alloc >::multiset (
 _InputIterator __first,
 _InputIterator __last) [inline]
```

Builds a multiset from a range.

**Parameters**

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

Create a multiset consisting of copies of the elements from `[first,last)`. This is linear in  $N$  if the range is already sorted, and  $N\log N$  otherwise (where  $N$  is `distance(__first,__last)`).

Definition at line 187 of file `stl_multiset.h`.

**4.733.2.4** `multiset()` [4/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator >
std::multiset< _Key, _Compare, _Alloc >::multiset (
 _InputIterator __first,
 _InputIterator __last,
 const _Compare & __comp,
 const allocator_type & __a = allocator_type()) [inline]
```

Builds a multiset from a range.

**Parameters**

|                      |                       |
|----------------------|-----------------------|
| <code>__first</code> | An input iterator.    |
| <code>__last</code>  | An input iterator.    |
| <code>__comp</code>  | A comparison functor. |
| <code>__a</code>     | An allocator object.  |

Create a multiset consisting of copies of the elements from `[__first,__last)`. This is linear in  $N$  if the range is already sorted, and  $N\log N$  otherwise (where  $N$  is `distance(__first,__last)`).

Definition at line 203 of file `stl_multiset.h`.

## 4.733.2.5 multiset() [5/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset<_Key, _Compare, _Alloc >::multiset (
 const multiset<_Key, _Compare, _Alloc > &) [default]
```

Multiset copy constructor.

Whether the allocator is copied depends on the allocator traits.

## 4.733.2.6 multiset() [6/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset<_Key, _Compare, _Alloc >::multiset (
 multiset<_Key, _Compare, _Alloc > &&) [default]
```

Multiset move constructor.

The newly-created multiset contains the exact contents of the moved instance. The moved instance is a valid, but unspecified multiset.

## 4.733.2.7 multiset() [7/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset<_Key, _Compare, _Alloc >::multiset (
 initializer_list<value_type> & __l,
 const _Compare & __comp = _Compare(),
 const allocator_type & __a = allocator_type()) [inline]
```

Builds a multiset from an initializer\_list.

## Parameters

|                     |                       |
|---------------------|-----------------------|
| <code>__l</code>    | An initializer_list.  |
| <code>__comp</code> | A comparison functor. |
| <code>__a</code>    | An allocator object.  |

Create a multiset consisting of copies of the elements from the list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is `__l.size()`).

Definition at line 239 of file `stl_multiset.h`.

## 4.733.2.8 multiset() [8/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
std::multiset< _Key, _Compare, _Alloc >::multiset (
 const allocator_type & __a) [inline], [explicit]
```

Allocator-extended default constructor.

Definition at line 247 of file `stl_multiset.h`.

#### 4.733.2.9 multiset() [9/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
 const multiset< _Key, _Compare, _Alloc > & __m,
 const allocator_type & __a) [inline]
```

Allocator-extended copy constructor.

Definition at line 251 of file `stl_multiset.h`.

#### 4.733.2.10 multiset() [10/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
 multiset< _Key, _Compare, _Alloc > && __m,
 const allocator_type & __a) [inline], [noexcept]
```

Allocator-extended move constructor.

Definition at line 255 of file `stl_multiset.h`.

#### 4.733.2.11 multiset() [11/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
 initializer_list< value_type > __l,
 const allocator_type & __a) [inline]
```

Allocator-extended initializer-list constructor.

Definition at line 261 of file `stl_multiset.h`.

## 4.733.2.12 multiset() [12/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>
template<typename _InputIterator >
std::multiset< _Key, _Compare, _Alloc >::multiset (
 _InputIterator __first,
 _InputIterator __last,
 const allocator_type & __a) [inline]
```

Allocator-extended range constructor.

Definition at line 267 of file stl\_multiset.h.

## 4.733.2.13 ~multiset()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>
std::multiset< _Key, _Compare, _Alloc >::~~multiset () [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

## 4.733.3 Member Function Documentation

## 4.733.3.1 begin()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>
iterator std::multiset< _Key, _Compare, _Alloc >::begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 340 of file stl\_multiset.h.

## 4.733.3.2 cbegin()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>
iterator std::multiset< _Key, _Compare, _Alloc >::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 377 of file stl\_multiset.h.

#### 4.733.3.3 cend()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 386 of file stl\_multiset.h.

#### 4.733.3.4 clear()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
void std::multiset< _Key, _Compare, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 718 of file stl\_multiset.h.

#### 4.733.3.5 count() [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
size_type std::multiset< _Key, _Compare, _Alloc >::count (
 const key_type & __x) const [inline]
```

Finds the number of elements with given key.

##### Parameters

|                        |                                |
|------------------------|--------------------------------|
| <code>↵<br/>__x</code> | Key of elements to be located. |
|------------------------|--------------------------------|

##### Returns

Number of elements with specified key.

Definition at line 730 of file stl\_multiset.h.

**4.733.3.6 count()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::multiset<_Key, _Compare, _Alloc >::count (
 const _Kt & __x) const -> decltype(_M_t._M_count_tr(__x)) [inline]
```

Finds the number of elements with given key.

**Parameters**

|                  |                                |
|------------------|--------------------------------|
| <code>__x</code> | Key of elements to be located. |
|------------------|--------------------------------|

**Returns**

Number of elements with specified key.

Definition at line 736 of file stl\_multiset.h.

**4.733.3.7 crbegin()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::multiset<_Key, _Compare, _Alloc >::crbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 395 of file stl\_multiset.h.

**4.733.3.8 crend()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::multiset<_Key, _Compare, _Alloc >::crend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 404 of file stl\_multiset.h.

**4.733.3.9 emplace()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename... _Args>
iterator std::multiset<_Key, _Compare, _Alloc >::emplace (
 _Args &&... __args) [inline]
```

Builds and inserts an element into the multiset.

**Parameters**

|                     |                                                                 |
|---------------------|-----------------------------------------------------------------|
| <code>__args</code> | Arguments used to generate the element instance to be inserted. |
|---------------------|-----------------------------------------------------------------|

**Returns**

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Insertion requires logarithmic time.

Definition at line 457 of file `stl_multiset.h`.

**4.733.3.10 `emplace_hint()`**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
template<typename... _Args>
iterator std::multiset<_Key, _Compare, _Alloc >::emplace_hint (
 const_iterator __pos,
 _Args &&... __args) [inline]
```

Builds and inserts an element into the multiset.

**Parameters**

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__args</code> | Arguments used to generate the element instance to be inserted.               |

**Returns**

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert_hints) for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 483 of file `stl_multiset.h`.

## 4.733.3.11 empty()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
bool std::multiset< _Key, _Compare, _Alloc >::empty () const [inline], [noexcept]
```

Returns true if the set is empty.

Definition at line 410 of file stl\_multiset.h.

## 4.733.3.12 end()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::end () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 349 of file stl\_multiset.h.

## 4.733.3.13 equal\_range() [1/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::pair<iterator, iterator> std::multiset< _Key, _Compare, _Alloc >::equal_range (
 const key_type & __x) [inline]
```

Finds a subsequence matching given key.

## Parameters

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

## Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
 c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 879 of file stl\_multiset.h.

**4.733.3.14** `equal_range()` [2/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::pair<const_iterator, const_iterator> std::multiset<_Key, _Compare, _Alloc>::equal_range (
 const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_X</code> |                    |

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
 c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 883 of file `stl_multiset.h`.

**4.733.3.15** `equal_range()` [3/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::multiset<_Key, _Compare, _Alloc>::equal_range (
 const _Kt & __x) -> decltype(pair<iterator, iterator>(_M_t._M_equal_range_tr(__x)))
[inline]
```

Finds a subsequence matching given key.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_X</code> |                    |

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
 c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 889 of file stl\_multiset.h.

#### 4.733.3.16 equal\_range() [4/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::equal_range (
 const _Kt & __x) const -> decltype(pair<iterator, iterator>(_M_t._M_equal_range_
tr(__x))) [inline]
```

Finds a subsequence matching given key.

##### Parameters

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

##### Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
 c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 895 of file stl\_multiset.h.

#### 4.733.3.17 erase() [1/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
_GLIBCXX_ABI_TAG_CXX11 iterator std::multiset< _Key, _Compare, _Alloc >::erase (
 const_iterator __position) [inline]
```

Erases an element from a multiset.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 639 of file `stl_multiset.h`.

**4.733.3.18 erase()** [2/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
size_type std::multiset< _Key, _Compare, _Alloc >::erase (
 const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

|                  |                              |
|------------------|------------------------------|
| <code>__x</code> | Key of element to be erased. |
|------------------|------------------------------|

**Returns**

The number of elements erased.

This function erases all elements located by the given key from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 669 of file `stl_multiset.h`.

**4.733.3.19 erase()** [3/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
_GLIBCXX_ABI_TAG_CXX11 iterator std::multiset< _Key, _Compare, _Alloc >::erase (
 const_iterator __first,
 const_iterator __last) [inline]
```

Erases a `[first,last)` range of elements from a multiset.

## Parameters

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

## Returns

The iterator *last*.

This function erases a sequence of elements from a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 691 of file `stl_multiset.h`.

## 4.733.3.20 find() [1/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::find (
 const key_type & __x) [inline]
```

Tries to locate an element in a set.

## Parameters

|                  |                        |
|------------------|------------------------|
| <code>↵</code>   | Element to be located. |
| <code>__x</code> |                        |

## Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 775 of file `stl_multiset.h`.

## 4.733.3.21 find() [2/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
const_iterator std::multiset< _Key, _Compare, _Alloc >::find (
 const key_type & __x) const [inline]
```

Tries to locate an element in a set.

**Parameters**

|                 |                        |
|-----------------|------------------------|
| <code>_↵</code> | Element to be located. |
| <code>_X</code> |                        |

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 779 of file `stl_multiset.h`.

**4.733.3.22 find()** [3/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::find (
 const _Kt & __x) -> decltype(iterator [inline]
```

Tries to locate an element in a set.

**Parameters**

|                 |                        |
|-----------------|------------------------|
| <code>_↵</code> | Element to be located. |
| <code>_X</code> |                        |

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 785 of file `stl_multiset.h`.

**4.733.3.23 find()** [4/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::find (
 const _Kt & __x) const -> decltype(const_iterator [inline]
```

Tries to locate an element in a set.

## Parameters

|                 |                        |
|-----------------|------------------------|
| <code>_↵</code> | Element to be located. |
| <code>_X</code> |                        |

## Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 791 of file `stl_multiset.h`.

## 4.733.3.24 get\_allocator()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
allocator_type std::multiset< _Key, _Compare, _Alloc >::get_allocator () const [inline], [noexcept]
```

Returns the memory allocation object.

Definition at line 331 of file `stl_multiset.h`.

## 4.733.3.25 insert() [1/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::insert (
 const value_type & __x) [inline]
```

Inserts an element into the multiset.

## Parameters

|                 |                         |
|-----------------|-------------------------|
| <code>_↵</code> | Element to be inserted. |
| <code>_X</code> |                         |

## Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Insertion requires logarithmic time.

Definition at line 502 of file `stl_multiset.h`.

Referenced by `std::multiset< _Key, _Compare, _Alloc >::insert()`.

#### 4.733.3.26 `insert()` [2/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::insert (
 const_iterator __position,
 const value_type & __x) [inline]
```

Inserts an element into the multiset.

##### Parameters

|                         |                                                                               |
|-------------------------|-------------------------------------------------------------------------------|
| <code>__position</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>        | Element to be inserted.                                                       |

##### Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert_hints) for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 532 of file `stl_multiset.h`.

#### 4.733.3.27 `insert()` [3/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
template<typename _InputIterator >
void std::multiset< _Key, _Compare, _Alloc >::insert (
 _InputIterator __first,
 _InputIterator __last) [inline]
```

A template function that tries to insert a range of elements.

## Parameters

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

Definition at line 551 of file `stl_multiset.h`.

## 4.733.3.28 insert() [4/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
void std::multiset< _Key, _Compare, _Alloc >::insert (
 initializer_list< value_type > __l) [inline]
```

Attempts to insert a list of elements into the multiset.

## Parameters

|                |                                                                                    |
|----------------|------------------------------------------------------------------------------------|
| <code>↵</code> | A <code>std::initializer_list&lt;value_type&gt;</code> of elements to be inserted. |
| <code>↵</code> |                                                                                    |
| <code>↵</code> |                                                                                    |
| <code>↵</code> |                                                                                    |
| <code>/</code> |                                                                                    |

Complexity similar to that of the range constructor.

Definition at line 563 of file `stl_multiset.h`.

References `std::multiset< _Key, _Compare, _Alloc >::insert()`.

## 4.733.3.29 key\_comp()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
key_compare std::multiset< _Key, _Compare, _Alloc >::key_comp () const [inline]
```

Returns the comparison object.

Definition at line 323 of file `stl_multiset.h`.

## 4.733.3.30 lower\_bound() [1/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::lower_bound (
 const key_type & __x) [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_X</code> |                    |

**Returns**

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 810 of file `stl_multiset.h`.

**4.733.3.31 lower\_bound()** [2/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
const_iterator std::multiset< _Key, _Compare, _Alloc >::lower_bound (
 const key_type & __x) const [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_X</code> |                    |

**Returns**

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 814 of file `stl_multiset.h`.

**4.733.3.32 lower\_bound()** [3/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::lower_bound (
 const _Kt & __x) -> decltype(iterator(_M.t._M_lower_bound_tr(__x))) [inline]
```

Finds the beginning of a subsequence matching given key.

## Parameters

|       |                    |
|-------|--------------------|
| $\_k$ | Key to be located. |
| $\_x$ |                    |

## Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 820 of file stl\_multiset.h.

## 4.733.3.33 lower\_bound() [4/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::lower_bound (
 const _Kt & __x) const -> decltype(iterator(_M_t._M_lower_bound_tr(__x))) [inline]
```

Finds the beginning of a subsequence matching given key.

## Parameters

|       |                    |
|-------|--------------------|
| $\_k$ | Key to be located. |
| $\_x$ |                    |

## Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 826 of file stl\_multiset.h.

## 4.733.3.34 max\_size()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
size_type std::multiset< _Key, _Compare, _Alloc >::max_size () const [inline], [noexcept]
```

Returns the maximum size of the set.

Definition at line 420 of file stl\_multiset.h.

**4.733.3.35 operator=()** [1/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
multiset& std::multiset< _Key, _Compare, _Alloc >::operator= (
 const multiset< _Key, _Compare, _Alloc > &) [default]
```

Multiset assignment operator.

Whether the allocator is copied depends on the allocator traits.

**4.733.3.36 operator=()** [2/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
multiset& std::multiset< _Key, _Compare, _Alloc >::operator= (
 multiset< _Key, _Compare, _Alloc > &&) [default]
```

Move assignment operator.

**4.733.3.37 operator=()** [3/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
multiset& std::multiset< _Key, _Compare, _Alloc >::operator= (
 initializer_list< value_type > __l) [inline]
```

Multiset list assignment operator.

**Parameters**

|   |                      |
|---|----------------------|
| ↩ | An initializer_list. |
| ↩ |                      |
| ↩ |                      |
| ↩ |                      |
| / |                      |

This function fills a multiset with copies of the elements in the initializer list \_\_l.

Note that the assignment completely changes the multiset and that the resulting multiset's size is the same as the number of elements assigned.

Definition at line 312 of file stl\_multiset.h.

**4.733.3.38 rbegin()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::multiset<_Key, _Compare, _Alloc >::rbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 358 of file stl\_multiset.h.

**4.733.3.39 rend()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::multiset<_Key, _Compare, _Alloc >::rend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 367 of file stl\_multiset.h.

**4.733.3.40 size()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
size_type std::multiset<_Key, _Compare, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the set.

Definition at line 415 of file stl\_multiset.h.

**4.733.3.41 swap()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
void std::multiset<_Key, _Compare, _Alloc >::swap (
 multiset<_Key, _Compare, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another multiset.

**Parameters**

|                  |                                                     |
|------------------|-----------------------------------------------------|
| <code>__x</code> | A multiset of the same element and allocator types. |
|------------------|-----------------------------------------------------|

This exchanges the elements between two multisets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

Definition at line 437 of file `stl_multiset.h`.

#### 4.733.3.42 `upper_bound()` [1/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::upper_bound (
 const key_type & __x) [inline]
```

Finds the end of a subsequence matching given key.

##### Parameters

|                  |                    |
|------------------|--------------------|
| <code>↵</code>   | Key to be located. |
| <code>__x</code> |                    |

##### Returns

Iterator pointing to the first element greater than key, or `end()`.

Definition at line 840 of file `stl_multiset.h`.

#### 4.733.3.43 `upper_bound()` [2/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
const_iterator std::multiset< _Key, _Compare, _Alloc >::upper_bound (
 const key_type & __x) const [inline]
```

Finds the end of a subsequence matching given key.

##### Parameters

|                  |                    |
|------------------|--------------------|
| <code>↵</code>   | Key to be located. |
| <code>__x</code> |                    |

##### Returns

Iterator pointing to the first element greater than key, or `end()`.

Definition at line 844 of file stl\_multiset.h.

#### 4.733.3.44 upper\_bound() [3/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::upper_bound (
 const _Kt & __x) -> decltype(iterator(_M_t._M_upper_bound_tr(__x))) [inline]
```

Finds the end of a subsequence matching given key.

##### Parameters

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

##### Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 850 of file stl\_multiset.h.

#### 4.733.3.45 upper\_bound() [4/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::upper_bound (
 const _Kt & __x) const -> decltype(iterator(_M_t._M_upper_bound_tr(__x))) [inline]
```

Finds the end of a subsequence matching given key.

##### Parameters

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

##### Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 856 of file stl\_multiset.h.

4.733.3.46 `value_comp()`

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
value_compare std::multiset< _Key, _Compare, _Alloc >::value_comp () const [inline]
```

Returns the comparison object.

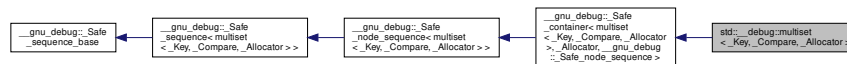

Definition at line 327 of file `stl_multiset.h`.

#### 4.734.1 Detailed Description

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Allocator = std::allocator<_Key>>
class std::__debug::multiset<_Key, _Compare, _Allocator >
```

Class std::multiset with safety/checking/debug instrumentation.

Definition at line 44 of file multiset.h.

#### 4.734.2 Member Function Documentation

##### 4.734.2.1 \_M\_detach\_all()

```
void __gnu_debug::_Safe_sequence_base::_M_detach_all () [protected], [inherited]
```

Detach all iterators, leaving them singular.

Referenced by \_\_gnu\_debug::\_Safe\_sequence\_base::~~\_Safe\_sequence\_base().

##### 4.734.2.2 \_M\_detach\_singular()

```
void __gnu_debug::_Safe_sequence_base::_M_detach_singular () [protected], [inherited]
```

Detach all singular iterators.

##### Postcondition

for all iterators i attached to this sequence, i->\_M\_version == \_M\_version.

##### 4.734.2.3 \_M\_get\_mutex()

```
__gnu_cxx::__mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex () throw () [protected],
[inherited]
```

For use in \_Safe\_sequence.

Referenced by \_\_gnu\_debug::\_Safe\_sequence< map<\_Key, \_Tp, \_Compare, \_Allocator > >::\_M\_transfer\_from\_if().

#### 4.734.2.4 `_M_invalidate_all()`

```
void __gnu_debug::_Safe_sequence_base::_M_invalidate_all () const [inline], [protected], [inherited]
```

Invalidates all iterators.

Definition at line 256 of file `safe_base.h`.

References `__gnu_debug::_Safe_sequence_base::_M_version`.

#### 4.734.2.5 `_M_invalidate_if()`

```
void __gnu_debug::_Safe_sequence< multiset< _Key, _Compare, _Allocator > >::_M_invalidate_if (
 _Predicate __pred) [inherited]
```

Invalidates all iterators `x` that reference this sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

Definition at line 38 of file `safe_sequence.tcc`.

#### 4.734.2.6 `_M_revalidate_singular()`

```
void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular () [protected], [inherited]
```

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

#### 4.734.2.7 `_M_swap()`

```
void __gnu_debug::_Safe_sequence_base::_M_swap (
 _Safe_sequence_base & __x) [protected], [noexcept], [inherited]
```

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

#### 4.734.2.8 `_M_transfer_from_if()`

```
void __gnu_debug::_Safe_sequence< multiset< _Key, _Compare, _Allocator > >::_M_transfer_from_if
(
 _Safe_sequence< multiset< _Key, _Compare, _Allocator > > & __from,
 _Predicate __pred) [inherited]
```

Transfers all iterators `x` that reference `from` sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

Definition at line 69 of file `safe_sequence.tcc`.

#### 4.734.3 Member Data Documentation

##### 4.734.3.1 `_M_const_iterators`

`_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_iterators` [inherited]

The list of constant iterators that reference this container.

Definition at line 197 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map<_Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

##### 4.734.3.2 `_M_iterators`

`_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators` [inherited]

The list of mutable iterators that reference this container.

Definition at line 194 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map<_Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

##### 4.734.3.3 `_M_version`

`unsigned int __gnu_debug::_Safe_sequence_base::_M_version` [mutable], [inherited]

The container version number. This number may never be 0.

Definition at line 200 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence_base::_M_invalidate_all()`.

The documentation for this class was generated from the following file:

##### 4.735.1 Detailed Description

Forces parallel sorting using multiway mergesort with exact splitting at compile time.

Definition at line 137 of file tags.h.

##### 4.735.2 Member Function Documentation

###### 4.735.2.1 \_\_get\_num\_threads()

```
_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads () [inline], [inherited]
```

Find out desired number of threads.

##### Returns

Desired number of threads.

Definition at line 63 of file tags.h.

Referenced by `__gnu_parallel::__parallel_sort()`.

###### 4.735.2.2 set\_num\_threads()

```
void __gnu_parallel::parallel_tag::set_num_threads (
 _ThreadIndex __num_threads) [inline], [inherited]
```

Set the desired number of threads.

## Parameters

|                            |                            |
|----------------------------|----------------------------|
| <code>__num_threads</code> | Desired number of threads. |
|----------------------------|----------------------------|

Definition at line 73 of file tags.h.

class std::negative_binomial_distribution< _IntType >
```

A [negative\\_binomial\\_distribution](#) random number distribution.

The formula for the negative binomial probability mass function is  $p(i) = \binom{n}{i} p^i (1 - p)^{t-i}$  where  $t$  and  $p$  are the parameters of the distribution.

Definition at line 4188 of file random.h.

#### 4.741.2 Member Typedef Documentation

##### 4.741.2.1 result\_type

```
template<typename _IntType = int>
typedef _IntType std::negative_binomial_distribution< _IntType >::result_type
```

The type of the range of the distribution.

Definition at line 4191 of file random.h.

#### 4.741.3 Member Function Documentation

##### 4.741.3.1 k()

```
template<typename _IntType = int>
_IntType std::negative_binomial_distribution< _IntType >::k () const [inline]
```

Return the  $k$  parameter of the distribution.

Definition at line 4255 of file random.h.

##### 4.741.3.2 max()

```
template<typename _IntType = int>
result_type std::negative_binomial_distribution< _IntType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

Definition at line 4291 of file random.h.

References `std::numeric_limits< _Tp >::max()`.

##### 4.741.3.3 min()

```
template<typename _IntType = int>
result_type std::negative_binomial_distribution< _IntType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

Definition at line 4284 of file random.h.

## 4.741.3.4 operator()

```
template<typename _IntType >
template<typename _UniformRandomNumberGenerator >
negative_binomial_distribution< _IntType >::result_type std::negative_binomial_distribution< _IntType >::operator() (
 _UniformRandomNumberGenerator & __urng)
```

Generating functions.

Definition at line 1112 of file bits/random.tcc.

## 4.741.3.5 p()

```
template<typename _IntType = int>
double std::negative_binomial_distribution< _IntType >::p () const [inline]
```

Return the  $p$  parameter of the distribution.

Definition at line 4262 of file random.h.

## 4.741.3.6 param() [1/2]

```
template<typename _IntType = int>
param_type std::negative_binomial_distribution< _IntType >::param () const [inline]
```

Returns the parameter set of the distribution.

Definition at line 4269 of file random.h.

## 4.741.3.7 param() [2/2]

```
template<typename _IntType = int>
void std::negative_binomial_distribution< _IntType >::param (
 const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

## Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

Definition at line 4277 of file random.h.

#### 4.741.3.8 reset()

```
template<typename _IntType = int>
void std::negative_binomial_distribution< _IntType >::reset () [inline]
```

Resets the distribution state.

Definition at line 4248 of file random.h.

References `std::gamma_distribution< _RealType >::reset()`.

### 4.741.4 Friends And Related Function Documentation

#### 4.741.4.1 operator<<

```
template<typename _IntType = int>
template<typename _IntType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
 std::basic_ostream< _CharT, _Traits > & __os,
 const std::negative_binomial_distribution< _IntType1 > & __x) [friend]
```

Inserts a `negative_binomial_distribution` random number distribution `__x` into the output stream `__os`.

##### Parameters

|                   |                                                                           |
|-------------------|---------------------------------------------------------------------------|
| <code>__os</code> | An output stream.                                                         |
| <code>__x</code>  | A <code>negative_binomial_distribution</code> random number distribution. |

##### Returns

The output stream with the state of `__x` inserted or in an error state.

#### 4.741.4.2 operator==

```
template<typename _IntType = int>
bool operator== (
 const negative_binomial_distribution< _IntType > & __d1,
 const negative_binomial_distribution< _IntType > & __d2) [friend]
```

Return true if two negative binomial distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 4340 of file random.h.

## 4.741.4.3 operator&gt;&gt;

```
template<typename _IntType = int>
template<typename _IntType1 , typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
 std::basic_istream< _CharT, _Traits > & __is,
 std::negative_binomial_distribution< _IntType1 > & __x) [friend]
```

Extracts a `negative_binomial_distribution` random number distribution `__x` from the input stream `__is`.

## Parameters

|                   |                                                                               |
|-------------------|-------------------------------------------------------------------------------|
| <code>__is</code> | An input stream.                                                              |
| <code>__x</code>  | A <code>negative_binomial_distribution</code> random number generator engine. |

## Returns

The input stream with `__x` extracted or in an error state.

The documentation for this class was generated from the following files:

- [random.h](#)
- [bits/random.tcc](#)

## 4.742 std::nested\_exception Class Reference

## Public Member Functions

- **nested\_exception** (const [nested\\_exception](#) &) noexcept=default
- **exception\_ptr nested\_ptr** () const noexcept
- **nested\_exception & operator=** (const [nested\\_exception](#) &) noexcept=default

void construct (_Up * __p, _Args &&... __args) noexcept(std::is\_nothrow\_constructible<_Up, _Args... >::value)`
- `void deallocate (_Tp * __p, size_type __t)`
- `template<typename _Up >  
void destroy (_Up * __p) noexcept(std::is\_nothrow\_destructible<_Up >::value)`
- `size_type max_size () const noexcept`

## Friends

- `template<typename _Up >  
constexpr bool operator!= (const new\_allocator &, const new\_allocator<_Up > &) noexcept`
- `template<typename _Up >  
constexpr bool operator== (const new\_allocator &, const new\_allocator<_Up > &) noexcept`

## 4.745.1 Detailed Description

```
template<typename _Tp>
class __gnu_cxx::new_allocator<_Tp>
```

An allocator that uses global new, as per [20.4].

This is precisely the allocator defined in the C++ Standard.

- all allocation calls operator new
- all deallocation calls operator delete

## Template Parameters

|                   |                           |
|-------------------|---------------------------|
| <code>__Tp</code> | Type of allocated object. |
|-------------------|---------------------------|

### 4.748.1 Detailed Description

```
template<typename _RealType = double>
class std::normal_distribution< _RealType >
```

A normal continuous distribution for random numbers.

The formula for the normal probability density function is

$$p(x|\mu, \sigma) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{x-\mu}{2\sigma^2}}$$

Definition at line 1970 of file random.h.

### 4.748.2 Member Typedef Documentation

#### 4.748.2.1 result\_type

```
template<typename _RealType = double>
typedef _RealType std::normal_distribution< _RealType >::result_type
```

The type of the range of the distribution.

Definition at line 1973 of file random.h.

### 4.748.3 Constructor & Destructor Documentation

#### 4.748.3.1 normal\_distribution()

```
template<typename _RealType = double>
std::normal_distribution< _RealType >::normal_distribution (
 result_type __mean,
 result_type __stddev = result_type(1)) [inline], [explicit]
```

Constructs a normal distribution with parameters *mean* and standard deviation.

Definition at line 2023 of file random.h.

#### 4.748.4 Member Function Documentation

##### 4.748.4.1 max()

```
template<typename _RealType = double>
result_type std::normal_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

Definition at line 2080 of file random.h.

##### 4.748.4.2 mean()

```
template<typename _RealType = double>
_RealType std::normal_distribution< _RealType >::mean () const [inline]
```

Returns the mean of the distribution.

Definition at line 2044 of file random.h.

##### 4.748.4.3 min()

```
template<typename _RealType = double>
result_type std::normal_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

Definition at line 2073 of file random.h.

**4.748.4.4 operator()** [1/2]

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::normal_distribution< _RealType >::operator() (
 _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Definition at line 2088 of file random.h.

Referenced by std::normal\_distribution< result\_type >::operator()().

**4.748.4.5 operator()** [2/2]

```
template<typename _RealType >
template<typename _UniformRandomNumberGenerator >
normal_distribution< _RealType >::result_type std::normal_distribution< _RealType >::operator()
(
 _UniformRandomNumberGenerator & __urng,
 const param_type & __param)
```

Polar method due to Marsaglia.

Devroye, L. Non-Uniform Random Variates Generation. Springer-Verlag, New York, 1986, Ch. V, Sect. 4.4.

Definition at line 1770 of file bits/random.tcc.

**4.748.4.6 param()** [1/2]

```
template<typename _RealType = double>
param_type std::normal_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

Definition at line 2058 of file random.h.

**4.748.4.7 param()** [2/2]

```
template<typename _RealType = double>
void std::normal_distribution< _RealType >::param (
 const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

## Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

Definition at line 2066 of file random.h.

## 4.748.4.8 reset()

```
template<typename _RealType = double>
void std::normal_distribution<_RealType>::reset () [inline]
```

Resets the distribution state.

Definition at line 2037 of file random.h.

Referenced by `std::lognormal_distribution<_RealType>::reset()`, `std::gamma_distribution<result_type>::reset()`, `std::student_t_distribution<_RealType>::reset()`, `std::binomial_distribution<_IntType>::reset()`, and `std::poisson_distribution<_IntType>::reset()`.

## 4.748.4.9 stddev()

```
template<typename _RealType = double>
_RealType std::normal_distribution<_RealType>::stddev () const [inline]
```

Returns the standard deviation of the distribution.

Definition at line 2051 of file random.h.

## 4.748.5 Friends And Related Function Documentation

## 4.748.5.1 operator&lt;&lt;

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
 std::basic_ostream<_CharT, _Traits> & __os,
 const std::normal_distribution<_RealType1> & __x) [friend]
```

Inserts a `normal_distribution` random number distribution `__x` into the output stream `__os`.

**Parameters**

|                   |                                                   |
|-------------------|---------------------------------------------------|
| <code>__os</code> | An output stream.                                 |
| <code>__x</code>  | A normal_distribution random number distribution. |

**Returns**

The output stream with the state of `__x` inserted or in an error state.

**4.748.5.2 operator==**

```
template<typename _RealType = double>
template<typename _RealType1 >
bool operator== (
 const std::normal_distribution< _RealType1 > & __d1,
 const std::normal_distribution< _RealType1 > & __d2) [friend]
```

Return true if two normal distributions have the same parameters and the sequences that would be generated are equal.

**4.748.5.3 operator>>**

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
 std::basic_istream< _CharT, _Traits > & __is,
 std::normal_distribution< _RealType1 > & __x) [friend]
```

Extracts a normal\_distribution random number distribution `__x` from the input stream `__is`.

**Parameters**

|                   |                                                       |
|-------------------|-------------------------------------------------------|
| <code>__is</code> | An input stream.                                      |
| <code>__x</code>  | A normal_distribution random number generator engine. |

**Returns**

The input stream with `__x` extracted or in an error state.

The documentation for this class was generated from the following files:

## 4.751 \_\_gnu\_pbds::null\_node\_update&lt; \_Tp1, \_Tp2, \_Tp3, \_Tp4 &gt; Struct Template Reference

Inheritance diagram for `__gnu_pbds::null_node_update< _Tp1, _Tp2, _Tp3, _Tp4 >`:

## 4.751.1 Detailed Description

```
template<typename _Tp1, typename _Tp2, typename _Tp3, typename _Tp4>
struct __gnu_pbds::null_node_update< _Tp1, _Tp2, _Tp3, _Tp4 >
```

A null node updatator, indicating that no node updates are required.

Definition at line 214 of file `tag_and_trait.hpp`.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

#### 4.752 `__gnu_pbds::null_type` Struct Reference

Inheritance diagram for `__gnu_pbds::null_type`:

##### 4.752.1 Detailed Description

Represents no type, or absence of type, for template tricks.

In a mapped-policy, indicates that an associative container is a set.

In a list-update policy, indicates that each link does not need metadata.

In a hash policy, indicates that the combining hash function is actually a ranged hash function.

In a probe policy, indicates that the combining probe function is actually a ranged probe function.

Definition at line 210 of file `tag_and_trait.hpp`.

The documentation for this struct was generated from the following file:

## 4.754.1 Detailed Description

```
template<typename _CharT, typename _InIter>
class std::num_get< _CharT, _InIter >
```

Primary class template num\_get.

This facet encapsulates the code to parse and return a number from a string. It is used by the istream numeric extraction operators.

The num\_get template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the num\_get facet.

Definition at line 1952 of file locale\_facets.h.

## 4.754.2 Member Typedef Documentation

## 4.754.2.1 char\_type

```
template<typename _CharT , typename _InIter >
typedef _CharT std::num_get< _CharT, _InIter >::char_type
```

Public typedefs.

Definition at line 1958 of file locale\_facets.h.

## 4.754.2.2 iter\_type

```
template<typename _CharT , typename _InIter >
typedef _InIter std::num_get< _CharT, _InIter >::iter_type
```

Public typedefs.

Definition at line 1959 of file locale\_facets.h.

#### 4.754.3 Constructor & Destructor Documentation

##### 4.754.3.1 num\_get()

```
template<typename _CharT , typename _InIter >
std::num_get< _CharT, _InIter >::num_get (
 size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

##### Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

Definition at line 1973 of file locale\_facets.h.

##### 4.754.3.2 ~num\_get()

```
template<typename _CharT , typename _InIter >
virtual std::num_get< _CharT, _InIter >::~~num_get () [inline], [protected], [virtual]
```

Destructor.

Definition at line 2145 of file locale\_facets.h.

#### 4.754.4 Member Function Documentation

##### 4.754.4.1 do\_get() [1/11]

```
template<typename _CharT , typename _InIter >
_InIter std::num_get< _CharT, _InIter >::do_get (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 bool & __v) const [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

`get()` for more details.

## Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

## Returns

Iterator after reading.

Definition at line 595 of file locale\_facets.tcc.

References `std::ios_base::_M_getloc()`, `std::ios_base::boolalpha`, `std::ios_base::eofbit`, `std::ios_base::failbit`, `std::ios_base::flags()`, and `std::ios_base::goodbit`.

Referenced by `std::num_get< _CharT, _InIter >::get()`.

## 4.754.4.2 do\_get() [2/11]

```
template<typename _CharT , typename _InIter >
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 long & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

## See also

`get()` for more details.

## Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

Definition at line 2215 of file locale\_facets.h.

**4.754.4.3 do\_get()** [3/11]

```
template<typename _CharT , typename _InIter >
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 unsigned short & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

**See also**

get() for more details.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

Definition at line 2220 of file locale\_facets.h.

**4.754.4.4 do\_get()** [4/11]

```
template<typename _CharT , typename _InIter >
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
 iter_type __beg,
 iter_type __end,
```

```

ios_base & __io,
ios_base::iostate & __err,
unsigned int & __v) const [inline], [protected], [virtual]

```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

Returns

Iterator after reading.

Definition at line 2225 of file locale\_facets.h.

#### 4.754.4.5 do\_get() [5/11]

```

template<typename _CharT , typename _InIter >
virtual iter_type std::num_get<_CharT, _InIter >::do_get (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 unsigned long & __v) const [inline], [protected], [virtual]

```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

Definition at line 2230 of file `locale_facets.h`.

**4.754.4.6 do\_get()** [6/11]

```
template<typename _CharT , typename _InIter >
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 long long & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

**See also**

`get()` for more details.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

Definition at line 2236 of file `locale_facets.h`.

## 4.754.4.7 do\_get() [7/11]

```
template<typename _CharT , typename _InIter >
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 unsigned long long & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable v. This function is a hook for derived classes to change the value returned.

**See also**

get() for more details.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

Definition at line 2241 of file locale\_facets.h.

## 4.754.4.8 do\_get() [8/11]

```
template<typename _CharT , typename _InIter >
_InIter std::num_get< _CharT, _InIter >::do_get (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 float & __v) const [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable v. This function is a hook for derived classes to change the value returned.

**See also**

get() for more details.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

Definition at line 691 of file `locale_facets.tcc`.

References `std::basic_string<_CharT, _Traits, _Alloc>::c_str()`, `std::ios_base::eofbit`, and `std::basic_string<_CharT, _Traits, _Alloc>::reserve()`.

**4.754.4.9 do\_get()** [9/11]

```
template<typename _CharT , typename _InIter >
_InIter std::num_get<_CharT, _InIter>::do_get (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 double & __v) const [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

**See also**

`get()` for more details.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

Definition at line 706 of file locale\_facets.tcc.

References std::basic\_string< \_CharT, \_Traits, \_Alloc >::c\_str(), std::ios\_base::eofbit, and std::basic\_string< \_CharT, \_Traits, \_Alloc >::reserve().

**4.754.4.10 do\_get()** [10/11]

```
template<typename _CharT , typename _InIter >
_InIter std::num_get< _CharT, _InIter >::do_get (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 long double & __v) const [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

**See also**

get() for more details.

**Parameters**

|              |                             |
|--------------|-----------------------------|
| <i>__beg</i> | Start of input stream.      |
| <i>__end</i> | End of input stream.        |
| <i>__io</i>  | Source of locale and flags. |
| <i>__err</i> | Error flags to set.         |
| <i>__v</i>   | Value to format and insert. |

**Returns**

Iterator after reading.

Definition at line 738 of file locale\_facets.tcc.

References std::basic\_string< \_CharT, \_Traits, \_Alloc >::c\_str(), std::ios\_base::eofbit, and std::basic\_string< \_CharT, \_Traits, \_Alloc >::reserve().

**4.754.4.11 do\_get()** [11/11]

```
template<typename _CharT , typename _InIter >
_InIter std::num_get< _CharT, _InIter >::do_get (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 void *& __v) const [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

**See also**

`get()` for more details.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

Definition at line 753 of file `locale_facets.tcc`.

References `std::ios_base::basefield`, `std::ios_base::flags()`, and `std::ios_base::hex`.

**4.754.4.12 get()** [1/11]

```
template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
 iter_type __in,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 bool & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the bool *v*. It does so by calling `num_get::do_get()`.

If `ios_base::boolalpha` is set, attempts to read `ctype<CharT>::truenamename()` or `ctype<CharT>::falsename()`. Sets `v` to true or false if successful. Sets `err` to `ios_base::failbit` if reading the string fails. Sets `err` to `ios_base::eofbit` if the stream is emptied.

If `ios_base::boolalpha` is not set, proceeds as with reading a long, except if the value is 1, sets `v` to true, if the value is 0, sets `v` to false, and otherwise set `err` to `ios_base::failbit`.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

Definition at line 1999 of file `locale_facets.h`.

References `std::num_get<_CharT, _InIter>::do_get()`.

**4.754.4.13 get()** [2/11]

```
template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
 iter_type __in,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 long & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in `io`.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

Definition at line 2036 of file locale\_facets.h.

References std::num\_get< \_CharT, \_InIter >::do\_get().

**4.754.4.14 get()** [3/11]

```
template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
 iter_type __in,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 unsigned short & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num\_get::do\_get().

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of io.flags() & ios\_base::basefield. If equal to ios\_base::oct, parses like the scanf o specifier. Else if equal to ios\_base::hex, parses like X specifier. Else if basefield equal to 0, parses like the i specifier. Otherwise, parses like d for signed and u for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands\_sep(). If the pattern of digit groups isn't consistent, sets err to ios\_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios\_base::failbit and leaves *v* unaltered. Sets err to ios\_base::eofbit if the stream is emptied.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

Definition at line 2041 of file locale\_facets.h.

References std::num\_get< \_CharT, \_InIter >::do\_get().

**4.754.4.15** `get()` [4/11]

```
template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
 iter_type __in,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 unsigned int & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

Definition at line 2046 of file `locale_facets.h`.

References `std::num_get< _CharT, _InIter >::do_get()`.

**4.754.4.16** `get()` [5/11]

```
template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
 iter_type __in,
 iter_type __end,
```

```

ios_base & __io,
ios_base::iostate & __err,
unsigned long & __v) const [inline]

```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num\_get::do\_get().

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of io.flags() & ios\_base::basefield. If equal to ios\_base::oct, parses like the scanf o specifier. Else if equal to ios\_base::hex, parses like X specifier. Else if basefield equal to 0, parses like the i specifier. Otherwise, parses like d for signed and u for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands\_sep(). If the pattern of digit groups isn't consistent, sets err to ios\_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios\_base::failbit and leaves *v* unaltered. Sets err to ios\_base::eofbit if the stream is emptied.

#### Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

#### Returns

Iterator after reading.

Definition at line 2051 of file locale\_facets.h.

