virtual streamsize std::basic_streambuf<_CharT, _Traits>::showmanyc () [inline], [protected],
[virtual], [inherited]
```

Investigating the data available.

## Returns

An estimate of the number of characters available in the input sequence, or -1.

*If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been supplied. If `showmanyc()` returns -1, then calls to `underflow()` or `uflow()` will fail. [27.5.2.4.3]/1*

## Note

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to `underflow` or `uflow`] will not return `eof()` but that they will return immediately.*

The standard adds that *the morphemes of `showmanyc` are **es-how-many-see**, not **show-manic**.*

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<char_type, traits_type>`, and `std::basic_stringbuf<_CharT, _Traits, _Alloc>`.

Definition at line 656 of file `streambuf`.

**4.942.2.29** `snextc()`

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::snextc () [inline], [inherited]
```

Getting the next character.

**Returns**

The next character, or eof.

Calls `sbumpc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.

Definition at line 305 of file `streambuf`.

**4.942.2.30** `sputbackc()`

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sputbackc (
 char_type __c) [inline], [inherited]
```

Pushing characters back into the input stream.

**Parameters**

|                  |                             |
|------------------|-----------------------------|
| <code>__c</code> | The character to push back. |
|------------------|-----------------------------|

**Returns**

The previous character, if possible.

Similar to `sungetc()`, but `__c` is pushed onto the stream instead of *the previous character*. If successful, the next character fetched from the input stream will be `__c`.

Definition at line 379 of file `streambuf`.

**4.942.2.31** `sputc()`

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sputc (
 char_type __c) [inline], [inherited]
```

Entry point for all single-character output functions.

## Parameters

|                  |                        |
|------------------|------------------------|
| <code>__c</code> | A character to output. |
|------------------|------------------------|

## Returns

`__c`, if possible.

One of two public output functions.

If a write position is available for the output sequence (i.e., the buffer is not full), stores `__c` in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(__c)`.

Definition at line 431 of file `streambuf`.

Referenced by `std::ostreambuf_iterator<_CharT, _Traits>::operator=()`.

4.942.2.32 `sputn()`

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::sputn (
 const char_type * __s,
 streamsize __n) [inline], [inherited]
```

Entry point for all single-character output functions.

## Parameters

|                  |                     |
|------------------|---------------------|
| <code>__s</code> | A buffer read area. |
| <code>__n</code> | A count.            |

One of two public output functions.

Returns `xsgputn(__s, __n)`. The effect is to write `__s[0]` through `__s[__n-1]` to the output sequence, if possible.

Definition at line 457 of file `streambuf`.

4.942.2.33 `sungetc()`

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sungetc () [inline], [inherited]
```

Moving backwards in the input stream.

**Returns**

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns `pbckfail()`. The effect is to *unget* the last character *gotten*.

Definition at line 404 of file `streambuf`.

**4.942.2.34 sync()**

```
template<typename _CharT , typename _Traits = std::char_traits<_CharT>>
virtual int __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >::sync (
 void) [inline], [protected], [virtual]
```

Synchronizes the buffer arrays with the controlled sequences.

**Returns**

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

**Note**

Base class version does nothing, returns zero.

Reimplemented from `std::basic_streambuf< _CharT, _Traits >`.

Definition at line 190 of file `stdio_sync_filebuf.h`.

**4.942.2.35 uflow()**

```
template<typename _CharT , typename _Traits = std::char_traits<_CharT>>
virtual int_type __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >::uflow () [inline], [protected],
[virtual]
```

Fetches more data from the controlled sequence.

**Returns**

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.

Reimplemented from `std::basic_streambuf< _CharT, _Traits >`.

Definition at line 138 of file `stdio_sync_filebuf.h`.

## 4.942.2.36 underflow()

```
template<typename _CharT , typename _Traits = std::char_traits<_CharT>>
virtual int_type __gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>::underflow () [inline], [protected],
[virtual]
```

Fetches more data from the controlled sequence.

## Returns

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.

For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.

A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html>

## Note

Base class version does nothing, returns eof().

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

Definition at line 131 of file `stdio_sync_filebuf.h`.

## 4.942.2.37 xsgetn()

```
template<typename _CharT , typename _Traits >
streamsize std::basic_streambuf<_CharT, _Traits>::xsgetn (
 char_type * __s,
 streamsize __n) [protected], [virtual], [inherited]
```

Multiple character extraction.

## Parameters

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__s</code> | A buffer area.                          |
| <code>__n</code> | Maximum number of characters to assign. |

**Returns**

The number of characters assigned.

Fills `__s[0]` through `__s[__n-1]` with characters from the input sequence, as if by `sbumpc()`. Stops when either `__n` characters have been copied, or when `traits::eof()` would be copied.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented in [std::basic\\_filebuf<\\_CharT, \\_Traits>](#), [std::basic\\_filebuf<\\_CharT, encoding\\_char\\_traits<\\_CharT>>](#), and [std::basic\\_filebuf<char\\_type, traits\\_type>](#).