References std::num\_get< \_CharT, \_InIter >::do\_get().

#### 4.754.4.17 get() [6/11]

```

template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
 iter_type __in,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 long long & __v) const [inline]

```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

#### Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

#### Returns

Iterator after reading.

Definition at line 2057 of file `locale_facets.h`.

References `std::num_get<_CharT, _InIter>::do_get()`.

#### 4.754.4.18 `get()` [7/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get<_CharT, _InIter>::get (
 iter_type __in,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 unsigned long long & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

## Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

## Returns

Iterator after reading.

Definition at line 2062 of file locale\_facets.h.

References `std::num_get< _CharT, _InIter >::do_get()`.

## 4.754.4.19 get() [8/11]

```
template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
 iter_type __in,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 float & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf g` specifier. The matching type length modifier is also used.

The decimal point character used is `num_punct::decimal_point()`. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

## Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

Definition at line 2096 of file locale\_facets.h.

References `std::num_get<_CharT, _InIter >::do_get()`.

**4.754.4.20 get()** [9/11]

```
template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
 iter_type __in,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 double & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf g` specifier. The matching type length modifier is also used.

The decimal point character used is `num_punct::decimal_point()`. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

Definition at line 2101 of file locale\_facets.h.

References `std::num_get<_CharT, _InIter >::do_get()`.

## 4.754.4.21 get() [10/11]

```
template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
 iter_type __in,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 long double & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num\_get::do\_get().

The input characters are parsed like the scanf g specifier. The matching type length modifier is also used.

The decimal point character used is numpunct::decimal\_point(). Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands\_sep(). If the pattern of digit groups isn't consistent, sets err to ios\_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios\_base::failbit and leaves *v* unaltered. Sets err to ios\_base::eofbit if the stream is emptied.

## Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

## Returns

Iterator after reading.

Definition at line 2106 of file locale\_facets.h.

References std::num\_get< \_CharT, \_InIter >::do\_get().

## 4.754.4.22 get() [11/11]

```
template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
 iter_type __in,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 void *& __v) const [inline]
```

Numeric parsing.

Parses the input stream into the pointer variable *v*. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf p` specifier.

Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

Note that the digit grouping effect for pointers is a bit ambiguous in the standard and shouldn't be relied on. See DR 344.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

#### Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

#### Returns

Iterator after reading.

Definition at line 2139 of file `locale_facets.h`.

References `std::num_get<_CharT, _InIter>::do_get()`.

### 4.754.5 Member Data Documentation

#### 4.754.5.1 `id`

```
template<typename _CharT , typename _InIter >
locale::id std::num_get< _CharT, _InIter >::id [static]
```

Numpunct facet `id`.

### 4.755.1 Detailed Description

```
template<typename _CharT, typename _Outiter>
class std::num_put< _CharT, _Outiter >
```

Primary class template `num_put`.

This facet encapsulates the code to convert a number to a string. It is used by the ostream numeric insertion operators.

The `num_put` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `num_put` facet.

Definition at line 2293 of file `locale_facets.h`.

#### 4.755.2 Member Typedef Documentation

##### 4.755.2.1 char\_type

```
template<typename _CharT , typename _OutIter >
typedef _CharT std::num_put< _CharT, _OutIter >::char_type
```

Public typedefs.

Definition at line 2299 of file locale\_facets.h.

##### 4.755.2.2 iter\_type

```
template<typename _CharT , typename _OutIter >
typedef _OutIter std::num_put< _CharT, _OutIter >::iter_type
```

Public typedefs.

Definition at line 2300 of file locale\_facets.h.

#### 4.755.3 Constructor & Destructor Documentation

##### 4.755.3.1 num\_put()

```
template<typename _CharT , typename _OutIter >
std::num_put< _CharT, _OutIter >::num_put (
 size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

Definition at line 2314 of file locale\_facets.h.

#### 4.755.3.2 ~num\_put()

```
template<typename _CharT, typename _OutIter >
virtual std::num_put< _CharT, _OutIter >::~~num_put () [inline], [protected], [virtual]
```

Destructor.

Definition at line 2493 of file locale\_facets.h.

#### 4.755.4 Member Function Documentation

##### 4.755.4.1 do\_put() [1/8]

```
template<typename _CharT, typename _OutIter >
_OutIter std::num_put< _CharT, _OutIter >::do_put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 bool __v) const [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

##### Parameters

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

##### Returns

Iterator after writing.

Definition at line 1106 of file locale\_facets.tcc.

References `std::ios_base::_M_getloc()`, `std::ios_base::adjustfield`, `std::ios_base::boolalpha`, `std::ios_base::flags()`, `std::ios_base::left`, and `std::ios_base::width()`.

Referenced by `std::num_put< _CharT, _OutIter >::put()`.

## 4.755.4.2 do\_put() [2/8]

```
template<typename _CharT , typename _OutIter >
virtual iter_type std::num_put< _CharT, _OutIter >::do_put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 long __v) const [inline], [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

## Parameters

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

## Returns

Iterator after writing.

Definition at line 2513 of file locale\_facets.h.

## 4.755.4.3 do\_put() [3/8]

```
template<typename _CharT , typename _OutIter >
virtual iter_type std::num_put< _CharT, _OutIter >::do_put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 unsigned long __v) const [inline], [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

## Parameters

|                  |                     |
|------------------|---------------------|
| <code>__s</code> | Stream to write to. |
|------------------|---------------------|

**Parameters**

|                     |                               |
|---------------------|-------------------------------|
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

**Returns**

Iterator after writing.

Definition at line 2517 of file locale\_facets.h.

**4.755.4.4 do\_put()** [4/8]

```
template<typename _CharT , typename _OutIter >
virtual iter_type std::num_put< _CharT, _OutIter >::do_put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 long long __v) const [inline], [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

**Parameters**

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

**Returns**

Iterator after writing.

Definition at line 2523 of file locale\_facets.h.

## 4.755.4.5 do\_put() [5/8]

```
template<typename _CharT , typename _OutIter >
virtual iter_type std::num_put< _CharT, _OutIter >::do_put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 unsigned long long __v) const [inline], [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

## Parameters

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

## Returns

Iterator after writing.

Definition at line 2528 of file locale\_facets.h.

## 4.755.4.6 do\_put() [6/8]

```
template<typename _CharT , typename _OutIter >
_OutIter std::num_put< _CharT, _OutIter >::do_put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 double __v) const [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

## Parameters

|                  |                     |
|------------------|---------------------|
| <code>__s</code> | Stream to write to. |
|------------------|---------------------|

**Parameters**

|                     |                               |
|---------------------|-------------------------------|
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

**Returns**

Iterator after writing.

Definition at line 1158 of file locale\_facets.tcc.

**4.755.4.7 do\_put()** [7/8]

```
template<typename _CharT, typename _OutIter >
_OutIter std::num_put< _CharT, _OutIter >::do_put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 long double __v) const [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

**Parameters**

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

**Returns**

Iterator after writing.

Definition at line 1172 of file locale\_facets.tcc.

## 4.755.4.8 do\_put() [8/8]

```
template<typename _CharT , typename _OutIter >
_OutIter std::num_put< _CharT, _OutIter >::do_put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 const void * __v) const [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

## Parameters

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

## Returns

Iterator after writing.

Definition at line 1179 of file locale\_facets.tcc.

References `std::ios_base::basefield`, `std::ios_base::flags()`, `std::ios_base::hex`, `std::ios_base::showbase`, and `std::ios_base::uppercase`.

## 4.755.4.9 put() [1/8]

```
template<typename _CharT , typename _OutIter >
iter_type std::num_put< _CharT, _OutIter >::put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 bool __v) const [inline]
```

Numeric formatting.

Formats the boolean `v` and inserts it into a stream. It does so by calling `num_put::do_put()`.

If `ios_base::boolalpha` is set, writes `ctype<CharT>::truename()` or `ctype<CharT>::falsename()`. Otherwise formats `v` as an int.

## Parameters

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

## Returns

Iterator after writing.

Definition at line 2332 of file locale\_facets.h.

References `std::num_put<_CharT, _OutIter>::do_put()`.

4.755.4.10 `put()` [2/8]

```
template<typename _CharT , typename _OutIter >
iter_type std::num_put< _CharT, _OutIter >::put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 long __v) const [inline]
```

Numeric formatting.

Formats the integral value `v` and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in `io`.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If `ios_base::showpos` is set, `'+'` is output before positive values. If `ios_base::showbase` is set, `'0'` precedes octal values (except 0) and `'0[xX]'` precedes hex values.

The decimal point character used is `num_punct::decimal_point()`. Thousands separators are inserted according to `num_punct::grouping()` and `num_punct::thousands_sep()`.

If `io.width()` is non-zero, enough `fill` characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a `'+'` or `'-'` or after `'0x'` or `'0X'`. Otherwise, padding occurs at the beginning.

## Parameters

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

## Returns

Iterator after writing.

Definition at line 2374 of file locale\_facets.h.

References `std::num_put< _CharT, _OutIter >::do_put()`.

## 4.755.4.11 put() [3/8]

```
template<typename _CharT , typename _OutIter >
iter_type std::num_put< _CharT, _OutIter >::put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 unsigned long __v) const [inline]
```

Numeric formatting.

Formats the integral value `v` and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in `io`.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If `ios_base::showpos` is set, `'+'` is output before positive values. If `ios_base::showbase` is set, `'0'` precedes octal values (except 0) and `'0[xX]'` precedes hex values.

The decimal point character used is `num_punct::decimal_point()`. Thousands separators are inserted according to `num_punct::grouping()` and `num_punct::thousands_sep()`.

If `io.width()` is non-zero, enough `fill` characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a `'+'` or `'-'` or after `'0x'` or `'0X'`. Otherwise, padding occurs at the beginning.

## Parameters

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

## Returns

Iterator after writing.

Definition at line 2378 of file locale\_facets.h.

References `std::num_put<_CharT, _OutIter >::do_put()`.

4.755.4.12 `put()` [4/8]

```
template<typename _CharT , typename _OutIter >
iter_type std::num_put< _CharT, _OutIter >::put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 long long __v) const [inline]
```

Numeric formatting.

Formats the integral value `v` and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in `io`.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If `ios_base::showpos` is set, `'+'` is output before positive values. If `ios_base::showbase` is set, `'0'` precedes octal values (except 0) and `'0[xX]'` precedes hex values.

The decimal point character used is `num_punct::decimal_point()`. Thousands separators are inserted according to `num_punct::grouping()` and `num_punct::thousands_sep()`.

If `io.width()` is non-zero, enough `fill` characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a `'+'` or `'-'` or after `'0x'` or `'0X'`. Otherwise, padding occurs at the beginning.

## Parameters

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

## Returns

Iterator after writing.

Definition at line 2384 of file locale\_facets.h.

References `std::num_put< _CharT, _OutIter >::do_put()`.

## 4.755.4.13 put() [5/8]

```
template<typename _CharT , typename _OutIter >
iter_type std::num_put< _CharT, _OutIter >::put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 unsigned long long __v) const [inline]
```

Numeric formatting.

Formats the integral value `v` and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in `io`.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If `ios_base::showpos` is set, `'+'` is output before positive values. If `ios_base::showbase` is set, `'0'` precedes octal values (except 0) and `'0[xX]'` precedes hex values.

The decimal point character used is `num_punct::decimal_point()`. Thousands separators are inserted according to `num_punct::grouping()` and `num_punct::thousands_sep()`.

If `io.width()` is non-zero, enough `fill` characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a `'+'` or `'-'` or after `'0x'` or `'0X'`. Otherwise, padding occurs at the beginning.

## Parameters

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

## Returns

Iterator after writing.

Definition at line 2388 of file locale\_facets.h.

References `std::num_put<_CharT, _OutIter>::do_put()`.

4.755.4.14 `put()` [6/8]

```
template<typename _CharT , typename _OutIter >
iter_type std::num_put< _CharT, _OutIter >::put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 double __v) const [inline]
```

Numeric formatting.

Formats the floating point value `v` and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in `io`.

The basic format is affected by the value of `io.flags()` & `ios_base::floatfield`. If equal to `ios_base::fixed`, formats like the printf `f` specifier. Else if equal to `ios_base::scientific`, formats like `e` or `E` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `g` or `G` depending on uppercase. Note that if both fixed and scientific are set, the effect will also be like `g` or `G`.

The output precision is given by `io.precision()`. This precision is capped at `numeric_limits::digits10 + 2` (different for double and long double). The default precision is 6.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showpoint` is set, a decimal point will always be output.

The decimal point character used is `num_punct::decimal_point()`. Thousands separators are inserted according to `num_punct::grouping()` and `num_punct::thousands_sep()`.

If `io.width()` is non-zero, enough `fill` characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

## Parameters

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

## Returns

Iterator after writing.

Definition at line 2437 of file locale\_facets.h.

References `std::num_put< _CharT, _OutIter >::do_put()`.

## 4.755.4.15 put() [7/8]

```
template<typename _CharT , typename _OutIter >
iter_type std::num_put< _CharT, _OutIter >::put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 long double __v) const [inline]
```

Numeric formatting.

Formats the floating point value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags() & ios_base::floatfield`. If equal to `ios_base::fixed`, formats like the printf *f* specifier. Else if equal to `ios_base::scientific`, formats like *e* or *E* with `ios_base::uppercase` unset or set respectively. Otherwise, formats like *g* or *G* depending on uppercase. Note that if both fixed and scientific are set, the effect will also be like *g* or *G*.

The output precision is given by `io.precision()`. This precision is capped at `numeric_limits::digits10 + 2` (different for double and long double). The default precision is 6.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showpoint` is set, a decimal point will always be output.

The decimal point character used is `numput::decimal_point()`. Thousands separators are inserted according to `numput::grouping()` and `numput::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

**Parameters**

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

**Returns**

Iterator after writing.

Definition at line 2441 of file locale\_facets.h.

References `std::num_put<_CharT, _OutIter >::do_put()`.

**4.755.4.16 put()** [8/8]

```
template<typename _CharT , typename _OutIter >
iter_type std::num_put< _CharT, _OutIter >::put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 const void * __v) const [inline]
```

Numeric formatting.

Formats the pointer value `v` and inserts it into a stream. It does so by calling `num_put::do_put()`.

This function formats `v` as an unsigned long with `ios_base::hex` and `ios_base::showbase` set.

**Parameters**

|                     |                               |
|---------------------|-------------------------------|

#### 4.756.1 Detailed Description

```
template<typename _Tp>
struct std::numeric_limits<_Tp>
```

Properties of fundamental types.

This class allows a program to obtain information about the representation of a fundamental type on a given platform. For non-fundamental types, the functions will return 0 and the data members will all be `false`.

Definition at line 312 of file `limits`.

## 4.756.2 Member Function Documentation

## 4.756.2.1 denorm\_min()

```
template<typename _Tp >
static constexpr _Tp std::numeric_limits< _Tp >::denorm_min () [inline], [static], [noexcept]
```

The minimum positive denormalized value. For types where `has_denorm` is `false`, this is the minimum positive normalized value.

Definition at line 357 of file `limits`.

## 4.756.2.2 epsilon()

```
template<typename _Tp >
static constexpr _Tp std::numeric_limits< _Tp >::epsilon () [inline], [static], [noexcept]
```

The *machine epsilon*: the difference between 1 and the least value greater than 1 that is representable.

Definition at line 333 of file `limits`.

Referenced by `std::generate_canonical()`, `std::binomial_distribution< _IntType >::operator()()`, and `std::poisson_distribution< _IntType >::operator()()`.

## 4.756.2.3 infinity()

```
template<typename _Tp >
static constexpr _Tp std::numeric_limits< _Tp >::infinity () [inline], [static], [noexcept]
```

The representation of positive infinity, if `has_infinity`.

Definition at line 341 of file `limits`.

## 4.756.2.4 lowest()

```
template<typename _Tp >
static constexpr _Tp std::numeric_limits< _Tp >::lowest () [inline], [static], [noexcept]
```

A finite value `x` such that there is no other finite value `y` where `y < x`.

Definition at line 327 of file `limits`.

Referenced by `std::normal_distribution< result_type >::min()`, `std::cauchy_distribution< _RealType >::min()`, `std::student_t_distribution< _RealType >::min()`, and `std::extreme_value_distribution< _RealType >::min()`.

#### 4.756.2.5 max()

```
template<typename _Tp >
static constexpr _Tp std::numeric_limits< _Tp >::max () [inline], [static], [noexcept]
```

The maximum finite value.

Definition at line 321 of file limits.

Referenced by `std::normal_distribution< result_type >::max()`, `std::lognormal_distribution< _RealType >::max()`, `std::gamma_distribution< result_type >::max()`, `std::chi_squared_distribution< _RealType >::max()`, `std::cauchy_distribution< _RealType >::max()`, `std::fisher_f_distribution< _RealType >::max()`, `std::student_t_distribution< _RealType >::max()`, `std::bernoulli_distribution::max()`, `std::geometric_distribution< _IntType >::max()`, `std::negative_binomial_distribution< _IntType >::max()`, `std::poisson_distribution< _IntType >::max()`, `std::exponential_distribution< _RealType >::max()`, `std::weibull_distribution< _RealType >::max()`, `std::extreme_value_distribution< _RealType >::max()`, `std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::operator()()`, `std::binomial_distribution< _IntType >::operator()()`, and `std::poisson_distribution< _IntType >::operator()()`.

#### 4.756.2.6 min()

```
template<typename _Tp >
static constexpr _Tp std::numeric_limits< _Tp >::min () [inline], [static], [noexcept]
```

The minimum finite value, or for floating types with denormalization, the minimum positive normalized value.

Definition at line 317 of file limits.

Referenced by `std::bernoulli_distribution::min()`, and `std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::operator()()`.

#### 4.756.2.7 quiet\_NaN()

```
template<typename _Tp >
static constexpr _Tp std::numeric_limits< _Tp >::quiet_NaN () [inline], [static], [noexcept]
```

The representation of a quiet Not a Number, if `has_quiet_NaN`.

Definition at line 346 of file limits.

#### 4.756.2.8 round\_error()

```
template<typename _Tp >
static constexpr _Tp std::numeric_limits< _Tp >::round_error () [inline], [static], [noexcept]
```

The maximum rounding error measurement (see LIA-1).

Definition at line 337 of file limits.

#### 4.756.2.9 signaling\_NaN()

```
template<typename _Tp >
static constexpr _Tp std::numeric_limits<_Tp>::signaling_NaN () [inline], [static], [noexcept]
```

The representation of a signaling Not a Number, if has\_signaling\_NaN.

Definition at line 351 of file limits.

### 4.756.3 Member Data Documentation

#### 4.756.3.1 digits

```
constexpr int std::__numeric_limits_base::digits [static], [inherited]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

Definition at line 211 of file limits.

#### 4.756.3.2 digits10

```
constexpr int std::__numeric_limits_base::digits10 [static], [inherited]
```

The number of base 10 digits that can be represented without change.

Definition at line 214 of file limits.

#### 4.756.3.3 has\_denorm

```
constexpr float_denorm_style std::__numeric_limits_base::has_denorm [static], [inherited]
```

See `std::float_denorm_style` for more information.

Definition at line 266 of file limits.

#### 4.756.3.4 has\_denorm\_loss

```
constexpr bool std::__numeric_limits_base::has_denorm_loss [static], [inherited]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

Definition at line 270 of file limits.

#### 4.756.3.5 has\_infinity

```
constexpr bool std::__numeric_limits_base::has_infinity [static], [inherited]
```

True if the type has a representation for positive infinity.

Definition at line 255 of file limits.

#### 4.756.3.6 has\_quiet\_NaN

```
constexpr bool std::__numeric_limits_base::has_quiet_NaN [static], [inherited]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

Definition at line 259 of file limits.

#### 4.756.3.7 has\_signaling\_NaN

```
constexpr bool std::__numeric_limits_base::has_signaling_NaN [static], [inherited]
```

True if the type has a representation for a signaling Not a Number.

Definition at line 263 of file limits.

#### 4.756.3.8 is\_bounded

```
constexpr bool std::__numeric_limits_base::is_bounded [static], [inherited]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

Definition at line 279 of file limits.

#### 4.756.3.9 is\_exact

```
constexpr bool std::__numeric_limits_base::is_exact [static], [inherited]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

Definition at line 231 of file limits.

#### 4.756.3.10 is\_iec559

```
constexpr bool std::__numeric_limits_base::is_iec559 [static], [inherited]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

Definition at line 274 of file limits.

#### 4.756.3.11 is\_integer

```
constexpr bool std::__numeric_limits_base::is_integer [static], [inherited]
```

True if the type is integer.

Definition at line 226 of file limits.

#### 4.756.3.12 is\_modulo

```
constexpr bool std::__numeric_limits_base::is_modulo [static], [inherited]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

Definition at line 288 of file limits.

#### 4.756.3.13 is\_signed

```
constexpr bool std::__numeric_limits_base::is_signed [static], [inherited]
```

True if the type is signed.

Definition at line 223 of file limits.

#### 4.756.3.14 is\_specialized

```
constexpr bool std::__numeric_limits_base::is_specialized [static], [inherited]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

Definition at line 206 of file limits.

**4.756.3.15 max\_digits10**

```
constexpr int std::__numeric_limits_base::max_digits10 [static], [inherited]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

Definition at line 219 of file limits.

**4.756.3.16 max\_exponent**

```
constexpr int std::__numeric_limits_base::max_exponent [static], [inherited]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

Definition at line 248 of file limits.

**4.756.3.17 max\_exponent10**

```
constexpr int std::__numeric_limits_base::max_exponent10 [static], [inherited]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

Definition at line 252 of file limits.

**4.756.3.18 min\_exponent**

```
constexpr int std::__numeric_limits_base::min_exponent [static], [inherited]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

Definition at line 239 of file limits.

**4.756.3.19 min\_exponent10**

```
constexpr int std::__numeric_limits_base::min_exponent10 [static], [inherited]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

Definition at line 243 of file limits.

#### 4.756.3.20 radix

```
constexpr int std::__numeric_limits_base::radix [static], [inherited]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

Definition at line 235 of file limits.

#### 4.756.3.21 round\_style

```
constexpr float_round_style std::__numeric_limits_base::round_style [static], [inherited]
```

See std::float\_round\_style for more information. This is only meaningful for floating types; integer types will all be round\_toward\_zero.

Definition at line 299 of file limits.

#### 4.756.3.22 tinyness\_before

```
constexpr bool std::__numeric_limits_base::tinyness_before [static], [inherited]
```

True if tininess is detected before rounding. (see IEC 559)

Definition at line 294 of file limits.

#### 4.756.3.23 traps

```
constexpr bool std::__numeric_limits_base::traps [static], [inherited]
```

True if trapping is implemented for this type.

Definition at line 291 of file limits.

## 4.775.1 Detailed Description

```
template<typename _CharT>
class std::numpunct<_CharT>
```

Primary class template numpunct.

This facet stores several pieces of information related to printing and scanning numbers, such as the decimal point character. It takes a template parameter specifying the char type. The numpunct facet is used by streams for many I/O operations involving numbers.

The numpunct template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from a numpunct facet.

Definition at line 1670 of file locale\_facets.h.

## 4.775.2 Member Typedef Documentation

#### 4.775.2.1 char\_type

```
template<typename _CharT >
typedef _CharT std::num_punct< _CharT >::char_type
```

Public typedefs.

Definition at line 1676 of file locale\_facets.h.

#### 4.775.2.2 string\_type

```
template<typename _CharT >
typedef basic_string<_CharT> std::num_punct< _CharT >::string_type
```

Public typedefs.

Definition at line 1677 of file locale\_facets.h.

### 4.775.3 Constructor & Destructor Documentation

#### 4.775.3.1 num\_punct() [1/3]

```
template<typename _CharT >
std::num_punct< _CharT >::num_punct (
 size_t __refs = 0) [inline], [explicit]
```

Num\_punct constructor.

Parameters

|                     |                                     |
|---------------------|-------------------------------------|
| <code>__refs</code> | Refcount to pass to the base class. |
|---------------------|-------------------------------------|

Definition at line 1694 of file locale\_facets.h.

#### 4.775.3.2 num\_punct() [2/3]

```
template<typename _CharT >
std::num_punct< _CharT >::num_punct (
 __cache_type * __cache,
 size_t __refs = 0) [inline], [explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up the predefined locale facets.

## Parameters

|                      |                                     |
|----------------------|-------------------------------------|
| <code>__cache</code> | __numpunct_cache object.            |
| <code>__refs</code>  | Refcount to pass to the base class. |

Definition at line 1708 of file locale\_facets.h.

## 4.775.3.3 numpunct() [3/3]

```
template<typename _CharT >
std::numpunct< _CharT >::numpunct (
 __c_locale __cloc,
 size_t __refs = 0) [inline], [explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

## Parameters

|                     |                                     |
|---------------------|-------------------------------------|
| <code>__cloc</code> | The C locale.                       |
| <code>__refs</code> | Refcount to pass to the base class. |

Definition at line 1722 of file locale\_facets.h.

## 4.775.3.4 ~numpunct()

```
template<typename _CharT >
virtual std::numpunct< _CharT >::~numpunct () [protected], [virtual]
```

Destructor.

## 4.775.4 Member Function Documentation

## 4.775.4.1 decimal\_point()

```
template<typename _CharT >
char_type std::numpunct< _CharT >::decimal_point () const [inline]
```

Return decimal point character.

This function returns a char\_type to use as a decimal point. It does so by returning returning numpunct<char\_type>↔::do\_decimal\_point().

**Returns**

*char\_type* representing a decimal point.

Definition at line 1736 of file locale\_facets.h.

References `std::num_punct<_CharT>::do_decimal_point()`.

**4.775.4.2 do\_decimal\_point()**

```
template<typename _CharT >
virtual char_type std::num_punct<_CharT>::do_decimal_point () const [inline], [protected], [virtual]
```

Return decimal point character.

Returns a *char\_type* to use as a decimal point. This function is a hook for derived classes to change the value returned.

**Returns**

*char\_type* representing a decimal point.

Definition at line 1823 of file locale\_facets.h.

Referenced by `std::num_punct<_CharT>::decimal_point()`.

**4.775.4.3 do\_falsename()**

```
template<typename _CharT >
virtual string_type std::num_punct<_CharT>::do_falsename () const [inline], [protected], [virtual]
```

Return string representation of bool false.

Returns a *string\_type* containing the text representation for false bool variables. This function is a hook for derived classes to change the value returned.

**Returns**

*string\_type* representing printed form of false.

Definition at line 1874 of file locale\_facets.h.

Referenced by `std::num_punct<_CharT>::falsename()`.

#### 4.775.4.4 do\_grouping()

```
template<typename _CharT >
virtual string std::num_punct<_CharT>::do_grouping () const [inline], [protected], [virtual]
```

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

##### See also

grouping() for details.

##### Returns

String representing grouping specification.

Definition at line 1848 of file locale\_facets.h.

Referenced by std::num\_punct<\_CharT>::grouping().

#### 4.775.4.5 do\_thousands\_sep()

```
template<typename _CharT >
virtual char_type std::num_punct<_CharT>::do_thousands_sep () const [inline], [protected],
[virtual]
```

Return thousands separator character.

Returns a char\_type to use as a thousands separator. This function is a hook for derived classes to change the value returned.

##### Returns

*char\_type* representing a thousands separator.

Definition at line 1835 of file locale\_facets.h.

Referenced by std::num\_punct<\_CharT>::thousands\_sep().

#### 4.775.4.6 do\_truename()

```
template<typename _CharT >
virtual string_type std::num_punct< _CharT >::do_truename () const [inline], [protected], [virtual]
```

Return string representation of bool true.

Returns a string\_type containing the text representation for true bool variables. This function is a hook for derived classes to change the value returned.

##### Returns

string\_type representing printed form of true.

Definition at line 1861 of file locale\_facets.h.

Referenced by std::num\_punct< \_CharT >::truename().

#### 4.775.4.7 falsename()

```
template<typename _CharT >
string_type std::num_punct< _CharT >::falsename () const [inline]
```

Return string representation of bool false.

This function returns a string\_type containing the text representation for false bool variables. It does so by calling num\_punct<char\_type>::do\_falsename().

##### Returns

string\_type representing printed form of false.

Definition at line 1806 of file locale\_facets.h.

References std::num\_punct< \_CharT >::do\_falsename().

## 4.775.4.8 grouping()

```
template<typename _CharT >
string std::num_punct<_CharT>::grouping () const [inline]
```

Return grouping specification.

This function returns a string representing groupings for the integer part of a number. Groupings indicate where thousands separators should be inserted in the integer part of a number.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the grouping() returns "\003\002" and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was "32", this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling num\_punct<char\_type>::do\_grouping().

**Returns**

string representing grouping specification.

Definition at line 1780 of file locale\_facets.h.

References std::num\_punct<\_CharT>::do\_grouping().

## 4.775.4.9 thousands\_sep()

```
template<typename _CharT >
char_type std::num_punct<_CharT>::thousands_sep () const [inline]
```

Return thousands separator character.

This function returns a char\_type to use as a thousands separator. It does so by returning num\_punct<char\_type>::do\_thousands\_sep().

**Returns**

char\_type representing a thousands separator.

Definition at line 1749 of file locale\_facets.h.

References std::num\_punct<\_CharT>::do\_thousands\_sep().

#### 4.775.4.10 true\_name()

```
template<typename _CharT >
string_type std::num_punct< _CharT >::true_name () const [inline]
```

Return string representation of bool true.

This function returns a string\_type containing the text representation for true bool variables. It does so by calling num\_punct<char\_type>::do\_true\_name().

##### Returns

string\_type representing printed form of true.

Definition at line 1793 of file locale\_facets.h.

References std::num\_punct< \_CharT >::do\_true\_name().

### 4.775.5 Member Data Documentation

#### 4.775.5.1 id

```
template<typename _CharT >
locale::id std::num_punct< _CharT >::id [static]
```

Num\_punct facet id.

Definition at line 1686 of file locale\_facets.h.

The documentation for this class was generated from the following file:

#### 4.776.1 Detailed Description

```
template<typename _CharT>
class std::numpunct_byname<_CharT>
```

class numpunct\_byname [22.2.3.2].

Definition at line 1903 of file locale\_facets.h.

#### 4.776.2 Member Function Documentation

##### 4.776.2.1 decimal\_point()

```
template<typename _CharT >
char_type std::numpunct<_CharT>::decimal_point () const [inline], [inherited]
```

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning `returning numpunct<char_type>::do_decimal_point()`.

##### Returns

*char\_type* representing a decimal point.

Definition at line 1736 of file locale\_facets.h.

References `std::numpunct<_CharT>::do_decimal_point()`.

##### 4.776.2.2 do\_decimal\_point()

```
template<typename _CharT >
virtual char_type std::numpunct<_CharT>::do_decimal_point () const [inline], [protected],
[virtual], [inherited]
```

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

##### Returns

*char\_type* representing a decimal point.

Definition at line 1823 of file locale\_facets.h.

Referenced by `std::numpunct<_CharT>::decimal_point()`.

#### 4.776.2.3 do\_falsename()

```
template<typename _CharT >
virtual string_type std::num_punct<_CharT>::do_falsename () const [inline], [protected], [virtual],
[inherited]
```

Return string representation of bool false.

Returns a string\_type containing the text representation for false bool variables. This function is a hook for derived classes to change the value returned.

##### Returns

string\_type representing printed form of false.

Definition at line 1874 of file locale\_facets.h.

Referenced by std::num\_punct<\_CharT>::falsename().

#### 4.776.2.4 do\_grouping()

```
template<typename _CharT >
virtual string std::num_punct<_CharT>::do_grouping () const [inline], [protected], [virtual],
[inherited]
```

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

##### See also

grouping() for details.

##### Returns

String representing grouping specification.

Definition at line 1848 of file locale\_facets.h.

Referenced by std::num\_punct<\_CharT>::grouping().

#### 4.776.2.5 do\_thousands\_sep()

```
template<typename _CharT >
virtual char_type std::num_punct< _CharT >::do_thousands_sep () const [inline], [protected],
[virtual], [inherited]
```

Return thousands separator character.

Returns a `char_type` to use as a thousands separator. This function is a hook for derived classes to change the value returned.

##### Returns

*char\_type* representing a thousands separator.

Definition at line 1835 of file `locale_facets.h`.

Referenced by `std::num_punct< _CharT >::thousands_sep()`.

#### 4.776.2.6 do\_truename()

```
template<typename _CharT >
virtual string_type std::num_punct< _CharT >::do_truename () const [inline], [protected], [virtual],
[inherited]
```

Return string representation of bool true.

Returns a `string_type` containing the text representation for true bool variables. This function is a hook for derived classes to change the value returned.

##### Returns

`string_type` representing printed form of true.

Definition at line 1861 of file `locale_facets.h`.

Referenced by `std::num_punct< _CharT >::truename()`.

#### 4.776.2.7 falsename()

```
template<typename _CharT >
string_type std::num_punct< _CharT >::falsename () const [inline], [inherited]
```

Return string representation of bool false.

This function returns a `string_type` containing the text representation for false bool variables. It does so by calling `num_punct<char_type>::do_falsename()`.

##### Returns

`string_type` representing printed form of false.

Definition at line 1806 of file `locale_facets.h`.

References `std::num_punct< _CharT >::do_falsename()`.

#### 4.776.2.8 grouping()

```
template<typename _CharT >
string std::num_punct<_CharT>::grouping () const [inline], [inherited]
```

Return grouping specification.

This function returns a string representing groupings for the integer part of a number. Groupings indicate where thousands separators should be inserted in the integer part of a number.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the grouping() returns "\003\002" and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was "32", this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling num\_punct<char\_type>::do\_grouping().

##### Returns

string representing grouping specification.

Definition at line 1780 of file locale\_facets.h.

References std::num\_punct<\_CharT>::do\_grouping().

#### 4.776.2.9 thousands\_sep()

```
template<typename _CharT >
char_type std::num_punct<_CharT>::thousands_sep () const [inline], [inherited]
```

Return thousands separator character.

This function returns a char\_type to use as a thousands separator. It does so by returning num\_punct<char\_type>::do\_thousands\_sep().

##### Returns

char\_type representing a thousands separator.

Definition at line 1749 of file locale\_facets.h.

References std::num\_punct<\_CharT>::do\_thousands\_sep().

#### 4.776.2.10 truename()

```
template<typename _CharT >
string_type std::num_punct< _CharT >::truename () const [inline], [inherited]
```

Return string representation of bool true.

This function returns a string\_type containing the text representation for true bool variables. It does so by calling num\_punct<char\_type>::do\_truename().

##### Returns

string\_type representing printed form of true.

Definition at line 1793 of file locale\_facets.h.

References std::num\_punct< \_CharT >::do\_truename().

### 4.776.3 Member Data Documentation

#### 4.776.3.1 id

```
template<typename _CharT >
locale::id std::num_punct< _CharT >::id [static], [inherited]
```

Num\_punct facet id.

Definition at line 1686 of file locale\_facets.h.

The documentation for this class was generated from the following file:

- [locale\\_facets.h](#)

### 4.777 \_\_gnu\_parallel::omp\_loop\_static\_tag Struct Reference

Inheritance diagram for \_\_gnu\_parallel::omp\_loop\_static\_tag:

## Public Member Functions

- [\\_ThreadIndex \\_\\_get\\_num\\_threads\(\)](#)
- void [set\\_num\\_threads\(\\_ThreadIndex \\_\\_num\\_threads\)](#)

## 4.777.1 Detailed Description

Recommends parallel execution using OpenMP static load-balancing at compile time.

Definition at line 100 of file tags.h.

## 4.777.2 Member Function Documentation

4.777.2.1 `__get_num_threads()`

```
_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads () [inline], [inherited]
```

Find out desired number of threads.

## Returns

Desired number of threads.

Definition at line 63 of file tags.h.

Referenced by `__gnu_parallel::__parallel_sort()`.

4.777.2.2 `set_num_threads()`

```
void __gnu_parallel::parallel_tag::set_num_threads (
 _ThreadIndex __num_threads) [inline], [inherited]
```

Set the desired number of threads.

## Parameters

|                            |                            |
|----------------------------|----------------------------|
| <code>__num_threads</code> | Desired number of threads. |
|----------------------------|----------------------------|

Definition at line 73 of file tags.h.

## 4.781.1 Detailed Description

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
class std::ostream_iterator< _Tp, _CharT, _Traits >
```

Provides output iterator semantics for streams.

This class provides an iterator to write to an ostream. The type `Tp` is the only type written by this iterator and there must be an `operator<<(Tp)` defined.

## Template Parameters

|                      |                                        |
|----------------------|----------------------------------------|
| <code>_Tp</code>     | The type to write to the ostream.      |
| <code>_CharT</code>  | The ostream <code>char_type</code> .   |
| <code>_Traits</code> | The ostream <code>char_traits</code> . |

Definition at line 176 of file `stream_iterator.h`.

## 4.781.2 Member Typedef Documentation

#### 4.781.2.1 char\_type

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>>
typedef _CharT std::ostream_iterator< _Tp, _CharT, _Traits >::char_type
```

Public typedef.

Definition at line 185 of file stream\_iterator.h.

#### 4.781.2.2 difference\_type

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::difference_type
[inherited]
```

Distance between iterators is represented as this type.

Definition at line 134 of file stl\_iterator\_base\_types.h.

#### 4.781.2.3 iterator\_category

```
typedef output_iterator_tag std::iterator< output_iterator_tag , void , void , void , void >←
::iterator_category [inherited]
```

One of the [tag types](#).

Definition at line 130 of file stl\_iterator\_base\_types.h.

#### 4.781.2.4 ostream\_type

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>>
typedef basic_ostream<_CharT, _Traits> std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_type
```

Public typedef.

Definition at line 187 of file stream\_iterator.h.

#### 4.781.2.5 pointer

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::pointer [inherited]
```

This type represents a pointer-to-value\_type.

Definition at line 136 of file stl\_iterator\_base\_types.h.

## 4.781.2.6 reference

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::reference [inherited]
```

This type represents a reference-to-value\_type.

Definition at line 138 of file stl\_iterator\_base\_types.h.

## 4.781.2.7 traits\_type

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>>
typedef _Traits std::ostream_iterator< _Tp, _CharT, _Traits >::traits_type
```

Public typedef.

Definition at line 186 of file stream\_iterator.h.

## 4.781.2.8 value\_type

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::value_type [inherited]
```

The type "pointed to" by the iterator.

Definition at line 132 of file stl\_iterator\_base\_types.h.

## 4.781.3 Constructor &amp; Destructor Documentation

## 4.781.3.1 ostream\_iterator() [1/3]

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (
 ostream_type & __s) [inline]
```

Construct from an ostream.

Definition at line 201 of file stream\_iterator.h.

## 4.781.3.2 ostream\_iterator() [2/3]

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (
 ostream_type & __s,
 const _CharT * __c) [inline]
```

Construct from an ostream.

The delimiter string *c* is written to the stream after every *Tp* written to the stream. The delimiter is not copied, and thus must not be destroyed while this iterator is in use.

## Parameters

|                                        |                                   |
|----------------------------------------|-----------------------------------|
| <a href="#"><code>_↵<br/>_s</code></a> | Underlying ostream to write to.   |
| <a href="#"><code>_↵<br/>_c</code></a> | CharT delimiter string to insert. |

Definition at line 214 of file `stream_iterator.h`.

4.781.3.3 `ostream_iterator()` [3/3]

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (
 const ostream_iterator< _Tp, _CharT, _Traits > &__obj) [inline]
```

Copy constructor.

Definition at line 218 of file `stream_iterator.h`.

## 4.781.4 Member Function Documentation

4.781.4.1 `operator=()`

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>>
ostream_iterator& std::ostream_iterator< _Tp, _CharT, _Traits >::operator= (
 const _Tp &__value) [inline]
```

Writes *value* to underlying ostream using `operator<<`. If constructed with delimiter string, writes delimiter to ostream.

Definition at line 228 of file `stream_iterator.h`.

The documentation for this class was generated from the following file:

- [stream\\_iterator.h](#)

```

Public typedefs.

Definition at line 250 of file `streambuf_iterator.h`.

#### 4.783.2.9 value\_type

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::value_type [inherited]
```

The type "pointed to" by the iterator.

Definition at line 132 of file `stl_iterator_base_types.h`.

### 4.783.3 Constructor & Destructor Documentation

#### 4.783.3.1 ostreambuf\_iterator() [1/2]

```
template<typename _CharT , typename _Traits >
std::ostreambuf_iterator< _CharT, _Traits >::ostreambuf_iterator (
 ostream_type & __s) [inline], [noexcept]
```

Construct output iterator from ostream.

Definition at line 274 of file ostreambuf\_iterator.h.

#### 4.783.3.2 ostreambuf\_iterator() [2/2]

```
template<typename _CharT , typename _Traits >
std::ostreambuf_iterator< _CharT, _Traits >::ostreambuf_iterator (
 streambuf_type * __s) [inline], [noexcept]
```

Construct output iterator from streambuf.

Definition at line 278 of file ostreambuf\_iterator.h.

### 4.783.4 Member Function Documentation

#### 4.783.4.1 failed()

```
template<typename _CharT , typename _Traits >
bool std::ostreambuf_iterator< _CharT, _Traits >::failed () const [inline], [noexcept]
```

Return true if previous operator=() failed.

Definition at line 308 of file ostreambuf\_iterator.h.

#### 4.783.4.2 operator\*()

```
template<typename _CharT , typename _Traits >
ostreambuf_iterator& std::ostreambuf_iterator< _CharT, _Traits >::operator* () [inline]
```

Return \*this.

Definition at line 293 of file ostreambuf\_iterator.h.

**4.783.4.3 operator++()** [1/2]

```
template<typename _CharT , typename _Traits >
ostreambuf_iterator& std::ostreambuf_iterator< _CharT, _Traits >::operator++ (
 int) [inline]
```

Return \*this.