Definition at line 46 of file `streambuf.tcc`.

**4.942.2.38 xsputn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::xsputn (
 const char_type * __s,
 streamsize __n) [protected], [virtual], [inherited]
```

Multiple character insertion.

**Parameters**

|                  |                                        |
|------------------|----------------------------------------|
| <code>__s</code> | A buffer area.                         |
| <code>__n</code> | Maximum number of characters to write. |

**Returns**

The number of characters written.

Writes `__s[0]` through `__s[__n-1]` to the output sequence, as if by `sputc()`. Stops when either `n` characters have been copied, or when `sputc()` would return `traits::eof()`.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented in [std::basic\\_filebuf<\\_CharT, \\_Traits>](#), [std::basic\\_filebuf<\\_CharT, encoding\\_char\\_traits<\\_CharT>>](#), and [std::basic\\_filebuf<char\\_type, traits\\_type>](#).

Definition at line 80 of file `streambuf.tcc`.

## 4.949.1 Detailed Description

```
template<typename _RealType = double>
class std::student_t_distribution< _RealType >
```

A [student\\_t\\_distribution](#) random number distribution.

The formula for the normal probability mass function is:

$$p(x|n) = \frac{1}{\sqrt{(n\pi)}} \frac{\Gamma((n+1)/2)}{\Gamma(n/2)} \left(1 + \frac{x^2}{n}\right)^{-(n+1)/2}$$

Definition at line 3294 of file random.h.

#### 4.949.2 Member Typedef Documentation

##### 4.949.2.1 result\_type

```
template<typename _RealType = double>
typedef _RealType std::student_t_distribution< _RealType >::result_type
```

The type of the range of the distribution.

Definition at line 3297 of file random.h.

#### 4.949.3 Member Function Documentation

##### 4.949.3.1 max()

```
template<typename _RealType = double>
result_type std::student_t_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

Definition at line 3386 of file random.h.

References std::numeric\_limits<\_Tp>::max().

##### 4.949.3.2 min()

```
template<typename _RealType = double>
result_type std::student_t_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

Definition at line 3379 of file random.h.

References std::numeric\_limits<\_Tp>::lowest().

##### 4.949.3.3 n()

```
template<typename _RealType = double>
_RealType std::student_t_distribution< _RealType >::n () const [inline]
```

Definition at line 3357 of file random.h.

Referenced by std::student\_t\_distribution<\_RealType>::operator()().

#### 4.949.3.4 operator()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::student_t_distribution< _RealType >::operator() (
 _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Definition at line 3394 of file random.h.

References `std::student_t_distribution< _RealType >::n()`, and `std::sqrt()`.

#### 4.949.3.5 param() [1/2]

```
template<typename _RealType = double>
param_type std::student_t_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

Definition at line 3364 of file random.h.

#### 4.949.3.6 param() [2/2]

```
template<typename _RealType = double>
void std::student_t_distribution< _RealType >::param (
 const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

##### Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

Definition at line 3372 of file random.h.

#### 4.949.3.7 reset()

```
template<typename _RealType = double>
void std::student_t_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

Definition at line 3347 of file random.h.

References `std::normal_distribution< _RealType >::reset()`, and `std::gamma_distribution< _RealType >::reset()`.

## 4.949.4 Friends And Related Function Documentation

## 4.949.4.1 operator&lt;&lt;

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
 std::basic_ostream<_CharT, _Traits > & __os,
 const std::student_t_distribution<_RealType1 > & __x) [friend]
```

Inserts a student\_t\_distribution random number distribution \_\_x into the output stream \_\_os.

## Parameters

|      |                                                      |
|------|------------------------------------------------------|
| __os | An output stream.                                    |
| __x  | A student_t_distribution random number distribution. |

## Returns

The output stream with the state of \_\_x inserted or in an error state.

## 4.949.4.2 operator==

```
template<typename _RealType = double>
bool operator== (
 const student_t_distribution<_RealType > & __d1,
 const student_t_distribution<_RealType > & __d2) [friend]
```

Return true if two Student t distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 3443 of file random.h.

## 4.949.4.3 operator&gt;&gt;

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
 std::basic_istream<_CharT, _Traits > & __is,
 std::student_t_distribution<_RealType1 > & __x) [friend]
```

Extracts a student\_t\_distribution random number distribution \_\_x from the input stream \_\_is.

## Parameters

|                         |                                                                       |
|-------------------------|-----------------------------------------------------------------------|
| <code>_↔<br/>_is</code> | An input stream.                                                      |
| <code>_↔<br/>_x</code>  | A <code>student_t_distribution</code> random number generator engine. |

## Returns

The input stream with `__x` extracted or in an error state.