Definition at line 298 of file ostreambuf\_iterator.h.

**4.783.4.4 operator++()** [2/2]

```
template<typename _CharT , typename _Traits >
ostreambuf_iterator& std::ostreambuf_iterator< _CharT, _Traits >::operator++ () [inline]
```

Return \*this.

Definition at line 303 of file ostreambuf\_iterator.h.

**4.783.4.5 operator=()**

```
template<typename _CharT , typename _Traits >
ostreambuf_iterator& std::ostreambuf_iterator< _CharT, _Traits >::operator= (
 _CharT __c) [inline]
```

Write character to ostreambuf. Calls ostreambuf.sputc().

Definition at line 283 of file ostreambuf\_iterator.h.

References `std::basic_ostreambuf< _CharT, _Traits >::sputc()`.

The documentation for this class was generated from the following files:

- [iosfwd](#)
- [ostreambuf\\_iterator.h](#)

## 4.784 std::out\_of\_range Class Reference

Inheritance diagram for std::out\_of\_range:

## Public Member Functions

- **out\_of\_range** (const [string](#) &\_\_arg) \_GLIBCXX\_TXN\_SAFE
- **out\_of\_range** (const char \*) \_GLIBCXX\_TXN\_SAFE
- **out\_of\_range** (const [out\\_of\\_range](#) &)=default
- **out\_of\_range** ([out\\_of\\_range](#) &&)=default
- [out\\_of\\_range](#) & **operator=** (const [out\\_of\\_range](#) &)=default
- [out\\_of\\_range](#) & **operator=** ([out\\_of\\_range](#) &&)=default
- virtual const char \* [what](#) () const noexcept

## 4.784.1 Detailed Description

This represents an argument whose value is not within the expected range (e.g., boundary checks in `basic_string`).

Definition at line 200 of file `stdexcept`.

## 4.784.2 Member Function Documentation

#### 4.784.2.1 `what()`

```
virtual const char* std::logic_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future\\_error](#).

The documentation for this class was generated from the following file:

- [stdexcept](#)

### 4.785 `std::output_iterator_tag` Struct Reference

#### 4.785.1 Detailed Description

Marking output iterators.

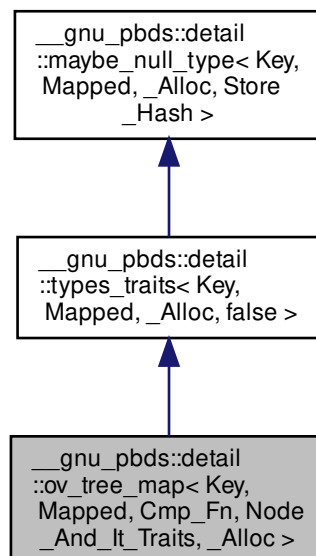

Definition at line 96 of file `stl_iterator_base_types.h`.

The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

### 4.786 `__gnu_pbds::detail::ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >` Class Template Reference

Inheritance diagram for `__gnu_pbds::detail::ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >`:

#### Public Attributes

- no\_throw\_indicator **m\_no\_throw\_copies\_indicator**
- store\_extra **m\_store\_extra\_indicator**

#### 4.786.1 Detailed Description

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
class __gnu_pbds::detail::ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >
```

Ordered-vector tree associative-container.

Definition at line 106 of file `ov_tree_map.hpp`.

#### 4.786.2 Member Function Documentation

**4.786.2.1 node\_begin()** [1/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename
_Alloc >
ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::ov_tree_map<
Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_begin () const [inline]
```

Returns a const node\_iterator corresponding to the node at the root of the tree.

Definition at line 47 of file ov\_tree\_map.hpp.

**4.786.2.2 node\_begin()** [2/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename
_Alloc >
ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::ov_tree_map<
Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_begin () [inline]
```

Returns a node\_iterator corresponding to the node at the root of the tree.

Definition at line 59 of file ov\_tree\_map.hpp.

**4.786.2.3 node\_end()** [1/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename
_Alloc >
ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::ov_tree_map<
Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end () const [inline]
```

Returns a const node\_iterator corresponding to a node just after a leaf of the tree.

Definition at line 53 of file ov\_tree\_map.hpp.

**4.786.2.4 node\_end()** [2/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename
_Alloc >
ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::ov_tree_map<
Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end () [inline]
```

Returns a node\_iterator corresponding to a node just after a leaf of the tree.

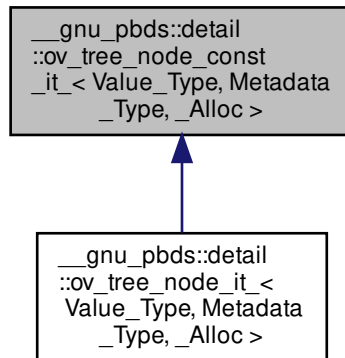

Definition at line 65 of file ov\_tree\_map.hpp.

The documentation for this class was generated from the following file:

- [ov\\_tree\\_map.hpp](#)

#### 4.787 `__gnu_pbds::detail::ov_tree_node_const_it_< Value_Type, Metadata_Type, _Alloc >` Class Template Reference

Inheritance diagram for `__gnu_pbds::detail::ov_tree_node_const_it_< Value_Type, Metadata_Type, _Alloc >`:

static `Ptr` **mid\_pointer** (`Ptr` p\_begin, `Ptr` p\_end)

### 4.787.1 Detailed Description

```
template<typename Value_Type, typename Metadata_Type, typename _Alloc>
class __gnu_pbds::detail::ov_tree_node_const_it_< Value_Type, Metadata_Type, _Alloc >
```

Const node reference.

Definition at line 57 of file `ov_tree_map_/node_iterators.hpp`.

### 4.787.2 Member Function Documentation

#### 4.787.2.1 `get_l_child()`

```
template<typename Value_Type , typename Metadata_Type , typename _Alloc >
this_type __gnu_pbds::detail::ov_tree_node_const_it_< Value_Type, Metadata_Type, _Alloc >::get_↔
l_child () const [inline]
```

Returns the node iterator associated with the left node.

Definition at line 135 of file `ov_tree_map_/node_iterators.hpp`.

#### 4.787.2.2 `get_r_child()`

```
template<typename Value_Type , typename Metadata_Type , typename _Alloc >
this_type __gnu_pbds::detail::ov_tree_node_const_it_< Value_Type, Metadata_Type, _Alloc >::get_↔
r_child () const [inline]
```

Returns the node iterator associated with the right node.

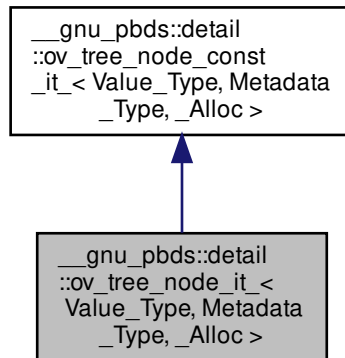

Definition at line 151 of file `ov_tree_map_/node_iterators.hpp`.

The documentation for this class was generated from the following file:

- [ov\\_tree\\_map\\_/node\\_iterators.hpp](#)

## Static Protected Member Functions

- `template<typename Ptr >`  
`static Ptr mid_pointer (Ptr p_begin, Ptr p_end)`

### 4.788.1 Detailed Description

```
template<typename Value_Type, typename Metadata_Type, typename _Alloc>
class __gnu_pbds::detail::ov_tree_node_it_< Value_Type, Metadata_Type, _Alloc >
```

Node reference.

Definition at line 197 of file `ov_tree_map_/node_iterators.hpp`.

### 4.788.2 Member Function Documentation

#### 4.788.2.1 `get_l_child()`

```
template<typename Value_Type , typename Metadata_Type , typename _Alloc >
ov_tree_node_it_ __gnu_pbds::detail::ov_tree_node_it_< Value_Type, Metadata_Type, _Alloc >::get↵
_l_child () const [inline]
```

Returns the node reference associated with the left node.

Definition at line 239 of file `ov_tree_map_/node_iterators.hpp`.

#### 4.788.2.2 `get_r_child()`

```
template<typename Value_Type , typename Metadata_Type , typename _Alloc >
ov_tree_node_it_ __gnu_pbds::detail::ov_tree_node_it_< Value_Type, Metadata_Type, _Alloc >::get↵
_r_child () const [inline]
```

Returns the node reference associated with the right node.

Definition at line 255 of file `ov_tree_map_/node_iterators.hpp`.

#### 4.788.2.3 operator\*()

```
template<typename Value_Type , typename Metadata_Type , typename _Alloc >
reference __gnu_pbds::detail::ov_tree_node_it_< Value_Type, Metadata_Type, _Alloc >::operator* (
) const [inline]
```

Access.

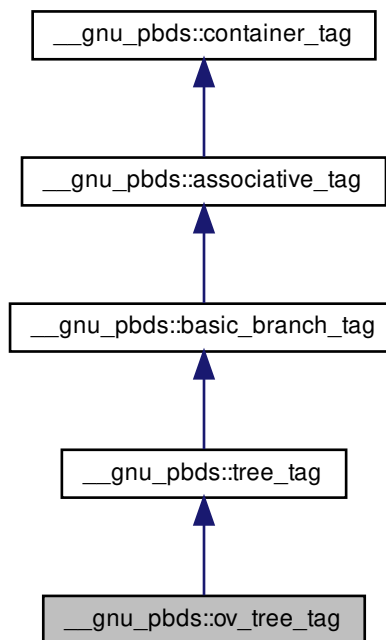

Definition at line 234 of file `ov_tree_map_/node_iterators.hpp`.

The documentation for this class was generated from the following file:

- [ov\\_tree\\_map\\_/node\\_iterators.hpp](#)

#### 4.789 \_\_gnu\_pbds::ov\_tree\_tag Struct Reference

Inheritance diagram for `__gnu_pbds::ov_tree_tag`:

##### 4.789.1 Detailed Description

Ordered-vector tree.

Definition at line 159 of file `tag_and_trait.hpp`.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 4.790 `std::overflow_error` Class Reference

Inheritance diagram for `std::overflow_error`:

### Public Member Functions

- **`overflow_error`** (const [string](#) &\_\_arg) `_GLIBCXX_TXN_SAFE`
- **`overflow_error`** (const char \*) `_GLIBCXX_TXN_SAFE`
- **`overflow_error`** (const [overflow\\_error](#) &)=default
- **`overflow_error`** ([overflow\\_error](#) &&)=default
- [overflow\\_error](#) & **`operator=`** (const [overflow\\_error](#) &)=default
- [overflow\\_error](#) & **`operator=`** ([overflow\\_error](#) &&)=default
- virtual const char \* [what](#) () const noexcept

### 4.790.1 Detailed Description

Thrown to indicate arithmetic overflow.

Definition at line 273 of file `stdexcept`.

### 4.790.2 Member Function Documentation

#### 4.790.2.1 `what()`

```
virtual const char* std::runtime_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::experimental::filesystem::v1::filesystem\\_error](#).

The documentation for this class was generated from the following file:

- [stdexcept](#)

### 4.791 `std::owner_less<_Tp>` Struct Template Reference

#### 4.791.1 Detailed Description

```
template<typename _Tp = void>
struct std::owner_less<_Tp>
```

Primary template `owner_less`.

Definition at line 768 of file `bits/shared_ptr.h`.

The documentation for this struct was generated from the following file:

- [bits/shared\\_ptr.h](#)

### 4.792 `std::experimental::fundamentals_v2::owner_less<shared_ptr<_Tp>>` Struct Template Reference

Inherits `std::_Sp_owner_less<_Tp, _Tp1>`.

#### Public Types

- typedef `_Tp` [first\\_argument\\_type](#)
- typedef `bool` [result\\_type](#)
- typedef `_Tp` [second\\_argument\\_type](#)

#### Public Member Functions

- `bool` **operator()** (const `_Tp` &\_\_lhs, const `_Tp` &\_\_rhs) const noexcept
- `bool` **operator()** (const `_Tp` &\_\_lhs, const `_Tp1` &\_\_rhs) const noexcept
- `bool` **operator()** (const `_Tp1` &\_\_lhs, const `_Tp` &\_\_rhs) const noexcept

#### 4.792.1 Detailed Description

```
template<typename _Tp>
struct std::experimental::fundamentals_v2::owner_less< shared_ptr< _Tp > >
```

Partial specialization of owner\_less for shared\_ptr.

Definition at line 509 of file experimental/bits/shared\_ptr.h.

#### 4.792.2 Member Typedef Documentation

##### 4.792.2.1 first\_argument\_type

```
typedef _Tp std::binary_function< _Tp , _Tp , bool >::first_argument_type [inherited]
```

first\_argument\_type is the type of the first argument

Definition at line 121 of file stl\_function.h.

##### 4.792.2.2 result\_type

```
typedef bool std::binary_function< _Tp , _Tp , bool >::result_type [inherited]
```

result\_type is the return type

Definition at line 127 of file stl\_function.h.

##### 4.792.2.3 second\_argument\_type

```
typedef _Tp std::binary_function< _Tp , _Tp , bool >::second_argument_type [inherited]
```

second\_argument\_type is the type of the second argument

Definition at line 124 of file stl\_function.h.

The documentation for this struct was generated from the following file:

- [experimental/bits/shared\\_ptr.h](#)

#### 4.793 std::owner\_less< shared\_ptr< \_Tp > > Struct Template Reference

Inherits std::\_Sp\_owner\_less< \_Tp, \_Tp1 >.

### Public Types

- typedef `_Tp` [first\\_argument\\_type](#)
- typedef `bool` [result\\_type](#)
- typedef `_Tp` [second\\_argument\\_type](#)

### Public Member Functions

- `bool` **operator()** (`const _Tp &__lhs, const _Tp &__rhs`) `const noexcept`
- `bool` **operator()** (`const _Tp &__lhs, const _Tp1 &__rhs`) `const noexcept`
- `bool` **operator()** (`const _Tp1 &__lhs, const _Tp &__rhs`) `const noexcept`

#### 4.793.1 Detailed Description

```
template<typename _Tp>
struct std::owner_less< shared_ptr< _Tp > >
```

Partial specialization of `owner_less` for `shared_ptr`.

Definition at line 777 of file `bits/shared_ptr.h`.

#### 4.793.2 Member Typedef Documentation

##### 4.793.2.1 `first_argument_type`

```
typedef _Tp std::binary_function< _Tp , _Tp , bool >::first_argument_type [inherited]
```

`first_argument_type` is the type of the first argument

Definition at line 121 of file `stl_function.h`.

##### 4.793.2.2 `result_type`

```
typedef bool std::binary_function< _Tp , _Tp , bool >::result_type [inherited]
```

`result_type` is the return type

Definition at line 127 of file `stl_function.h`.

## 4.793.2.3 second\_argument\_type

```
typedef _Tp std::binary_function< _Tp , _Tp , bool >::second_argument_type [inherited]
```

second\_argument\_type is the type of the second argument

Definition at line 124 of file stl\_function.h.

The documentation for this struct was generated from the following file:

- [bits/shared\\_ptr.h](#)

## 4.794 std::owner\_less&lt; void &gt; Struct Template Reference

Inherits std::\_Sp\_owner\_less< \_Tp, \_Tp1 >.

## Public Types

- typedef \_Tp [first\\_argument\\_type](#)
- typedef bool [result\\_type](#)
- typedef \_Tp [second\\_argument\\_type](#)

## Public Member Functions

- bool **operator()** (const \_Tp &\_\_lhs, const \_Tp &\_\_rhs) const noexcept
- bool **operator()** (const \_Tp &\_\_lhs, const \_Tp1 &\_\_rhs) const noexcept
- bool **operator()** (const \_Tp1 &\_\_lhs, const \_Tp &\_\_rhs) const noexcept

## 4.794.1 Detailed Description

```
template<>
struct std::owner_less< void >
```

Void specialization of owner\_less compares either shared\_ptr or weak\_ptr.

Definition at line 772 of file bits/shared\_ptr.h.

## 4.794.2 Member Typedef Documentation

#### 4.794.2.1 first\_argument\_type

```
typedef _Tp std::binary_function< _Tp , _Tp , bool >::first_argument_type [inherited]
```

first\_argument\_type is the type of the first argument

Definition at line 121 of file stl\_function.h.

#### 4.794.2.2 result\_type

```
typedef bool std::binary_function< _Tp , _Tp , bool >::result_type [inherited]
```

result\_type is the return type

Definition at line 127 of file stl\_function.h.

#### 4.794.2.3 second\_argument\_type

```
typedef _Tp std::binary_function< _Tp , _Tp , bool >::second_argument_type [inherited]
```

second\_argument\_type is the type of the second argument

Definition at line 124 of file stl\_function.h.

The documentation for this struct was generated from the following file:

- [bits/shared\\_ptr.h](#)

### 4.795 std::owner\_less< weak\_ptr< \_Tp > > Struct Template Reference

Inherits std::Sp\_owner\_less< \_Tp, \_Tp1 >.

#### Public Types

- typedef \_Tp [first\\_argument\\_type](#)
- typedef bool [result\\_type](#)
- typedef \_Tp [second\\_argument\\_type](#)

#### Public Member Functions

- bool **operator()** (const \_Tp &\_\_lhs, const \_Tp &\_\_rhs) const noexcept
- bool **operator()** (const \_Tp &\_\_lhs, const \_Tp1 &\_\_rhs) const noexcept
- bool **operator()** (const \_Tp1 &\_\_lhs, const \_Tp &\_\_rhs) const noexcept

### 4.795.1 Detailed Description

```
template<typename _Tp>
struct std::owner_less< weak_ptr< _Tp > >
```

Partial specialization of owner\_less for weak\_ptr.

Definition at line 783 of file bits/shared\_ptr.h.

### 4.795.2 Member Typedef Documentation

#### 4.795.2.1 first\_argument\_type

```
typedef _Tp std::binary_function< _Tp , _Tp , bool >::first_argument_type [inherited]
```

first\_argument\_type is the type of the first argument

Definition at line 121 of file stl\_function.h.

#### 4.795.2.2 result\_type

```
typedef bool std::binary_function< _Tp , _Tp , bool >::result_type [inherited]
```

result\_type is the return type

Definition at line 127 of file stl\_function.h.

#### 4.795.2.3 second\_argument\_type

```
typedef _Tp std::binary_function< _Tp , _Tp , bool >::second_argument_type [inherited]
```

second\_argument\_type is the type of the second argument

Definition at line 124 of file stl\_function.h.

The documentation for this struct was generated from the following file:

- [bits/shared\\_ptr.h](#)

## 4.796 std::experimental::fundamentals\_v2::owner\_less< weak\_ptr< \_Tp > > Struct Template Reference

Inherits std::\_Sp\_owner\_less< \_Tp, \_Tp1 >.

### Public Types

#### 4.798.1 Detailed Description

```
template<typename _T1, typename _T2>
struct std::pair<_T1, _T2>
```

Struct holding two objects of arbitrary type.

### Template Parameters

|                  |                        |
|------------------|------------------------|
| <code>_T1</code> | Type of first object.  |
| <code>_T2</code> | Type of second object. |

<https://gcc.gnu.org/onlinedocs/libstdc++/manual/utilities.html>

Definition at line 211 of file `stl_pair.h`.

## 4.798.2 Member Typedef Documentation

### 4.798.2.1 `first_type`

```
template<typename _T1, typename _T2>
typedef _T1 std::pair< _T1, _T2 >::first_type
```

The type of the `first` member.

Definition at line 214 of file `stl_pair.h`.

### 4.798.2.2 `second_type`

```
template<typename _T1, typename _T2>
typedef _T2 std::pair< _T1, _T2 >::second_type
```

The type of the `second` member.

Definition at line 215 of file `stl_pair.h`.

## 4.798.3 Constructor & Destructor Documentation

### 4.798.3.1 `pair()` [1/5]

```
template<typename _T1, typename _T2>
template<typename _U1 = _T1, typename _U2 = _T2, typename enable_if< __and< __is_implicitly_↵
default_constructible< _U1 >, __is_implicitly_default_constructible< _U2 >> ::value, bool >↵
::type = true>
constexpr std::pair< _T1, _T2 >::pair () [inline]
```

The default constructor creates `first` and `second` using their respective default constructors.

Definition at line 232 of file `stl_pair.h`.

## 4.798.3.2 pair() [2/5]

```
template<typename _T1, typename _T2>
template<typename _U1 = _T1, typename _U2 = _T2, typename enable_if< _PCCP::template _ConstructiblePair< _U1, _U2 >() &&_PCCP::template _ImplicitlyConvertiblePair< _U1, _U2 >(), bool >::type = true>
constexpr std::pair< _T1, _T2 >::pair (
 const _T1 & __a,
 const _T2 & __b) [inline]
```

Construct from two const lvalues, allowing implicit conversions.

Definition at line 266 of file stl\_pair.h.

## 4.798.3.3 pair() [3/5]

```
template<typename _T1, typename _T2>
template<typename _U1 = _T1, typename _U2 = _T2, typename enable_if< _PCCP::template _ConstructiblePair< _U1, _U2 >() &&!_PCCP::template _ImplicitlyConvertiblePair< _U1, _U2 >(), bool >::type = false>
constexpr std::pair< _T1, _T2 >::pair (
 const _T1 & __a,
 const _T2 & __b) [inline], [explicit]
```

Construct from two const lvalues, disallowing implicit conversions.

Definition at line 276 of file stl\_pair.h.

## 4.798.3.4 pair() [4/5]

```
template<typename _T1, typename _T2>
constexpr std::pair< _T1, _T2 >::pair (
 const pair< _T1, _T2 > &) [default]
```

Copy constructor.

## 4.798.3.5 pair() [5/5]

```
template<typename _T1, typename _T2>
constexpr std::pair< _T1, _T2 >::pair (
 pair< _T1, _T2 > &&) [default]
```

Move constructor.

#### 4.798.4 Member Function Documentation

##### 4.798.4.1 swap()

```
template<typename _T1, typename _T2>
constexpr void std::pair< _T1, _T2 >::swap (
 pair< _T1, _T2 > & __p) [inline], [noexcept]
```

Swap the first members and then the second members.

Definition at line 439 of file `stl_pair.h`.

Referenced by `std::pair< _Biliter, _Biliter >::swap()`.

#### 4.798.5 Member Data Documentation

##### 4.798.5.1 first

```
template<typename _T1, typename _T2>
_T1 std::pair< _T1, _T2 >::first
```

The first member.

Definition at line 217 of file `stl_pair.h`.

Referenced by `__gnu_parallel::__find_template()`, `std::__sample()`, `std::Temporary_buffer< _ForwardIterator, _Tp >::Temporary_buffer()`, `std::set< _Key, _Compare, _Alloc >::insert()`, `std::pair< _Biliter, _Biliter >::operator<()`, `std::pair< _Biliter, _Biliter >::operator==()`, and `std::pair< _Biliter, _Biliter >::swap()`.

##### 4.798.5.2 second

```
template<typename _T1, typename _T2>
_T2 std::pair< _T1, _T2 >::second
```

The second member.

Definition at line 218 of file `stl_pair.h`.

Referenced by `std::__sample()`, `std::set< _Key, _Compare, _Alloc >::insert()`, `std::pair< _Biliter, _Biliter >::operator<()`, `std::pair< _Biliter, _Biliter >::operator==()`, and `std::pair< _Biliter, _Biliter >::swap()`.

The documentation for this struct was generated from the following files:

## 4.799.1 Detailed Description

```
template<typename Value_Type, typename Cmp_Fn, typename _Alloc>
class __gnu_pbds::detail::pairing_heap< Value_Type, Cmp_Fn, _Alloc >
```

Pairing heap.

Definition at line 77 of file pairing\_heap.hpp.

The documentation for this class was generated from the following file:

- [pairing\\_heap.hpp](#)

## 4.800 \_\_gnu\_pbds::pairing\_heap\_tag Struct Reference

Inheritance diagram for \_\_gnu\_pbds::pairing\_heap\_tag:

## 4.800.1 Detailed Description

Pairing-heap.

Definition at line 174 of file tag\_and\_trait.hpp.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

#### 4.801 \_\_gnu\_parallel::parallel\_tag Struct Reference

Inheritance diagram for \_\_gnu\_parallel::parallel\_tag:

#### Public Member Functions

- `parallel_tag ()`
- `parallel_tag (_ThreadIndex __num_threads)`
- `_ThreadIndex __get_num_threads ()`
- `void set_num_threads (_ThreadIndex __num_threads)`

#### 4.801.1 Detailed Description

Recommends parallel execution at compile time, optionally using a user-specified number of threads.

Definition at line 46 of file tags.h.

#### 4.801.2 Constructor & Destructor Documentation

##### 4.801.2.1 parallel\_tag() [1/2]

```
__gnu_parallel::parallel_tag::parallel_tag () [inline]
```

Default constructor. Use default number of threads.

Definition at line 53 of file tags.h.

##### 4.801.2.2 parallel\_tag() [2/2]

```
__gnu_parallel::parallel_tag::parallel_tag (
 _ThreadIndex __num_threads) [inline]
```

Default constructor. Recommend number of threads to use.

##### Parameters

|                            |                            |
|----------------------------|----------------------------|
| <code>__num_threads</code> | Desired number of threads. |
|----------------------------|----------------------------|

Definition at line 58 of file tags.h.

#### 4.801.3 Member Function Documentation

##### 4.801.3.1 \_\_get\_num\_threads()

```
_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads () [inline]
```

Find out desired number of threads.

##### Returns

Desired number of threads.

Definition at line 63 of file tags.h.

Referenced by \_\_gnu\_parallel::\_\_parallel\_sort().

#### 4.801.3.2 set\_num\_threads()

```
void __gnu_parallel::parallel_tag::set_num_threads (
 _ThreadIndex __num_threads) [inline]
```

Set the desired number of threads.

##### Parameters

|                            |                            |
|----------------------------|----------------------------|
| <code>__num_threads</code> | Desired number of threads. |
|----------------------------|----------------------------|

Definition at line 73 of file tags.h.

The documentation for this struct was generated from the following file:

#### 4.823.1 Detailed Description

```
template<typename Key, typename Mapped, typename Node_And_It_Traits, typename _Alloc>
class __gnu_pbds::detail::pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >
```

PATRICIA trie.

This implementation loosely borrows ideas from: 1) Fast Mergeable Integer Maps, Okasaki, Gill 1998 2) Ptset: Sets of integers implemented as Patricia trees, Jean-Christophe Filliatr, 2000.

Definition at line 101 of file `pat_trie_.hpp`.

#### 4.823.2 Member Enumeration Documentation

##### 4.823.2.1 node\_type

```
enum __gnu_pbds::detail::pat_trie_base::node_type [inherited]
```

Three types of nodes.

i\_node is used by \_Inode, leaf\_node by \_Leaf, and head\_node by \_Head.

Definition at line 58 of file pat\_trie\_base.hpp.

#### 4.823.3 Member Function Documentation

##### 4.823.3.1 node\_begin() [1/2]

```
template<typename Key , typename Mapped , typename Node_And_It_Traits , typename _Alloc >
pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::pat_trie_map<
Key, Mapped, Node_And_It_Traits, _Alloc >::node_begin () const [inline]
```

Returns a const node\_iterator corresponding to the node at the root of the tree.

Definition at line 103 of file pat\_trie\_.hpp.

##### 4.823.3.2 node\_begin() [2/2]

```
template<typename Key , typename Mapped , typename Node_And_It_Traits , typename _Alloc >
pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::pat_trie_map<
Key, Mapped, Node_And_It_Traits, _Alloc >::node_begin () [inline]
```

Returns a node\_iterator corresponding to the node at the root of the tree.

Definition at line 109 of file pat\_trie\_.hpp.

##### 4.823.3.3 node\_end() [1/2]

```
template<typename Key , typename Mapped , typename Node_And_It_Traits , typename _Alloc >
pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::pat_trie_map<
Key, Mapped, Node_And_It_Traits, _Alloc >::node_end () const [inline]
```

Returns a const node\_iterator corresponding to a node just after a leaf of the tree.

Definition at line 115 of file pat\_trie\_.hpp.

## 4.823.3.4 node\_end() [2/2]

```
template<typename Key , typename Mapped , typename Node_And_It_Traits , typename _Alloc >
pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::pat_trie_map<
Key, Mapped, Node_And_It_Traits, _Alloc >::node_end () [inline]
```

Returns a node\_iterator corresponding to a node just after a leaf of the tree.

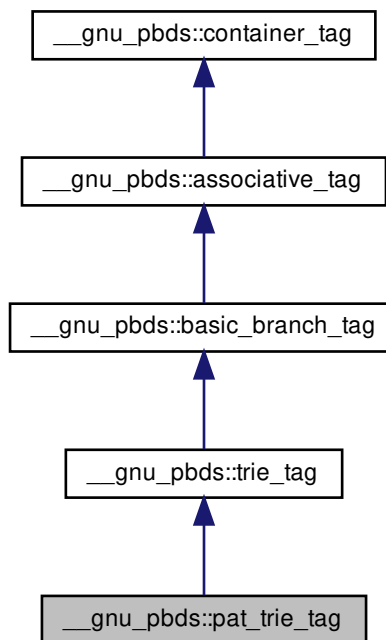

Definition at line 121 of file pat\_trie\_.hpp.

#### 4.826.1 Detailed Description

```
template<typename _RealType = double>
class std::piecewise_constant_distribution< _RealType >
```

A piecewise\_constant\_distribution random number distribution.

The formula for the piecewise constant probability mass function is

Definition at line 5512 of file random.h.

#### 4.826.2 Member Typedef Documentation

##### 4.826.2.1 result\_type

```
template<typename _RealType = double>
typedef _RealType std::piecewise_constant_distribution< _RealType >::result_type
```

The type of the range of the distribution.

Definition at line 5515 of file random.h.

### 4.826.3 Member Function Documentation

#### 4.826.3.1 densities()

```
template<typename _RealType = double>
std::vector<double> std::piecewise_constant_distribution< _RealType >::densities () const [inline]
```

Returns a vector of the probability densities.

Definition at line 5637 of file random.h.

References `std::vector< _Tp, _Alloc >::empty()`.

#### 4.826.3.2 intervals()

```
template<typename _RealType = double>
std::vector<_RealType> std::piecewise_constant_distribution< _RealType >::intervals () const
[inline]
```

Returns a vector of the intervals.

Definition at line 5621 of file random.h.

References `std::vector< _Tp, _Alloc >::empty()`.

#### 4.826.3.3 max()

```
template<typename _RealType = double>
result_type std::piecewise_constant_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

Definition at line 5672 of file random.h.

References `std::vector< _Tp, _Alloc >::back()`, and `std::vector< _Tp, _Alloc >::empty()`.

#### 4.826.3.4 min()

```
template<typename _RealType = double>
result_type std::piecewise_constant_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

Definition at line 5662 of file random.h.

References `std::vector< _Tp, _Alloc >::empty()`, and `std::vector< _Tp, _Alloc >::front()`.

## 4.826.3.5 operator()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::piecewise_constant_distribution< _RealType >::operator() (
 _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Definition at line 5683 of file random.h.

## 4.826.3.6 param() [1/2]

```
template<typename _RealType = double>
param_type std::piecewise_constant_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

Definition at line 5647 of file random.h.

## 4.826.3.7 param() [2/2]

```
template<typename _RealType = double>
void std::piecewise_constant_distribution< _RealType >::param (
 const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

## Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

Definition at line 5655 of file random.h.

## 4.826.3.8 reset()

```
template<typename _RealType = double>
void std::piecewise_constant_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

Definition at line 5614 of file random.h.

## 4.826.4 Friends And Related Function Documentation

### 4.826.4.1 operator<<

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
 std::basic_ostream< _CharT, _Traits > & __os,
 const std::piecewise_constant_distribution< _RealType1 > & __x) [friend]
```

Inserts a `piecewise_constant_distribution` random number distribution `__x` into the output stream `__os`.

#### Parameters

|                   |                                                                            |
|-------------------|----------------------------------------------------------------------------|
| <code>__os</code> | An output stream.                                                          |
| <code>__x</code>  | A <code>piecewise_constant_distribution</code> random number distribution. |

#### Returns

The output stream with the state of `__x` inserted or in an error state.

### 4.826.4.2 operator==

```
template<typename _RealType = double>
bool operator== (
 const piecewise_constant_distribution< _RealType > & __d1,
 const piecewise_constant_distribution< _RealType > & __d2) [friend]
```

Return true if two `piecewise constant distributions` have the same parameters.

Definition at line 5718 of file `random.h`.

### 4.826.4.3 operator>>

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
 std::basic_istream< _CharT, _Traits > & __is,
 std::piecewise_constant_distribution< _RealType1 > & __x) [friend]
```

Extracts a `piecewise_constant_distribution` random number distribution `__x` from the input stream `__is`.

## Parameters

|                                                                                                      |                                                                   |
|------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------|
| <a href="#">_is</a> | An input stream.                                                  |
| <a href="#">_x</a>  | A piecewise_constant_distribution random number generator engine. |

## Returns

The input stream with [!\[\]\(a03a7eb2f4046e1d3c76772003e549ea\_img.jpg\)\\_x](#) extracted or in an error state.

The documentation for this class was generated from the following files:

## 4.828.1 Detailed Description

```
template<typename _RealType = double>
class std::piecewise_linear_distribution<_RealType>
```

A `piecewise_linear_distribution` random number distribution.

The formula for the piecewise linear probability mass function is

Definition at line 5783 of file `random.h`.

## 4.828.2 Member Typedef Documentation

### 4.828.2.1 result\_type

```
template<typename _RealType = double>
typedef _RealType std::piecewise_linear_distribution< _RealType >::result_type
```

The type of the range of the distribution.

Definition at line 5786 of file random.h.

## 4.828.3 Member Function Documentation

### 4.828.3.1 densities()

```
template<typename _RealType = double>
std::vector<double> std::piecewise_linear_distribution< _RealType >::densities () const [inline]
```

Return a vector of the probability densities of the distribution.

Definition at line 5910 of file random.h.

References `std::vector<_Tp, _Alloc>::empty()`.

### 4.828.3.2 intervals()

```
template<typename _RealType = double>
std::vector<_RealType> std::piecewise_linear_distribution< _RealType >::intervals () const
[inline]
```

Return the intervals of the distribution.

Definition at line 5893 of file random.h.

References `std::vector<_Tp, _Alloc>::empty()`.

#### 4.828.3.3 max()

```
template<typename _RealType = double>
result_type std::piecewise_linear_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

Definition at line 5945 of file random.h.

References `std::vector< _Tp, _Alloc >::back()`, and `std::vector< _Tp, _Alloc >::empty()`.

#### 4.828.3.4 min()

```
template<typename _RealType = double>
result_type std::piecewise_linear_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

Definition at line 5935 of file random.h.

References `std::vector< _Tp, _Alloc >::empty()`, and `std::vector< _Tp, _Alloc >::front()`.

#### 4.828.3.5 operator>()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::piecewise_linear_distribution< _RealType >::operator() (
 _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Definition at line 5956 of file random.h.

#### 4.828.3.6 param() [1/2]

```
template<typename _RealType = double>
param_type std::piecewise_linear_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

Definition at line 5920 of file random.h.

#### 4.828.3.7 param() [2/2]

```
template<typename _RealType = double>
void std::piecewise_linear_distribution< _RealType >::param (
 const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

## Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

Definition at line 5928 of file random.h.

## 4.828.3.8 reset()

```
template<typename _RealType = double>
void std::piecewise_linear_distribution<_RealType >::reset () [inline]
```

Resets the distribution state.

Definition at line 5886 of file random.h.

## 4.828.4 Friends And Related Function Documentation

## 4.828.4.1 operator&lt;&lt;

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
 std::basic_ostream<_CharT, _Traits > & __os,
 const std::piecewise_linear_distribution<_RealType1 > & __x) [friend]
```

Inserts a piecewise\_linear\_distribution random number distribution `__x` into the output stream `__os`.

## Parameters

|                   |                                                             |
|-------------------|-------------------------------------------------------------|
| <code>__os</code> | An output stream.                                           |
| <code>__x</code>  | A piecewise_linear_distribution random number distribution. |

## Returns

The output stream with the state of `__x` inserted or in an error state.

## 4.828.4.2 operator==

```
template<typename _RealType = double>
bool operator== (
```

```
const piecewise_linear_distribution< _RealType > & __d1,
const piecewise_linear_distribution< _RealType > & __d2) [friend]
```

Return true if two piecewise linear distributions have the same parameters.

Definition at line 5991 of file random.h.

#### 4.828.4.3 `operator>>`

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
 std::basic_istream< _CharT, _Traits > & __is,
 std::piecewise_linear_distribution< _RealType1 > & __x) [friend]
```

Extracts a `piecewise_linear_distribution` random number distribution `__x` from the input stream `__is`.

##### Parameters

|                   |                                                                              |
|-------------------|------------------------------------------------------------------------------|
| <code>__is</code> | An input stream.                                                             |
| <code>__x</code>  | A <code>piecewise_linear_distribution</code> random number generator engine. |

##### Returns

The input stream with `__x` extracted or in an error state.

The documentation for this class was generated from the following files:

#### 4.831.1 Detailed Description

```
template<typename _Arg1, typename _Arg2, typename _Result>
class std::pointer_to_binary_function< _Arg1, _Arg2, _Result >
```

One of the [adaptors for function pointers](#).

Definition at line 1105 of file `stl_function.h`.

#### 4.831.2 Member Typedef Documentation

##### 4.831.2.1 first\_argument\_type

```
template<typename _Arg1, typename _Arg2, typename _Result>
typedef _Arg1 std::binary_function< _Arg1, _Arg2, _Result >::first_argument_type [inherited]
```

`first_argument_type` is the type of the first argument

Definition at line 121 of file `stl_function.h`.

##### 4.831.2.2 result\_type

```
template<typename _Arg1, typename _Arg2, typename _Result>
typedef _Result std::binary_function< _Arg1, _Arg2, _Result >::result_type [inherited]
```

`result_type` is the return type

Definition at line 127 of file `stl_function.h`.

##### 4.831.2.3 second\_argument\_type

```
template<typename _Arg1, typename _Arg2, typename _Result>
typedef _Arg2 std::binary_function< _Arg1, _Arg2, _Result >::second_argument_type [inherited]
```

`second_argument_type` is the type of the second argument

Definition at line 124 of file `stl_function.h`.

The documentation for this class was generated from the following file:

- [stl\\_function.h](#)

## 4.832 std::pointer\_to\_unary\_function< \_Arg, \_Result > Class Template Reference

Inheritance diagram for std::pointer\_to\_unary\_function< \_Arg, \_Result >:

### Public Types

- typedef `_Arg` [argument\\_type](#)
- typedef `_Result` [result\\_type](#)

### Public Member Functions

- **pointer\_to\_unary\_function** (`_Result(*__x)(_Arg)`)
- `_Result` **operator()** (`_Arg __x`) const

### Protected Attributes

- `_Result(* M_ptr )(_Arg)`

#### 4.832.1 Detailed Description

```
template<typename _Arg, typename _Result>
class std::pointer_to_unary_function< _Arg, _Result >
```

One of the [adaptors for function pointers](#).

Definition at line 1080 of file `stl_function.h`.

#### 4.832.2 Member Typedef Documentation

#### 4.832.2.1 `argument_type`

```
template<typename _Arg, typename _Result>
typedef _Arg std::unary_function< _Arg, _Result >::argument_type [inherited]
```

`argument_type` is the type of the argument

Definition at line 108 of file `stl_function.h`.

#### 4.832.2.2 `result_type`

```
template<typename _Arg, typename _Result>
typedef _Result std::unary_function< _Arg, _Result >::result_type [inherited]
```

`result_type` is the return type

Definition at line 111 of file `stl_function.h`.

### 4.833 `std::pointer_traits<_Ptr>` Struct Template Reference

#### Public Types

- using [difference\\_type](#) = `__detected_or_t< ptrdiff_t, __difference_type, _Ptr >`
- using [element\\_type](#) = `__detected_or_t< __get_first_arg_t< _Ptr >, __element_type, _Ptr >`
- using [pointer](#) = `_Ptr`
- `template<typename _Up >`  
using [rebind](#) = `typename __rebind< _Ptr, _Up >::type`

#### Static Public Member Functions

- `static _Ptr pointer\_to (__make_not_void< element\_type > &__e)`

#### 4.833.1 Detailed Description

```
template<typename _Ptr>
struct std::pointer_traits< _Ptr >
```

Uniform interface to all pointer-like types.

Definition at line 83 of file `ptr_traits.h`.

#### 4.833.2 Member Typedef Documentation

##### 4.833.2.1 difference\_type

```
template<typename _Ptr>
using std::pointer_traits<_Ptr>::difference_type = __detected_or_t<ptrdiff_t, __difference_↵
type, _Ptr>
```

The type used to represent the difference between two pointers.

Definition at line 109 of file ptr\_traits.h.

##### 4.833.2.2 element\_type

```
template<typename _Ptr>
using std::pointer_traits<_Ptr>::element_type = __detected_or_t<__get_first_arg_t<_Ptr>, __↵
element_type, _Ptr>
```

The type pointed to.

Definition at line 105 of file ptr\_traits.h.

##### 4.833.2.3 pointer

```
template<typename _Ptr>
using std::pointer_traits<_Ptr>::pointer = _Ptr
```

The pointer type.

Definition at line 101 of file ptr\_traits.h.

##### 4.833.2.4 rebind

```
template<typename _Ptr>
template<typename _Up>
using std::pointer_traits<_Ptr>::rebind = typename __rebind<_Ptr, _Up>::type
```

A pointer to a different type.

Definition at line 113 of file ptr\_traits.h.

The documentation for this struct was generated from the following file:

- [ptr\\_traits.h](#)

## 4.834 `std::pointer_traits<_Tp*>` Struct Template Reference

### Public Types

- typedef ptrdiff\_t [difference\\_type](#)
- typedef \_Tp [element\\_type](#)
- typedef \_Tp\* [pointer](#)
- template<typename \_Up >  
using **rebind** = \_Up\*

### Static Public Member Functions

- static constexpr [pointer](#) [pointer\\_to](#) (\_\_make\_not\_void< [element\\_type](#) > &\_\_r) noexcept

#### 4.834.1 Detailed Description

```
template<typename _Tp>
struct std::pointer_traits<_Tp*>
```

Partial specialization for built-in pointers.

Definition at line 128 of file ptr\_traits.h.

#### 4.834.2 Member Typedef Documentation

##### 4.834.2.1 [difference\\_type](#)

```
template<typename _Tp >
typedef ptrdiff_t std::pointer_traits<_Tp*>::difference_type
```

Type used to represent the difference between two pointers.

Definition at line 135 of file ptr\_traits.h.

##### 4.834.2.2 [element\\_type](#)

```
template<typename _Tp >
typedef _Tp std::pointer_traits<_Tp*>::element_type
```

The type pointed to.

Definition at line 133 of file ptr\_traits.h.

4.834.2.3 `pointer`

```
template<typename _Tp >
typedef _Tp* std::pointer_traits< _Tp * >::pointer
```

The pointer type.

Definition at line 131 of file `ptr_traits.h`.

## 4.834.3 Member Function Documentation

4.834.3.1 `pointer_to()`

```
template<typename _Tp >
static constexpr pointer std::pointer_traits< _Tp * >::pointer_to (
 __make_not_void< element_type > & __r) [inline], [static], [noexcept]
```

Obtain a pointer to an object.

## Parameters

|                |                                                            |
|----------------|------------------------------------------------------------|
| <code>↔</code> | A reference to an object of type <code>element_type</code> |
| <code>↔</code> |                                                            |
| <code>↔</code> |                                                            |
| <code>↔</code> |                                                            |
| <code>r</code> |                                                            |

## Returns

```
addressof(__r)
```

Definition at line 146 of file `ptr_traits.h`.

References `std::addressof()`.

## 4.835.1 Detailed Description

```
template<typename _IntType = int>
class std::poisson_distribution< _IntType >
```

A discrete Poisson random number distribution.

The formula for the Poisson probability density function is  $p(i|\mu) = \frac{\mu^i}{i!} e^{-\mu}$  where  $\mu$  is the parameter of the distribution.

Definition at line 4419 of file random.h.

#### 4.835.2 Member Typedef Documentation

##### 4.835.2.1 result\_type

```
template<typename _IntType = int>
typedef _IntType std::poisson_distribution< _IntType >::result_type
```

The type of the range of the distribution.

Definition at line 4422 of file random.h.

#### 4.835.3 Member Function Documentation

##### 4.835.3.1 max()

```
template<typename _IntType = int>
result_type std::poisson_distribution< _IntType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

Definition at line 4523 of file random.h.

References std::numeric\_limits<\_Tp>::max().

##### 4.835.3.2 mean()

```
template<typename _IntType = int>
double std::poisson_distribution< _IntType >::mean () const [inline]
```

Returns the distribution parameter mean.

Definition at line 4494 of file random.h.

##### 4.835.3.3 min()

```
template<typename _IntType = int>
result_type std::poisson_distribution< _IntType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

Definition at line 4516 of file random.h.

**4.835.3.4 operator() [1/2]**

```
template<typename _IntType = int>
template<typename _UniformRandomNumberGenerator >
result_type std::poisson_distribution< _IntType >::operator() (
 _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Definition at line 4531 of file random.h.

**4.835.3.5 operator() [2/2]**

```
template<typename _IntType >
template<typename _UniformRandomNumberGenerator >
poisson_distribution< _IntType >::result_type std::poisson_distribution< _IntType >::operator()
(
 _UniformRandomNumberGenerator & __urng,
 const param_type & __param)
```

A rejection algorithm when mean  $\geq 12$  and a simple method based upon the multiplication of uniform random variates otherwise. NB: The former is available only if `_GLIBCXX_USE_C99_MATH_TR1` is defined.

Reference: Devroye, L. Non-Uniform Random Variates Generation. Springer-Verlag, New York, 1986, Ch. X, Sects. 3.3 & 3.4 (+ Errata!).

Definition at line 1269 of file bits/random.tcc.

References `std::abs()`, `std::numeric_limits<_Tp>::epsilon()`, `std::log()`, and `std::numeric_limits<_Tp>::max()`.

**4.835.3.6 param() [1/2]**

```
template<typename _IntType = int>
param_type std::poisson_distribution< _IntType >::param () const [inline]
```

Returns the parameter set of the distribution.

Definition at line 4501 of file random.h.

**4.835.3.7 param() [2/2]**

```
template<typename _IntType = int>
void std::poisson_distribution< _IntType >::param (
 const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

#### Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

Definition at line 4509 of file random.h.

#### 4.835.3.8 reset()

```
template<typename _IntType = int>
void std::poisson_distribution< _IntType >::reset () [inline]
```

Resets the distribution state.

Definition at line 4487 of file random.h.

References `std::normal_distribution< _RealType >::reset()`.

#### 4.835.4 Friends And Related Function Documentation

##### 4.835.4.1 operator<<

```
template<typename _IntType = int>
template<typename _IntType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
 std::basic_ostream< _CharT, _Traits > & __os,
 const std::poisson_distribution< _IntType1 > & __x) [friend]
```

Inserts a `poisson_distribution` random number distribution `__x` into the output stream `__os`.

#### Parameters

|                   |                                                                 |
|-------------------|-----------------------------------------------------------------|
| <code>__os</code> | An output stream.                                               |
| <code>__x</code>  | A <code>poisson_distribution</code> random number distribution. |

#### Returns

The output stream with the state of `__x` inserted or in an error state.

#### 4.835.4.2 operator==

```
template<typename _IntType = int>
bool operator== (
 const poisson_distribution< _IntType > & __d1,
 const poisson_distribution< _IntType > & __d2) [friend]
```

Return true if two Poisson distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 4567 of file random.h.

#### 4.835.4.3 operator>>

```
template<typename _IntType = int>
template<typename _IntType1 , typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
 std::basic_istream< _CharT, _Traits > & __is,
 std::poisson_distribution< _IntType1 > & __x) [friend]
```

Extracts a poisson\_distribution random number distribution \_\_x from the input stream \_\_is.

##### Parameters

|                                                                                             |                                                        |
|---------------------------------------------------------------------------------------------|--------------------------------------------------------|
| <br>__is | An input stream.                                       |
| <br>__x  | A poisson_distribution random number generator engine. |

##### Returns

The input stream with \_\_x extracted or in an error state.

The documentation for this class was generated from the following files:

- [random.h](#)
- [bits/random.tcc](#)

## 4.836 \_\_gnu\_pbds::priority\_queue< \_Tv, Cmp\_Fn, Tag, \_Alloc > Class Template Reference

Inherits type< \_Tv, Cmp\_Fn, \_Alloc, Tag >.

- void **swap** ([priority\\_queue](#) &`other`)

## 4.836.1 Detailed Description

```
template<typename _Tv, typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename _Alloc = std::allocator<char>>
class __gnu_pbds::priority_queue<_Tv, Cmp_Fn, Tag, _Alloc>
```

A priority queue composed of one specific heap policy.

## Template Parameters

|                     |                                                                     |
|---------------------|---------------------------------------------------------------------|
| <code>_Tv</code>    | Value type.                                                         |
| <code>Cmp_Fn</code> | Comparison functor.                                                 |
| <code>Tag</code>    | Instantiating data structure type, see <code>container_tag</code> . |
| <code>_Alloc</code> | Allocator type.                                                     |

Base is dispatched at compile time via `Tag`, from the following choices: `binary_heap_tag`, `binomial_heap_tag`, `pairing_heap_tag`, `rc_binomial_heap_tag`, `thin_heap_tag`

Base choices are: `detail::binary_heap`, `detail::binomial_heap`, `detail::pairing_heap`, `detail::rc_binomial_heap`, `detail::thin_heap`.

Definition at line 83 of file priority\_queue.hpp.

### Protected Attributes

- `_Sequence` **c**
- `_Compare` **comp**

#### 4.837.1 Detailed Description

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>>
class std::priority_queue<_Tp, _Sequence, _Compare>
```

A standard container automatically sorting its contents.

### Template Parameters

|                        |                                                                                               |
|------------------------|-----------------------------------------------------------------------------------------------|
| <code>_Tp</code>       | Type of element.                                                                              |
| <code>_Sequence</code> | Type of underlying sequence, defaults to <code>vector&lt;_Tp&gt;</code> .                     |
| <code>_Compare</code>  | Comparison function object type, defaults to <code>less&lt;_Sequence::value_type&gt;</code> . |

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces priority-based sorting and queue behavior. Very few of the standard container/sequence interface requirements are met (e.g., iterators).

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::vector`, but it can be any type that supports `front()`, `push_back`, `pop_back`, and random-access iterators, such as `std::deque` or an appropriate user-defined type.

The third template parameter supplies the means of making priority comparisons. It defaults to `less<value_type>` but can be anything defining a strict weak ordering.

Members not found in *normal* containers are `container_type`, which is a typedef for the second `Sequence` parameter, and `push`, `pop`, and `top`, which are standard queue operations.

### Note

No equality/comparison operators are provided for `priority_queue`.

Sorting of the elements takes place as they are added to, and removed from, the `priority_queue` using the `priority_queue`'s member functions. If you access the elements by other means, and change their data such that the sorting order would be different, the `priority_queue` will not re-sort the elements for you. (How could it know to do so?)

Definition at line 456 of file `stl_queue.h`.

#### 4.837.2 Constructor & Destructor Documentation

**4.837.2.1** `priority_queue()` [1/2]

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↵
Sequence::value_type>>
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<__and<is_default_↵
constructible<_Compare>, is_default_constructible<_Seq>>::value>::type>
std::priority_queue< _Tp, _Sequence, _Compare >::priority_queue () [inline]
```

Default constructor creates no elements.

Definition at line 514 of file `stl_queue.h`.

**4.837.2.2** `priority_queue()` [2/2]

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↵
Sequence::value_type>>
template<typename _InputIterator >
std::priority_queue< _Tp, _Sequence, _Compare >::priority_queue (
 _InputIterator __first,
 _InputIterator __last,
 const _Compare & __x,
 const _Sequence & __s) [inline]
```

Builds a queue from a range.

**Parameters**

|                      |                                                         |
|----------------------|---------------------------------------------------------|
| <code>__first</code> | An input iterator.                                      |
| <code>__last</code>  | An input iterator.                                      |
| <code>__x</code>     | A comparison functor describing a strict weak ordering. |
| <code>__s</code>     | An initial sequence with which to start.                |

Begins by copying `__s`, inserting a copy of the elements from `[first,last)` into the copy of `__s`, then ordering the copy according to `__x`.

For more information on function objects, see the documentation on [functor base classes](#).

Definition at line 586 of file `stl_queue.h`.

**4.837.3** Member Function Documentation

## 4.837.3.1 empty()

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↵
Sequence::value_type>>
bool std::priority_queue<_Tp, _Sequence, _Compare >::empty () const [inline]
```

Returns true if the queue is empty.

Definition at line 612 of file stl\_queue.h.

## 4.837.3.2 pop()

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↵
Sequence::value_type>>
void std::priority_queue<_Tp, _Sequence, _Compare >::pop () [inline]
```

Removes first element.

This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop() is called.

Definition at line 675 of file stl\_queue.h.

## 4.837.3.3 push()

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↵
Sequence::value_type>>
void std::priority_queue<_Tp, _Sequence, _Compare >::push (
 const value_type & __x) [inline]
```

Add data to the queue.

## Parameters

|                  |                   |
|------------------|-------------------|
| <code>_↵</code>  | Data to be added. |
| <code>__x</code> |                   |

This is a typical queue operation. The time complexity of the operation depends on the underlying sequence.

Definition at line 640 of file stl\_queue.h.

References std::push\_heap().

#### 4.837.3.4 size()

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>>
size_type std::priority_queue< _Tp, _Sequence, _Compare >::size () const [inline]
```

Returns the number of elements in the queue.

Definition at line 617 of file `stl_queue.h`.

#### 4.837.3.5 top()

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>>
const_reference std::priority_queue< _Tp, _Sequence, _Compare >::top () const [inline]
```

Returns a read-only (constant) reference to the data at the first element of the queue.

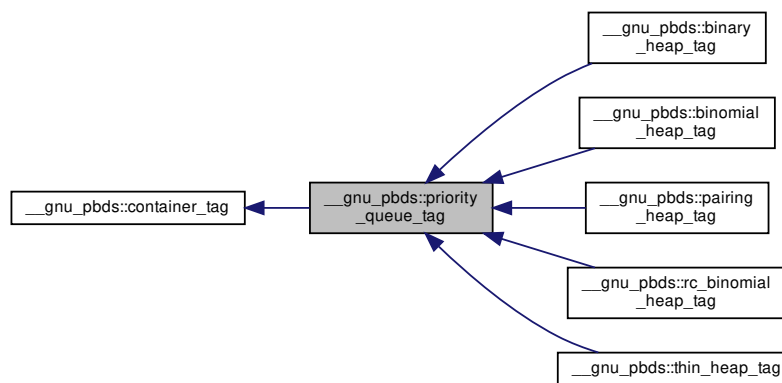

Definition at line 625 of file `stl_queue.h`.

The documentation for this class was generated from the following file:

- [stl\\_queue.h](#)

#### 4.838 \_\_gnu\_pbds::priority\_queue\_tag Struct Reference

bool operator== (const queue< _Tp1, _Seq1 > &, const queue< _Tp1, _Seq1 > &)`

## 4.847.1 Detailed Description

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
class std::queue< _Tp, _Sequence >
```

A standard container giving FIFO behavior.

### Template Parameters

|                        |                                                                          |
|------------------------|--------------------------------------------------------------------------|
| <code>_Tp</code>       | Type of element.                                                         |
| <code>_Sequence</code> | Type of underlying sequence, defaults to <code>deque&lt;_Tp&gt;</code> . |

Meets many of the requirements of a [container](#), but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-first-out queue behavior.

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::deque`, but it can be any type that supports `front`, `back`, `push_back`, and `pop_front`, such as `std::list` or an appropriate user-defined type.

Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push` and `pop`, which are standard queue/FIFO operations.

Definition at line 96 of file `stl_queue.h`.

## 4.847.2 Constructor & Destructor Documentation

### 4.847.2.1 `queue()`

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<is_default_constructible<↔
_Seq>::value>::type>
std::queue< _Tp, _Sequence >::queue () [inline]
```

Default constructor creates no elements.

Definition at line 166 of file `stl_queue.h`.

## 4.847.3 Member Function Documentation

### 4.847.3.1 `back()` [1/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
reference std::queue< _Tp, _Sequence >::back () [inline]
```

Returns a read/write reference to the data at the last element of the queue.

Definition at line 238 of file `stl_queue.h`.

#### 4.847.3.2 `back()` [2/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
const_reference std::queue<_Tp, _Sequence>::back () const [inline]
```

Returns a read-only (constant) reference to the data at the last element of the queue.

Definition at line 249 of file `stl_queue.h`.

#### 4.847.3.3 `empty()`

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
bool std::queue<_Tp, _Sequence>::empty () const [inline]
```

Returns true if the queue is empty.

Definition at line 203 of file `stl_queue.h`.

References `std::queue<_Tp, _Sequence>::c`.

#### 4.847.3.4 `front()` [1/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
reference std::queue<_Tp, _Sequence>::front () [inline]
```

Returns a read/write reference to the data at the first element of the queue.

Definition at line 216 of file `stl_queue.h`.

#### 4.847.3.5 `front()` [2/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
const_reference std::queue<_Tp, _Sequence>::front () const [inline]
```

Returns a read-only (constant) reference to the data at the first element of the queue.

Definition at line 227 of file `stl_queue.h`.

#### 4.847.3.6 pop()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::queue< _Tp, _Sequence >::pop () [inline]
```

Removes first element.

This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop() is called.

Definition at line 298 of file stl\_queue.h.

#### 4.847.3.7 push()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::queue< _Tp, _Sequence >::push (
 const value_type & __x) [inline]
```

Add data to the end of the queue.

## Parameters

|                                                                                   |                   |
|-----------------------------------------------------------------------------------|-------------------|
|  | Data to be added. |
| <code>_X</code>                                                                   |                   |

This is a typical queue operation. The function creates an element at the end of the queue and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

Definition at line 265 of file `stl_queue.h`.

References `std::queue< _Tp, _Sequence >::c`.

## 4.847.3.8 size()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
size_type std::queue< _Tp, _Sequence >::size () const [inline]
```

Returns the number of elements in the queue.

Definition at line 208 of file `stl_queue.h`.

References `std::queue< _Tp, _Sequence >::c`.

## 4.847.4 Member Data Documentation

## 4.847.4.1 c

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
_Sequence std::queue< _Tp, _Sequence >::c [protected]
```

`c` is the underlying container.

Definition at line 153 of file `stl_queue.h`.

Referenced by `std::queue< _Tp, _Sequence >::empty()`, `std::operator<()`, `std::operator==()`, `std::queue< _Tp,  Sequence >::push()`, and `std::queue< _Tp, _Sequence >::size()`.

The documentation for this class was generated from the following file:

- [stl\\_queue.h](#)

#### 4.848 \_\_gnu\_parallel::quicksort\_tag Struct Reference

Inheritance diagram for \_\_gnu\_parallel::quicksort\_tag:

##### Public Member Functions

- **quicksort\_tag** ([\\_ThreadIndex](#) \_\_num\_threads)
- [\\_ThreadIndex](#) **\_\_get\_num\_threads** ()
- void **set\_num\_threads** ([\\_ThreadIndex](#) \_\_num\_threads)

##### 4.848.1 Detailed Description

Forces parallel sorting using unbalanced quicksort at compile time.

Definition at line 155 of file tags.h.

##### 4.848.2 Member Function Documentation

###### 4.848.2.1 \_\_get\_num\_threads()

```
_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads () [inline], [inherited]
```

Find out desired number of threads.

##### Returns

Desired number of threads.

Definition at line 63 of file tags.h.

Referenced by `__gnu_parallel::__parallel_sort()`.

###### 4.848.2.2 set\_num\_threads()

```
void __gnu_parallel::parallel_tag::set_num_threads (
 _ThreadIndex __num_threads) [inline], [inherited]
```

Set the desired number of threads.

## Parameters

|                            |                            |
|----------------------------|----------------------------|
| <code>__num_threads</code> | Desired number of threads. |
|----------------------------|----------------------------|

Definition at line 73 of file tags.h.

The documentation for this struct was generated from the following file:

- [tags.h](#)

#### 4.849 std::random\_access\_iterator\_tag Struct Reference

Inheritance diagram for std::random\_access\_iterator\_tag:

##### 4.849.1 Detailed Description

Random-access iterators support a superset of bidirectional iterator operations.

Definition at line 107 of file stl\_iterator\_base\_types.h.

The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

## 4.850 `__gnu_cxx::random_condition` Struct Reference

Inheritance diagram for `__gnu_cxx::random_condition`:

### Classes

- struct [always\\_adjustor](#)
- struct [group\\_adjustor](#)
- struct [never\\_adjustor](#)

### Public Member Functions

- void **seed** (unsigned long \_\_s)

### Static Public Member Functions

- static void **set\_probability** (double \_\_p)
- static void **throw\_conditionally** ()

#### 4.850.1 Detailed Description

Base class for random probability control and throw.

Definition at line 500 of file `throw_allocator.h`.

The documentation for this struct was generated from the following file:

- [throw\\_allocator.h](#)

## 4.851 `std::random_device` Class Reference

### Public Types

- typedef unsigned int [result\\_type](#)

### Public Member Functions

- **random\_device** (const [std::string](#) &\_\_token)
- **random\_device** (const [random\\_device](#) &)=delete
- double **entropy** () const noexcept
- [result\\_type](#) **operator()** ()
- void **operator=** (const [random\\_device](#) &)=delete

### Static Public Member Functions

- static constexpr [result\\_type](#) **max** ()
- static constexpr [result\\_type](#) **min** ()

#### 4.851.1 Detailed Description

A standard interface to a platform-specific non-deterministic random number generator (if any are available).

Definition at line 1608 of file `random.h`.

#### 4.851.2 Member Typedef Documentation

##### 4.851.2.1 `result_type`

```
typedef unsigned int std::random_device::result_type
```

The type of the generated random value.

Definition at line 1612 of file `random.h`.

The documentation for this class was generated from the following file:

- [random.h](#)

## 4.852 std::range\_error Class Reference

Inheritance diagram for std::range\_error:

### Public Member Functions

- **range\_error** (const [string](#) &\_\_arg) \_GLIBCXX\_TXN\_SAFE
- **range\_error** (const char \*) \_GLIBCXX\_TXN\_SAFE
- **range\_error** (const [range\\_error](#) &)=default
- **range\_error** ([range\\_error](#) &&)=default
- [range\\_error](#) & **operator=** (const [range\\_error](#) &)=default
- [range\\_error](#) & **operator=** ([range\\_error](#) &&)=default
- virtual const char \* **what** () const noexcept

### 4.852.1 Detailed Description

Thrown to indicate range errors in internal computations.

Definition at line 258 of file stdexcept.

### 4.852.2 Member Function Documentation

4.852.2.1 `what()`

```
virtual const char* std::runtime_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::experimental::filesystem::v1::filesystem\\_error](#).

The documentation for this class was generated from the following file:

- [stdexcept](#)

4.853 `__gnu_pbds::range_invalidation_guarantee` Struct Reference

Inheritance diagram for `__gnu_pbds::range_invalidation_guarantee`:

## 4.853.1 Detailed Description

Signifies an invalidation guarantee that includes all those of its base, and additionally, that any range-type iterator (including the returns of `begin()` and `end()`) is in the correct relative positions to other range-type iterators as long as its corresponding entry has not be erased, regardless of modifications to the container object.

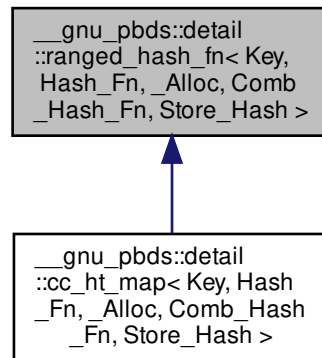

Definition at line 114 of file `tag_and_trait.hpp`.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

#### 4.854 `__gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash >` Class Template Reference

Inheritance diagram for `__gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash >`:

##### 4.854.1 Detailed Description

```
template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Hash_Fn, bool Store_Hash>
class __gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash >
```

Primary template.

Definition at line 56 of file `ranged_hash_fn.hpp`.

The documentation for this class was generated from the following file:

- [ranged\\_hash\\_fn.hpp](#)

#### 4.855 `__gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, false >` Class Template Reference

Inherits `Hash_Fn`, and `Comb_Hash_Fn`.

##### Protected Types

- typedef `Comb_Hash_Fn` **comb\_hash\_fn\_base**
- typedef `Hash_Fn` **hash\_fn\_base**
- typedef `rebind_traits< _Alloc, Key >::const_reference` **key\_const\_reference**
- typedef `_Alloc::size_type` **size\_type**

#### Protected Member Functions

- `ranged_hash_fn` (size\_type)
- `ranged_hash_fn` (size\_type, const Hash\_Fn &)
- `ranged_hash_fn` (size\_type, const Hash\_Fn &, const Comb\_Hash\_Fn &)
- void `notify_resized` (size\_type)
- size\_type `operator()` (key\_const\_reference) const
- void `swap` (`ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, false >` &)

#### 4.855.1 Detailed Description

```
template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Hash_Fn>
class __gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, false >
```

Specialization 1 The client supplies a hash function and a ranged hash function, and requests that hash values not be stored.

Definition at line 72 of file `ranged_hash_fn.hpp`.

The documentation for this class was generated from the following file:

- [ranged\\_hash\\_fn.hpp](#)

#### 4.856 `__gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, true >` Class Template Reference

Inherits `Hash_Fn`, and `Comb_Hash_Fn`.

#### Protected Types

- typedef `Comb_Hash_Fn` **comb\_hash\_fn\_base**
- typedef `std::pair< size_type, size_type >` **comp\_hash**
- typedef `Hash_Fn` **hash\_fn\_base**
- typedef `rebind_traits< _Alloc, Key >::const_reference` **key\_const\_reference**
- typedef `_Alloc::size_type` **size\_type**

#### Protected Member Functions

- `ranged_hash_fn` (size\_type)
- `ranged_hash_fn` (size\_type, const Hash\_Fn &)
- `ranged_hash_fn` (size\_type, const Hash\_Fn &, const Comb\_Hash\_Fn &)
- void `notify_resized` (size\_type)
- `comp_hash operator()` (key\_const\_reference) const
- `comp_hash operator()` (key\_const\_reference, size\_type) const
- void `swap` (`ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, true >` &)

#### 4.856.1 Detailed Description

```
template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Hash_Fn>
class __gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, true >
```

Specialization 2 The client supplies a hash function and a ranged hash function, and requests that hash values be stored.

Definition at line 154 of file `ranged_hash_fn.hpp`.

The documentation for this class was generated from the following file:

- [ranged\\_hash\\_fn.hpp](#)

#### 4.857 \_\_gnu\_pbds::detail::ranged\_hash\_fn< Key, null\_type, \_Alloc, Comb\_Hash\_Fn, false > Class Template Reference

Inherits `Comb_Hash_Fn`.

##### Protected Types

- typedef `Comb_Hash_Fn` **comb\_hash\_fn\_base**
- typedef `_Alloc::size_type` **size\_type**

##### Protected Member Functions

- **ranged\_hash\_fn** (`size_type`)
- **ranged\_hash\_fn** (`size_type`, `const Comb_Hash_Fn &`)
- **ranged\_hash\_fn** (`size_type`, `const null_type &`, `const Comb_Hash_Fn &`)
- void **swap** ([ranged\\_hash\\_fn](#)< `Key`, `null_type`, `_Alloc`, `Comb_Hash_Fn`, `false` > &)

#### 4.857.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Comb_Hash_Fn>
class __gnu_pbds::detail::ranged_hash_fn< Key, null_type, _Alloc, Comb_Hash_Fn, false >
```

Specialization 3 The client does not supply a hash function (by specifying `null_type` as the `Hash_Fn` parameter), and requests that hash values not be stored.

Definition at line 256 of file `ranged_hash_fn.hpp`.

The documentation for this class was generated from the following file:

- [ranged\\_hash\\_fn.hpp](#)

## 4.858 `__gnu_pbds::detail::ranged_hash_fn< Key, null_type, _Alloc, Comb_Hash_Fn, true >` Class Template Reference

Inherits `Comb_Hash_Fn`.

### Protected Types

- typedef `Comb_Hash_Fn` **`comb_hash_fn_base`**
- typedef `_Alloc::size_type` **`size_type`**

### Protected Member Functions

- **`ranged_hash_fn`** (`size_type`)
- **`ranged_hash_fn`** (`size_type`, `const Comb_Hash_Fn &`)
- **`ranged_hash_fn`** (`size_type`, `const null_type &`, `const Comb_Hash_Fn &`)
- void **`swap`** (`ranged_hash_fn< Key, null_type, _Alloc, Comb_Hash_Fn, true > &`)

### 4.858.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Comb_Hash_Fn>
class __gnu_pbds::detail::ranged_hash_fn< Key, null_type, _Alloc, Comb_Hash_Fn, true >
```

Specialization 4 The client does not supply a hash function (by specifying `null_type` as the `Hash_Fn` parameter), and requests that hash values be stored.

Definition at line 313 of file `ranged_hash_fn.hpp`.

The documentation for this class was generated from the following file:

- [ranged\\_hash\\_fn.hpp](#)

## 4.859 `__gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, Store_Hash >` Class Template Reference

Inheritance diagram for `__gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, Store_Hash >`:

#### 4.859.1 Detailed Description

```
template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Probe_Fn, typename Probe_Fn, bool Store_Hash>
class __gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, Store_Hash >
```

Primary template.

Definition at line 55 of file `ranged_probe_fn.hpp`.

The documentation for this class was generated from the following file:

- [ranged\\_probe\\_fn.hpp](#)

#### 4.860 \_\_gnu\_pbds::detail::ranged\_probe\_fn< Key, Hash\_Fn, \_Alloc, Comb\_Probe\_Fn, Probe\_Fn, false > Class Template Reference

Inherits `Hash_Fn`, `Comb_Probe_Fn`, and `Probe_Fn`.

##### Protected Types

- typedef `Comb_Probe_Fn` **comb\_probe\_fn\_base**
- typedef `Hash_Fn` **hash\_fn\_base**
- typedef [rebind\\_traits](#)< `_Alloc`, `Key` >::const\_reference **key\_const\_reference**
- typedef `Probe_Fn` **probe\_fn\_base**
- typedef `_Alloc::size_type` **size\_type**

##### Protected Member Functions

- **ranged\_probe\_fn** (`size_type`)
- **ranged\_probe\_fn** (`size_type`, const `Hash_Fn` &)
- **ranged\_probe\_fn** (`size_type`, const `Hash_Fn` &, const `Comb_Probe_Fn` &)

- void **notify\_resized** (`size_type`)
- `size_type` **operator()** (`key_const_reference`) const
- `size_type` **operator()** (`key_const_reference`, `size_type`, `size_type`) const
- void **swap** ([ranged\\_probe\\_fn](#)< `Key`, `Hash_Fn`, `_Alloc`, `Comb_Probe_Fn`, `Probe_Fn`, false > &)

#### 4.860.1 Detailed Description

```
template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Probe_Fn, typename Probe_Fn>
class __gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, false >
```

##### Specialization 1

The client supplies a probe function and a ranged probe function, and requests that hash values not be stored.

Definition at line 71 of file `ranged_probe_fn.hpp`.

The documentation for this class was generated from the following file:

- [ranged\\_probe\\_fn.hpp](#)

4.861 `__gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, true >` Class Template Reference

Inherits `Hash_Fn`, `Comb_Probe_Fn`, and `Probe_Fn`.

## Protected Types

- typedef `Comb_Probe_Fn` **comb\_probe\_fn\_base**
- typedef `std::pair< size_type, size_type >` **comp\_hash**
- typedef `Hash_Fn` **hash\_fn\_base**
- typedef `rebind_traits< _Alloc, Key >::const_reference` **key\_const\_reference**
- typedef `Probe_Fn` **probe\_fn\_base**
- typedef `_Alloc::size_type` **size\_type**

## Protected Member Functions

- **ranged\_probe\_fn** (`size_type`)
- **ranged\_probe\_fn** (`size_type`, `const Hash_Fn &`)
- **ranged\_probe\_fn** (`size_type`, `const Hash_Fn &`, `const Comb_Probe_Fn &`)
- **ranged\_probe\_fn** (`size_type`, `const Hash_Fn &`, `const Comb_Probe_Fn &`, `const Probe_Fn &`)
- void **notify\_resized** (`size_type`)
- **comp\_hash operator()** (`key_const_reference`) `const`
- `size_type` **operator()** (`key_const_reference`, `size_type`, `size_type`) `const`
- `size_type` **operator()** (`key_const_reference`, `size_type`) `const`
- void **swap** (`ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, true > &`)

## 4.861.1 Detailed Description

```
template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Probe_Fn, typename Probe_Fn>
class __gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, true >
```

Specialization 2- The client supplies a probe function and a ranged probe function, and requests that hash values not be stored.

Definition at line 176 of file `ranged_probe_fn.hpp`.

The documentation for this class was generated from the following file:

- [ranged\\_probe\\_fn.hpp](#)

4.862 `__gnu_pbds::detail::ranged_probe_fn< Key, null_type, _Alloc, Comb_Probe_Fn, null_type, false >` Class Template Reference

Inherits `Comb_Probe_Fn`.

## Protected Types

- typedef Comb\_Probe\_Fn **comb\_probe\_fn\_base**
- typedef [rebind\\_traits](#)<\_Alloc, Key >::const\_reference **key\_const\_reference**
- typedef \_Alloc::size\_type **size\_type**

## Protected Member Functions

- **ranged\_probe\_fn** (size\_type size)
- **ranged\_probe\_fn** (size\_type, const Comb\_Probe\_Fn &r\_comb\_probe\_fn)
- **ranged\_probe\_fn** (size\_type, const [null\\_type](#) &, const Comb\_Probe\_Fn &r\_comb\_probe\_fn, const [null\\_type](#) &)
- void **swap** ([ranged\\_probe\\_fn](#) &other)

## 4.862.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Comb_Probe_Fn>
class __gnu_pbds::detail::ranged_probe_fn< Key, null_type, _Alloc, Comb_Probe_Fn, null_type, false >
```

Specialization 3 and 4 The client does not supply a hash function or probe function, and requests that hash values not be stored.

Definition at line 296 of file [ranged\\_probe\\_fn.hpp](#).

The documentation for this class was generated from the following file:

- [ranged\\_probe\\_fn.hpp](#)

## 4.863 std::rank&lt; typename &gt; Struct Template Reference

Inheritance diagram for std::rank< typename >:

#### Public Types

- typedef [integral\\_constant](#)< std::size\_t, \_\_v > **type**
- typedef std::size\_t **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

#### Static Public Attributes

- static constexpr std::size\_t **value**

#### 4.863.1 Detailed Description

```
template<typename>
struct std::rank< typename >
```

rank

Definition at line 1359 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 4.864 `std::ratio< _Num, _Den >` Struct Template Reference

#### Public Types

- typedef [ratio](#)< num, den > **type**

#### Static Public Attributes

- static constexpr intmax\_t **den**
- static constexpr intmax\_t **num**

#### 4.864.1 Detailed Description

```
template<intmax_t _Num, intmax_t _Den = 1>
struct std::ratio< _Num, _Den >
```

Provides compile-time rational arithmetic.

This class template represents any finite rational number with a numerator and denominator representable by compile-time constants of type `intmax_t`. The ratio is simplified when instantiated.

For example:

```
std::ratio<7,-21>::num == -1;
std::ratio<7,-21>::den == 3;
```

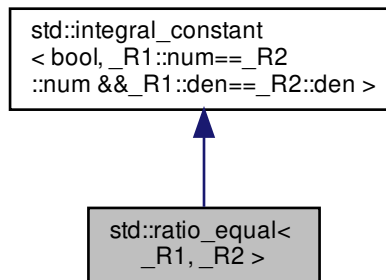

Definition at line 266 of file `ratio`.

The documentation for this struct was generated from the following file:

- [ratio](#)

#### 4.865 `std::ratio_equal< _R1, _R2 >` Struct Template Reference

Inheritance diagram for `std::ratio_equal< _R1, _R2 >`:

#### Public Types

- typedef `integral_constant< bool, __v >` **type**
- typedef `bool` **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

## Static Public Attributes

- static constexpr bool **value**

## 4.865.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_equal< _R1, _R2 >
```

ratio\_equal

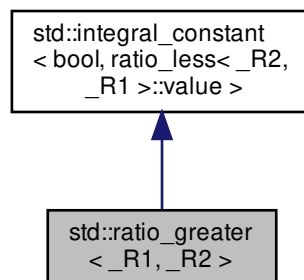

Definition at line 351 of file ratio.

The documentation for this struct was generated from the following file:

- [ratio](#)

## 4.866 std::ratio\_greater&lt; \_R1, \_R2 &gt; Struct Template Reference

Inheritance diagram for std::ratio\_greater< \_R1, \_R2 >:

## Public Types

- typedef [integral\\_constant](#)< bool, \_\_v > **type**
- typedef bool **value\_type**

## Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

#### Static Public Attributes

- static constexpr bool **value**

#### 4.866.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_greater< _R1, _R2 >
```

ratio\_greater

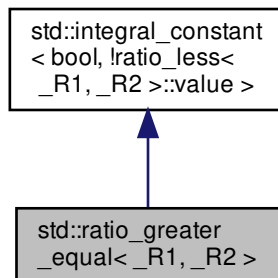

Definition at line 409 of file ratio.

The documentation for this struct was generated from the following file:

- [ratio](#)

#### 4.867 std::ratio\_greater\_equal< \_R1, \_R2 > Struct Template Reference

Inheritance diagram for std::ratio\_greater\_equal< \_R1, \_R2 >:

#### Public Types

- typedef [integral\\_constant](#)< bool, \_\_v > **type**
- typedef bool **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

## Static Public Attributes

- static constexpr bool **value**

## 4.867.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_greater_equal< _R1, _R2 >
```

ratio\_greater\_equal

Definition at line 415 of file ratio.

The documentation for this struct was generated from the following file:

- [ratio](#)

4.868 `std::ratio_less< _R1, _R2 >` Struct Template Reference

Inherits type< \_R1, \_R2 >.

## 4.868.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_less< _R1, _R2 >
```

ratio\_less

Definition at line 397 of file ratio.

The documentation for this struct was generated from the following file:

- [ratio](#)

4.869 `std::ratio_less_equal< _R1, _R2 >` Struct Template Reference

Inheritance diagram for `std::ratio_less_equal< _R1, _R2 >`:

#### Public Types

- typedef [integral\\_constant](#)< bool, \_\_v > **type**
- typedef bool **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

#### Static Public Attributes

#### 4.869.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_less_equal< _R1, _R2 >
```

ratio\_less\_equal

Definition at line 403 of file ratio.

The documentation for this struct was generated from the following file:

- [ratio](#)

#### 4.870 std::ratio\_not\_equal< \_R1, \_R2 > Struct Template Reference

Inheritance diagram for std::ratio\_not\_equal< \_R1, \_R2 >:

## Public Types

- typedef [integral\\_constant](#)< bool, \_\_v > **type**
- typedef bool **value\_type**

## Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

## Static Public Attributes

- static constexpr bool **value**

## 4.870.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_not_equal< _R1, _R2 >
```

ratio\_not\_equal

Definition at line 357 of file ratio.

The documentation for this struct was generated from the following file:

- [ratio](#)

4.871 `std::raw_storage_iterator< _OutputIterator, _Tp >` Class Template Reference

Inheritance diagram for `std::raw_storage_iterator< _OutputIterator, _Tp >`:

### Public Types

- typedef void [difference\\_type](#)
- typedef [output\\_iterator\\_tag](#) [iterator\\_category](#)
- typedef void [pointer](#)
- typedef void [reference](#)
- typedef void [value\\_type](#)

### Public Member Functions

- **raw\_storage\_iterator** ([\\_OutputIterator](#) \_\_x)
- [\\_OutputIterator](#) **base** () const
- [raw\\_storage\\_iterator](#) & **operator\*** ()
- [raw\\_storage\\_iterator](#) & **operator++** ()
- [raw\\_storage\\_iterator](#) **operator++** (int)
- [raw\\_storage\\_iterator](#) & **operator=** (const [\\_Tp](#) &\_\_element)
- [raw\\_storage\\_iterator](#) & **operator=** ([\\_Tp](#) &&\_\_element)

### Protected Attributes

- [\\_OutputIterator](#) **\_M\_iter**

#### 4.871.1 Detailed Description

```
template<class _OutputIterator, class _Tp>
class std::raw_storage_iterator< _OutputIterator, _Tp >
```

This iterator class lets algorithms store their results into uninitialized memory.

Definition at line 68 of file `stl_raw_storage_iter.h`.

#### 4.871.2 Member Typedef Documentation

##### 4.871.2.1 [difference\\_type](#)

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::difference_type
[inherited]
```

Distance between iterators is represented as this type.

Definition at line 134 of file `stl_iterator_base_types.h`.

#### 4.871.2.2 `iterator_category`

```
typedef output_iterator_tag std::iterator< output_iterator_tag , void , void , void , void >↵
::iterator_category [inherited]
```

One of the [tag types](#).

Definition at line 130 of file `stl_iterator_base_types.h`.

#### 4.871.2.3 `pointer`

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::pointer [inherited]
```

This type represents a pointer-to-value\_type.

Definition at line 136 of file `stl_iterator_base_types.h`.

#### 4.871.2.4 `reference`

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::reference [inherited]
```

This type represents a reference-to-value\_type.

Definition at line 138 of file `stl_iterator_base_types.h`.

#### 4.871.2.5 `value_type`

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::value_type [inherited]
```

The type "pointed to" by the iterator.

Definition at line 132 of file `stl_iterator_base_types.h`.

The documentation for this class was generated from the following file:

- [stl\\_raw\\_storage\\_iter.h](#)

### 4.872 `__gnu_cxx::rb_tree< _Key, _Value, _KeyOfValue, _Compare, _Alloc >` Struct Template Reference

Inherits `std::_Rb_tree< _Key, _Val, _KeyOfValue, _Compare, _Alloc >`.

## Public Types

- `template<typename _Iter >`  
`using __same_value_type = is_same< value_type, typename iterator_traits< _Iter >::value_type >`
- `typedef std::_Rb_tree< _Key, _Value, _KeyOfValue, _Compare, _Alloc > _Base`
- `typedef _Base::allocator_type allocator_type`
- `typedef _Rb_tree_const_iterator< value_type > const_iterator`
- `typedef const value_type * const_pointer`
- `typedef const value_type & const_reference`
- `typedef std::reverse\_iterator< const_iterator > const_reverse_iterator`
- `typedef ptrdiff_t difference_type`
- `typedef _Rb_tree_iterator< value_type > iterator`
- `typedef _Key key_type`
- `typedef value_type * pointer`
- `typedef value_type & reference`
- `typedef std::reverse\_iterator< iterator > reverse_iterator`
- `typedef size_t size_type`
- `typedef _Val value_type`

## Public Member Functions

- `rb_tree (const _Compare &__comp=_Compare(), const allocator_type &__a=allocator_type())`
- `bool __rb_verify () const`
- `template<typename _Iterator >`  
`void _M_assign_equal (_Iterator, _Iterator)`

#### 4.873.1 Detailed Description

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
class __gnu_pbds::detail::rb_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >
```

Red-Black tree.

This implementation uses an idea from the SGI STL (using a *header* node which is needed for efficient iteration).

Definition at line 84 of file rb\_tree\_.hpp.