The documentation for this class was generated from the following files:

- [random.h](#)
- [bits/random.tcc](#)

#### 4.950.1 Detailed Description

```
template<typename _Bilter>
class std::sub_match< _Bilter >
```

A sequence of characters matched by a particular marked sub-expression.

An object of this class is essentially a pair of iterators marking a matched subexpression within a regular expression pattern match. Such objects can be converted to and compared with `std::basic_string` objects of a similar base character type as the pattern matched by the regular expression.

The iterators that make up the pair are the usual half-open interval referencing the actual original pattern matched.

Definition at line 868 of file `regex.h`.

#### 4.950.2 Member Typedef Documentation

##### 4.950.2.1 first\_type

```
typedef _BiIter std::pair< _BiIter , _BiIter >::first_type [inherited]
```

The type of the `first` member.

Definition at line 214 of file `stl_pair.h`.

##### 4.950.2.2 second\_type

```
typedef _BiIter std::pair< _BiIter , _BiIter >::second_type [inherited]
```

The type of the `second` member.

Definition at line 215 of file `stl_pair.h`.

#### 4.950.3 Member Function Documentation

##### 4.950.3.1 compare() [1/3]

```
template<typename _BiIter>
int std::sub_match< _BiIter >::compare (
 const sub_match< _BiIter > &__s) const [inline]
```

Compares this and another matched sequence.

## Parameters

|       |                                                  |
|-------|--------------------------------------------------|
| $\_s$ | Another matched sequence to compare to this one. |
|-------|--------------------------------------------------|

## Return values

|      |                                                   |
|------|---------------------------------------------------|
| $<0$ | this matched sequence will collate before $\_s$ . |
| $=0$ | this matched sequence is equivalent to $\_s$ .    |
| $>0$ | this matched sequence will collate after $\_s$ .  |

Definition at line 923 of file regex.h.

Referenced by `std::sub_match<_Bi_iter>::operator!=()`, `std::sub_match<_Bi_iter>::operator<()`, `std::sub_match<_Bi_iter>::operator<=()`, `std::sub_match<_Bi_iter>::operator==()`, `std::sub_match<_Bi_iter>::operator>()`, and `std::sub_match<_Bi_iter>::operator>=()`.

## 4.950.3.2 compare() [2/3]

```
template<typename _BiIter>
int std::sub_match<_BiIter>::compare (
 const string_type & __s) const [inline]
```

Compares this sub\_match to a string.

## Parameters

|       |                                        |
|-------|----------------------------------------|
| $\_s$ | A string to compare to this sub_match. |
|-------|----------------------------------------|

## Return values

|      |                                                   |
|------|---------------------------------------------------|
| $<0$ | this matched sequence will collate before $\_s$ . |
| $=0$ | this matched sequence is equivalent to $\_s$ .    |
| $>0$ | this matched sequence will collate after $\_s$ .  |

Definition at line 937 of file regex.h.

## 4.950.3.3 compare() [3/3]

```
template<typename _BiIter>
int std::sub_match<_BiIter>::compare (
 const value_type * __s) const [inline]
```

Compares this sub\_match to a string.

**Parameters**

|                  |                                                      |
|------------------|------------------------------------------------------|
| <code>__s</code> | A string to compare to this <code>sub_match</code> . |
|------------------|------------------------------------------------------|

**Return values**

|                     |                                                              |
|---------------------|--------------------------------------------------------------|
| <code>&lt; 0</code> | this matched sequence will collate before <code>__s</code> . |
| <code>= 0</code>    | this matched sequence is equivalent to <code>__s</code> .    |
| <code>&gt; 0</code> | this matched sequence will collate after <code>__s</code> .  |

Definition at line 941 of file `regex.h`.

**4.950.3.4 `length()`**

```
template<typename _BiIter>
difference_type std::sub_match< _BiIter >::length () const [inline], [noexcept]
```

Gets the length of the matching sequence.

Definition at line 884 of file `regex.h`.

**4.950.3.5 `operator string_type()`**

```
template<typename _BiIter>
std::sub_match< _BiIter >::operator string_type () const [inline]
```

Gets the matching sequence as a string.

**Returns**

the matching sequence as a string.

This is the implicit conversion operator. It is identical to the `str()` member function except that it will want to pop up in unexpected places and cause a great deal of confusion and cursing from the unwary.

Definition at line 897 of file `regex.h`.

## 4.950.3.6 str()

```
template<typename _BiIter>
string_type std::sub_match<_BiIter >::str () const [inline]
```

Gets the matching sequence as a string.

## Returns

the matching sequence as a string.

Definition at line 906 of file regex.h.

Referenced by std::sub\_match<\_Bi\_iter >::operator string\_type(), and std::sub\_match<\_Bi\_iter >::operator<<().

## 4.950.3.7 swap()

```
constexpr void std::pair<_BiIter , _BiIter >::swap (
 pair<_BiIter, _BiIter > & __p) [inline], [noexcept], [inherited]
```

Swap the first members and then the second members.

Definition at line 439 of file stl\_pair.h.

## 4.950.4 Friends And Related Function Documentation

## 4.950.4.1 make\_pair()

```
constexpr pair< typename __decay_and_strip<_BiIter >::__type, typename __decay_and_strip<_BiIter >::__type > make_pair (
 _BiIter && __x,
 _BiIter && __y) [related]
```

A convenience wrapper for creating a pair from two objects.

## Parameters

|       |                    |
|-------|--------------------|
| $\_x$ | The first object.  |
| $\_y$ | The second object. |

**Returns**

A newly-constructed `pair<>` object of the appropriate type.

The C++98 standard says the objects are passed by reference-to-const, but C++03 says they are passed by value (this was LWG issue #181).

Since C++11 they have been passed by forwarding reference and then forwarded to the new members of the pair. To create a pair with a member of reference type, pass a `reference_wrapper` to this function.

Definition at line 567 of file `stl_pair.h`.

**4.950.4.2 `operator!=()`**

```
constexpr bool operator!= (
 const pair< _BiIter , _BiIter > & __x,
 const pair< _BiIter , _BiIter > & __y) [related]
```

Uses `operator==` to find the result.

Definition at line 496 of file `stl_pair.h`.

**4.950.4.3 `operator<()`**

```
constexpr bool operator< (
 const pair< _BiIter , _BiIter > & __x,
 const pair< _BiIter , _BiIter > & __y) [related]
```

Defines a lexicographical order for pairs.

For two pairs of the same type, `P` is ordered before `Q` if `P.first` is less than `Q.first`, or if `P.first` and `Q.first` are equivalent (neither is less than the other) and `P.second` is less than `Q.second`.

Definition at line 489 of file `stl_pair.h`.

**4.950.4.4 `operator<=()`**

```
constexpr bool operator<= (
 const pair< _BiIter , _BiIter > & __x,
 const pair< _BiIter , _BiIter > & __y) [related]
```

Uses `operator<` to find the result.

Definition at line 508 of file `stl_pair.h`.

#### 4.950.4.5 operator==()

```
constexpr bool operator== (
 const pair< _BiIter , _BiIter > & __x,
 const pair< _BiIter , _BiIter > & __y) [related]
```

Two pairs of the same type are equal iff their members are equal.

Definition at line 466 of file stl\_pair.h.

#### 4.950.4.6 operator>()

```
constexpr bool operator> (
 const pair< _BiIter , _BiIter > & __x,
 const pair< _BiIter , _BiIter > & __y) [related]
```

Uses operator< to find the result.

Definition at line 502 of file stl\_pair.h.

#### 4.950.4.7 operator>=()

```
constexpr bool operator>= (
 const pair< _BiIter , _BiIter > & __x,
 const pair< _BiIter , _BiIter > & __y) [related]
```

Uses operator< to find the result.

Definition at line 514 of file stl\_pair.h.

#### 4.950.4.8 swap()

```
constexpr enable_if< __and< __is_swappable< _BiIter >, __is_swappable< _BiIter > >::value >↔
::type swap (
 pair< _BiIter , _BiIter > & __x,
 pair< _BiIter , _BiIter > & __y) [related]
```

Swap overload for pairs. Calls std::pair::swap().

#### Note

This std::swap overload is not declared in C++03 mode, which has performance implications, e.g. see <https://gcc.gnu.org/PR38466>

Definition at line 533 of file stl\_pair.h.

#### 4.950.5 Member Data Documentation

##### 4.950.5.1 first

`_BiIter` [std::pair](#)< `_BiIter` , `_BiIter` >::first [inherited]

The first member.

Definition at line 217 of file `stl_pair.h`.

##### 4.950.5.2 second

`_BiIter` [std::pair](#)< `_BiIter` , `_BiIter` >::second [inherited]

The second member.

Definition at line 218 of file `stl_pair.h`.

## 4.951.1 Detailed Description

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
class std::subtract_with_carry_engine< _UIntType, __w, __s, __r >
```

The Marsaglia-Zaman generator.

This is a model of a Generalized Fibonacci discrete random number generator, sometimes referred to as the SWC generator.

A discrete random number generator that produces pseudorandom numbers using:

$$x_i \leftarrow (x_{i-s} - x_{i-r} - carry_{i-1}) \bmod m$$

The size of the state is  $r$  and the maximum period of the generator is  $(m^r - m^s - 1)$ .

Definition at line 692 of file random.h.

## 4.951.2 Member Typedef Documentation

#### 4.951.2.1 result\_type

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
typedef _UIntType std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::result_type
```

The type of the generated random value.

Definition at line 707 of file random.h.