## 4.873.2 Member Function Documentation

### 4.873.2.1 `node_begin()` [1/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename
_Alloc >
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __↵
gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node↵
begin () const [inline], [inherited]
```

Returns a const `node_iterator` corresponding to the node at the root of the tree.

Definition at line 111 of file `bin_search_tree.hpp`.

### 4.873.2.2 `node_begin()` [2/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename
_Alloc >
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu↵
pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node↵
begin () [inline], [inherited]
```

Returns a `node_iterator` corresponding to the node at the root of the tree.

Definition at line 119 of file `bin_search_tree.hpp`.

### 4.873.2.3 `node_end()` [1/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename
_Alloc >
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __↵
gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node↵
end () const [inline], [inherited]
```

Returns a const `node_iterator` corresponding to a node just after a leaf of the tree.

Definition at line 127 of file `bin_search_tree.hpp`.

#### 4.873.2.4 node\_end() [2/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename
_Alloc >
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_←
pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end (
) [inline], [inherited]
```

Returns a node\_iterator corresponding to a node just after a leaf of the tree.

Definition at line 135 of file bin\_search\_tree\_.hpp.

The documentation for this class was generated from the following file:

- [rb\\_tree\\_.hpp](#)

#### 4.874 \_\_gnu\_pbds::detail::rb\_tree\_node\_< Value\_Type, Metadata, \_Alloc > Struct Template Reference

Inherits template `rebind_traits< T >`.

## Public Types

- using **const\_reference** = const T &
- using **reference** = T &

#### 4.879.1 Detailed Description

```
template<typename _Alloc, typename T>
struct __gnu_pbds::detail::rebind_traits< _Alloc, T >
```

Consistent API for accessing allocator-related types.

Definition at line 137 of file types\_traits.hpp.

The documentation for this struct was generated from the following file:

- [types\\_traits.hpp](#)

#### 4.880 \_\_gnu\_cxx::recursive\_init\_error Class Reference

Inheritance diagram for \_\_gnu\_cxx::recursive\_init\_error:

#### Public Member Functions

- virtual const char \* [what](#) () const noexcept

#### 4.880.1 Detailed Description

Exception thrown by \_\_cxa\_guard\_acquire.

C++ 2011 6.7 [stmt.dcl]/4: If control re-enters the declaration recursively while the variable is being initialized, the behavior is undefined.

Since we already have a library function to handle locking, we might as well check for this situation and throw an exception. We use the second byte of the guard variable to remember that we're in the middle of an initialization.

Definition at line 696 of file cxxabi.h.

The documentation for this class was generated from the following file:

- [cxxabi.h](#)

## 4.881 `std::recursive_mutex` Class Reference

Inherits `std::__recursive_mutex_base`.

### Public Types

- `typedef __native_type * native_handle_type`

### Public Member Functions

- `recursive_mutex` (const [recursive\\_mutex](#) &)=delete
- `void lock` ()
- `native_handle_type native_handle` () noexcept
- [recursive\\_mutex](#) & `operator=` (const [recursive\\_mutex](#) &)=delete
- `bool try_lock` () noexcept
- `void unlock` ()

### Private Types

- `typedef __gthread_recursive_mutex_t __native_type`

### Private Attributes

- `__native_type _M_mutex`

#### 4.881.1 Detailed Description

The standard recursive mutex type.

Definition at line 92 of file `mutex`.

The documentation for this class was generated from the following file:

- [mutex](#)

## 4.882 `std::recursive_timed_mutex` Class Reference

### Public Member Functions

- `recursive_timed_mutex` (const [recursive\\_timed\\_mutex](#) &)=delete
- `void lock` ()
- [recursive\\_timed\\_mutex](#) & `operator=` (const [recursive\\_timed\\_mutex](#) &)=delete
- `bool try_lock` ()
- `template<typename _Rep, typename _Period >`  
`bool try_lock_for` (const [chrono::duration](#)< \_Rep, \_Period > &\_\_rtime)
- `template<typename _Clock, typename _Duration >`  
`bool try_lock_until` (const [chrono::time\\_point](#)< \_Clock, \_Duration > &\_\_atime)
- `void unlock` ()

#### 4.882.1 Detailed Description

`recursive_timed_mutex`

Definition at line 408 of file `mutex`.

The documentation for this class was generated from the following file:

- [mutex](#)

#### 4.883 `std::bitset<_Nb>::reference` Class Reference

##### Public Member Functions

- **reference** ([bitset](#) &\_\_b, `size_t __pos`) `noexcept`
- **reference** (const [reference](#) &)=default
- [reference](#) & **flip** () `noexcept`
- **operator bool** () `const noexcept`
- [reference](#) & **operator=** (`bool __x`) `noexcept`
- [reference](#) & **operator=** (const [reference](#) &\_\_j) `noexcept`
- `bool` **operator~** () `const noexcept`

##### Friends

- class **bitset**

#### 4.883.1 Detailed Description

```
template<size_t _Nb>
class std::bitset<_Nb>::reference
```

This encapsulates the concept of a single bit. An instance of this class is a proxy for an actual bit; this way the individual bit operations are done as faster word-size bitwise instructions.

Most users will never need to use this class directly; conversions to and from `bool` are automatic and should be transparent. Overloaded operators help to preserve the illusion.

(On a typical system, this *bit reference* is 64 times the size of an actual bit. Ha.)

Definition at line 802 of file `bitset`.

The documentation for this class was generated from the following file:

- [bitset](#)

## 4.884 std::tr2::dynamic\_bitset< \_WordT, \_Alloc >::reference Class Reference

### Public Member Functions

- **reference** ([dynamic\\_bitset](#) &\_\_b, size\_type \_\_pos) noexcept
- [reference](#) & **flip** () noexcept
- **operator bool** () const noexcept
- [reference](#) & **operator=** (bool \_\_x) noexcept
- [reference](#) & **operator=** (const [reference](#) &\_\_j) noexcept
- bool **operator~** () const noexcept

### Friends

- class **dynamic\_bitset**

### 4.884.1 Detailed Description

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
class std::tr2::dynamic_bitset< _WordT, _Alloc >::reference
```

This encapsulates the concept of a single bit. An instance of this class is a proxy for an actual bit; this way the individual bit operations are done as faster word-size bitwise instructions.

Most users will never need to use this class directly; conversions to and from bool are automatic and should be transparent. Overloaded operators help to preserve the illusion.

(On a typical system, this "bit %reference" is 64 times the size of an actual bit. Ha.)

Definition at line 513 of file dynamic\_bitset.

The documentation for this class was generated from the following file:

- [dynamic\\_bitset](#)

## 4.885 std::reference\_wrapper< \_Tp > Class Template Reference

Inherits [\\_Reference\\_wrapper\\_base\\_memfun< remove\\_cv< \\_Tp >::type >](#).

### Public Types

- typedef [\\_Tp](#) **type**

## Public Member Functions

- `template<typename _Up, typename = __not_same<_Up>, typename = decltype(reference_wrapper::_S_fun(std::declval<_Up>()))>`  
`constexpr reference_wrapper (_Up &&__uref) noexcept(noexcept(reference_wrapper::_S_fun(std::declval<_Up>())`  
`↪ _Up >()))`
- `reference_wrapper (const reference_wrapper &)=default`
- `constexpr _Tp & get () const noexcept`
- `constexpr operator _Tp & () const noexcept`
- `template<typename... _Args>`  
`constexpr result_of<_Tp &(_Args &&...)>::type operator() (_Args &&... __args) const`
- `reference_wrapper & operator= (const reference_wrapper &)=default`

## Related Functions

(Note that these are not member functions.)

- `template<typename _Tp >`  
`constexpr reference_wrapper<_Tp> ref (_Tp &__t) noexcept`

- `template<typename _Tp >`  
`constexpr reference_wrapper<_Tp> ref (reference_wrapper<_Tp> __t) noexcept`
- `template<typename _Tp >`  
`constexpr reference_wrapper<const _Tp> cref (reference_wrapper<_Tp> __t) noexcept`

### 4.885.1 Detailed Description

```
template<typename _Tp>
class std::reference_wrapper<_Tp>
```

Primary class template for `reference_wrapper`.

Definition at line 2160 of file `type_traits`.

### 4.885.2 Friends And Related Function Documentation

#### 4.885.2.1 `cref()` [1/2]

```
template<typename _Tp >
constexpr reference_wrapper<const _Tp> cref (
 const _Tp & __t) [related]
```

Denotes a const reference should be taken to a variable.

Definition at line 371 of file `refwrap.h`.

#### 4.885.2.2 cref() [2/2]

```
template<typename _Tp >
constexpr reference_wrapper< const _Tp > cref (
 reference_wrapper< _Tp > __t) [related]
```

std::cref overload to prevent wrapping a reference\_wrapper

Definition at line 391 of file refwrap.h.

#### 4.885.2.3 ref() [1/2]

```
template<typename _Tp >
constexpr reference_wrapper< _Tp > ref (
 _Tp & __t) [related]
```

Denotes a reference should be taken to a variable.

Definition at line 364 of file refwrap.h.

#### 4.885.2.4 ref() [2/2]

```
template<typename _Tp >
constexpr reference_wrapper< _Tp > ref (
 reference_wrapper< _Tp > __t) [related]
```

std::ref overload to prevent wrapping a reference\_wrapper

Definition at line 384 of file refwrap.h.

The documentation for this class was generated from the following files:

- [type\\_traits](#)
- [refwrap.h](#)

## 4.886 std::regex\_error Class Reference

Inheritance diagram for std::regex\_error:

### Public Member Functions

- [regex\\_error](#) ([regex\\_constants::error\\_type](#) \_\_ecode)
- [regex\\_constants::error\\_type](#) [code](#) () const
- virtual const char \* [what](#) () const noexcept

### Friends

- void [\\_\\_throw\\_regex\\_error](#) ([regex\\_constants::error\\_type](#), const char \*)

### 4.886.1 Detailed Description

A regular expression exception class.

The regular expression library throws objects of this class on error.

Definition at line 132 of file `regex_error.h`.

### 4.886.2 Constructor & Destructor Documentation

#### 4.886.2.1 regex\_error()

```
std::regex_error::regex_error (
 regex_constants::error_type __ecode) [explicit]
```

Constructs a `regex_error` object.

## Parameters

|                      |                       |
|----------------------|-----------------------|
| <code>__ecode</code> | the regex error code. |
|----------------------|-----------------------|

## 4.886.3 Member Function Documentation

4.886.3.1 `code()`

```
regex_constants::error_type std::regex_error::code () const [inline]
```

Gets the regex error code.

## Returns

the regex error code.

Definition at line 153 of file `regex_error.h`.

4.886.3.2 `what()`

```
virtual const char* std::runtime_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::experimental::filesystem::v1::filesystem\\_error](#).

The documentation for this class was generated from the following file:

- [regex\\_error.h](#)

4.887 `std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>` Class Template Reference

## Public Types

- typedef `std::ptrdiff_t` **difference\_type**
- typedef [std::forward\\_iterator\\_tag](#) **iterator\_category**
- typedef const [value\\_type](#) \* **pointer**
- typedef const [value\\_type](#) & **reference**

- const `value_type * operator->` () const noexcept
- `regex_iterator & operator=` (const `regex_iterator &`)=default
- bool `operator==` (const `regex_iterator &`) const noexcept

## 4.887.1 Detailed Description

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
class std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >
```

An iterator adaptor that will provide repeated calls of `regex_search` over a range until no more matches remain.

Definition at line 2625 of file `regex.h`.

## 4.887.2 Constructor &amp; Destructor Documentation

4.887.2.1 `regex_iterator()` [1/3]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator () [default]
```

Provides a singular iterator, useful for indicating one-past-the-end of a range.

Referenced by `std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator()`.

4.887.2.2 `regex_iterator()` [2/3]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator (
 _Bi_iter __a,
 _Bi_iter __b,
 const regex_type & __re,
 regex_constants::match_flag_type __m = regex_constants::match_default) [inline]
```

Constructs a `regex_iterator`...

## Parameters

|                         |                                                    |
|-------------------------|----------------------------------------------------|
| <code>_↵<br/>_a</code>  | [IN] The start of a text range to search.          |
| <code>_↵<br/>_b</code>  | [IN] One-past-the-end of the text range to search. |
| <code>_↵<br/>_re</code> | [IN] The regular expression to match.              |
| <code>_↵<br/>_m</code>  | [IN] Policy flags for match rules.                 |

Definition at line 2648 of file regex.h.

References `std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator()`, and `std::regex_search()`.

## 4.887.2.3 regex\_iterator() [3/3]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator (
 const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > &) [default]
```

Copy constructs a `regex_iterator`.

## 4.887.3 Member Function Documentation

## 4.887.3.1 operator!=(())

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
bool std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator!=(
 const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs) const [inline],
[noexcept]
```

Tests the inequivalence of two `regex_iterator`s.

Definition at line 2682 of file regex.h.

#### 4.887.3.2 operator\*()

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
const value_type& std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator* () const
[inline], [noexcept]
```

Dereferences a regex\_iterator.

Definition at line 2689 of file regex.h.

#### 4.887.3.3 operator++() [1/2]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
regex_iterator& std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ ()
```

Increments a regex\_iterator.

#### 4.887.3.4 operator++() [2/2]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
regex_iterator std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ (
 int) [inline]
```

Postincrements a regex\_iterator.

Definition at line 2709 of file regex.h.

#### 4.887.3.5 operator->()

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
const value_type* std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator-> () const
[inline], [noexcept]
```

Selects a regex\_iterator member.

Definition at line 2696 of file regex.h.

## 4.887.3.6 operator=()

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
regex_iterator& std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator= (
 const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > &) [default]
```

Copy assigns one regex\_iterator to another.

## 4.887.3.7 operator==()

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
bool std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator== (
 const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > &) const [noexcept]
```

Tests the equivalence of two regex iterators.

The documentation for this class was generated from the following file:

- [regex.h](#)

#### 4.888.1 Detailed Description

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
class std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >
```

Iterates over submatches in a range (or *splits* a text string).

The purpose of this iterator is to enumerate all, or all specified, matches of a regular expression within a text range. The dereferenced value of an iterator of this class is a *std::sub\_match* object.

Definition at line 2742 of file *regex.h*.

#### 4.888.2 Constructor & Destructor Documentation

##### 4.888.2.1 *regex\_token\_iterator*() [1/6]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator () [inline]
```

Default constructs a *regex\_token\_iterator*.

A default-constructed *regex\_token\_iterator* is a singular iterator that will compare equal to the one-past-the-end value for any iterator of the same type.

Definition at line 2760 of file *regex.h*.

##### 4.888.2.2 *regex\_token\_iterator*() [2/6]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
 _Bi_iter __a,
 _Bi_iter __b,
 const regex_type & __re,
 int __submatch = 0,
 regex_constants::match_flag_type __m = regex_constants::match_default) [inline]
```

Constructs a *regex\_token\_iterator*...

## Parameters

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__a</code>        | [IN] The start of the text to search.                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>__b</code>        | [IN] One-past-the-end of the text to search.                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>__re</code>       | [IN] The regular expression to search for.                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>__submatch</code> | [IN] Which submatch to return. There are some special values for this parameter: <ul style="list-style-type: none"> <li>• -1 each enumerated subexpression does NOT match the regular expression (aka field splitting)</li> <li>• 0 the entire string matching the subexpression is returned for each match within the text.</li> <li>• &gt;0 enumerates only the indicated subexpression from a match within the text.</li> </ul> |
| <code>__m</code>        | [IN] Policy flags for match rules.                                                                                                                                                                                                                                                                                                                                                                                                 |

## 4.888.2.3 regex\_token\_iterator() [3/6]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
 _Bi_iter __a,
 _Bi_iter __b,
 const regex_type & __re,
 const std::vector< int > & __submatches,
 regex_constants::match_flag_type __m = regex_constants::match_default) [inline]
```

Constructs a regex\_token\_iterator...

## Parameters

|                           |                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------|
| <code>__a</code>          | [IN] The start of the text to search.                                                      |
| <code>__b</code>          | [IN] One-past-the-end of the text to search.                                               |
| <code>__re</code>         | [IN] The regular expression to search for.                                                 |
| <code>__submatches</code> | [IN] A list of subexpressions to return for each regular expression match within the text. |
| <code>__m</code>          | [IN] Policy flags for match rules.                                                         |

## 4.888.2.4 regex\_token\_iterator() [4/6]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
```

```

 __Bi_iter __a,
 __Bi_iter __b,
 const regex_type & __re,
 initializer_list< int > __submatches,
 regex_constants::match_flag_type __m = regex_constants::match_default) [inline]

```

Constructs a regex\_token\_iterator...

#### Parameters

|                           |                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------|
| <code>__a</code>          | [IN] The start of the text to search.                                                      |
| <code>__b</code>          | [IN] One-past-the-end of the text to search.                                               |
| <code>__re</code>         | [IN] The regular expression to search for.                                                 |
| <code>__submatches</code> | [IN] A list of subexpressions to return for each regular expression match within the text. |
| <code>__m</code>          | [IN] Policy flags for match rules.                                                         |

Definition at line 2815 of file regex.h.

#### 4.888.2.5 regex\_token\_iterator() [5/6]

```

template<typename __Bi_iter , typename __Ch_type = typename iterator_traits<__Bi_iter>::value_type,
typename __Rx_traits = regex_traits<__Ch_type>>
template<std::size_t __Nm>
std::regex_token_iterator< __Bi_iter, __Ch_type, __Rx_traits >::regex_token_iterator (
 __Bi_iter __a,
 __Bi_iter __b,
 const regex_type & __re,
 const int (&) __submatches[__Nm],
 regex_constants::match_flag_type __m = regex_constants::match_default) [inline]

```

Constructs a regex\_token\_iterator...

#### Parameters

|                           |                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------|
| <code>__a</code>          | [IN] The start of the text to search.                                                      |
| <code>__b</code>          | [IN] One-past-the-end of the text to search.                                               |
| <code>__re</code>         | [IN] The regular expression to search for.                                                 |
| <code>__submatches</code> | [IN] A list of subexpressions to return for each regular expression match within the text. |
| <code>__m</code>          | [IN] Policy flags for match rules.                                                         |

Definition at line 2833 of file regex.h.

#### 4.888.2.6 regex\_token\_iterator() [6/6]

```

template<typename __Bi_iter , typename __Ch_type = typename iterator_traits<__Bi_iter>::value_type,
typename __Rx_traits = regex_traits<__Ch_type>>

```

```
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
 const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs) [inline]
```

Copy constructs a regex\_token\_iterator.

#### Parameters

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__rhs</code> | [IN] A regex_token_iterator to copy. |
|--------------------|--------------------------------------|

Definition at line 2865 of file regex.h.

### 4.888.3 Member Function Documentation

#### 4.888.3.1 operator!=(())

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
bool std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator!= (
 const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs) const [inline]
```

Compares a regex\_token\_iterator to another for inequality.

Definition at line 2887 of file regex.h.

#### 4.888.3.2 operator\*()

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
const value_type& std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator* ()
const [inline]
```

Dereferences a regex\_token\_iterator.

Definition at line 2894 of file regex.h.

#### 4.888.3.3 operator++() [1/2]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
regex_token_iterator& std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ ()
```

Increments a regex\_token\_iterator.

#### 4.888.3.4 operator++() [2/2]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
regex_token_iterator std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ (
 int) [inline]
```

Postincrements a regex\_token\_iterator.

Definition at line 2914 of file regex.h.

#### 4.888.3.5 operator->()

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
const value_type* std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator-> ()
const [inline]
```

Selects a regex\_token\_iterator member.

Definition at line 2901 of file regex.h.

#### 4.888.3.6 operator=()

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
regex_token_iterator& std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator= (
 const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs)
```

Assigns a regex\_token\_iterator to another.

##### Parameters

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__rhs</code> | [IN] A regex_token_iterator to copy. |
|--------------------|--------------------------------------|

#### 4.888.3.7 operator==()

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
bool std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator== (
 const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs) const
```

Compares a regex\_token\_iterator to another for equality.

The documentation for this class was generated from the following file:

- [regex.h](#)

## 4.889 std::regex\_traits&lt;\_Ch\_type&gt; Class Template Reference

## Public Types

- typedef `_RegexMask` **char\_class\_type**

## Protected Attributes

- `locale_type` **\_M\_locale**

## 4.889.1 Detailed Description

```
template<typename _Ch_type>
class std::regex_traits<_Ch_type>
```

Describes aspects of a regular expression.

A regular expression traits class that satisfies the requirements of section [28.7].

The class `regex` is parameterized around a set of related types and functions used to complete the definition of its semantics. This class satisfies the requirements of such a traits class.

Definition at line 80 of file `regex.h`.

## 4.889.2 Constructor & Destructor Documentation

### 4.889.2.1 regex\_traits()

```
template<typename _Ch_type>
std::regex_traits< _Ch_type >::regex_traits () [inline]
```

Constructs a default traits object.

Definition at line 159 of file regex.h.

## 4.889.3 Member Function Documentation

### 4.889.3.1 getloc()

```
template<typename _Ch_type>
locale_type std::regex_traits< _Ch_type >::getloc () const [inline]
```

Gets a copy of the current locale in use by the regex\_traits object.

Definition at line 372 of file regex.h.

### 4.889.3.2 imbue()

```
template<typename _Ch_type>
locale_type std::regex_traits< _Ch_type >::imbue (
 locale_type __loc) [inline]
```

Imbues the regex\_traits object with a copy of a new locale.

#### Parameters

|                    |           |
|--------------------|-----------|
| <code>__loc</code> | A locale. |
|--------------------|-----------|

#### Returns

a copy of the previous locale in use by the regex\_traits object.

**Note**

Calling imbue with a different locale than the one currently in use invalidates all cached data held by \*this.

Definition at line 361 of file regex.h.

**4.889.3.3 isctype()**

```
template<typename _Ch_type>
bool std::regex_traits< _Ch_type >::isctype (
 _Ch_type __c,
 char_class_type __f) const
```

Determines if *c* is a member of an identified class.

**Parameters**

|                          |                                                   |
|--------------------------|---------------------------------------------------|
| $\leftrightarrow$<br>__c | a character.                                      |
| $\leftrightarrow$<br>__f | a class type (as returned from lookup_classname). |

**Returns**

true if the character \_\_c is a member of the classification represented by \_\_f, false otherwise.

**Exceptions**

|                      |                                                    |
|----------------------|----------------------------------------------------|
| <i>std::bad_cast</i> | if the current locale does not have a ctype facet. |
|----------------------|----------------------------------------------------|

**4.889.3.4 length()**

```
template<typename _Ch_type>
static std::size_t std::regex_traits< _Ch_type >::length (
 const char_type * __p) [inline], [static]
```

Gives the length of a C-style string starting at \_\_p.

**Parameters**

|                          |                                                 |
|--------------------------|-------------------------------------------------|
| $\leftrightarrow$<br>__p | a pointer to the start of a character sequence. |
|--------------------------|-------------------------------------------------|

**Returns**

the number of characters between \*`__p` and the first default-initialized value of type `char_type`. In other words, uses the C-string algorithm for determining the length of a sequence of characters.

Definition at line 172 of file `regex.h`.

**4.889.3.5 lookup\_classname()**

```
template<typename _Ch_type>
template<typename _Fwd_iter >
char_class_type std::regex_traits< _Ch_type >::lookup_classname (
 _Fwd_iter __first,
 _Fwd_iter __last,
 bool __icase = false) const
```

Maps one or more characters to a named character classification.

**Parameters**

|                      |                                              |
|----------------------|----------------------------------------------|
| <code>__first</code> | beginning of the character sequence.         |
| <code>__last</code>  | one-past-the-end of the character sequence.  |
| <code>__icase</code> | ignores the case of the classification name. |

**Returns**

an unspecified value that represents the character classification named by the character sequence designated by the iterator range `[__first, __last)`. If `icase` is true, the returned mask identifies the classification regardless of the case of the characters to be matched (for example, `[[:lower:]]` is the same as `[[:alpha:]]`), otherwise a case-dependent classification is returned. The value returned shall be independent of the case of the characters in the character sequence. If the name is not recognized then returns a value that compares equal to 0.

At least the following names (or their wide-character equivalent) are supported.

- `d`
- `w`
- `s`
- `alnum`
- `alpha`
- `blank`
- `cntrl`
- `digit`
- `graph`

- lower
- print
- punct
- space
- upper
- xdigit

#### 4.889.3.6 lookup\_collatename()

```
template<typename _Ch_type>
template<typename _Fwd_iter >
string_type std::regex_traits< _Ch_type >::lookup_collatename (
 _Fwd_iter __first,
 _Fwd_iter __last) const
```

Gets a collation element by name.

##### Parameters

|                      |                                                 |
|----------------------|-------------------------------------------------|
| <code>__first</code> | beginning of the collation element name.        |
| <code>__last</code>  | one-past-the-end of the collation element name. |

##### Returns

a sequence of one or more characters that represents the collating element consisting of the character sequence designated by the iterator range [`__first`, `__last`). Returns an empty string if the character sequence is not a valid collating element.

#### 4.889.3.7 transform()

```
template<typename _Ch_type>
template<typename _Fwd_iter >
string_type std::regex_traits< _Ch_type >::transform (
 _Fwd_iter __first,
 _Fwd_iter __last) const [inline]
```

Gets a sort key for a character sequence.

##### Parameters

|                      |                                             |
|----------------------|---------------------------------------------|
| <code>__first</code> | beginning of the character sequence.        |
| <code>__last</code>  | one-past-the-end of the character sequence. |

Returns a sort key for the character sequence designated by the iterator range [F1, F2) such that if the character sequence [G1, G2) sorts before the character sequence [H1, H2) then `v.transform(G1, G2) < v.transform(H1, H2)`.

What this really does is provide a more efficient way to compare a string to multiple other strings in locales with fancy collation rules and equivalence classes.

#### Returns

a locale-specific sort key equivalent to the input range.

#### Exceptions

|                            |                                                      |
|----------------------------|------------------------------------------------------|
| <code>std::bad_cast</code> | if the current locale does not have a collate facet. |
|----------------------------|------------------------------------------------------|

Definition at line 225 of file `regex.h`.

Referenced by `std::regex_traits<_CharType>::transform_primary()`.

#### 4.889.3.8 transform\_primary()

```
template<typename _Ch_type>
template<typename _Fwd_iter >
string_type std::regex_traits<_Ch_type>::transform_primary (
 _Fwd_iter __first,
 _Fwd_iter __last) const [inline]
```

Gets a sort key for a character sequence, independent of case.

#### Parameters

|                      |                                             |
|----------------------|---------------------------------------------|
| <code>__first</code> | beginning of the character sequence.        |
| <code>__last</code>  | one-past-the-end of the character sequence. |

Effects: if `typeid(use_facet<collate<_Ch_type>>) == typeid(collate_byname<_Ch_type>)` and the form of the sort key returned by `collate_byname<_Ch_type>::transform(__first, __last)` is known and can be converted into a primary sort key then returns that key, otherwise returns an empty string.

**Todo** Implement this function correctly.

Definition at line 249 of file `regex.h`.

#### 4.889.3.9 translate()

```
template<typename _Ch_type>
char_type std::regex_traits<_Ch_type>::translate (
 char_type __c) const [inline]
```

Performs the identity translation.

**Parameters**

|                  |                                                   |
|------------------|---------------------------------------------------|
| <code>__c</code> | A character to the locale-specific character set. |
|------------------|---------------------------------------------------|

**Returns**

`__c`.

Definition at line 183 of file `regex.h`.

**4.889.3.10 `translate_nocase()`**

```
template<typename _Ch_type>
char_type std::regex_traits< _Ch_type >::translate_nocase (
 char_type __c) const [inline]
```

Translates a character into a case-insensitive equivalent.

**Parameters**

|                  |                                                   |
|------------------|---------------------------------------------------|
| <code>__c</code> | A character to the locale-specific character set. |
|------------------|---------------------------------------------------|

**Returns**

the locale-specific lower-case equivalent of `__c`.

**Exceptions**

|                            |                                                        |
|----------------------------|--------------------------------------------------------|
| <code>std::bad_cast</code> | if the imbued locale does not support the ctype facet. |
|----------------------------|--------------------------------------------------------|

Definition at line 196 of file `regex.h`.

**4.889.3.11 `value()`**

```
template<typename _Ch_type>
int std::regex_traits< _Ch_type >::value (
 _Ch_type __ch,
 int __radix) const
```

Converts a digit to an int.

## Parameters

|                      |                                                                |
|----------------------|----------------------------------------------------------------|
| <code>__ch</code>    | a character representing a digit.                              |
| <code>__radix</code> | the radix if the numeric conversion (limited to 8, 10, or 16). |

## Returns

the value represented by the digit `__ch` in base `radix` if the character `__ch` is a valid digit in base `radix`; otherwise returns -1.

### 4.900.1 Detailed Description

```
template<typename _Iterator>
class std::reverse_iterator< _Iterator >
```

Bidirectional and random access iterators have corresponding reverse iterator adaptors that iterate through the data structure in the opposite direction. They have the same signatures as the corresponding iterators. The fundamental relation between a reverse iterator and its corresponding iterator `i` is established by the identity:

```
&*(reverse_iterator(i)) == &*(i - 1)
```

*This mapping is dictated by the fact that while there is always a pointer past the end of an array, there might not be a valid pointer before the beginning of an array. [24.4.1]/1,2*

Reverse iterators can be tricky and surprising at first. Their semantics make sense, however, and the trickiness is a side effect of the requirement that the iterators must be safe.

Definition at line 125 of file `bits/stl_iterator.h`.

## 4.900.2 Member Typedef Documentation

### 4.900.2.1 iterator\_category

```
typedef iterator_traits<_Iterator>::iterator_category std::iterator< iterator_traits<_Iterator>::iterator_category, iterator_traits<_Iterator>::value_type, iterator_traits<_Iterator>::difference_type, iterator_traits<_Iterator>::pointer, iterator_traits<_Iterator>::reference>::iterator_category [inherited]
```

One of the [tag types](#).

Definition at line 130 of file `stl_iterator_base_types.h`.

### 4.900.2.2 value\_type

```
typedef iterator_traits<_Iterator>::value_type std::iterator< iterator_traits<_Iterator>::iterator_category, iterator_traits<_Iterator>::value_type, iterator_traits<_Iterator>::difference_type, iterator_traits<_Iterator>::pointer, iterator_traits<_Iterator>::reference>::value_type [inherited]
```

The type "pointed to" by the iterator.

Definition at line 132 of file `stl_iterator_base_types.h`.

## 4.900.3 Constructor & Destructor Documentation

### 4.900.3.1 reverse\_iterator() [1/4]

```
template<typename _Iterator>
constexpr std::reverse_iterator<_Iterator>::reverse_iterator () [inline]
```

The default constructor value-initializes member `current`. If it is a pointer, that means it is zero-initialized.

Definition at line 161 of file `bits/stl_iterator.h`.

Referenced by `std::reverse_iterator<_Iterator>::operator+()`, and `std::reverse_iterator<_Iterator>::operator-()`.

#### 4.900.3.2 reverse\_iterator() [2/4]

```
template<typename _Iterator>
constexpr std::reverse_iterator< _Iterator >::reverse_iterator (
 iterator_type __x) [inline], [explicit]
```

This iterator will move in the opposite direction that `x` does.

Definition at line 167 of file `bits/stl_iterator.h`.

#### 4.900.3.3 reverse\_iterator() [3/4]

```
template<typename _Iterator>
constexpr std::reverse_iterator< _Iterator >::reverse_iterator (
 const reverse_iterator< _Iterator > & __x) [inline]
```

The copy constructor is normal.

Definition at line 173 of file `bits/stl_iterator.h`.

#### 4.900.3.4 reverse\_iterator() [4/4]

```
template<typename _Iterator>
template<typename _Iter >
constexpr std::reverse_iterator< _Iterator >::reverse_iterator (
 const reverse_iterator< _Iter > & __x) [inline]
```

A `reverse_iterator` across other types can be copied if the underlying iterator can be converted to the type of `current`.

Definition at line 186 of file `bits/stl_iterator.h`.

### 4.900.4 Member Function Documentation

#### 4.900.4.1 base()

```
template<typename _Iterator>
constexpr iterator_type std::reverse_iterator< _Iterator >::base () const [inline]
```

##### Returns

`current`, the iterator used for underlying work.

Definition at line 193 of file `bits/stl_iterator.h`.

Referenced by `std::operator==()`.

#### 4.900.4.2 operator\*()

```
template<typename _Iterator>
constexpr reference std::reverse_iterator<_Iterator>::operator* () const [inline]
```

##### Returns

A reference to the value at `-current`

This requires that `-current` is dereferenceable.

##### Warning

This implementation requires that for an iterator of the underlying iterator type, `x`, a reference obtained by `*x` remains valid after `x` has been modified or destroyed. This is a bug: <http://gcc.gnu.org/PR51823>

Definition at line 207 of file `bits/stl_iterator.h`.

#### 4.900.4.3 operator+()

```
template<typename _Iterator>
constexpr reverse_iterator std::reverse_iterator<_Iterator>::operator+ (
 difference_type __n) const [inline]
```

##### Returns

A `reverse_iterator` that refers to `current - __n`

The underlying iterator must be a Random Access Iterator.

Definition at line 288 of file `bits/stl_iterator.h`.

References `std::reverse_iterator<_Iterator>::reverse_iterator()`.

#### 4.900.4.4 operator++() [1/2]

```
template<typename _Iterator>
constexpr reverse_iterator& std::reverse_iterator<_Iterator>::operator++ () [inline]
```

##### Returns

`*this`

Decrements the underlying iterator.

Definition at line 238 of file `bits/stl_iterator.h`.

#### 4.900.4.5 operator++() [2/2]

```
template<typename _Iterator>
constexpr reverse_iterator std::reverse_iterator< _Iterator >::operator++ (
 int) [inline]
```

##### Returns

The original value of `*this`

Decrements the underlying iterator.

Definition at line 250 of file `bits/stl_iterator.h`.

#### 4.900.4.6 operator+=()

```
template<typename _Iterator>
constexpr reverse_iterator& std::reverse_iterator< _Iterator >::operator+= (
 difference_type __n) [inline]
```

##### Returns

`*this`

Moves the underlying iterator backwards `__n` steps. The underlying iterator must be a Random Access Iterator.

Definition at line 298 of file `bits/stl_iterator.h`.

#### 4.900.4.7 operator-()

```
template<typename _Iterator>
constexpr reverse_iterator std::reverse_iterator< _Iterator >::operator- (
 difference_type __n) const [inline]
```

##### Returns

A `reverse_iterator` that refers to `current - __n`

The underlying iterator must be a Random Access Iterator.

Definition at line 310 of file `bits/stl_iterator.h`.

References `std::reverse_iterator< _Iterator >::reverse_iterator()`.

## 4.900.4.8 operator--() [1/2]

```
template<typename _Iterator>
constexpr reverse_iterator& std::reverse_iterator<_Iterator>::operator-- () [inline]
```

**Returns**

\*this

Increments the underlying iterator.

Definition at line 263 of file bits/stl\_iterator.h.

## 4.900.4.9 operator--() [2/2]

```
template<typename _Iterator>
constexpr reverse_iterator& std::reverse_iterator<_Iterator>::operator-- (
 int) [inline]
```

**Returns**

A reverse\_iterator with the previous value of \*this

Increments the underlying iterator.

Definition at line 275 of file bits/stl\_iterator.h.

## 4.900.4.10 operator+=( )

```
template<typename _Iterator>
constexpr reverse_iterator& std::reverse_iterator<_Iterator>::operator+= (
 difference_type __n) [inline]
```

**Returns**

\*this

Moves the underlying iterator forwards \_\_n steps. The underlying iterator must be a Random Access Iterator.

Definition at line 320 of file bits/stl\_iterator.h.

4.900.4.11 `operator->()`

```
template<typename _Iterator>
constexpr pointer std::reverse_iterator< _Iterator >::operator-> () const [inline]
```

**Returns**

A pointer to the value at `-current`

This requires that `-current` is dereferenceable.

Definition at line 219 of file `bits/stl_iterator.h`.

4.900.4.12 `operator[]()`

```
template<typename _Iterator>
constexpr reference std::reverse_iterator< _Iterator >::operator[] (
 difference_type __n) const [inline]
```

**Returns**

The value at `current - __n - 1`

The underlying iterator must be a Random Access Iterator.

Definition at line 332 of file `bits/stl_iterator.h`.

The documentation for this class was generated from the following file:

- [bits/stl\\_iterator.h](#)

## 4.901.1 Detailed Description

```
template<class _CharT, class _Alloc>
class __gnu_cxx::rope<_CharT, _Alloc>
```

This is an SGI extension.

**Todo** Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html)

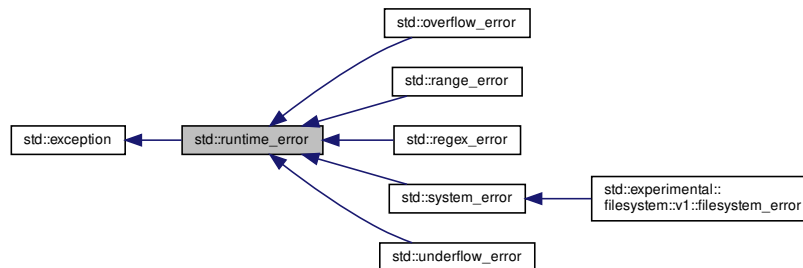

Definition at line 323 of file rope.

The documentation for this class was generated from the following files:

- [ropeimpl.h](#)

## 4.902 std::runtime\_error Class Reference

Inheritance diagram for `std::runtime_error`:

## Public Member Functions

- [runtime\\_error](#) (const [string](#) &\_\_arg) \_GLIBCXX\_TXN\_SAFE
- [runtime\\_error](#) (const char \*) \_GLIBCXX\_TXN\_SAFE
- [runtime\\_error](#) ([runtime\\_error](#) &&) noexcept
- [runtime\\_error](#) (const [runtime\\_error](#) &)=default
- [runtime\\_error](#) & [operator=](#) ([runtime\\_error](#) &&) noexcept
- [runtime\\_error](#) & [operator=](#) (const [runtime\\_error](#) &)=default
- virtual const char \* [what](#) () const noexcept

### 4.902.1 Detailed Description

One of two subclasses of exception.

Runtime errors represent problems outside the scope of a program; they cannot be easily predicted and can generally only be caught as the program executes.

Definition at line 219 of file `stdexcept`.

### 4.902.2 Constructor & Destructor Documentation

#### 4.902.2.1 [runtime\\_error](#)()

```
std::runtime_error::runtime_error (
 const string & __arg) [explicit]
```

Takes a character string describing the error.

### 4.902.3 Member Function Documentation

#### 4.902.3.1 [what](#)()

```
virtual const char* std::runtime_error::what () const [virtual], [noexcept]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::experimental::filesystem::v1::filesystem\\_error](#).

The documentation for this class was generated from the following file:

- [stdexcept](#)

## 4.903 \_\_gnu\_pbds::sample\_probe\_fn Class Reference

### Public Types

- typedef std::size\_t **size\_type**

### Public Member Functions

- [sample\\_probe\\_fn](#) ()
- [sample\\_probe\\_fn](#) (const [sample\\_probe\\_fn](#) &)
- void [swap](#) ([sample\\_probe\\_fn](#) &)

### Protected Member Functions

- size\_type [operator\(\)](#) (key\_const\_reference r\_key, size\_type i) const

#### 4.903.1 Detailed Description

A sample probe policy.

Definition at line 47 of file `sample_probe_fn.hpp`.

#### 4.903.2 Constructor & Destructor Documentation

##### 4.903.2.1 [sample\\_probe\\_fn\(\)](#) [1/2]

```
__gnu_pbds::sample_probe_fn::sample_probe_fn ()
```

Default constructor.

##### 4.903.2.2 [sample\\_probe\\_fn\(\)](#) [2/2]

```
__gnu_pbds::sample_probe_fn::sample_probe_fn (
 const sample_probe_fn &)
```

Copy constructor.

#### 4.903.3 Member Function Documentation

#### 4.903.3.1 operator()

```
size_type __gnu_pbds::sample_probe_fn::operator() (
 key_const_reference r_key,
 size_type i) const [inline], [protected]
```

Returns the i-th offset from the hash value of some key r\_key.

#### 4.903.3.2 swap()

```
void __gnu_pbds::sample_probe_fn::swap (
 sample_probe_fn &) [inline]
```

Swaps content.

The documentation for this class was generated from the following file:

- [sample\\_probe\\_fn.hpp](#)

### 4.904 \_\_gnu\_pbds::sample\_range\_hashing Class Reference

#### Public Types

- typedef std::size\_t [size\\_type](#)

#### Public Member Functions

- [sample\\_range\\_hashing](#) ()
- [sample\\_range\\_hashing](#) (const [sample\\_range\\_hashing](#) &other)
- void [swap](#) ([sample\\_range\\_hashing](#) &other)

#### Protected Member Functions

- void [notify\\_resized](#) ([size\\_type](#))
- [size\\_type operator\(\)](#) ([size\\_type](#)) const

#### 4.904.1 Detailed Description

A sample range-hashing functor.

Definition at line 47 of file [sample\\_range\\_hashing.hpp](#).

## 4.904.2 Member Typedef Documentation

### 4.904.2.1 size\_type

```
typedef std::size_t __gnu_pbds::sample_range_hashing::size_type
```

Size type.

Definition at line 51 of file sample\_range\_hashing.hpp.

## 4.904.3 Constructor & Destructor Documentation

### 4.904.3.1 sample\_range\_hashing() [1/2]

```
__gnu_pbds::sample_range_hashing::sample_range_hashing ()
```

Default constructor.

### 4.904.3.2 sample\_range\_hashing() [2/2]

```
__gnu_pbds::sample_range_hashing::sample_range_hashing (
 const sample_range_hashing & other)
```

Copy constructor.