#### 4.951.3 Constructor & Destructor Documentation

##### 4.951.3.1 subtract\_with\_carry\_engine() [1/2]

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::subtract_with_carry_engine (
 result_type __sd) [inline], [explicit]
```

Constructs an explicitly seeded subtract\_with\_carry\_engine random number generator.

Definition at line 723 of file random.h.

References `std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::seed()`.

##### 4.951.3.2 subtract\_with\_carry\_engine() [2/2]

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
template<typename _Sseq , typename = _If_seed_seq<_Sseq>>
std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::subtract_with_carry_engine (
 _Sseq & __q) [inline], [explicit]
```

Constructs a subtract\_with\_carry\_engine random number engine seeded from the seed sequence `__q`.

##### Parameters

|                  |                    |
|------------------|--------------------|
| <code>__q</code> | the seed sequence. |
|------------------|--------------------|

Definition at line 734 of file random.h.

References `std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::seed()`.

#### 4.951.4 Member Function Documentation

#### 4.951.4.1 discard()

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
void std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::discard (
 unsigned long long __z) [inline]
```

Discard a sequence of random numbers.

Definition at line 780 of file random.h.

#### 4.951.4.2 max()

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
static constexpr result_type std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::max ()
[inline], [static]
```

Gets the inclusive maximum value of the range of random integers returned by this generator.

Definition at line 773 of file random.h.

#### 4.951.4.3 min()

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
static constexpr result_type std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::min ()
[inline], [static]
```

Gets the inclusive minimum value of the range of random integers returned by this generator.

Definition at line 765 of file random.h.

#### 4.951.4.4 operator()()

```
template<typename _UIntType , size_t __w, size_t __s, size_t __r>
subtract_with_carry_engine< _UIntType, __w, __s, __r >::result_type std::subtract_with_carry_engine<
_UIntType, __w, __s, __r >::operator() ()
```

Gets the next random number in the sequence.

Definition at line 594 of file bits/random.tcc.

## 4.951.4.5 seed() [1/2]

```
template<typename _UIntType , size_t __w, size_t __s, size_t __r>
void std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::seed (
 result_type __sd = default_seed)
```

Seeds the initial state  $x_0$  of the random number generator.

N1688[4.19] modifies this as follows. If `__value == 0`, sets value to 19780503. In any case, with a linear congruential generator `lcg(i)` having parameters  $m_{lcg} = 2147483563$ ,  $a_{lcg} = 40014$ ,  $c_{lcg} = 0$ , and  $lcg(0) = value$ , sets  $x_r \dots x_{-1}$  to  $lcg(1) \bmod m \dots lcg(r) \bmod m$  respectively. If  $x_{-1} = 0$  set carry to 1, otherwise sets carry to 0.

Definition at line 538 of file `bits/random.tcc`.

Referenced by `std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::subtract_with_carry_engine()`.

## 4.951.4.6 seed() [2/2]

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
template<typename _Sseq >
_If_seed_seq<_Sseq> std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::seed (
 _Sseq & __q)
```

Seeds the initial state  $x_0$  of the % `subtract_with_carry_engine` random number generator.

## 4.951.5 Friends And Related Function Documentation

## 4.951.5.1 operator&lt;&lt;

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
template<typename _UIntType1 , size_t __w1, size_t __s1, size_t __r1, typename _CharT , typename
_Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
 std::basic_ostream< _CharT, _Traits > & __os,
 const std::subtract_with_carry_engine< _UIntType1, __w1, __s1, __r1 > & __x) [friend]
```

Inserts the current state of a % `subtract_with_carry_engine` random number generator engine `__x` into the output stream `__os`.

## Parameters

|                   |                                                                             |
|-------------------|-----------------------------------------------------------------------------|
| <code>__os</code> | An output stream.                                                           |
| <code>__x</code>  | A % <code>subtract_with_carry_engine</code> random number generator engine. |

**Returns**

The output stream with the state of \_\_x inserted or in an error state.

**4.951.5.2 operator==**

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
bool operator== (
 const subtract_with_carry_engine< _UIntType, __w, __s, __r > & __lhs,
 const subtract_with_carry_engine< _UIntType, __w, __s, __r > & __rhs) [friend]
```

Compares two % subtract\_with\_carry\_engine random number generator objects of the same type for equality.

**Parameters**

|                    |                                                                      |
|--------------------|----------------------------------------------------------------------|
| <code>__lhs</code> | A % subtract_with_carry_engine random number generator object.       |
| <code>__rhs</code> | Another % subtract_with_carry_engine random number generator object. |

**Returns**

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 805 of file random.h.