## 4.904.4 Member Function Documentation

### 4.904.4.1 notify\_resized()

```
void __gnu_pbds::sample_range_hashing::notify_resized (
 size_type) [protected]
```

Notifies the policy object that the container's size has changed to argument's size.

#### 4.904.4.2 operator()

```
size_type __gnu_pbds::sample_range_hashing::operator() (
 size_type) const [inline], [protected]
```

Transforms the \_\_hash value hash into a ranged-hash value.

#### 4.904.4.3 swap()

```
void __gnu_pbds::sample_range_hashing::swap (
 sample_range_hashing & other) [inline]
```

Swaps content.

The documentation for this class was generated from the following file:

- [sample\\_range\\_hashing.hpp](#)

### 4.905 \_\_gnu\_pbds::sample\_ranged\_hash\_fn Class Reference

#### Public Types

- typedef std::size\_t **size\_type**

#### Public Member Functions

- [sample\\_ranged\\_hash\\_fn](#) ()
- [sample\\_ranged\\_hash\\_fn](#) (const [sample\\_ranged\\_hash\\_fn](#) &)
- void [swap](#) ([sample\\_ranged\\_hash\\_fn](#) &)

#### Protected Member Functions

- void [notify\\_resized](#) (size\_type)
- size\_type [operator\(\)](#) (key\_const\_reference) const

#### 4.905.1 Detailed Description

A sample ranged-hash functor.

Definition at line 47 of file [sample\\_ranged\\_hash\\_fn.hpp](#).

#### 4.905.2 Constructor & Destructor Documentation

#### 4.905.2.1 sample\_ranged\_hash\_fn() [1/2]

```
__gnu_pbds::sample_ranged_hash_fn::sample_ranged_hash_fn ()
```

Default constructor.

#### 4.905.2.2 sample\_ranged\_hash\_fn() [2/2]

```
__gnu_pbds::sample_ranged_hash_fn::sample_ranged_hash_fn (
 const sample_ranged_hash_fn &)
```

Copy constructor.

### 4.905.3 Member Function Documentation

#### 4.905.3.1 notify\_resized()

```
void __gnu_pbds::sample_ranged_hash_fn::notify_resized (
 size_type) [protected]
```

Notifies the policy object that the container's \_\_size has changed to size.

#### 4.905.3.2 operator()()

```
size_type __gnu_pbds::sample_ranged_hash_fn::operator() (
 key_const_reference) const [inline], [protected]
```

Transforms key\_const\_reference into a position within the table.

#### 4.905.3.3 swap()

```
void __gnu_pbds::sample_ranged_hash_fn::swap (
 sample_ranged_hash_fn &) [inline]
```

Swaps content.

The documentation for this class was generated from the following file:

- [sample\\_ranged\\_hash\\_fn.hpp](#)

## 4.906 `__gnu_pbds::sample_ranged_probe_fn` Class Reference

### Public Types

- typedef std::size\_t **size\_type**

### Public Member Functions

- **sample\_ranged\_probe\_fn** (const [sample\\_ranged\\_probe\\_fn](#) &)
- void **swap** ([sample\\_ranged\\_probe\\_fn](#) &)

### Protected Member Functions

- void **notify\_resized** (size\_type)
- size\_type **operator()** (key\_const\_reference, std::size\_t, size\_type) const

#### 4.906.1 Detailed Description

A sample ranged-probe functor.

Definition at line 47 of file `sample_ranged_probe_fn.hpp`.

The documentation for this class was generated from the following file:

- [sample\\_ranged\\_probe\\_fn.hpp](#)

## 4.907 `__gnu_pbds::sample_resize_policy` Class Reference

### Public Types

- typedef std::size\_t [size\\_type](#)

### Public Member Functions

- [sample\\_resize\\_policy](#) ()
- [sample\\_range\\_hashing](#) (const [sample\\_resize\\_policy](#) &other)
- void **swap** ([sample\\_resize\\_policy](#) &other)

### Protected Member Functions

- [size\\_type get\\_new\\_size](#) ([size\\_type](#) size, [size\\_type](#) num\_used\_e) const
- [bool is\\_resize\\_needed](#) () const
- [void notify\\_cleared](#) ()
- [void notify\\_erase\\_search\\_collision](#) ()
- [void notify\\_erase\\_search\\_end](#) ()
- [void notify\\_erase\\_search\\_start](#) ()
- [void notify\\_erased](#) ([size\\_type](#) num\_e)
- [void notify\\_find\\_search\\_collision](#) ()
- [void notify\\_find\\_search\\_end](#) ()
- [void notify\\_find\\_search\\_start](#) ()
- [void notify\\_insert\\_search\\_collision](#) ()
- [void notify\\_insert\\_search\\_end](#) ()
- [void notify\\_insert\\_search\\_start](#) ()
- [void notify\\_inserted](#) ([size\\_type](#) num\_e)
- [void notify\\_resized](#) ([size\\_type](#) new\_size)

#### 4.907.1 Detailed Description

A sample resize policy.

Definition at line 47 of file `sample_resize_policy.hpp`.

#### 4.907.2 Member Typedef Documentation

##### 4.907.2.1 size\_type

```
typedef std::size_t __gnu_pbds::sample_resize_policy::size_type
```

Size type.

Definition at line 51 of file `sample_resize_policy.hpp`.

#### 4.907.3 Constructor & Destructor Documentation

##### 4.907.3.1 sample\_resize\_policy()

```
__gnu_pbds::sample_resize_policy::sample_resize_policy ()
```

Default constructor.

#### 4.907.4 Member Function Documentation

##### 4.907.4.1 `get_new_size()`

```
size_type __gnu_pbds::sample_resize_policy::get_new_size (
 size_type size,
 size_type num_used_e) const [protected]
```

Queries what the new size should be.

##### 4.907.4.2 `is_resize_needed()`

```
bool __gnu_pbds::sample_resize_policy::is_resize_needed () const [inline], [protected]
```

Queries whether a resize is needed.

##### 4.907.4.3 `notify_cleared()`

```
void __gnu_pbds::sample_resize_policy::notify_cleared () [protected]
```

Notifies the table was cleared.

##### 4.907.4.4 `notify_erase_search_collision()`

```
void __gnu_pbds::sample_resize_policy::notify_erase_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

##### 4.907.4.5 `notify_erase_search_end()`

```
void __gnu_pbds::sample_resize_policy::notify_erase_search_end () [inline], [protected]
```

Notifies a search ended.

#### 4.907.4.6 notify\_erase\_search\_start()

```
void __gnu_pbds::sample_resize_policy::notify_erase_search_start () [inline], [protected]
```

Notifies a search started.

#### 4.907.4.7 notify\_erased()

```
void __gnu_pbds::sample_resize_policy::notify_erased (
 size_type num_e) [inline], [protected]
```

Notifies an element was erased.

#### 4.907.4.8 notify\_find\_search\_collision()

```
void __gnu_pbds::sample_resize_policy::notify_find_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

#### 4.907.4.9 notify\_find\_search\_end()

```
void __gnu_pbds::sample_resize_policy::notify_find_search_end () [inline], [protected]
```

Notifies a search ended.

#### 4.907.4.10 notify\_find\_search\_start()

```
void __gnu_pbds::sample_resize_policy::notify_find_search_start () [inline], [protected]
```

Notifies a search started.

#### 4.907.4.11 notify\_insert\_search\_collision()

```
void __gnu_pbds::sample_resize_policy::notify_insert_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

**4.907.4.12 notify\_insert\_search\_end()**

```
void __gnu_pbds::sample_resize_policy::notify_insert_search_end () [inline], [protected]
```

Notifies a search ended.

**4.907.4.13 notify\_insert\_search\_start()**

```
void __gnu_pbds::sample_resize_policy::notify_insert_search_start () [inline], [protected]
```

Notifies a search started.

**4.907.4.14 notify\_inserted()**

```
void __gnu_pbds::sample_resize_policy::notify_inserted (
 size_type num_e) [inline], [protected]
```

Notifies an element was inserted.

**4.907.4.15 notify\_resized()**

```
void __gnu_pbds::sample_resize_policy::notify_resized (
 size_type new_size) [protected]
```

Notifies the table was resized to new\_size.

**4.907.4.16 sample\_range\_hashing()**

```
__gnu_pbds::sample_resize_policy::sample_range_hashing (
 const sample_resize_policy & other)
```

Copy constructor.

**4.907.4.17 swap()**

```
void __gnu_pbds::sample_resize_policy::swap (
 sample_resize_policy & other) [inline]
```

Swaps content.

The documentation for this class was generated from the following file:

- [sample\\_resize\\_policy.hpp](#)

## 4.908 `__gnu_pbds::sample_resize_trigger` Class Reference

### Public Types

- typedef `std::size_t` `size_type`

### Public Member Functions

- `sample_resize_trigger` ()

### 4.908.1 Detailed Description

A sample resize trigger policy.

Definition at line 47 of file `sample_resize_trigger.hpp`.

### 4.908.2 Member Typedef Documentation

#### 4.908.2.1 `size_type`

```
typedef std::size_t __gnu_pbds::sample_resize_trigger::size_type
```

Size type.

Definition at line 51 of file `sample_resize_trigger.hpp`.

#### 4.908.3 Constructor & Destructor Documentation

##### 4.908.3.1 sample\_resize\_trigger()

```
__gnu_pbds::sample_resize_trigger::sample_resize_trigger ()
```

Default constructor.

#### 4.908.4 Member Function Documentation

##### 4.908.4.1 is\_grow\_needed()

```
bool __gnu_pbds::sample_resize_trigger::is_grow_needed (
 size_type size,
 size_type num_entries) const [inline], [protected]
```

Queries whether a grow is needed.

##### 4.908.4.2 is\_resize\_needed()

```
bool __gnu_pbds::sample_resize_trigger::is_resize_needed () const [inline], [protected]
```

Queries whether a resize is needed.

##### 4.908.4.3 notify\_cleared()

```
void __gnu_pbds::sample_resize_trigger::notify_cleared () [protected]
```

Notifies the table was cleared.

##### 4.908.4.4 notify\_erase\_search\_collision()

```
void __gnu_pbds::sample_resize_trigger::notify_erase_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

#### 4.908.4.5 notify\_erase\_search\_end()

```
void __gnu_pbds::sample_resize_trigger::notify_erase_search_end () [inline], [protected]
```

Notifies a search ended.

#### 4.908.4.6 notify\_erase\_search\_start()

```
void __gnu_pbds::sample_resize_trigger::notify_erase_search_start () [inline], [protected]
```

Notifies a search started.

#### 4.908.4.7 notify\_erased()

```
void __gnu_pbds::sample_resize_trigger::notify_erased (
 size_type num_entries) [inline], [protected]
```

Notifies an element was erased.

#### 4.908.4.8 notify\_externally\_resized()

```
void __gnu_pbds::sample_resize_trigger::notify_externally_resized (
 size_type new_size) [protected]
```

Notifies the table was resized externally.

#### 4.908.4.9 notify\_find\_search\_collision()

```
void __gnu_pbds::sample_resize_trigger::notify_find_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

#### 4.908.4.10 notify\_find\_search\_end()

```
void __gnu_pbds::sample_resize_trigger::notify_find_search_end () [inline], [protected]
```

Notifies a search ended.

**4.908.4.11 notify\_find\_search\_start()**

```
void __gnu_pbds::sample_resize_trigger::notify_find_search_start () [inline], [protected]
```

Notifies a search started.

**4.908.4.12 notify\_insert\_search\_collision()**

```
void __gnu_pbds::sample_resize_trigger::notify_insert_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

**4.908.4.13 notify\_insert\_search\_end()**

```
void __gnu_pbds::sample_resize_trigger::notify_insert_search_end () [inline], [protected]
```

Notifies a search ended.

**4.908.4.14 notify\_insert\_search\_start()**

```
void __gnu_pbds::sample_resize_trigger::notify_insert_search_start () [inline], [protected]
```

Notifies a search started.

**4.908.4.15 notify\_inserted()**

```
void __gnu_pbds::sample_resize_trigger::notify_inserted (
 size_type num_entries) [inline], [protected]
```

Notifies an element was inserted. the total number of entries in the table is num\_entries.

**4.908.4.16 notify\_resized()**

```
void __gnu_pbds::sample_resize_trigger::notify_resized (
 size_type new_size) [protected]
```

Notifies the table was resized as a result of this object's signifying that a resize is needed.

## 4.908.4.17 sample\_range\_hashing()

```
__gnu_pbds::sample_resize_trigger::sample_range_hashing (
 const sample_resize_trigger &)
```

Copy constructor.

## 4.908.4.18 swap()

```
void __gnu_pbds::sample_resize_trigger::swap (
 sample_resize_trigger &) [inline]
```

Swaps content.

The documentation for this class was generated from the following file:

- [sample\\_resize\\_trigger.hpp](#)

## 4.909 \_\_gnu\_pbds::sample\_size\_policy Class Reference

## Public Types

- typedef std::size\_t [size\\_type](#)

## Public Member Functions

- [sample\\_size\\_policy](#) ()
- [sample\\_range\\_hashing](#) (const [sample\\_size\\_policy](#) &)
- void [swap](#) ([sample\\_size\\_policy](#) &other)

## Protected Member Functions

- [size\\_type](#) [get\\_nearest\\_larger\\_size](#) ([size\\_type](#) size) const
- [size\\_type](#) [get\\_nearest\\_smaller\\_size](#) ([size\\_type](#) size) const

## 4.909.1 Detailed Description

A sample size policy.

Definition at line 47 of file [sample\\_size\\_policy.hpp](#).

## 4.909.2 Member Typedef Documentation

#### 4.909.2.1 size\_type

```
typedef std::size_t __gnu_pbds::sample_size_policy::size_type
```

Size type.

Definition at line 51 of file sample\_size\_policy.hpp.

### 4.909.3 Constructor & Destructor Documentation

#### 4.909.3.1 sample\_size\_policy()

```
__gnu_pbds::sample_size_policy::sample_size_policy ()
```

Default constructor.

### 4.909.4 Member Function Documentation

#### 4.909.4.1 get\_nearest\_larger\_size()

```
size_type __gnu_pbds::sample_size_policy::get_nearest_larger_size (
 size_type size) const [inline], [protected]
```

Given a \_\_size size, returns a \_\_size that is larger.

#### 4.909.4.2 get\_nearest\_smaller\_size()

```
size_type __gnu_pbds::sample_size_policy::get_nearest_smaller_size (
 size_type size) const [inline], [protected]
```

Given a \_\_size size, returns a \_\_size that is smaller.

#### 4.909.4.3 sample\_range\_hashing()

```
__gnu_pbds::sample_size_policy::sample_range_hashing (
 const sample_size_policy &)
```

Copy constructor.

#### 4.909.4.4 `swap()`

```
void __gnu_pbds::sample_size_policy::swap (
 sample_size_policy & other) [inline]
```

Swaps content.

The documentation for this class was generated from the following file:

- [sample\\_size\\_policy.hpp](#)

### 4.910 `__gnu_pbds::sample_tree_node_update< Const_Node_Iter, Node_Iter, Cmp_Fn, _Alloc >` Class Template Reference

#### 4.910.1 Detailed Description

```
template<typename Const_Node_Iter, typename Node_Iter, typename Cmp_Fn, typename _Alloc>
class __gnu_pbds::sample_tree_node_update< Const_Node_Iter, Node_Iter, Cmp_Fn, _Alloc >
```

A sample node updator.

Definition at line 49 of file `sample_tree_node_update.hpp`.

The documentation for this class was generated from the following file:

- [sample\\_tree\\_node\\_update.hpp](#)

### 4.911 `__gnu_pbds::sample_trie_access_traits` Struct Reference

#### Public Types

- enum { **max\_size** }
- typedef `std::string::const_iterator` **const\_iterator**
- typedef char **e\_type**
- typedef `rebind_traits< _Alloc, key_type >::const_reference` **key\_const\_reference**
- typedef `std::string` **key\_type**
- typedef `std::size_t` **size\_type**

#### Static Public Member Functions

- static `const_iterator` **begin** (`key_const_reference`)
- static `size_type` **e\_pos** (`e_type`)
- static `const_iterator` **end** (`key_const_reference`)

#### 4.911.1 Detailed Description

A sample trie element access traits.

Definition at line 47 of file `sample_trie_access_traits.hpp`.

#### 4.911.2 Member Typedef Documentation

##### 4.911.2.1 `e_type`

```
typedef char __gnu_pbds::sample_trie_access_traits::e_type
```

Element type.

Definition at line 57 of file `sample_trie_access_traits.hpp`.

#### 4.911.3 Member Function Documentation

##### 4.911.3.1 `begin()`

```
static const_iterator __gnu_pbds::sample_trie_access_traits::begin (
 key_const_reference) [inline], [static]
```

Returns a `const_iterator` to the first element of `r_key`.

##### 4.911.3.2 `e_pos()`

```
static size_type __gnu_pbds::sample_trie_access_traits::e_pos (
 e_type) [inline], [static]
```

Maps an element to a position.

##### 4.911.3.3 `end()`

```
static const_iterator __gnu_pbds::sample_trie_access_traits::end (
 key_const_reference) [inline], [static]
```

Returns a `const_iterator` to the after-last element of `r_key`.

The documentation for this struct was generated from the following file:

- [sample\\_trie\\_access\\_traits.hpp](#)

## 4.912 `__gnu_pbds::sample_trie_node_update< Node_Cltr, Node_Itr, _ATraits, _Alloc >` Class Template Reference

### Public Types

- typedef std::size\_t **metadata\_type**

### Protected Member Functions

- [sample\\_trie\\_node\\_update](#) ()
- void [operator](#)() (node\_iterator, node\_const\_iterator) const

#### 4.912.1 Detailed Description

```
template<typename Node_Cltr, typename Node_Itr, typename _ATraits, typename _Alloc>
class __gnu_pbds::sample_trie_node_update< Node_Cltr, Node_Itr, _ATraits, _Alloc >
```

A sample node updator.

Definition at line 49 of file `sample_trie_node_update.hpp`.

#### 4.912.2 Constructor & Destructor Documentation

##### 4.912.2.1 `sample_trie_node_update()`

```
template<typename Node_Cltr , typename Node_Itr , typename _ATraits , typename _Alloc >
__gnu_pbds::sample_trie_node_update< Node_Cltr, Node_Itr, _ATraits, _Alloc >::sample_trie_node_update
() [protected]
```

Default constructor.

#### 4.912.3 Member Function Documentation

##### 4.912.3.1 `operator()`

```
template<typename Node_Cltr , typename Node_Itr , typename _ATraits , typename _Alloc >
void __gnu_pbds::sample_trie_node_update< Node_Cltr, Node_Itr, _ATraits, _Alloc >::operator() (
 node_iterator ,
 node_const_iterator) const [inline], [protected]
```

Updates the rank of a node through a node\_iterator `node_it`; `end_nd_it` is the end node iterator.

The documentation for this class was generated from the following file:

- [sample\\_trie\\_node\\_update.hpp](#)

## 4.913 \_\_gnu\_pbds::sample\_update\_policy Struct Reference

### Public Member Functions

- [sample\\_update\\_policy](#) ()
- [sample\\_update\\_policy](#) (const [sample\\_update\\_policy](#) &)
- void [swap](#) ([sample\\_update\\_policy](#) &other)

### Protected Types

- typedef some\_metadata\_type [metadata\\_type](#)

### Protected Member Functions

- [metadata\\_type operator\(\)](#) () const
- bool [operator\(\)](#) (metadata\_reference) const

#### 4.913.1 Detailed Description

A sample list-update policy.

Definition at line 47 of file [sample\\_update\\_policy.hpp](#).

#### 4.913.2 Member Typedef Documentation

##### 4.913.2.1 [metadata\\_type](#)

```
typedef some_metadata_type __gnu_pbds::sample_update_policy::metadata_type [protected]
```

Metadata on which this functor operates.

Definition at line 61 of file [sample\\_update\\_policy.hpp](#).

#### 4.913.3 Constructor & Destructor Documentation

##### 4.913.3.1 [sample\\_update\\_policy\(\)](#) [1/2]

```
__gnu_pbds::sample_update_policy::sample_update_policy ()
```

Default constructor.

#### 4.913.3.2 sample\_update\_policy() [2/2]

```
__gnu_pbds::sample_update_policy::sample_update_policy (
 const sample_update_policy &)
```

Copy constructor.

### 4.913.4 Member Function Documentation

#### 4.913.4.1 operator()() [1/2]

```
metadata_type __gnu_pbds::sample_update_policy::operator() () const [protected]
```

Creates a metadata object.

#### 4.913.4.2 operator()() [2/2]

```
bool __gnu_pbds::sample_update_policy::operator() (
 metadata_reference) const [protected]
```

Decides whether a metadata object should be moved to the front of the list. A list-update based containers object will call this method to decide whether to move a node to the front of the list. The method should return true if the node should be moved to the front of the list.

#### 4.913.4.3 swap()

```
void __gnu_pbds::sample_update_policy::swap (
 sample_update_policy & other) [inline]
```

Swaps content.

The documentation for this struct was generated from the following file:

- [sample\\_update\\_policy.hpp](#)

#### 4.914 \_\_gnu\_parallel::sampling\_tag Struct Reference

Inheritance diagram for \_\_gnu\_parallel::sampling\_tag:

##### Public Member Functions

- **sampling\_tag** ([\\_ThreadIndex](#) \_\_num\_threads)
- [\\_ThreadIndex](#) **\_\_get\_num\_threads** ()
- void **set\_num\_threads** ([\\_ThreadIndex](#) \_\_num\_threads)

##### 4.914.1 Detailed Description

Forces parallel merging with exact splitting, at compile time.

Definition at line 118 of file tags.h.

##### 4.914.2 Member Function Documentation

###### 4.914.2.1 \_\_get\_num\_threads()

```
_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads () [inline], [inherited]
```

Find out desired number of threads.

##### Returns

Desired number of threads.

Definition at line 63 of file tags.h.

Referenced by `__gnu_parallel::__parallel_sort()`.

###### 4.914.2.2 set\_num\_threads()

```
void __gnu_parallel::parallel_tag::set_num_threads (
 _ThreadIndex __num_threads) [inline], [inherited]
```

Set the desired number of threads.

## Parameters

|                            |                            |
|----------------------------|----------------------------|
| <code>__num_threads</code> | Desired number of threads. |
|----------------------------|----------------------------|

Definition at line 73 of file `tags.h`.

The documentation for this struct was generated from the following file:

- [tags.h](#)

4.915 `std::scoped_allocator_adaptor<_OuterAlloc, _InnerAllocs>` Class Template Reference

Inherits `_OuterAlloc`.

## 4.919 `__gnu_pbds::detail::select_value_type< Key, Mapped >` Struct Template Reference

### Public Types

- typedef [std::pair](#)< const Key, Mapped > **type**

## 4.919.1 Detailed Description

```
template<typename Key, typename Mapped>
struct __gnu_pbds::detail::select_value_type< Key, Mapped >
```

Choose `value_type` to be a key/value pair or just a key.

Definition at line 107 of file `types_traits.hpp`.

The documentation for this struct was generated from the following file:

- [types\\_traits.hpp](#)

4.920 `__gnu_pbds::detail::select_value_type< Key, null_type >` Struct Template Reference

## Public Types

- typedef Key **type**

## 4.920.1 Detailed Description

```
template<typename Key>
struct __gnu_pbds::detail::select_value_type< Key, null_type >
```

Specialization for sets where the key is the `value_type`.

Definition at line 114 of file `types_traits.hpp`.

The documentation for this struct was generated from the following file:

- [types\\_traits.hpp](#)

4.921 `std::basic_istream< _CharT, _Traits >::sentry` Class Reference

## Public Types

- typedef `__istream_type::__ctype_type` **\_\_ctype\_type**
- typedef `_Traits::int_type` **\_\_int\_type**
- typedef `basic_istream< _CharT, _Traits >` **\_\_istream\_type**
- typedef `basic_streambuf< _CharT, _Traits >` **\_\_streambuf\_type**
- typedef `_Traits` **traits\_type**

## Public Member Functions

- [sentry](#) (`basic_istream< _CharT, _Traits > &__is`, `bool __noskipws=false`)
- [operator bool](#) () const

#### 4.921.1 Detailed Description

```
template<typename _CharT, typename _Traits>
class std::basic_istream< _CharT, _Traits >::sentry
```

Performs setup work for input streams.

Objects of this class are created before all of the standard extractors are run. It is responsible for *exception-safe prefix and suffix operations*, although only prefix actions are currently required by the standard.

Definition at line 686 of file istream.

#### 4.921.2 Member Typedef Documentation

##### 4.921.2.1 traits\_type

```
template<typename _CharT, typename _Traits>
typedef _Traits std::basic_istream< _CharT, _Traits >::sentry::traits_type
```

Easy access to dependent types.

Definition at line 693 of file istream.

#### 4.921.3 Constructor & Destructor Documentation

##### 4.921.3.1 sentry()

```
template<typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits >::sentry::sentry (
 basic_istream< _CharT, _Traits > & __is,
 bool __noskipws = false) [explicit]
```

The constructor performs all the work.

##### Parameters

|                         |                                       |
|-------------------------|---------------------------------------|
| <code>__is</code>       | The input stream to guard.            |
| <code>__noskipws</code> | Whether to consume whitespace or not. |

If the stream state is good (`__is.good()` is true), then the following actions are performed, otherwise the sentry state is false (*not okay*) and failbit is set in the stream state.

The sentry's preparatory actions are:

1. if the stream is tied to an output stream, `is.tie()->flush()` is called to synchronize the output sequence
2. if `__noskipws` is false, and `ios_base::skipws` is set in `is.flags()`, the sentry extracts and discards whitespace characters from the stream. The currently imbued locale is used to determine whether each character is whitespace.

If the stream state is still good, then the sentry state becomes true (*okay*).

Definition at line 47 of file `istream.tcc`.

References `std::basic_ios<_CharT, _Traits>::good()`, and `std::ios_base::goodbit`.

#### 4.921.4 Member Function Documentation

##### 4.921.4.1 `operator bool()`

```
template<typename _CharT, typename _Traits>
std::basic_istream<_CharT, _Traits>::sentry::operator bool () const [inline], [explicit]
```

Quick status checking.

##### Returns

The sentry state.

For ease of use, sentries may be converted to booleans. The return value is that of the sentry state (`true == okay`).

Definition at line 734 of file `istream`.

The documentation for this class was generated from the following files:

- [istream](#)
- [istream.tcc](#)

## 4.922 `std::basic_ostream<_CharT, _Traits>::sentry` Class Reference

### Public Member Functions

- [sentry](#) ([basic\\_ostream](#)<\_CharT, \_Traits> &\_\_os)
- [~sentry](#) ()
- [operator bool](#) () const

#### 4.922.1 Detailed Description

```
template<typename _CharT, typename _Traits>
class std::basic_ostream< _CharT, _Traits >::sentry
```

Performs setup work for output streams.

Objects of this class are created before all of the standard inserters are run. It is responsible for *exception-safe prefix and suffix operations*.

Definition at line 432 of file ostream.

#### 4.922.2 Constructor & Destructor Documentation

##### 4.922.2.1 sentry()

```
template<typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits >::sentry::sentry (
 basic_ostream< _CharT, _Traits > & __os) [explicit]
```

The constructor performs preparatory work.

##### Parameters

|                   |                             |
|-------------------|-----------------------------|
| <code>__os</code> | The output stream to guard. |
|-------------------|-----------------------------|

If the stream state is good (`__os.good()` is true), then if the stream is tied to another output stream, `is-<tie()->flush()` is called to synchronize the output sequences.

If the stream state is still good, then the sentry state becomes true (*okay*).

Definition at line 47 of file ostream.tcc.

References `std::ios_base::failbit`, `std::basic_ios< _CharT, _Traits >::good()`, `std::basic_ios< _CharT, _Traits >::setstate()`, and `std::basic_ios< _CharT, _Traits >::tie()`.

##### 4.922.2.2 ~sentry()

```
template<typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits >::sentry::~sentry () [inline]
```

Possibly flushes the stream.

If `ios_base::unitbuf` is set in `os.flags()`, and `std::uncaught_exception()` is true, the sentry destructor calls `flush()` on the output stream.

Definition at line 462 of file ostream.

## 4.922.3 Member Function Documentation

## 4.922.3.1 operator bool()

```
template<typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits >::sentry::operator bool () const [inline], [explicit]
```

Quick status checking.

**Returns**

The sentry state.

For ease of use, sentries may be converted to booleans. The return value is that of the sentry state (true == okay).

Definition at line 484 of file ostream.

The documentation for this class was generated from the following files:

- [ostream](#)
- [ostream.tcc](#)

## 4.923 \_\_gnu\_pbds::sequence\_tag Struct Reference

Inheritance diagram for \_\_gnu\_pbds::sequence\_tag:

#### 4.923.1 Detailed Description

Basic sequence.

Definition at line 129 of file tag\_and\_trait.hpp.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

#### 4.924 \_\_gnu\_parallel::sequential\_tag Struct Reference

##### 4.924.1 Detailed Description

Forces sequential execution at compile time.

Definition at line 42 of file tags.h.

The documentation for this struct was generated from the following file:

- [tags.h](#)

#### 4.925 std::set<\_Key, \_Compare, \_Alloc> Class Template Reference

`bool operator== (const set< _K1, _C1, _A1 > &, const set< _K1, _C1, _A1 > &)`

## 4.925.1 Detailed Description

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
class std::set< _Key, _Compare, _Alloc >
```

A standard container made up of unique keys, which can be retrieved in logarithmic time.

## Template Parameters

|                       |                                                                              |
|-----------------------|------------------------------------------------------------------------------|
| <code>_Key</code>     | Type of key objects.                                                         |
| <code>_Compare</code> | Comparison function object type, defaults to <code>less&lt;_Key&gt;</code> . |
| <code>_Alloc</code>   | Allocator type, defaults to <code>allocator&lt;_Key&gt;</code> .             |

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using unique keys).

Sets support bidirectional iterators.

The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (\*\_unique versus \*\_equal, same as the standard).

Definition at line 70 of file `stl_multiset.h`.

## 4.925.2 Member Typedef Documentation

## 4.925.2.1 allocator\_type

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
typedef _Alloc std::set< _Key, _Compare, _Alloc >::allocator_type
```

Public typedefs.

Definition at line 124 of file `stl_set.h`.

#### 4.925.2.2 `const_iterator`

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
typedef _Rep_type::const_iterator std::set< _Key, _Compare, _Alloc >::const_iterator
```

Iterator-related typedefs.

Definition at line 148 of file `stl_set.h`.

#### 4.925.2.3 `const_pointer`

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
typedef _Alloc_traits::const_pointer std::set< _Key, _Compare, _Alloc >::const_pointer
```

Iterator-related typedefs.

Definition at line 141 of file `stl_set.h`.

#### 4.925.2.4 `const_reference`

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
typedef _Alloc_traits::const_reference std::set< _Key, _Compare, _Alloc >::const_reference
```

Iterator-related typedefs.

Definition at line 143 of file `stl_set.h`.

#### 4.925.2.5 `const_reverse_iterator`

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
typedef _Rep_type::const_reverse_iterator std::set< _Key, _Compare, _Alloc >::const_reverse_iterator
```

Iterator-related typedefs.

Definition at line 150 of file `stl_set.h`.

#### 4.925.2.6 difference\_type

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
typedef _Rep_type::difference_type std::set< _Key, _Compare, _Alloc >::difference_type
```

Iterator-related typedefs.

Definition at line 152 of file stl\_set.h.

#### 4.925.2.7 iterator

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
typedef _Rep_type::const_iterator std::set< _Key, _Compare, _Alloc >::iterator
```

Iterator-related typedefs.

Definition at line 147 of file stl\_set.h.

#### 4.925.2.8 key\_compare

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
typedef _Compare std::set< _Key, _Compare, _Alloc >::key_compare
```

Public typedefs.

Definition at line 122 of file stl\_set.h.

#### 4.925.2.9 key\_type

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
typedef _Key std::set< _Key, _Compare, _Alloc >::key_type
```

Public typedefs.

Definition at line 109 of file stl\_set.h.

#### 4.925.2.10 pointer

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
typedef _Alloc_traits::pointer std::set< _Key, _Compare, _Alloc >::pointer
```

Iterator-related typedefs.

Definition at line 140 of file stl\_set.h.

#### 4.925.2.11 reference

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
typedef _Alloc_traits::reference std::set< _Key, _Compare, _Alloc >::reference
```

Iterator-related typedefs.

Definition at line 142 of file stl\_set.h.

#### 4.925.2.12 reverse\_iterator

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
typedef _Rep_type::const_reverse_iterator std::set< _Key, _Compare, _Alloc >::reverse_iterator
```

Iterator-related typedefs.

Definition at line 149 of file stl\_set.h.

#### 4.925.2.13 size\_type

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
typedef _Rep_type::size_type std::set< _Key, _Compare, _Alloc >::size_type
```

Iterator-related typedefs.

Definition at line 151 of file stl\_set.h.

## 4.925.2.14 value\_compare

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
typename _Compare std::set< _Key, _Compare, _Alloc >::value_compare
```

Public typedefs.

Definition at line 123 of file stl\_set.h.

## 4.925.2.15 value\_type

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
typename _Key std::set< _Key, _Compare, _Alloc >::value_type
```

Public typedefs.

Definition at line 121 of file stl\_set.h.

## 4.925.3 Constructor &amp; Destructor Documentation

## 4.925.3.1 set() [1/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set () [default]
```

Default constructor creates no elements.

## 4.925.3.2 set() [2/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
 const _Compare & __comp,
 const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Creates a set with no elements.

Parameters

|                     |                      |
|---------------------|----------------------|
| <code>__comp</code> | Comparator to use.   |
| <code>__a</code>    | An allocator object. |

Definition at line 176 of file `stl_set.h`.

#### 4.925.3.3 `set()` [3/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator >
std::set< _Key, _Compare, _Alloc >::set (
 _InputIterator __first,
 _InputIterator __last) [inline]
```

Builds a set from a range.

##### Parameters

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

Create a set consisting of copies of the elements from `[__first,__last)`. This is linear in  $N$  if the range is already sorted, and  $N\log N$  otherwise (where  $N$  is `distance(__first,__last)`).

Definition at line 191 of file `stl_set.h`.

#### 4.925.3.4 `set()` [4/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator >
std::set< _Key, _Compare, _Alloc >::set (
 _InputIterator __first,
 _InputIterator __last,
 const _Compare & __comp,
 const allocator_type & __a = allocator_type()) [inline]
```

Builds a set from a range.

##### Parameters

|                      |                       |
|----------------------|-----------------------|
| <code>__first</code> | An input iterator.    |
| <code>__last</code>  | An input iterator.    |
| <code>__comp</code>  | A comparison functor. |
| <code>__a</code>     | An allocator object.  |

Create a set consisting of copies of the elements from `[__first,__last)`. This is linear in  $N$  if the range is already sorted, and  $N\log N$  otherwise (where  $N$  is `distance(__first,__last)`).

Definition at line 208 of file stl\_set.h.

#### 4.925.3.5 set() [5/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
 const set< _Key, _Compare, _Alloc > &) [default]
```

Set copy constructor.

Whether the allocator is copied depends on the allocator traits.

#### 4.925.3.6 set() [6/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
 set< _Key, _Compare, _Alloc > &&) [default]
```

Set move constructor

The newly-created set contains the exact contents of the moved instance. The moved instance is a valid, but unspecified, set.

#### 4.925.3.7 set() [7/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
 initializer_list< value_type > __l,
 const _Compare & __comp = _Compare(),
 const allocator_type & __a = allocator_type()) [inline]
```

Builds a set from an initializer\_list.

##### Parameters

|                     |                       |
|---------------------|-----------------------|
| <code>__l</code>    | An initializer_list.  |
| <code>__comp</code> | A comparison functor. |
| <code>__a</code>    | An allocator object.  |

Create a set consisting of copies of the elements in the list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is `__l.size()`).

Definition at line 243 of file stl\_set.h.

**4.925.3.8 set()** [8/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
 const allocator_type & __a) [inline], [explicit]
```

Allocator-extended default constructor.

Definition at line 251 of file stl\_set.h.

**4.925.3.9 set()** [9/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
 const set< _Key, _Compare, _Alloc > & __x,
 const allocator_type & __a) [inline]
```

Allocator-extended copy constructor.

Definition at line 255 of file stl\_set.h.

**4.925.3.10 set()** [10/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
 set< _Key, _Compare, _Alloc > && __x,
 const allocator_type & __a) [inline], [noexcept]
```

Allocator-extended move constructor.

Definition at line 259 of file stl\_set.h.

**4.925.3.11 set()** [11/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
 initializer_list< value_type > __l,
 const allocator_type & __a) [inline]
```

Allocator-extended initializer-list constructor.

Definition at line 265 of file stl\_set.h.

## 4.925.3.12 set() [12/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator >
std::set< _Key, _Compare, _Alloc >::set (
 _InputIterator __first,
 _InputIterator __last,
 const allocator_type & __a) [inline]
```

Allocator-extended range constructor.

Definition at line 271 of file stl\_set.h.

## 4.925.3.13 ~set()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::~set () [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

## 4.925.4 Member Function Documentation

## 4.925.4.1 begin()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set< _Key, _Compare, _Alloc >::begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

Definition at line 344 of file stl\_set.h.

## 4.925.4.2 cbegin()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set< _Key, _Compare, _Alloc >::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

Definition at line 381 of file stl\_set.h.

#### 4.925.4.3 cend()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::set< _Key, _Compare, _Alloc >::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

Definition at line 390 of file stl\_set.h.

#### 4.925.4.4 clear()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
void std::set< _Key, _Compare, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in a set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 733 of file stl\_set.h.

#### 4.925.4.5 count() [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
size_type std::set< _Key, _Compare, _Alloc >::count (
 const key_type & __x) const [inline]
```

Finds the number of elements.

##### Parameters

|                  |                     |
|------------------|---------------------|
| <code>__x</code> | Element to located. |
|------------------|---------------------|

##### Returns

Number of elements with specified key.

This function only makes sense for multisets; for set the result will either be 0 (not present) or 1 (present).

Definition at line 748 of file stl\_set.h.

## 4.925.4.6 count() [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::set< _Key, _Compare, _Alloc >::count (
 const _Kt & __x) const -> decltype(_M_t._M_count_tr(__x)) [inline]
```

Finds the number of elements.

## Parameters

|                  |                     |
|------------------|---------------------|
| <code>__x</code> | Element to located. |
|------------------|---------------------|

## Returns

Number of elements with specified key.

This function only makes sense for multisets; for set the result will either be 0 (not present) or 1 (present).

Definition at line 754 of file stl\_set.h.

## 4.925.4.7 crbegin()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::set< _Key, _Compare, _Alloc >::crbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

Definition at line 399 of file stl\_set.h.

## 4.925.4.8 crend()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::set< _Key, _Compare, _Alloc >::crend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

Definition at line 408 of file stl\_set.h.

## 4.925.4.9 emplace()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename... _Args>
std::pair<iterator, bool> std::set< _Key, _Compare, _Alloc >::emplace (
 _Args &&... __args) [inline]
```

Attempts to build and insert an element into the set.

**Parameters**

|                     |                                        |
|---------------------|----------------------------------------|
| <code>__args</code> | Arguments used to generate an element. |
|---------------------|----------------------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to build and insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.

Insertion requires logarithmic time.

Definition at line 462 of file `stl_set.h`.

**4.925.4.10 `emplace_hint()`**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename... _Args>
iterator std::set<_Key, _Compare, _Alloc>::emplace_hint (
 const_iterator __pos,
 _Args &&... __args) [inline]
```

Attempts to insert an element into the set.

**Parameters**

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__args</code> | Arguments used to generate the element to be inserted.                        |

**Returns**

An iterator that points to the element with key equivalent to the one generated from `__args` (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 488 of file `stl_set.h`.

## 4.925.4.11 empty()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
bool std::set< _Key, _Compare, _Alloc >::empty () const [inline], [noexcept]
```

Returns true if the set is empty.

Definition at line 414 of file stl\_set.h.

## 4.925.4.12 end()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set< _Key, _Compare, _Alloc >::end () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

Definition at line 353 of file stl\_set.h.

## 4.925.4.13 equal\_range() [1/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::pair<iterator, iterator> std::set< _Key, _Compare, _Alloc >::equal_range (
 const key_type & __x) [inline]
```

Finds a subsequence matching given key.

## Parameters

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

## Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
 c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 898 of file stl\_set.h.

**4.925.4.14** `equal_range()` [2/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::pair<const_iterator, const_iterator> std::set<_Key, _Compare, _Alloc >::equal_range (
 const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_X</code> |                    |

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
 c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 902 of file `stl_set.h`.

**4.925.4.15** `equal_range()` [3/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::set<_Key, _Compare, _Alloc >::equal_range (
 const _Kt & __x) -> decltype(pair<iterator, iterator>(_M_t._M_equal_range_tr(__x)))
[inline]
```

Finds a subsequence matching given key.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_X</code> |                    |

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
 c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 908 of file stl\_set.h.

#### 4.925.4.16 equal\_range() [4/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::set< _Key, _Compare, _Alloc >::equal_range (
 const _Kt & __x) const -> decltype(pair<iterator, iterator>(_M_t._M_equal_range_
tr(__x))) [inline]
```

Finds a subsequence matching given key.

##### Parameters

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

##### Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
 c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 914 of file stl\_set.h.

#### 4.925.4.17 erase() [1/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
_GLIBCXX_ABI_TAG_CXX11 iterator std::set< _Key, _Compare, _Alloc >::erase (
 const_iterator __position) [inline]
```

Erases an element from a set.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 654 of file `stl_set.h`.

**4.925.4.18 erase()** [2/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
size_type std::set< _Key, _Compare, _Alloc >::erase (
 const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

|                                    |                              |
|------------------------------------|------------------------------|
| <code>↵</code><br><code>__x</code> | Key of element to be erased. |
|------------------------------------|------------------------------|

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 684 of file `stl_set.h`.

**4.925.4.19 erase()** [3/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
_GLIBCXX_ABI_TAG_CXX11 iterator std::set< _Key, _Compare, _Alloc >::erase (
 const_iterator __first,
 const_iterator __last) [inline]
```

Erases a [`__first`,`__last`) range of elements from a set.

## Parameters

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

## Returns

The iterator `__last`.

This function erases a sequence of elements from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 706 of file `stl_set.h`.

## 4.925.4.20 find() [1/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::set< _Key, _Compare, _Alloc >::find (
 const key_type & __x) [inline]
```

Tries to locate an element in a set.

## Parameters

|                  |                        |
|------------------|------------------------|
| <code>↵</code>   | Element to be located. |
| <code>__x</code> |                        |

## Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 794 of file `stl_set.h`.

## 4.925.4.21 find() [2/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
const_iterator std::set< _Key, _Compare, _Alloc >::find (
 const key_type & __x) const [inline]
```

Tries to locate an element in a set.

**Parameters**

|                 |                        |
|-----------------|------------------------|
| <code>_↔</code> | Element to be located. |
| <code>_X</code> |                        |

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 798 of file `stl_set.h`.

**4.925.4.22 find()** [3/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
template<typename _Kt >
auto std::set< _Key, _Compare, _Alloc >::find (
 const _Kt & __x) -> decltype(iterator [inline]
```

Tries to locate an element in a set.

**Parameters**

|                 |                        |
|-----------------|------------------------|
| <code>_↔</code> | Element to be located. |
| <code>_X</code> |                        |

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 804 of file `stl_set.h`.

**4.925.4.23 find()** [4/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
template<typename _Kt >
auto std::set< _Key, _Compare, _Alloc >::find (
 const _Kt & __x) const -> decltype(const_iterator [inline]
```

Tries to locate an element in a set.

## Parameters

|                 |                        |
|-----------------|------------------------|
| <code>_↵</code> | Element to be located. |
| <code>_X</code> |                        |

## Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 810 of file `stl_set.h`.

## 4.925.4.24 get\_allocator()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
allocator_type std::set< _Key, _Compare, _Alloc >::get_allocator () const [inline], [noexcept]
```

Returns the allocator object with which the set was constructed.

Definition at line 335 of file `stl_set.h`.

## 4.925.4.25 insert() [1/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
std::pair<iterator, bool> std::set< _Key, _Compare, _Alloc >::insert (
 const value_type & __x) [inline]
```

Attempts to insert an element into the set.

## Parameters

|                 |                         |
|-----------------|-------------------------|
| <code>_↵</code> | Element to be inserted. |
| <code>_X</code> |                         |

## Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.

Insertion requires logarithmic time.

Definition at line 509 of file `stl_set.h`.

References `std::pair<_T1, _T2>::first`, and `std::pair<_T1, _T2>::second`.

Referenced by `std::set<_Key, _Compare, _Alloc>::insert()`.

#### 4.925.4.26 `insert()` [2/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set<_Key, _Compare, _Alloc>::insert (
 const_iterator __position,
 const value_type & __x) [inline]
```

Attempts to insert an element into the set.

##### Parameters

|                         |                                                                               |
|-------------------------|-------------------------------------------------------------------------------|
| <code>__position</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>        | Element to be inserted.                                                       |

##### Returns

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 546 of file `stl_set.h`.

#### 4.925.4.27 `insert()` [3/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator >
void std::set<_Key, _Compare, _Alloc>::insert (
 _InputIterator __first,
 _InputIterator __last) [inline]
```

A template function that attempts to insert a range of elements.

## Parameters

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

Definition at line 566 of file stl\_set.h.

## 4.925.4.28 insert() [4/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
void std::set< _Key, _Compare, _Alloc >::insert (
 initializer_list< value_type > __l) [inline]
```

Attempts to insert a list of elements into the set.

## Parameters

|                |                                                                 |
|----------------|-----------------------------------------------------------------|
| <code>↔</code> | A std::initializer_list<value_type> of elements to be inserted. |
| <code>↔</code> |                                                                 |
| <code>↔</code> |                                                                 |
| <code>↔</code> |                                                                 |
| <code>/</code> |                                                                 |

Complexity similar to that of the range constructor.

Definition at line 578 of file stl\_set.h.

References std::set< \_Key, \_Compare, \_Alloc >::insert().

## 4.925.4.29 key\_comp()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
key_compare std::set< _Key, _Compare, _Alloc >::key_comp () const [inline]
```

Returns the comparison object with which the set was constructed.

Definition at line 327 of file stl\_set.h.

## 4.925.4.30 lower\_bound() [1/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set< _Key, _Compare, _Alloc >::lower_bound (
 const key_type & __x) [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_X</code> |                    |

**Returns**

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 829 of file `stl_set.h`.

**4.925.4.31 lower\_bound()** [2/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
const_iterator std::set< _Key, _Compare, _Alloc >::lower_bound (
 const key_type & __x) const [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_X</code> |                    |

**Returns**

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 833 of file `stl_set.h`.

**4.925.4.32 lower\_bound()** [3/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
template<typename _Kt >
auto std::set< _Key, _Compare, _Alloc >::lower_bound (
 const _Kt & __x) -> decltype(iterator(_M_t._M_lower_bound_tr(__x))) [inline]
```

Finds the beginning of a subsequence matching given key.

## Parameters

|                   |                    |
|-------------------|--------------------|
| $\leftrightarrow$ | Key to be located. |
| $\_x$             |                    |

## Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 839 of file stl\_set.h.

## 4.925.4.33 lower\_bound() [4/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<
_Key>>
template<typename _Kt >
auto std::set< _Key, _Compare, _Alloc >::lower_bound (
 const _Kt & __x) const -> decltype(const_iterator(_M_t._M_lower_bound_tr(__x)))
[inline]
```

Finds the beginning of a subsequence matching given key.

## Parameters

|                   |                    |
|-------------------|--------------------|
| $\leftrightarrow$ | Key to be located. |
| $\_x$             |                    |

## Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 845 of file stl\_set.h.

## 4.925.4.34 max\_size()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<
_Key>>
size_type std::set< _Key, _Compare, _Alloc >::max_size () const [inline], [noexcept]
```

Returns the maximum size of the set.

Definition at line 424 of file stl\_set.h.

**4.925.4.35 operator=()** [1/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
set& std::set< _Key, _Compare, _Alloc >::operator= (
 const set< _Key, _Compare, _Alloc > &) [default]
```

Set assignment operator.

Whether the allocator is copied depends on the allocator traits.

**4.925.4.36 operator=()** [2/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
set& std::set< _Key, _Compare, _Alloc >::operator= (
 set< _Key, _Compare, _Alloc > &&) [default]
```

Move assignment operator.

**4.925.4.37 operator=()** [3/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
set& std::set< _Key, _Compare, _Alloc >::operator= (
 initializer_list< value_type > __l) [inline]
```

Set list assignment operator.

**Parameters**

|    |                      |
|----|----------------------|
| ↵  | An initializer_list. |
| _↵ |                      |
| ↵  |                      |
| _↵ |                      |
| /  |                      |

This function fills a set with copies of the elements in the initializer list \_\_l.

Note that the assignment completely changes the set and that the resulting set's size is the same as the number of elements assigned.

Definition at line 316 of file stl\_set.h.

## 4.925.4.38 rbegin()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
reverse_iterator std::set< _Key, _Compare, _Alloc >::rbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

Definition at line 362 of file stl\_set.h.

## 4.925.4.39 rend()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
reverse_iterator std::set< _Key, _Compare, _Alloc >::rend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

Definition at line 371 of file stl\_set.h.

## 4.925.4.40 size()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
size_type std::set< _Key, _Compare, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the set.

Definition at line 419 of file stl\_set.h.

## 4.925.4.41 swap()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
void std::set< _Key, _Compare, _Alloc >::swap (
 set< _Key, _Compare, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another set.

## Parameters

|                  |                                                |
|------------------|------------------------------------------------|
| <code>__x</code> | A set of the same element and allocator types. |
|------------------|------------------------------------------------|

This exchanges the elements between two sets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

Definition at line 441 of file `stl_set.h`.

#### 4.925.4.42 `upper_bound()` [1/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::set< _Key, _Compare, _Alloc >::upper_bound (
 const key_type & __x) [inline]
```

Finds the end of a subsequence matching given key.

##### Parameters

|                  |                    |
|------------------|--------------------|
| <code>↵</code>   | Key to be located. |
| <code>__x</code> |                    |

##### Returns

Iterator pointing to the first element greater than key, or `end()`.

Definition at line 859 of file `stl_set.h`.

#### 4.925.4.43 `upper_bound()` [2/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
const_iterator std::set< _Key, _Compare, _Alloc >::upper_bound (
 const key_type & __x) const [inline]
```

Finds the end of a subsequence matching given key.

##### Parameters

|                  |                    |
|------------------|--------------------|
| <code>↵</code>   | Key to be located. |
| <code>__x</code> |                    |

##### Returns

Iterator pointing to the first element greater than key, or `end()`.

Definition at line 863 of file stl\_set.h.

#### 4.925.4.44 upper\_bound() [3/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::set< _Key, _Compare, _Alloc >::upper_bound (
 const _Kt & __x) -> decltype(iterator(_M_t._M_upper_bound_tr(__x))) [inline]
```

Finds the end of a subsequence matching given key.

##### Parameters

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_X</code> |                    |

##### Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 869 of file stl\_set.h.

#### 4.925.4.45 upper\_bound() [4/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::set< _Key, _Compare, _Alloc >::upper_bound (
 const _Kt & __x) const -> decltype(iterator(_M_t._M_upper_bound_tr(__x))) [inline]
```

Finds the end of a subsequence matching given key.

##### Parameters

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_X</code> |                    |

##### Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 875 of file stl\_set.h.

4.925.4.46 `value_comp()`

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
value_compare std::set< _Key, _Compare, _Alloc >::value_comp () const [inline]
```

Returns the comparison object with which the set was constructed.

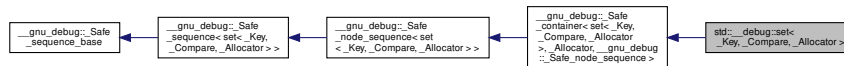

Definition at line 331 of file `stl_set.h`.

#### 4.926.1 Detailed Description

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Allocator = std::allocator<_Key>>
class std::__debug::set< _Key, _Compare, _Allocator >
```

Class std::set with safety/checking/debug instrumentation.

Definition at line 44 of file set.h.

#### 4.926.2 Member Function Documentation

##### 4.926.2.1 \_M\_detach\_all()

```
void __gnu_debug::_Safe_sequence_base::_M_detach_all () [protected], [inherited]
```

Detach all iterators, leaving them singular.

Referenced by \_\_gnu\_debug::\_Safe\_sequence\_base::~~\_Safe\_sequence\_base().

##### 4.926.2.2 \_M\_detach\_singular()

```
void __gnu_debug::_Safe_sequence_base::_M_detach_singular () [protected], [inherited]
```

Detach all singular iterators.

##### Postcondition

for all iterators i attached to this sequence, i->\_M\_version == \_M\_version.

##### 4.926.2.3 \_M\_get\_mutex()

```
__gnu_cxx::__mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex () throw () [protected],
[inherited]
```

For use in \_Safe\_sequence.

Referenced by \_\_gnu\_debug::\_Safe\_sequence< map< \_Key, \_Tp, \_Compare, \_Allocator > >::\_M\_transfer\_from\_if().

#### 4.926.2.4 `_M_invalidate_all()`

```
void __gnu_debug::_Safe_sequence_base::_M_invalidate_all () const [inline], [protected], [inherited]
```

Invalidates all iterators.

Definition at line 256 of file `safe_base.h`.

References `__gnu_debug::_Safe_sequence_base::_M_version`.

#### 4.926.2.5 `_M_invalidate_if()`

```
void __gnu_debug::_Safe_sequence< set< _Key, _Compare, _Allocator > >::_M_invalidate_if (
 _Predicate __pred) [inherited]
```

Invalidates all iterators `x` that reference this sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

Definition at line 38 of file `safe_sequence.tcc`.

#### 4.926.2.6 `_M_revalidate_singular()`

```
void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular () [protected], [inherited]
```

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

#### 4.926.2.7 `_M_swap()`

```
void __gnu_debug::_Safe_sequence_base::_M_swap (
 _Safe_sequence_base & __x) [protected], [noexcept], [inherited]
```

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

#### 4.926.2.8 `_M_transfer_from_if()`

```
void __gnu_debug::_Safe_sequence< set< _Key, _Compare, _Allocator > >::_M_transfer_from_if (
 _Safe_sequence< set< _Key, _Compare, _Allocator > > & __from,
 _Predicate __pred) [inherited]
```

Transfers all iterators `x` that reference `from` sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

Definition at line 69 of file `safe_sequence.tcc`.

### 4.926.3 Member Data Documentation

#### 4.926.3.1 \_M\_const\_iterators

`_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_iterators` [inherited]

The list of constant iterators that reference this container.

Definition at line 197 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

#### 4.926.3.2 \_M\_iterators

`_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators` [inherited]

The list of mutable iterators that reference this container.

Definition at line 194 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

#### 4.926.3.3 \_M\_version

`unsigned int __gnu_debug::_Safe_sequence_base::_M_version` [mutable], [inherited]

The container version number. This number may never be 0.

Definition at line 200 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence_base::_M_invalidate_all()`.

## 4.927.1 Detailed Description

```
template<typename _Res>
class std::shared_future<_Res>
```

Primary template for shared\_future.

Definition at line 128 of file future.

## 4.927.2 Member Typedef Documentation

4.927.2.1 [\\_Ptr](#)

```
template<typename _Res>
using std::__future_base::_Ptr = unique_ptr<_Res, _Result_base::_Deleter> [inherited]
```

A [unique\\_ptr](#) for result objects.

Definition at line 223 of file future.

### 4.927.3 Constructor & Destructor Documentation

#### 4.927.3.1 `shared_future()` [1/3]

```
template<typename _Res >
std::shared_future< _Res >::shared_future (
 const shared_future< _Res > & __sf) [inline], [noexcept]
```

Copy constructor.

Definition at line 910 of file future.

#### 4.927.3.2 `shared_future()` [2/3]

```
template<typename _Res >
std::shared_future< _Res >::shared_future (
 future< _Res > && __uf) [inline], [noexcept]
```

Construct from a future rvalue.

Definition at line 913 of file future.

#### 4.927.3.3 `shared_future()` [3/3]

```
template<typename _Res >
std::shared_future< _Res >::shared_future (
 shared_future< _Res > && __sf) [inline], [noexcept]
```

Construct from a shared\_future rvalue.

Definition at line 918 of file future.

### 4.927.4 Member Function Documentation

#### 4.927.4.1 `_M_get_result()`

```
template<typename _Res>
__result_type std::__basic_future< _Res >::_M_get_result () const [inline], [protected], [inherited]
```

Wait for the state to be ready and rethrow any stored exception.

Definition at line 725 of file future.

## 4.927.4.2 get()

```
template<typename _Res >
const _Res& std::shared_future<_Res >::get () const [inline]
```

Retrieving the value.

Definition at line 936 of file future.

### 4.928.1 Detailed Description

```
template<typename _Res>
class std::shared_future< _Res & >
```

Partial specialization for `shared_future`<R&>

Definition at line 941 of file future.

## 4.928.2 Member Typedef Documentation

### 4.928.2.1 \_Ptr

```
template<typename _Res >
using std::__future_base::_Ptr = unique_ptr<_Res, _Result_base::_Deleter> [inherited]
```

A unique\_ptr for result objects.

Definition at line 223 of file future.

## 4.928.3 Constructor & Destructor Documentation

### 4.928.3.1 shared\_future() [1/3]

```
template<typename _Res >
std::shared_future<_Res & >::shared_future (
 const shared_future<_Res & > & __sf) [inline]
```

Copy constructor.

Definition at line 949 of file future.

### 4.928.3.2 shared\_future() [2/3]

```
template<typename _Res >
std::shared_future<_Res & >::shared_future (
 future<_Res & > && __uf) [inline], [noexcept]
```

Construct from a future rvalue.

Definition at line 952 of file future.

### 4.928.3.3 shared\_future() [3/3]

```
template<typename _Res >
std::shared_future<_Res & >::shared_future (
 shared_future<_Res & > && __sf) [inline], [noexcept]
```

Construct from a shared\_future rvalue.

Definition at line 957 of file future.

#### 4.928.4 Member Function Documentation

##### 4.928.4.1 `_M_get_result()`

```
__result_type std::__basic_future< _Res & >::_M_get_result () const [inline], [protected],
[inherited]
```

Wait for the state to be ready and rethrow any stored exception.

Definition at line 725 of file future.

##### 4.928.4.2 `get()`

```
template<typename _Res >
_Res& std::shared_future< _Res & >::get () const [inline]
```

Retrieving the value.

Definition at line 975 of file future.

#### 4.931.1 Detailed Description

```
template<typename _Tp>
class std::shared_ptr< _Tp >
```

A smart pointer with reference-counted copy semantics.

A shared\_ptr object is either empty or *owns* a pointer passed to the constructor. Copies of a shared\_ptr share ownership of the same pointer. When the last shared\_ptr that owns the pointer is destroyed or reset, the owned pointer is freed (either by delete or by invoking a custom deleter that was passed to the constructor).

A shared\_ptr also stores another pointer, which is usually (but not always) the same pointer as it owns. The stored pointer can be retrieved by calling the get () member function.

The equality and relational operators for shared\_ptr only compare the stored pointer returned by get (), not the owned pointer. To test whether two shared\_ptr objects share ownership of the same pointer see std::shared\_ptr::owner\_before and std::owner\_less.

Definition at line 121 of file bits/shared\_ptr.h.

## 4.931.2 Member Typedef Documentation

### 4.931.2.1 element\_type

```
template<typename _Tp>
using std::shared_ptr< _Tp >::element_type = typename __shared_ptr<_Tp>::element_type
```

The type pointed to by the stored pointer, remove\_extent\_t<\_Tp>

Definition at line 136 of file bits/shared\_ptr.h.

## 4.931.3 Constructor & Destructor Documentation

### 4.931.3.1 shared\_ptr() [1/13]

```
template<typename _Tp>
constexpr std::shared_ptr< _Tp >::shared_ptr () [inline], [noexcept]
```

Construct an empty shared\_ptr.

#### Postcondition

use\_count()==0 && get()==0

Definition at line 147 of file bits/shared\_ptr.h.

### 4.931.3.2 shared\_ptr() [2/13]

```
template<typename _Tp>
std::shared_ptr< _Tp >::shared_ptr (
 const shared_ptr< _Tp > &) [default], [noexcept]
```

Copy constructor.

### 4.931.3.3 shared\_ptr() [3/13]

```
template<typename _Tp>
template<typename _Yp , typename = _Constructible<_Yp*>>
std::shared_ptr< _Tp >::shared_ptr (
 _Yp * __p) [inline], [explicit]
```

Construct a shared\_ptr that owns the pointer \_\_p.

## Parameters

|                          |                                                 |
|--------------------------|-------------------------------------------------|
| $\leftrightarrow$<br>__p | A pointer that is convertible to element_type*. |
|--------------------------|-------------------------------------------------|

## Postcondition

use\_count() == 1 && get() == \_\_p

## Exceptions

|                    |                                  |
|--------------------|----------------------------------|
| std::bad_alloc, in | which case delete __p is called. |
|--------------------|----------------------------------|

Definition at line 159 of file bits/shared\_ptr.h.

## 4.931.3.4 shared\_ptr() [4/13]

```
template<typename _Tp>
template<typename _Yp , typename _Deleter , typename = _Constructible<_Yp*, _Deleter>>
std::shared_ptr< _Tp >::shared_ptr (
 _Yp * __p,
 _Deleter __d) [inline]
```

Construct a shared\_ptr that owns the pointer \_\_p and the deleter \_\_d.

## Parameters

|                          |            |
|--------------------------|------------|
| $\leftrightarrow$<br>__p | A pointer. |
| $\leftrightarrow$<br>__d | A deleter. |

## Postcondition

use\_count() == 1 && get() == \_\_p

## Exceptions

|                    |                                |
|--------------------|--------------------------------|
| std::bad_alloc, in | which case __d(__p) is called. |
|--------------------|--------------------------------|

Requirements: \_Deleter's copy constructor and destructor must not throw

\_\_shared\_ptr will release \_\_p by calling \_\_d(\_\_p)

Definition at line 176 of file bits/shared\_ptr.h.

#### 4.931.3.5 shared\_ptr() [5/13]

```
template<typename _Tp>
template<typename _Deleter >
std::shared_ptr< _Tp >::shared_ptr (
 nullptr_t __p,
 _Deleter __d) [inline]
```

Construct a shared\_ptr that owns a null pointer and the deleter \_\_d.

##### Parameters

|                          |                          |
|--------------------------|--------------------------|
| $\leftrightarrow$<br>__p | A null pointer constant. |
| $\leftrightarrow$<br>__d | A deleter.               |

##### Postcondition

use\_count() == 1 && get() == \_\_p

##### Exceptions

|                            |                                |
|----------------------------|--------------------------------|
| <i>std::bad_alloc</i> , in | which case __d(__p) is called. |
|----------------------------|--------------------------------|

Requirements: \_Deleter's copy constructor and destructor must not throw

The last owner will call \_\_d(\_\_p)

Definition at line 193 of file bits/shared\_ptr.h.

#### 4.931.3.6 shared\_ptr() [6/13]

```
template<typename _Tp>
template<typename _Yp , typename _Deleter , typename _Alloc , typename = _Constructible<_Yp*, \leftrightarrow
_Deleter, _Alloc>>
std::shared_ptr< _Tp >::shared_ptr (
 _Yp * __p,
 _Deleter __d,
 _Alloc __a) [inline]
```

Construct a shared\_ptr that owns the pointer \_\_p and the deleter \_\_d.

## Parameters

|                  |               |
|------------------|---------------|
| <code>__p</code> | A pointer.    |
| <code>__d</code> | A deleter.    |
| <code>__a</code> | An allocator. |

## Postcondition

`use_count() == 1 && get() == __p`

## Exceptions

|                                  |                                             |
|----------------------------------|---------------------------------------------|
| <code>std::bad_alloc</code> , in | which case <code>__d(__p)</code> is called. |
|----------------------------------|---------------------------------------------|

Requirements: `_Deleter`'s copy constructor and destructor must not throw `_Alloc`'s copy constructor and destructor must not throw.

`__shared_ptr` will release `__p` by calling `__d(__p)`

Definition at line 213 of file `bits/shared_ptr.h`.

4.931.3.7 `shared_ptr()` [7/13]

```
template<typename _Tp>
template<typename _Deleter , typename _Alloc >
std::shared_ptr<_Tp>::shared_ptr (
 nullptr_t __p,
 _Deleter __d,
 _Alloc __a) [inline]
```

Construct a `shared_ptr` that owns a null pointer and the deleter `__d`.

## Parameters

|                  |                          |
|------------------|--------------------------|
| <code>__p</code> | A null pointer constant. |
| <code>__d</code> | A deleter.               |
| <code>__a</code> | An allocator.            |

**Postcondition**

```
use_count() == 1 && get() == __p
```

**Exceptions**

|                                  |                                             |
|----------------------------------|---------------------------------------------|
| <code>std::bad_alloc</code> , in | which case <code>__d(__p)</code> is called. |
|----------------------------------|---------------------------------------------|

Requirements: `_Deleter`'s copy constructor and destructor must not throw `_Alloc`'s copy constructor and destructor must not throw.

The last owner will call `__d(__p)`

Definition at line 232 of file `bits/shared_ptr.h`.

**4.931.3.8 shared\_ptr()** [8/13]

```
template<typename _Tp>
template<typename _Yp >
std::shared_ptr< _Tp >::shared_ptr (
 const shared_ptr< _Yp > & __r,
 element_type * __p) [inline], [noexcept]
```

Constructs a `shared_ptr` instance that stores `__p` and shares ownership with `__r`.

**Parameters**

|                  |                                                                    |
|------------------|--------------------------------------------------------------------|
| <code>__r</code> | A <code>shared_ptr</code> .                                        |
| <code>__p</code> | A pointer that will remain valid while <code>*__r</code> is valid. |

**Postcondition**

```
get() == __p && use_count() == __r.use_count()
```

This can be used to construct a `shared_ptr` to a sub-object of an object managed by an existing `shared_ptr`. The complete object will remain valid while any `shared_ptr` owns it, even if they don't store a pointer to the complete object.

```
shared_ptr<pair<int,int>> pii(new pair<int,int>());
shared_ptr<int> pi(pii, &pii->first);
assert(pii.use_count() == 2);
```

Definition at line 256 of file `bits/shared_ptr.h`.

## 4.931.3.9 shared\_ptr() [9/13]

```
template<typename _Tp>
template<typename _Yp , typename = _Constructible<const shared_ptr<_Yp>&>>
std::shared_ptr<_Tp>::shared_ptr (
 const shared_ptr<_Yp> & __r) [inline], [noexcept]
```

If `__r` is empty, constructs an empty `shared_ptr`; otherwise construct a `shared_ptr` that shares ownership with `__r`.

## Parameters

|          |               |
|----------|---------------|
| ↩        | A shared_ptr. |
| __↩      |               |
| ↩        |               |
| __↩      |               |
| <i>r</i> |               |

## Postcondition

`get() == __r.get() && use_count() == __r.use_count()`

Definition at line 295 of file `bits/shared_ptr.h`.

## 4.931.3.10 shared\_ptr() [10/13]

```
template<typename _Tp>
std::shared_ptr<_Tp>::shared_ptr (
 shared_ptr<_Tp> && __r) [inline], [noexcept]
```

Move-constructs a `shared_ptr` instance from `__r`.

## Parameters

|          |                      |
|----------|----------------------|
| ↩        | A shared_ptr rvalue. |
| __↩      |                      |
| ↩        |                      |
| __↩      |                      |
| <i>r</i> |                      |

## Postcondition

\*this contains the old value of `__r`, `__r` is empty.

Definition at line 303 of file `bits/shared_ptr.h`.

**4.931.3.11** `shared_ptr()` [11/13]

```
template<typename _Tp>
template<typename _Yp , typename = _Constructible<shared_ptr<_Yp>>>
std::shared_ptr< _Tp >::shared_ptr (
 shared_ptr< _Yp > && __r) [inline], [noexcept]
```

Move-constructs a `shared_ptr` instance from `__r`.

**Parameters**

|          |                                   |
|----------|-----------------------------------|
| ↩        | A <code>shared_ptr</code> rvalue. |
| ↩        |                                   |
| ↩        |                                   |
| ↩        |                                   |
| <i>r</i> |                                   |

**Postcondition**

\*this contains the old value of `__r`, `__r` is empty.

Definition at line 312 of file `bits/shared_ptr.h`.

**4.931.3.12** `shared_ptr()` [12/13]

```
template<typename _Tp>
template<typename _Yp , typename = _Constructible<const weak_ptr<_Yp>&>>
std::shared_ptr< _Tp >::shared_ptr (
 const weak_ptr< _Yp > & __r) [inline], [explicit]
```

Constructs a `shared_ptr` that shares ownership with `__r` and stores a copy of the pointer stored in `__r`.

**Parameters**

|          |                           |
|----------|---------------------------|
| ↩        | A <code>weak_ptr</code> . |
| ↩        |                           |
| ↩        |                           |
| ↩        |                           |
| <i>r</i> |                           |

**Postcondition**

`use_count() == __r.use_count()`

**Exceptions**

|                     |                                                                                |
|---------------------|--------------------------------------------------------------------------------|
| <i>bad_weak_ptr</i> | when <code>__r.expired()</code> , in which case the constructor has no effect. |
|---------------------|--------------------------------------------------------------------------------|

Definition at line 324 of file bits/shared\_ptr.h.

#### 4.931.3.13 shared\_ptr() [13/13]

```
template<typename _Tp>
constexpr std::shared_ptr< _Tp >::shared_ptr (
 nullptr_t) [inline], [noexcept]
```

Construct an empty shared\_ptr.

##### Postcondition

use\_count() == 0 && get() == nullptr

Definition at line 356 of file bits/shared\_ptr.h.

#### 4.931.4 Member Function Documentation

##### 4.931.4.1 get()

```
template<typename _Tp, _Lock_policy _Lp>
element_type* std::__shared_ptr< _Tp, _Lp >::get (
 void) const [inline], [noexcept], [inherited]
```

Return the stored pointer.

Definition at line 1324 of file shared\_ptr\_base.h.

##### 4.931.4.2 operator bool()

```
template<typename _Tp, _Lock_policy _Lp>
std::__shared_ptr< _Tp, _Lp >::operator bool () const [inline], [explicit], [inherited]
```

Return true if the stored pointer is not null.

Definition at line 1328 of file shared\_ptr\_base.h.

**4.931.4.3 owner\_before()** [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
template<typename _Tp1 >
bool std::__shared_ptr< _Tp, _Lp >::owner_before (
 __shared_ptr< _Tp1, _Lp > const & __rhs) const [inline], [noexcept], [inherited]
```

Define an ordering based on ownership.

This function defines a strict weak ordering between two `shared_ptr` or `weak_ptr` objects, such that one object is less than the other unless they share ownership of the same pointer, or are both empty.

Definition at line 1358 of file `shared_ptr_base.h`.

**4.931.4.4 owner\_before()** [2/2]

```
template<typename _Tp, _Lock_policy _Lp>
template<typename _Tp1 >
bool std::__shared_ptr< _Tp, _Lp >::owner_before (
 __weak_ptr< _Tp1, _Lp > const & __rhs) const [inline], [noexcept], [inherited]
```

Define an ordering based on ownership.

This function defines a strict weak ordering between two `shared_ptr` or `weak_ptr` objects, such that one object is less than the other unless they share ownership of the same pointer, or are both empty.

Definition at line 1363 of file `shared_ptr_base.h`.

**4.931.4.5 swap()**

```
template<typename _Tp, _Lock_policy _Lp>
void std::__shared_ptr< _Tp, _Lp >::swap (
 __shared_ptr< _Tp, _Lp > & __other) [inline], [noexcept], [inherited]
```

Exchange both the owned pointer and the stored pointer.

Definition at line 1343 of file `shared_ptr_base.h`.

**4.931.4.6 unique()**

```
template<typename _Tp, _Lock_policy _Lp>
bool std::__shared_ptr< _Tp, _Lp >::unique () const [inline], [noexcept], [inherited]
```

Return true if `use_count() == 1`.

Definition at line 1333 of file `shared_ptr_base.h`.

## 4.931.4.7 use\_count()

```
template<typename _Tp, _Lock_policy _Lp>
long std::__shared_ptr< _Tp, _Lp >::use_count () const [inline], [noexcept], [inherited]
```

If \*this owns a pointer, return the number of owners, otherwise zero.

Definition at line 1338 of file shared\_ptr\_base.h.

#### 4.933.1 Detailed Description

```
template<typename _RandomNumberEngine, size_t __k>
class std::shuffle_order_engine< _RandomNumberEngine, __k >
```

Produces random numbers by combining random numbers from some base engine to produce random numbers with a specifies number of bits \_\_k.

Definition at line 1324 of file random.h.

#### 4.933.2 Member Typedef Documentation

##### 4.933.2.1 result\_type

```
template<typename _RandomNumberEngine, size_t __k>
typedef _RandomNumberEngine::result_type std::shuffle_order_engine< _RandomNumberEngine, __k >↔
::result_type
```

The type of the generated random value.

Definition at line 1327 of file random.h.

#### 4.933.3 Constructor & Destructor Documentation

##### 4.933.3.1 shuffle\_order\_engine() [1/5]

```
template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine () [inline]
```

Constructs a default shuffle\_order\_engine engine.

The underlying engine is default constructed as well.

Definition at line 1344 of file random.h.

##### 4.933.3.2 shuffle\_order\_engine() [2/5]

```
template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
 const _RandomNumberEngine & __rng) [inline], [explicit]
```

Copy constructs a shuffle\_order\_engine engine.

Copies an existing base class random number generator.

**Parameters**

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__rng</code> | An existing (base class) engine object. |
|--------------------|-----------------------------------------|

Definition at line 1355 of file random.h.

**4.933.3.3 shuffle\_order\_engine()** [3/5]

```
template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
 _RandomNumberEngine && __rng) [inline], [explicit]
```

Move constructs a shuffle\_order\_engine engine.

Copies an existing base class random number generator.

**Parameters**

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__rng</code> | An existing (base class) engine object. |
|--------------------|-----------------------------------------|

Definition at line 1366 of file random.h.

**4.933.3.4 shuffle\_order\_engine()** [4/5]

```
template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
 result_type __s) [inline], [explicit]
```

Seed constructs a shuffle\_order\_engine engine.

Constructs the underlying generator engine seeded with \_\_s.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__s</code> | A seed value for the base class engine. |
|------------------|-----------------------------------------|

Definition at line 1377 of file random.h.

**4.933.3.5 shuffle\_order\_engine()** [5/5]

```
template<typename _RandomNumberEngine, size_t __k>
template<typename _Sseq , typename = _If_seed_seq<_Sseq>>
```

```
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
 _Sseq & __q) [inline], [explicit]
```

Generator construct a shuffle\_order\_engine engine.

#### Parameters

|                   |                  |
|-------------------|------------------|
| $\leftrightarrow$ | A seed sequence. |
| $q$               |                  |

Definition at line 1388 of file random.h.

### 4.933.4 Member Function Documentation

#### 4.933.4.1 base()

```
template<typename _RandomNumberEngine, size_t __k>
const _RandomNumberEngine& std::shuffle_order_engine< _RandomNumberEngine, __k >::base () const
[inline], [noexcept]
```

Gets a const reference to the underlying generator engine object.

Definition at line 1431 of file random.h.

#### 4.933.4.2 discard()

```
template<typename _RandomNumberEngine, size_t __k>
void std::shuffle_order_engine< _RandomNumberEngine, __k >::discard (
 unsigned long long __z) [inline]
```

Discard a sequence of random numbers.

Definition at line 1452 of file random.h.

#### 4.933.4.3 max()

```
template<typename _RandomNumberEngine, size_t __k>
static constexpr result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::max () [inline],
[static]
```

Gets the maximum value in the generated random number range.

Definition at line 1445 of file random.h.

References std::max().

#### 4.933.4.4 min()

```
template<typename _RandomNumberEngine, size_t __k>
static constexpr result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::min () [inline],
[static]
```

Gets the minimum value in the generated random number range.

Definition at line 1438 of file random.h.

References std::min().

#### 4.933.4.5 operator()()

```
template<typename _RandomNumberEngine , size_t __k>
shuffle_order_engine< _RandomNumberEngine, __k >::result_type std::shuffle_order_engine< _↵
RandomNumberEngine, __k >::operator() ()
```

Gets the next value in the generated random number sequence.

Definition at line 810 of file bits/random.tcc.

#### 4.933.4.6 seed() [1/3]

```
template<typename _RandomNumberEngine, size_t __k>
void std::shuffle_order_engine< _RandomNumberEngine, __k >::seed () [inline]
```

Reseeds the shuffle\_order\_engine object with the default seed for the underlying base class generator engine.

Definition at line 1397 of file random.h.

#### 4.933.4.7 seed() [2/3]

```
template<typename _RandomNumberEngine, size_t __k>
void std::shuffle_order_engine< _RandomNumberEngine, __k >::seed (
 result_type __s) [inline]
```

Reseeds the shuffle\_order\_engine object with the default seed for the underlying base class generator engine.

Definition at line 1408 of file random.h.

#### 4.933.4.8 seed() [3/3]

```
template<typename _RandomNumberEngine, size_t __k>
template<typename _Sseq >
_If_seed_seq<_Sseq> std::shuffle_order_engine< _RandomNumberEngine, __k >::seed (
 _Sseq & __q) [inline]
```

Reseeds the shuffle\_order\_engine object with the given seed sequence.

## Parameters

|                  |                            |
|------------------|----------------------------|
| <code>__q</code> | A seed generator function. |
|------------------|----------------------------|

Definition at line 1421 of file random.h.

## 4.933.5 Friends And Related Function Documentation

## 4.933.5.1 operator&lt;&lt;

```
template<typename _RandomNumberEngine, size_t __k>
template<typename _RandomNumberEngine1, size_t __k1, typename _CharT, typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
 std::basic_ostream< _CharT, _Traits > & __os,
 const std::shuffle_order_engine< _RandomNumberEngine1, __k1 > & __x) [friend]
```

Inserts the current state of a shuffle\_order\_engine random number generator engine \_\_x into the output stream \_\_os.

## Parameters

|                   |                                                        |
|-------------------|--------------------------------------------------------|
| <code>__os</code> | An output stream.                                      |
| <code>__x</code>  | A shuffle_order_engine random number generator engine. |

## Returns

The output stream with the state of \_\_x inserted or in an error state.

## 4.933.5.2 operator==

```
template<typename _RandomNumberEngine, size_t __k>
bool operator== (
 const shuffle_order_engine< _RandomNumberEngine, __k > & __lhs,
 const shuffle_order_engine< _RandomNumberEngine, __k > & __rhs) [friend]
```

Compares two shuffle\_order\_engine random number generator objects of the same type for equality.

## Parameters

|                    |                                                              |
|--------------------|--------------------------------------------------------------|
| <code>__lhs</code> | A shuffle_order_engine random number generator object.       |
| <code>__rhs</code> | Another shuffle_order_engine random number generator object. |

**Returns**

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 1476 of file random.h.

**4.933.5.3 operator>>**

```
template<typename _RandomNumberEngine, size_t __k>
template<typename _RandomNumberEngine1, size_t __k1, typename _CharT, typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
 std::basic_istream<_CharT, _Traits > & __is,
 std::shuffle_order_engine<_RandomNumberEngine1, __k1 > & __x) [friend]
```

Extracts the current state of a % subtract\_with\_carry\_engine random number generator engine \_\_x from the input stream \_\_is.

**Parameters**

|                                                                                           |                                                        |
|-------------------------------------------------------------------------------------------|--------------------------------------------------------|
| <br>__is | An input stream.                                       |
| <br>__x  | A shuffle_order_engine random number generator engine. |

**Returns**

The input stream with the state of \_\_x extracted or in an error state.

The documentation for this class was generated from the following files:

- [random.h](#)
- [bits/random.tcc](#)

**4.934 std::slice Class Reference****Public Member Functions**

- [slice](#) ()
- [slice](#) (size\_t \_\_o, size\_t \_\_d, size\_t \_\_s)
- size\_t [size](#) () const
- size\_t [start](#) () const
- size\_t [stride](#) () const

## 4.934.1 Detailed Description

Class defining one-dimensional subset of an array.

The slice class represents a one-dimensional subset of an array, specified by three parameters: start offset, size, and stride. The start offset is the index of the first element of the array that is part of the subset. The size is the total number of elements in the subset. Stride is the distance between each successive array element to include in the subset.

For example, with an array of size 10, and a slice with offset 1, size 3 and stride 2, the subset consists of array elements 1, 3, and 5.

Definition at line 59 of file `slice_array.h`.

The documentation for this class was generated from the following file:

- [slice\\_array.h](#)

#### Friends

- class [valarray](#)< \_Tp >

#### 4.935.1 Detailed Description

```
template<typename _Tp>
class std::slice_array< _Tp >
```

Reference to one-dimensional subset of an array.

A slice\_array is a reference to the actual elements of an array specified by a slice. The way to get a slice\_array is to call operator[] (slice) on a valarray. The returned slice\_array then permits carrying operations out on the referenced subset of elements in the original valarray. For example, operator+=(valarray) will add values to the subset of elements in the underlying valarray this slice\_array refers to.

#### Parameters

|           |               |
|-----------|---------------|
| <i>Tp</i> | Element type. |
|-----------|---------------|

Definition at line 91 of file valarray.

### 4.937.1 Detailed Description

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
class __gnu_pbds::detail::splay_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >
```

Splay tree.

Definition at line 107 of file splay\_tree\_.hpp.

### 4.937.2 Member Function Documentation

#### 4.937.2.1 node\_begin() [1/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename
_Alloc >
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __↵
gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_↵
begin () const [inline], [inherited]
```

Returns a const node\_iterator corresponding to the node at the root of the tree.

Definition at line 111 of file bin\_search\_tree\_.hpp.

#### 4.937.2.2 node\_begin() [2/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename
_Alloc >
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_↵
pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_begin
() [inline], [inherited]
```

Returns a node\_iterator corresponding to the node at the root of the tree.

Definition at line 119 of file bin\_search\_tree\_.hpp.

#### 4.937.2.3 `node_end()` [1/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename
_Alloc >
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __↵
gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_↵
end () const [inline], [inherited]
```

Returns a const `node_iterator` corresponding to a node just after a leaf of the tree.

Definition at line 127 of file `bin_search_tree_.hpp`.

#### 4.937.2.4 `node_end()` [2/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename
_Alloc >
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_↵
pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end (
) [inline], [inherited]
```

Returns a `node_iterator` corresponding to a node just after a leaf of the tree.

Definition at line 135 of file `bin_search_tree_.hpp`.

The documentation for this class was generated from the following file:

- [splay\\_tree\\_.hpp](#)

### 4.940.1 Detailed Description

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
class std::stack<_Tp, _Sequence >
```

A standard container giving FILO behavior.

#### Template Parameters

|                        |                                                                          |
|------------------------|--------------------------------------------------------------------------|
| <code>_Tp</code>       | Type of element.                                                         |
| <code>_Sequence</code> | Type of underlying sequence, defaults to <code>deque&lt;_Tp&gt;</code> . |

Meets many of the requirements of a [container](#), but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-last-out stack behavior.