**4.951.5.3 operator>>**

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
template<typename _UIntType1, size_t __w1, size_t __s1, size_t __r1, typename _CharT, typename
_traits >
std::basic_istream<_CharT, _Traits>& operator>> (
 std::basic_istream< _CharT, _Traits > & __is,
 std::subtract_with_carry_engine< _UIntType1, __w1, __s1, __r1 > & __x) [friend]
```

Extracts the current state of a % subtract\_with\_carry\_engine random number generator engine \_\_x from the input stream \_\_is.

**Parameters**

|                   |                                                                |
|-------------------|----------------------------------------------------------------|
| <code>__is</code> | An input stream.                                               |
| <code>__x</code>  | A % subtract_with_carry_engine random number generator engine. |

**Returns**

The input stream with the state of `__x` extracted or in an error state.

The documentation for this class was generated from the following files:

**4.952 `__gnu_cxx::subtractive_rng` Class Reference**

Inheritance diagram for `__gnu_cxx::subtractive_rng`:

**Public Types**

- typedef unsigned int [argument\\_type](#)
- typedef unsigned int [result\\_type](#)

**Public Member Functions**

- [subtractive\\_rng](#) (unsigned int `__seed`)
- [subtractive\\_rng](#) ()
- void **`_M_initialize`** (unsigned int `__seed`)
- unsigned int [operator\(\)](#) (unsigned int `__limit`)

**4.952.1 Detailed Description**

The `subtractive_rng` class is documented on [SGI's site](#). Note that this code assumes that `int` is 32 bits.

Definition at line 344 of file `ext/functional`.

#### 4.952.2 Member Typedef Documentation

##### 4.952.2.1 `argument_type`

```
typedef unsigned int std::unary_function< unsigned int , unsigned int >::argument_type [inherited]
```

`argument_type` is the type of the argument

Definition at line 108 of file `stl_function.h`.

##### 4.952.2.2 `result_type`

```
typedef unsigned int std::unary_function< unsigned int , unsigned int >::result_type [inherited]
```

`result_type` is the return type

Definition at line 111 of file `stl_function.h`.

#### 4.952.3 Constructor & Destructor Documentation

##### 4.952.3.1 `subtractive_rng()` [1/2]

```
__gnu_cxx::subtractive_rng::subtractive_rng (
 unsigned int __seed) [inline]
```

Ctor allowing you to initialize the seed.

Definition at line 386 of file `ext/functional`.

##### 4.952.3.2 `subtractive_rng()` [2/2]

```
__gnu_cxx::subtractive_rng::subtractive_rng () [inline]
```

Default ctor; initializes its state with some number you don't see.

Definition at line 390 of file `ext/functional`.

#### 4.952.4 Member Function Documentation

#### 4.952.4.1 operator()

```
unsigned int __gnu_cxx::subtractive_rng::operator() (
 unsigned int __limit) [inline]
```

Returns a number less than the argument.

Definition at line 355 of file ext/functional.

The documentation for this class was generated from the following file:

- [ext/functional](#)

#### 4.953 \_\_gnu\_pbds::detail::synth\_access\_traits< Type\_Traits, Set, \_ATraits > Struct Template Reference

Inherits `_ATraits`.

##### Public Types

- typedef `_ATraits` **base\_type**
- typedef `base_type::const_iterator` **const\_iterator**
- typedef `type_traits::const_reference` **const\_reference**
- typedef `type_traits::key_const_reference` **key\_const\_reference**
- typedef `Type_Traits` **type\_traits**

##### Public Member Functions

- **synth\_access\_traits** (const `base_type` &)
- bool **cmp\_keys** (key\_const\_reference, key\_const\_reference) const
- bool **cmp\_prefixes** (const\_iterator, const\_iterator, const\_iterator, const\_iterator, bool compare\_after=false) const
- bool **equal\_keys** (key\_const\_reference, key\_const\_reference) const
- bool **equal\_prefixes** (const\_iterator, const\_iterator, const\_iterator, const\_iterator, bool compare\_after=true) const

##### Static Public Member Functions

- static key\_const\_reference **extract\_key** (const\_reference)

#### 4.953.1 Detailed Description

```
template<typename Type_Traits, bool Set, typename _ATraits>
struct __gnu_pbds::detail::synth_access_traits< Type_Traits, Set, _ATraits >
```

Synthetic element access traits.

Definition at line 59 of file synth\_access\_traits.hpp.

The documentation for this struct was generated from the following file:

- [synth\\_access\\_traits.hpp](#)

## 4.954 `std::chrono::_V2::system_clock` Struct Reference

### Public Types

- typedef `chrono::nanoseconds` **duration**
- typedef `duration::period` **period**
- typedef `duration::rep` **rep**
- typedef `chrono::time_point< system_clock, duration >` **time\_point**

### Static Public Member Functions

- static `time_point from_time_t` (`std::time_t __t`) noexcept
- static `time_point now` () noexcept
- static `std::time_t to_time_t` (const `time_point &__t`) noexcept

### Static Public Attributes

- static constexpr bool **is\_steady**

#### 4.954.1 Detailed Description

System clock.

Time returned represents wall time from the system-wide clock.

Definition at line 1038 of file `chrono`.

The documentation for this struct was generated from the following file:

- `chrono`

## 4.955 std::system\_error Class Reference

Inheritance diagram for std::system\_error:

### Public Member Functions

- **system\_error** ([error\\_code](#) \_\_ec=[error\\_code](#)())
- **system\_error** ([error\\_code](#) \_\_ec, const [string](#) &\_\_what)
- **system\_error** ([error\\_code](#) \_\_ec, const char \* \_\_what)
- **system\_error** (int \_\_v, const error\_category &\_\_ecat, const char \* \_\_what)
- **system\_error** (int \_\_v, const error\_category &\_\_ecat)
- **system\_error** (int \_\_v, const error\_category &\_\_ecat, const [string](#) &\_\_what)
- **system\_error** (const [system\\_error](#) &)=default
- const [error\\_code](#) & **code** () const noexcept
- [system\\_error](#) & **operator=** (const [system\\_error](#) &)=default
- virtual const char \* **what** () const noexcept

### 4.955.1 Detailed Description

An exception type that includes an `error_code` value.

Typically used to report errors from the operating system and other low-level APIs.

Definition at line 428 of file `system_error`.

## 4.955.2 Member Function Documentation

4.955.2.1 `what()`

```
virtual const char* std::runtime_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::experimental::filesystem::v1::filesystem\\_error](#).

The documentation for this class was generated from the following file:

- [system\\_error](#)

4.956 `__gnu_cxx::temporary_buffer<_ForwardIterator, _Tp>` Struct Template Reference

Inheritance diagram for `__gnu_cxx::temporary_buffer<_ForwardIterator, _Tp>`:

## Public Types

- typedef pointer **iterator**
- typedef value\_type \* **pointer**
- typedef ptrdiff\_t **size\_type**
- typedef \_Tp **value\_type**

## Public Member Functions

- [temporary\\_buffer](#) ([\\_ForwardIterator](#) \_\_first, [\\_ForwardIterator](#) \_\_last)
- [~temporary\\_buffer](#) ()
- iterator [begin](#) ()
- iterator [end](#) ()
- [size\\_type](#) [requested\\_size](#) () const
- [size\\_type](#) [size](#) () const

## Protected Attributes

- pointer [\\_M\\_buffer](#)
- [size\\_type](#) [\\_M\\_len](#)
- [size\\_type](#) [\\_M\\_original\\_len](#)

### 4.956.1 Detailed Description

```
template<class _ForwardIterator, class _Tp = typename std::iterator_traits<_ForwardIterator>::value_type>
struct __gnu_cxx::temporary_buffer< _ForwardIterator, _Tp >
```

This class provides similar behavior and semantics of the standard functions `get_temporary_buffer()` and `return_temporary_buffer()`, but encapsulated in a type vaguely resembling a standard container.

By default, a `temporary_buffer<Iter>` stores space for objects of whatever type the `Iter` iterator points to. It is constructed from a typical `[first,last)` range, and provides the `begin()`, `end()`, `size()` functions, as well as `requested_size()`. For non-trivial types, copies of `*first` will be used to initialize the storage.

`malloc` is used to obtain underlying storage.

Like `get_temporary_buffer()`, not all the requested memory may be available. Ideally, the created buffer will be large enough to hold a copy of `[first,last)`, but if `size()` is less than `requested_size()`, then this didn't happen.

Definition at line 184 of file `ext/memory`.

### 4.956.2 Constructor & Destructor Documentation

#### 4.956.2.1 temporary\_buffer()

```
template<class _ForwardIterator , class _Tp = typename std::iterator_traits<_ForwardIterator>::value_type>
__gnu_cxx::temporary_buffer< _ForwardIterator, _Tp >::temporary_buffer (
 _ForwardIterator __first,
 _ForwardIterator __last) [inline]
```

Requests storage large enough to hold a copy of `[first,last)`.

Definition at line 187 of file `ext/memory`.

#### 4.956.2.2 ~temporary\_buffer()

```
template<class _ForwardIterator , class _Tp = typename std::iterator_traits<_ForwardIterator>←
::value_type>
__gnu_cxx::temporary_buffer< _ForwardIterator, _Tp >::~~temporary_buffer () [inline]
```

Destroys objects and frees storage.

Definition at line 193 of file ext/memory.

### 4.956.3 Member Function Documentation

#### 4.956.3.1 begin()

```
template<typename _ForwardIterator , typename _Tp >
iterator std::_Temporary_buffer< _ForwardIterator, _Tp >::begin () [inline], [inherited]
```

As per Table mumble.

Definition at line 165 of file stl\_tempbuf.h.

#### 4.956.3.2 end()

```
template<typename _ForwardIterator , typename _Tp >
iterator std::_Temporary_buffer< _ForwardIterator, _Tp >::end () [inline], [inherited]
```

As per Table mumble.

Definition at line 170 of file stl\_tempbuf.h.

#### 4.956.3.3 requested\_size()

```
template<typename _ForwardIterator , typename _Tp >
size_type std::_Temporary_buffer< _ForwardIterator, _Tp >::requested_size () const [inline],
[inherited]
```

Returns the size requested by the constructor; may be >size().

Definition at line 160 of file stl\_tempbuf.h.