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::deque`, but it can be any type that supports `back`, `push_back`, and `pop_back`, such as `std::list`, `std::vector`, or an appropriate user-defined type.

Members not found in *normal* containers are `container_type`, which is a typedef for the second `Sequence` parameter, and `push`, `pop`, and `top`, which are standard stack/FILO operations.

Definition at line 99 of file `stl_stack.h`.

### 4.940.2 Constructor & Destructor Documentation

#### 4.940.2.1 `stack()`

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<is_default_constructible<↔
_Seq>::value>::type>
std::stack<_Tp, _Sequence >::stack () [inline]
```

Default constructor creates no elements.

Definition at line 162 of file `stl_stack.h`.

### 4.940.3 Member Function Documentation

#### 4.940.3.1 empty()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
bool std::stack<_Tp, _Sequence >::empty () const [inline]
```

Returns true if the stack is empty.

Definition at line 199 of file stl\_stack.h.

#### 4.940.3.2 pop()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::stack<_Tp, _Sequence >::pop () [inline]
```

Removes first element.

This is a typical stack operation. It shrinks the stack by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop() is called.

Definition at line 272 of file stl\_stack.h.

#### 4.940.3.3 push()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::stack<_Tp, _Sequence >::push (
 const value_type & __x) [inline]
```

Add data to the top of the stack.

##### Parameters

|                                                                                        |                   |
|----------------------------------------------------------------------------------------|-------------------|
|  _x | Data to be added. |
|----------------------------------------------------------------------------------------|-------------------|

This is a typical stack operation. The function creates an element at the top of the stack and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

Definition at line 239 of file stl\_stack.h.

#### 4.940.3.4 size()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
size_type std::stack<_Tp, _Sequence >::size () const [inline]
```

Returns the number of elements in the stack.

Definition at line 204 of file `stl_stack.h`.

#### 4.940.3.5 top() [1/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
reference std::stack<_Tp, _Sequence >::top () [inline]
```

Returns a read/write reference to the data at the first element of the stack.

Definition at line 212 of file `stl_stack.h`.

#### 4.940.3.6 top() [2/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
const_reference std::stack<_Tp, _Sequence >::top () const [inline]
```

Returns a read-only (constant) reference to the data at the first element of the stack.

Definition at line 223 of file `stl_stack.h`.

The documentation for this class was generated from the following file:

## 4.941.1 Detailed Description

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
class __gnu_cxx::stdio_filebuf<_CharT, _Traits>
```

Provides a layer of compatibility for C/POSIX.

This GNU extension provides extensions for working with standard C FILE\*'s and POSIX file descriptors. It must be instantiated by the user with the type of character used in the file stream, e.g., `stdio_filebuf<char>`.

Definition at line 50 of file `stdio_filebuf.h`.

## 4.941.2 Constructor &amp; Destructor Documentation

**4.941.2.1 stdio\_filebuf()** [1/3]

```
template<typename _CharT , typename _Traits = std::char_traits<_CharT>>
__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf () [inline]
```

deferred initialization

Definition at line 65 of file `stdio_filebuf.h`.

**4.941.2.2 stdio\_filebuf()** [2/3]

```
template<typename _CharT , typename _Traits >
__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf (
 int __fd,
 std::ios_base::openmode __mode,
 size_t __size = static_cast<size_t>(BUFSIZ))
```

**Parameters**

|                     |                                                         |
|---------------------|---------------------------------------------------------|
| <code>__fd</code>   | An open file descriptor.                                |
| <code>__mode</code> | Same meaning as in a standard filebuf.                  |
| <code>__size</code> | Optimal or preferred size of internal buffer, in chars. |

This constructor associates a file stream buffer with an open POSIX file descriptor. The file descriptor will be automatically closed when the `stdio_filebuf` is closed/destroyed.

Definition at line 137 of file `stdio_filebuf.h`.

**4.941.2.3 stdio\_filebuf()** [3/3]

```
template<typename _CharT , typename _Traits >
__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf (
 std::__c_file * __f,
 std::ios_base::openmode __mode,
 size_t __size = static_cast<size_t>(BUFSIZ))
```

**Parameters**

|                     |                                                                                                    |
|---------------------|----------------------------------------------------------------------------------------------------|
| <code>__f</code>    | An open <code>FILE*</code> .                                                                       |
| <code>__mode</code> | Same meaning as in a standard filebuf.                                                             |
| <code>__size</code> | Optimal or preferred size of internal buffer, in chars. Defaults to system's <code>BUFSIZ</code> . |

This constructor associates a file stream buffer with an open C `FILE*`. The `FILE*` will not be automatically closed when the `stdio_filebuf` is closed/destroyed.

Definition at line 153 of file `stdio_filebuf.h`.

#### 4.941.2.4 `~stdio_filebuf()`

```
template<typename _CharT, typename _Traits>
__gnu_cxx::stdio_filebuf<_CharT, _Traits>::~~stdio_filebuf () [virtual]
```

Closes the external data stream if the file descriptor constructor was used.

Definition at line 132 of file `stdio_filebuf.h`.

### 4.941.3 Member Function Documentation

#### 4.941.3.1 `_M_create_pback()`

```
template<typename _CharT, typename _Traits>
void std::basic_filebuf<_CharT, _Traits>::_M_create_pback () [inline], [protected], [inherited]
```

Initializes pback buffers, and moves normal buffers to safety. Assumptions: `_M_in_cur` has already been moved back

Definition at line 199 of file `fstream`.

#### 4.941.3.2 `_M_destroy_pback()`

```
template<typename _CharT, typename _Traits>
void std::basic_filebuf<_CharT, _Traits>::_M_destroy_pback () throw () [inline], [protected],
[inherited]
```

Deactivates pback buffer contents, and restores normal buffer. Assumptions: The pback buffer has only moved forward.

Definition at line 216 of file `fstream`.

#### 4.941.3.3 `_M_set_buffer()`

```
template<typename _CharT, typename _Traits>
void std::basic_filebuf<_CharT, _Traits>::_M_set_buffer (
 streamsize __off) [inline], [protected], [inherited]
```

This function sets the pointers of the internal buffer, both get and put areas. Typically:

`__off == egptr() - eback()` upon underflow/uflow (**read** mode); `__off == 0` upon overflow (**write** mode); `__off == -1` upon open, setbuf, seekoff/pos (**uncommitted** mode).

NB: `egptr() - pbase() == _M_buf_size - 1`, since `_M_buf_size` reflects the actual allocated memory and the last cell is reserved for the overflow char of a full put area.

Definition at line 459 of file `fstream`.

Referenced by `std::basic_filebuf<char_type, traits_type>::close()`.

#### 4.941.3.4 close()

```
template<typename _CharT, typename _Traits >
basic_filebuf< _CharT, _Traits >::__filebuf_type * std::basic_filebuf< _CharT, _Traits >::close
() [inherited]
```

Closes the currently associated file.

##### Returns

`this` on success, NULL on failure

If no file is currently open, this function immediately fails.

If a *put buffer area* exists, `overflow(eof)` is called to flush all the characters. The file is then closed.

If any operations fail, this function also fails.

Definition at line 250 of file `fstream.tcc`.

#### 4.941.3.5 eback()

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::eback () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Definition at line 489 of file `streambuf`.

#### 4.941.3.6 egptr()

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::egptr () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Definition at line 495 of file `streambuf`.

#### 4.941.3.7 epptr()

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf<_CharT, _Traits>::epptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Definition at line 542 of file streambuf.

#### 4.941.3.8 fd()

```
template<typename _CharT , typename _Traits = std::char_traits<_CharT>>
int __gnu_cxx::stdio_filebuf<_CharT, _Traits>::fd () [inline]
```

##### Returns

The underlying file descriptor.

Once associated with an external data stream, this function can be used to access the underlying POSIX file descriptor. Note that there is no way for the library to track what you do with the descriptor, so be careful.

Definition at line 118 of file stdio\_filebuf.h.

#### 4.941.3.9 file()

```
template<typename _CharT , typename _Traits = std::char_traits<_CharT>>
std::__c_file* __gnu_cxx::stdio_filebuf<_CharT, _Traits>::file () [inline]
```

##### Returns

The underlying FILE\*.

This function can be used to access the underlying "C" file pointer. Note that there is no way for the library to track what you do with the file, so be careful.

Definition at line 128 of file stdio\_filebuf.h.

#### 4.941.3.10 gbump()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf<_CharT, _Traits>::gbump (
 int __n) [inline], [protected], [inherited]
```

Moving the read position.

**Parameters**

|                 |                             |
|-----------------|-----------------------------|
| <code>_↵</code> | The delta by which to move. |
| <code>_n</code> |                             |

This just advances the read position without returning any data.

Definition at line 505 of file streambuf.

**4.941.3.11 getloc()**

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf< _CharT, _Traits >::getloc () const [inline], [inherited]
```

Locale access.

**Returns**

The current locale in effect.

If pubimbue(loc) has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.

Definition at line 233 of file streambuf.

**4.941.3.12 gptr()**

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::gptr () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Definition at line 492 of file streambuf.

**4.941.3.13 imbue()**

```
template<typename _CharT , typename _Traits >
void std::basic_filebuf< _CharT, _Traits >::imbue (
 const locale & __loc) [protected], [virtual], [inherited]
```

Changes translations.

## Parameters

|                    |               |
|--------------------|---------------|
| <code>__loc</code> | A new locale. |
|--------------------|---------------|

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

## Note

Base class version does nothing.

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits>](#).

Definition at line 1030 of file fstream.tcc.

## 4.941.3.14 in\_avail()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::in_avail () [inline], [inherited]
```

Looking ahead into the stream.

## Returns

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

Definition at line 291 of file streambuf.

## 4.941.3.15 is\_open()

```
template<typename _CharT, typename _Traits>
bool std::basic_filebuf<_CharT, _Traits>::is_open () const throw () [inline], [inherited]
```

Returns true if the external file is open.

Definition at line 265 of file fstream.

## 4.941.3.16 open() [1/2]

```
template<typename _CharT, typename _Traits>
basic_filebuf<_CharT, _Traits>::__filebuf_type * std::basic_filebuf<_CharT, _Traits>::open (
 const char * __s,
 ios_base::openmode __mode) [inherited]
```

Opens an external file.

## Parameters

|                     |                       |
|---------------------|-----------------------|
| <code>__s</code>    | The name of the file. |
| <code>__mode</code> | The open mode flags.  |

## Returns

`this` on success, `NULL` on failure

If a file is already open, this function immediately fails. Otherwise it tries to open the file named `__s` using the flags given in `__mode`.

Table 92, adapted here, gives the relation between openmode combinations and the equivalent `fopen()` flags. (NB: lines `app`, `in|out|app`, `in|app`, `binary|app`, `binary|in|out|app`, and `binary|in|app` per DR 596)

| ios_base Flag combination |    |     |       |     | stdio equivalent |
|---------------------------|----|-----|-------|-----|------------------|
| binary                    | in | out | trunc | app |                  |
|                           |    | +   |       |     | w                |
|                           |    | +   |       | +   | a                |
|                           |    |     |       | +   | a                |
|                           |    | +   | +     |     | w                |
|                           | +  |     |       |     | r                |
|                           | +  | +   |       |     | r+               |
|                           | +  | +   | +     |     | w+               |
|                           | +  | +   |       | +   | a+               |
|                           | +  |     |       | +   | a+               |
| +                         |    | +   |       |     | wb               |
| +                         |    | +   |       | +   | ab               |
| +                         |    |     |       | +   | ab               |
| +                         |    | +   | +     |     | wb               |
| +                         | +  |     |       |     | rb               |
| +                         | +  | +   |       |     | r+b              |
| +                         | +  | +   | +     |     | w+b              |
| +                         | +  | +   |       | +   | a+b              |
| +                         | +  |     |       | +   | a+b              |

Definition at line 180 of file `fstream.tcc`.

Referenced by `std::basic_filebuf< char_type, traits_type >::open()`.

4.941.3.17 `open()` [2/2]

```
template<typename _CharT, typename _Traits>
__filebuf_type* std::basic_filebuf< _CharT, _Traits >::open (
 const std::string & __s,
 ios_base::openmode __mode) [inline], [inherited]
```

Opens an external file.

## Parameters

|                     |                       |
|---------------------|-----------------------|
| <code>__s</code>    | The name of the file. |
| <code>__mode</code> | The open mode flags.  |

## Returns

`this` on success, `NULL` on failure

Definition at line 331 of file `fstream`.

4.941.3.18 `overflow()`

```
template<typename _CharT , typename _Traits >
basic_filebuf< _CharT, _Traits >::int_type std::basic_filebuf< _CharT, _Traits >::overflow (
 int_type __c = _Traits::eof()) [protected], [virtual], [inherited]
```

Consumes data from the buffer; writes to the controlled sequence.

## Parameters

|                  |                                     |
|------------------|-------------------------------------|
| <code>__c</code> | An additional character to consume. |
|------------------|-------------------------------------|

## Returns

`eof()` to indicate failure, something else (usually `__c`, or `not_eof()`)

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character `c` is also written out, if `__c` is not `eof()`.

For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.

A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

## Note

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

Definition at line 542 of file `fstream.tcc`.

4.941.3.19 `pbackfail()`

```
template<typename _CharT , typename _Traits >
basic_filebuf< _CharT, _Traits >::int_type std::basic_filebuf< _CharT, _Traits >::pbackfail (
 int_type __c = _Traits::eof()) [protected], [virtual], [inherited]
```

Tries to back up the input sequence.

**Parameters**

|                 |                                                      |
|-----------------|------------------------------------------------------|
| <code>_c</code> | The character to be inserted back into the sequence. |
|-----------------|------------------------------------------------------|

**Returns**

`eof()` on failure, *some other value* on success

**Postcondition**

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits>](#).

Definition at line 483 of file `fstream.tcc`.

**4.941.3.20 pbase()**

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf<_CharT, _Traits>::pbase () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `eptr()` returns the end pointer for the output sequence

Definition at line 536 of file `streambuf`.

**4.941.3.21 pbump()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf<_CharT, _Traits>::pbump (
 int __n) [inline], [protected], [inherited]
```

Moving the write position.

## Parameters

|                 |                             |
|-----------------|-----------------------------|
| <code>_↵</code> | The delta by which to move. |
| <code>_n</code> |                             |

This just advances the write position without returning any data.

Definition at line 552 of file `streambuf`.

4.941.3.22 `pptr()`

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf<_CharT, _Traits>::pptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

Definition at line 539 of file `streambuf`.

4.941.3.23 `pubimbue()`

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf<_CharT, _Traits>::pubimbue (
 const locale & __loc) [inline], [inherited]
```

Entry point for `imbue()`.

## Parameters

|                    |                 |
|--------------------|-----------------|
| <code>__loc</code> | The new locale. |
|--------------------|-----------------|

## Returns

The previous locale.

Calls the derived `imbue(__loc)`.

Definition at line 216 of file `streambuf`.

#### 4.941.3.24 pubseekoff()

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekoff (
 off_type __off,
 ios_base::seekdir __way,
 ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

##### Parameters

|                     |                                             |
|---------------------|---------------------------------------------|
| <code>__off</code>  | Offset.                                     |
| <code>__way</code>  | Value for <code>ios_base::seekdir</code> .  |
| <code>__mode</code> | Value for <code>ios_base::openmode</code> . |

Calls virtual seekoff function.

Definition at line 258 of file streambuf.

#### 4.941.3.25 pubseekpos()

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekpos (
 pos_type __sp,
 ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

##### Parameters

|                     |                                             |
|---------------------|---------------------------------------------|
| <code>__sp</code>   | Position                                    |
| <code>__mode</code> | Value for <code>ios_base::openmode</code> . |

Calls virtual seekpos function.

Definition at line 270 of file streambuf.

#### 4.941.3.26 pubsetbuf()

```
template<typename _CharT, typename _Traits>
basic_streambuf* std::basic_streambuf< _CharT, _Traits >::pubsetbuf (
 char_type * __s,
 streamsize __n) [inline], [inherited]
```

Entry points for derived buffer functions.

The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.

Definition at line 246 of file `streambuf`.

#### 4.941.3.27 `pubsync()`

```
template<typename _CharT, typename _Traits>
int std::basic_streambuf<_CharT, _Traits>::pubsync () [inline], [inherited]
```

Calls virtual sync function.

Definition at line 278 of file `streambuf`.

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::sync()`.

#### 4.941.3.28 `sbumpc()`

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sbumpc () [inline], [inherited]
```

Getting the next character.

#### Returns

The next character, or `eof`.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `uflow()`.

Definition at line 323 of file `streambuf`.

#### 4.941.3.29 `seekoff()`

```
template<typename _CharT, typename _Traits>
basic_filebuf<_CharT, _Traits>::pos_type std::basic_filebuf<_CharT, _Traits>::seekoff (
 off_type,
 ios_base::seekdir,
 ios_base::openmode = ios_base::in | ios_base::out) [protected], [virtual], [inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

#### Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

Definition at line 833 of file `fstream.tcc`.

**4.941.3.30 seekpos()**

```
template<typename _CharT , typename _Traits >
basic_filebuf< _CharT, _Traits >::pos_type std::basic_filebuf< _CharT, _Traits >::seekpos (
 pos_type ,
 ios_base::openmode = ios_base::in | ios_base::out) [protected], [virtual], [inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

**Note**

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from `std::basic_streambuf< _CharT, _Traits >`.

Definition at line 893 of file `fstream.tcc`.

**4.941.3.31 setbuf()**

```
template<typename _CharT , typename _Traits >
basic_filebuf< _CharT, _Traits >::__streambuf_type * std::basic_filebuf< _CharT, _Traits >↵
::setbuf (
 char_type * __s,
 streamsize __n) [protected], [virtual], [inherited]
```

Manipulates the buffer.

**Parameters**

|                        |                            |
|------------------------|----------------------------|
| <code>↵<br/>__s</code> | Pointer to a buffer area.  |
| <code>↵<br/>__n</code> | Size of <code>__s</code> . |

**Returns**

`this`

If no file has been opened, and both `__s` and `__n` are zero, then the stream becomes unbuffered. Otherwise, `__s` is used as a buffer; see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.↵html#io.streambuf.buffering> for more.

Reimplemented from `std::basic_streambuf< _CharT, _Traits >`.

Definition at line 804 of file `fstream.tcc`.

## 4.941.3.32 setg()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf<_CharT, _Traits>::setg (
 char_type * __gbeg,
 char_type * __gnext,
 char_type * __gend) [inline], [protected], [inherited]
```

Setting the three read area pointers.

## Parameters

|                      |            |
|----------------------|------------|
| <code>__gbeg</code>  | A pointer. |
| <code>__gnext</code> | A pointer. |
| <code>__gend</code>  | A pointer. |

## Postcondition

`__gbeg == eback()`, `__gnext == gptr()`, and `__gend == egptr()`

Definition at line 516 of file streambuf.

## 4.941.3.33 setp()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf<_CharT, _Traits>::setp (
 char_type * __pbeg,
 char_type * __pend) [inline], [protected], [inherited]
```

Setting the three write area pointers.

## Parameters

|                     |            |
|---------------------|------------|
| <code>__pbeg</code> | A pointer. |
| <code>__pend</code> | A pointer. |

## Postcondition

`__pbeg == pbase()`, `__pbeg == pptr()`, and `__pend == epptr()`

Definition at line 562 of file streambuf.

**4.941.3.34 sgetc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sgetc () [inline], [inherited]
```

Getting the next character.

**Returns**

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.

Definition at line 345 of file `streambuf`.

**4.941.3.35 sgetn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::sgetn (
 char_type * __s,
 streamsize __n) [inline], [inherited]
```

Entry point for `xsgetn`.

**Parameters**

|                  |                |
|------------------|----------------|
| <code>__s</code> | A buffer area. |
| <code>__n</code> | A count.       |

Returns `xsgetn(__s,__n)`. The effect is to fill `__s[0]` through `__s[__n-1]` with characters from the input sequence, if possible.

Definition at line 364 of file `streambuf`.

**4.941.3.36 showmanyc()**

```
template<typename _CharT , typename _Traits >
streamsize std::basic_filebuf< _CharT, _Traits >::showmanyc () [protected], [virtual], [inherited]
```

Investigating the data available.

**Returns**

An estimate of the number of characters available in the input sequence, or -1.

*If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been supplied. If `showmanyc()` returns -1, then calls to `underflow()` or `uflow()` will fail.* [27.5.2.4.3]/1

**Note**

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to `underflow` or `uflow`] will not return `eof()` but that they will return immediately.*

The standard adds that *the morphemes of `showmanyc` are **es-how-many-see**, not **show-manic**.*

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits>](#).

Definition at line 298 of file `fstream.tcc`.

**4.941.3.37 `snextc()`**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::snextc () [inline], [inherited]
```

Getting the next character.

**Returns**

The next character, or eof.

Calls `sbumpc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.

Definition at line 305 of file `streambuf`.

**4.941.3.38 `sputbackc()`**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sputbackc (
 char_type __c) [inline], [inherited]
```

Pushing characters back into the input stream.

**Parameters**

|                  |                             |
|------------------|-----------------------------|
| <code>__c</code> | The character to push back. |
|------------------|-----------------------------|

**Returns**

The previous character, if possible.

Similar to `sungetc()`, but `__c` is pushed onto the stream instead of *the previous character*. If successful, the next character fetched from the input stream will be `__c`.

Definition at line 379 of file `streambuf`.

**4.941.3.39 sputc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sputc (
 char_type __c) [inline], [inherited]
```

Entry point for all single-character output functions.

**Parameters**

|                  |                        |
|------------------|------------------------|
| <code>__c</code> | A character to output. |
|------------------|------------------------|

**Returns**

`__c`, if possible.

One of two public output functions.

If a write position is available for the output sequence (i.e., the buffer is not full), stores `__c` in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(↵__c)`.

Definition at line 431 of file `streambuf`.

Referenced by `std::ostreambuf_iterator< _CharT, _Traits >::operator=()`.

**4.941.3.40 sputn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::sputn (
 const char_type * __s,
 streamsize __n) [inline], [inherited]
```

Entry point for all single-character output functions.

## Parameters

|                  |                     |
|------------------|---------------------|
| <code>__s</code> | A buffer read area. |
| <code>__n</code> | A count.            |

One of two public output functions.

Returns `xspn(__s, __n)`. The effect is to write `__s[0]` through `__s[__n-1]` to the output sequence, if possible.

Definition at line 457 of file `streambuf`.

4.941.3.41 `sungetc()`

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sungetc () [inline], [inherited]
```

Moving backwards in the input stream.

## Returns

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns `pbackfail()`. The effect is to *unget* the last character *gotten*.

Definition at line 404 of file `streambuf`.

4.941.3.42 `sync()`

```
template<typename _CharT, typename _Traits>
int std::basic_filebuf<_CharT, _Traits>::sync () [protected], [virtual], [inherited]
```

Synchronizes the buffer arrays with the controlled sequences.

## Returns

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

## Note

Base class version does nothing, returns zero.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

Definition at line 1013 of file `fstream.tcc`.

#### 4.941.3.43 uflow()

```
template<typename _CharT, typename _Traits>
virtual int_type std::basic_streambuf< _CharT, _Traits >::uflow () [inline], [protected], [virtual],
[inherited]
```

Fetches more data from the controlled sequence.

##### Returns

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.

Reimplemented in `__gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >`.

Definition at line 707 of file `streambuf`.

#### 4.941.3.44 underflow()

```
template<typename _CharT , typename _Traits >
basic_filebuf< _CharT, _Traits >::int_type std::basic_filebuf< _CharT, _Traits >::underflow ()
[protected], [virtual], [inherited]
```

Fetches more data from the controlled sequence.

##### Returns

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.

For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.

A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html>

##### Note

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf< _CharT, _Traits >`.

Definition at line 324 of file `fstream.tcc`.

#### 4.941.3.45 xsgetn()

```
template<typename _CharT , typename _Traits >
streamsize std::basic_filebuf< _CharT, _Traits >::xsgetn (
 char_type * __s,
 streamsize __n) [protected], [virtual], [inherited]
```

Multiple character extraction.

## Parameters

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__s</code> | A buffer area.                          |
| <code>__n</code> | Maximum number of characters to assign. |

## Returns

The number of characters assigned.

Fills `__s[0]` through `__s[__n-1]` with characters from the input sequence, as if by `sbumpc()`. Stops when either `__n` characters have been copied, or when `traits::eof()` would be copied.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

Definition at line 670 of file `fstream.tcc`.

4.941.3.46 `xspn()`

```
template<typename _CharT, typename _Traits>
streamsize std::basic_filebuf<_CharT, _Traits>::xspn (
 const char_type * __s,
 streamsize __n) [protected], [virtual], [inherited]
```

Multiple character insertion.

## Parameters

|                  |                                        |
|------------------|----------------------------------------|
| <code>__s</code> | A buffer area.                         |
| <code>__n</code> | Maximum number of characters to write. |

## Returns

The number of characters written.

Writes `__s[0]` through `__s[__n-1]` to the output sequence, as if by `sputc()`. Stops when either `n` characters have been copied, or when `sputc()` would return `traits::eof()`.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

Definition at line 756 of file `fstream.tcc`.

#### 4.941.4 Member Data Documentation

##### 4.941.4.1 `_M_buf`

```
template<typename _CharT, typename _Traits>
char_type* std::basic_filebuf< _CharT, _Traits >::_M_buf [protected], [inherited]
```

Pointer to the beginning of internal buffer.

Definition at line 136 of file `fstream`.

##### 4.941.4.2 `_M_buf_locale`

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf< _CharT, _Traits >::_M_buf_locale [protected], [inherited]
```

Current locale setting.

Definition at line 199 of file `streambuf`.

##### 4.941.4.3 `_M_buf_size`

```
template<typename _CharT, typename _Traits>
size_t std::basic_filebuf< _CharT, _Traits >::_M_buf_size [protected], [inherited]
```

Actual size of internal buffer. This number is equal to the size of the put area + 1 position, reserved for the overflow char of a full area.

Definition at line 143 of file `fstream`.

##### 4.941.4.4 `_M_ext_buf`

```
template<typename _CharT, typename _Traits>
char* std::basic_filebuf< _CharT, _Traits >::_M_ext_buf [protected], [inherited]
```

Buffer for external characters. Used for input when `codecvt::always_noconv() == false`. When valid, this corresponds to `eback()`.

Definition at line 178 of file `fstream`.

#### 4.941.4.5 \_M\_ext\_buf\_size

```
template<typename _CharT, typename _Traits>
streamsize std::basic_filebuf< _CharT, _Traits >::_M_ext_buf_size [protected], [inherited]
```

Size of buffer held by \_M\_ext\_buf.

Definition at line 183 of file fstream.

#### 4.941.4.6 \_M\_ext\_next

```
template<typename _CharT, typename _Traits>
const char* std::basic_filebuf< _CharT, _Traits >::_M_ext_next [protected], [inherited]
```

Pointers into the buffer held by \_M\_ext\_buf that delimit a subsequence of bytes that have been read but not yet converted. When valid, \_M\_ext\_next corresponds to egptr().

Definition at line 190 of file fstream.

#### 4.941.4.7 \_M\_in\_beg

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::_M_in_beg [protected], [inherited]
```

Start of get area.

Definition at line 191 of file streambuf.

#### 4.941.4.8 \_M\_in\_cur

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::_M_in_cur [protected], [inherited]
```

Current read area.

Definition at line 192 of file streambuf.

#### 4.941.4.9 \_M\_in\_end

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::_M_in_end [protected], [inherited]
```

End of get area.

Definition at line 193 of file streambuf.

#### 4.941.4.10 `_M_mode`

```
template<typename _CharT, typename _Traits>
ios_base::openmode std::basic_filebuf< _CharT, _Traits >::_M_mode [protected], [inherited]
```

Place to stash in || out || in | out settings for current filebuf.

Definition at line 121 of file fstream.

Referenced by `std::basic_filebuf`< char\_type, traits\_type >::close().

#### 4.941.4.11 `_M_out_beg`

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::_M_out_beg [protected], [inherited]
```

Start of put area.

Definition at line 194 of file streambuf.

#### 4.941.4.12 `_M_out_cur`

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::_M_out_cur [protected], [inherited]
```

Current put area.

Definition at line 195 of file streambuf.

#### 4.941.4.13 `_M_out_end`

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::_M_out_end [protected], [inherited]
```

End of put area.

Definition at line 196 of file streambuf.

#### 4.941.4.14 \_M\_pback

```
template<typename _CharT, typename _Traits>
char_type std::basic_filebuf<_CharT, _Traits>::_M_pback [protected], [inherited]
```

Necessary bits for putback buffer management.

##### Note

pbacks of over one character are not currently supported.

Definition at line 164 of file fstream.

#### 4.941.4.15 \_M\_pback\_cur\_save

```
template<typename _CharT, typename _Traits>
char_type* std::basic_filebuf<_CharT, _Traits>::_M_pback_cur_save [protected], [inherited]
```

Necessary bits for putback buffer management.

##### Note

pbacks of over one character are not currently supported.

Definition at line 165 of file fstream.

#### 4.941.4.16 \_M\_pback\_end\_save

```
template<typename _CharT, typename _Traits>
char_type* std::basic_filebuf<_CharT, _Traits>::_M_pback_end_save [protected], [inherited]
```

Necessary bits for putback buffer management.

##### Note

pbacks of over one character are not currently supported.

Definition at line 166 of file fstream.

#### 4.941.4.17 `_M_pback_init`

```
template<typename _CharT, typename _Traits>
bool std::basic_filebuf< _CharT, _Traits >::_M_pback_init [protected], [inherited]
```

Necessary bits for putback buffer management.

##### Note

pbacks of over one character are not currently supported.

Definition at line 167 of file `fstream`.

Referenced by `std::basic_filebuf< char_type, traits_type >::close()`.

#### 4.941.4.18 `_M_reading`

```
template<typename _CharT, typename _Traits>
bool std::basic_filebuf< _CharT, _Traits >::_M_reading [protected], [inherited]
```

`_M_reading == false` && `_M_writing == false` for **uncommitted** mode; `_M_reading == true` for **read** mode; `_M_writing == true` for **write** mode;

NB: `_M_reading == true` && `_M_writing == true` is unused.

Definition at line 155 of file `fstream`.

Referenced by `std::basic_filebuf< char_type, traits_type >::close()`.

The documentation for this class was generated from the following file:

- [stdio\\_filebuf.h](#)

### 4.942 `__gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >` Class Template Reference

Inheritance diagram for `__gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >`:

## Public Types

- typedef `_CharT` **char\_type**
- typedef `traits_type::int_type` **int\_type**
- typedef `traits_type::off_type` **off\_type**
- typedef `traits_type::pos_type` **pos\_type**
- typedef `_Traits` **traits\_type**

## Public Member Functions

- **stdio\_sync\_filebuf** (`std::__c_file * __f`)
- **stdio\_sync\_filebuf** (`stdio_sync_filebuf && __fb`) noexcept
- `std::__c_file * file` ()
- locale `getloc` () const
- streamsize `in_avail` ()
- **stdio\_sync\_filebuf** & **operator=** (`stdio_sync_filebuf && __fb`) noexcept
- locale `pubimbue` (const locale & \_\_loc)
- `int_type sbumpc` ()
- `int_type sgetc` ()
- streamsize `sgetn` (`char_type * __s`, streamsize \_\_n)
- `int_type snextc` ()
- `int_type sputbackc` (`char_type __c`)
- `int_type sputc` (`char_type __c`)
- streamsize `sputn` (const `char_type * __s`, streamsize \_\_n)
- `int_type sungetc` ()
- void **swap** (`stdio_sync_filebuf & __fb`)
- `basic_streambuf * pubsetbuf` (`char_type * __s`, streamsize \_\_n)
- `pos_type pubseekoff` (`off_type __off`, `ios_base::seekdir __way`, `ios_base::openmode __mode=ios_base::in|ios_base::out`)
- `pos_type pubseekpos` (`pos_type __sp`, `ios_base::openmode __mode=ios_base::in|ios_base::out`)
- int `pubsync` ()

#### 4.942.1 Detailed Description

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
class __gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>
```

Provides a layer of compatibility for C.

This GNU extension provides extensions for working with standard C FILE\*'s. It must be instantiated by the user with the type of character used in the file stream, e.g., `stdio_filebuf<char>`.

Definition at line 57 of file `stdio_sync_filebuf.h`.

#### 4.942.2 Member Function Documentation

##### 4.942.2.1 `eback()`

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf<_CharT, _Traits>::eback () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Definition at line 489 of file `streambuf`.

#### 4.942.2.2 egptr()

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::egptr () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Definition at line 495 of file streambuf.

#### 4.942.2.3 epptr()

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::epptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Definition at line 542 of file streambuf.

#### 4.942.2.4 file()

```
template<typename _CharT , typename _Traits = std::char_traits<_CharT>>
std::__c_file* __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >::file () [inline]
```

##### Returns

The underlying FILE\*.

This function can be used to access the underlying C file pointer. Note that there is no way for the library to track what you do with the file, so be careful.

Definition at line 118 of file stdio\_sync\_filebuf.h.

#### 4.942.2.5 gbump()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::gbump (
 int __n) [inline], [protected], [inherited]
```

Moving the read position.

## Parameters

|                 |                             |
|-----------------|-----------------------------|
| <code>_↵</code> | The delta by which to move. |
| <code>_n</code> |                             |

This just advances the read position without returning any data.

Definition at line 505 of file streambuf.

## 4.942.2.6 getloc()

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf<_CharT, _Traits>::getloc () const [inline], [inherited]
```

Locale access.

## Returns

The current locale in effect.

If pubimbue(loc) has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.

Definition at line 233 of file streambuf.

## 4.942.2.7 gptr()

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf<_CharT, _Traits>::gptr () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Definition at line 492 of file streambuf.

## 4.942.2.8 imbue()

```
template<typename _CharT, typename _Traits>
virtual void std::basic_streambuf<_CharT, _Traits>::imbue (
 const locale & __loc) [inline], [protected], [virtual], [inherited]
```

Changes translations.

**Parameters**

|                    |               |
|--------------------|---------------|
| <code>__loc</code> | A new locale. |
|--------------------|---------------|

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

**Note**

Base class version does nothing.

Reimplemented in [std::basic\\_filebuf<\\_CharT, \\_Traits>](#), [std::basic\\_filebuf<\\_CharT, encoding\\_char\\_traits<\\_CharT>>](#), and [std::basic\\_filebuf<char\\_type, traits\\_type>](#).

Definition at line 583 of file streambuf.

**4.942.2.9 in\_avail()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::in_avail () [inline], [inherited]
```

Looking ahead into the stream.

**Returns**

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

Definition at line 291 of file streambuf.

**4.942.2.10 overflow()**

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
virtual int_type __gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>::overflow (
 int_type __c = traits_type::eof()) [inline], [protected], [virtual]
```

Consumes data from the buffer; writes to the controlled sequence.

**Parameters**

|                  |                                     |
|------------------|-------------------------------------|
| <code>__c</code> | An additional character to consume. |
|------------------|-------------------------------------|

**Returns**

`eof()` to indicate failure, something else (usually `__c`, or `not_eof()`)

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character `c` is also written out, if `__c` is not `eof()`.

For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.

A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits>](#).

Definition at line 171 of file `stdio_sync_filebuf.h`.

**4.942.2.11 pbackfail()**

```
template<typename _CharT , typename _Traits = std::char_traits<_CharT>>
virtual int_type __gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>::pbackfail (
 int_type __c = traits_type::eof()) [inline], [protected], [virtual]
```

Tries to back up the input sequence.

**Parameters**

|                  |                                                      |
|------------------|------------------------------------------------------|
| <code>__c</code> | The character to be inserted back into the sequence. |
|------------------|------------------------------------------------------|

**Returns**

`eof()` on failure, *some other value* on success

**Postcondition**

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits>](#).

Definition at line 146 of file `stdio_sync_filebuf.h`.

#### 4.942.2.12 pbase()

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::pbase () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Definition at line 536 of file streambuf.

#### 4.942.2.13 pbump()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::pbump (
 int __n) [inline], [protected], [inherited]
```

Moving the write position.

##### Parameters

|                  |                             |
|------------------|-----------------------------|
| <code>__n</code> | The delta by which to move. |
|------------------|-----------------------------|

This just advances the write position without returning any data.

Definition at line 552 of file streambuf.

#### 4.942.2.14 pptr()

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::pptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Definition at line 539 of file streambuf.

## 4.942.2.15 pubimbue()

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf< _CharT, _Traits >::pubimbue (
 const locale & __loc) [inline], [inherited]
```

Entry point for imbue().

## Parameters

|                    |                 |
|--------------------|-----------------|
| <code>__loc</code> | The new locale. |
|--------------------|-----------------|

## Returns

The previous locale.

Calls the derived imbue(\_\_loc).

Definition at line 216 of file streambuf.

## 4.942.2.16 pubseekoff()

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekoff (
 off_type __off,
 ios_base::seekdir __way,
 ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

## Parameters

|                     |                               |
|---------------------|-------------------------------|
| <code>__off</code>  | Offset.                       |
| <code>__way</code>  | Value for ios_base::seekdir.  |
| <code>__mode</code> | Value for ios_base::openmode. |

Calls virtual seekoff function.

Definition at line 258 of file streambuf.

## 4.942.2.17 pubseekpos()

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekpos (
```

```
pos_type __sp,
ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

## Parameters

|                     |                                             |
|---------------------|---------------------------------------------|
| <code>__sp</code>   | Position                                    |
| <code>__mode</code> | Value for <code>ios_base::openmode</code> . |

Calls virtual `seekpos` function.

Definition at line 270 of file `streambuf`.

4.942.2.18 `pubsetbuf()`

```
template<typename _CharT, typename _Traits>
basic_streambuf* std::basic_streambuf<_CharT, _Traits>::pubsetbuf (
 char_type * __s,
 streamsize __n) [inline], [inherited]
```

Entry points for derived buffer functions.

The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.

Definition at line 246 of file `streambuf`.

4.942.2.19 `pubsync()`

```
template<typename _CharT, typename _Traits>
int std::basic_streambuf<_CharT, _Traits>::pubsync () [inline], [inherited]
```

Calls virtual `sync` function.

Definition at line 278 of file `streambuf`.

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::sync()`.

4.942.2.20 `sbumpc()`

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sbumpc () [inline], [inherited]
```

Getting the next character.

## Returns

The next character, or `eof`.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `uflow()`.

Definition at line 323 of file `streambuf`.

#### 4.942.2.21 seekoff()

```
template<typename _CharT, typename _Traits>
virtual pos_type std::basic_streambuf< _CharT, _Traits >::seekoff (
 off_type ,
 ios_base::seekdir ,
 ios_base::openmode = ios_base::in | ios_base::out) [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

##### Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented in `std::basic_filebuf< _CharT, _Traits >`, `std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >`, `std::basic_filebuf< char_type, traits_type >`, and `std::basic_stringbuf< _CharT, _Traits, _Alloc >`.

Definition at line 609 of file `streambuf`.

#### 4.942.2.22 seekpos()

```
template<typename _CharT, typename _Traits>
virtual pos_type std::basic_streambuf< _CharT, _Traits >::seekpos (
 pos_type ,
 ios_base::openmode = ios_base::in | ios_base::out) [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

##### Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented in `std::basic_filebuf< _CharT, _Traits >`, `std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >`, `std::basic_filebuf< char_type, traits_type >`, and `std::basic_stringbuf< _CharT, _Traits, _Alloc >`.

Definition at line 621 of file `streambuf`.

## 4.942.2.23 setbuf()

```
template<typename _CharT, typename _Traits>
virtual basic_streambuf<char_type, _Traits>* std::basic_streambuf<_CharT, _Traits>::setbuf (
 char_type * ,
 streamsize) [inline], [protected], [virtual], [inherited]
```

Manipulates the buffer.

Each derived class provides its own appropriate behavior. See the next-to-last paragraph of <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.streambuf.buffering> for more on this function.

## Note

Base class version does nothing, returns `this`.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<char_type, traits_type>`, and `std::basic_stringbuf<_CharT, _Traits, _Alloc>`.

Definition at line 598 of file `streambuf`.

## 4.942.2.24 setg()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf<_CharT, _Traits>::setg (
 char_type * __gbeg,
 char_type * __gnext,
 char_type * __gend) [inline], [protected], [inherited]
```

Setting the three read area pointers.

## Parameters

|                      |            |
|----------------------|------------|
| <code>__gbeg</code>  | A pointer. |
| <code>__gnext</code> | A pointer. |
| <code>__gend</code>  | A pointer. |

## Postcondition

`__gbeg == eback()`, `__gnext == gptr()`, and `__gend == egptr()`

Definition at line 516 of file `streambuf`.

#### 4.942.2.25 setp()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::setp (
 char_type * __pbeg,
 char_type * __pend) [inline], [protected], [inherited]
```

Setting the three write area pointers.

##### Parameters

|                     |            |
|---------------------|------------|
| <code>__pbeg</code> | A pointer. |
| <code>__pend</code> | A pointer. |

##### Postcondition

`__pbeg == pbase()`, `__pbeg == pptr()`, and `__pend == epptr()`

Definition at line 562 of file streambuf.

#### 4.942.2.26 sgetc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sgetc () [inline], [inherited]
```

Getting the next character.

##### Returns

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.

Definition at line 345 of file streambuf.

#### 4.942.2.27 sgetn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::sgetn (
 char_type * __s,
 streamsize __n) [inline], [inherited]
```

Entry point for `xsggetn`.

## Parameters

|                  |                |
|------------------|----------------|
| <code>__s</code> | A buffer area. |
| <code>__n</code> | A count.       |

Returns `xsgetn(__s, __n)`. The effect is to fill `__s[0]` through `__s[__n-1]` with characters from the input sequence, if possible.

Definition at line 364 of file `streambuf`.

4.942.2.28 `showmanyc()`

```
template<typename _CharT, typename _Traits>