## 4.956.3.4 size()

```
template<typename _ForwardIterator , typename _Tp >
size_type std::_Temporary_buffer< _ForwardIterator, _Tp >::size () const [inline], [inherited]
```

As per Table mumble.

Definition at line 155 of file stl\_tempbuf.h.

The documentation for this struct was generated from the following file:

- [ext/memory](#)

## 4.957 \_\_gnu\_pbds::detail::thin\_heap&lt; Value\_Type, Cmp\_Fn, \_Alloc &gt; Class Template Reference

Inheritance diagram for \_\_gnu\_pbds::detail::thin\_heap< Value\_Type, Cmp\_Fn, \_Alloc >:

## Public Types

## 4.966 std::time\_base Class Reference

Inheritance diagram for std::time\_base:

#### Public Types

- enum **dateorder** {  
    **no\_order**, **dmy**, **mdy**, **ymd**,  
    **ydm** }

#### 4.966.1 Detailed Description

Time format ordering data.

This class provides an enum representing different orderings of time: day, month, and year.

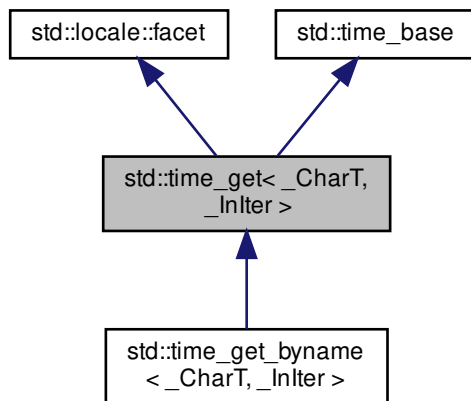

Definition at line 52 of file `locale_facets_nonio.h`.

The documentation for this class was generated from the following file:

- [locale\\_facets\\_nonio.h](#)

#### 4.967 std::time\_get<\_CharT, \_InIter> Class Template Reference

Inheritance diagram for `std::time_get<_CharT, _InIter>`:

#### Public Types

- enum **dateorder** {  
    **no\_order**, **dmy**, **mdy**, **ymd**,  
    **ydm** }

- typedef `_CharT` [char\\_type](#)
- typedef `_InIter` [iter\\_type](#)

## Public Member Functions

#### 4.967.1 Detailed Description

```
template<typename _CharT, typename _InIter>
class std::time_get< _CharT, _InIter >
```

Primary class template `time_get`.

This facet encapsulates the code to parse and return a date or time from a string. It is used by the istream numeric extraction operators.

The `time_get` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `time_get` facet.

Definition at line 368 of file `locale_facets_nonio.h`.

#### 4.967.2 Member Typedef Documentation

##### 4.967.2.1 `char_type`

```
template<typename _CharT , typename _InIter >
typedef _CharT std::time_get< _CharT, _InIter >::char_type
```

Public typedefs.

Definition at line 374 of file `locale_facets_nonio.h`.

##### 4.967.2.2 `iter_type`

```
template<typename _CharT , typename _InIter >
typedef _InIter std::time_get< _CharT, _InIter >::iter_type
```

Public typedefs.

Definition at line 375 of file `locale_facets_nonio.h`.

#### 4.967.3 Constructor & Destructor Documentation

##### 4.967.3.1 `time_get()`

```
template<typename _CharT , typename _InIter >
std::time_get< _CharT, _InIter >::time_get (
 size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

#### Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

Definition at line 389 of file locale\_facets\_nonio.h.

#### 4.967.3.2 ~time\_get()

```
template<typename _CharT , typename _InIter >
virtual std::time_get< _CharT, _InIter >::~~time_get () [inline], [protected], [virtual]
```

Destructor.

Definition at line 593 of file locale\_facets\_nonio.h.

### 4.967.4 Member Function Documentation

#### 4.967.4.1 date\_order()

```
template<typename _CharT , typename _InIter >
dateorder std::time_get< _CharT, _InIter >::date_order () const [inline]
```

Return preferred order of month, day, and year.

This function returns an enum from `time_base::dateorder` giving the preferred ordering if the format `x` given to `time_get::put::put()` only uses month, day, and year. If the format `x` for the associated locale uses other fields, this function returns `time_base::dateorder::noorder`.

NOTE: The library always returns `noorder` at the moment.

#### Returns

A member of `time_base::dateorder`.

Definition at line 406 of file locale\_facets\_nonio.h.

References `std::time_get< _CharT, _InIter >::do_date_order()`.

#### 4.967.4.2 do\_date\_order()

```
template<typename _CharT , typename _InIter >
_GLIBCXX_END_NAMESPACE_LDBL_OR_CXX11 time_base::dateorder std::time_get< _CharT, _InIter >::do_↵
date_order () const [protected], [virtual]
```

Return preferred order of month, day, and year.

This function returns an enum from `time_base::dateorder` giving the preferred ordering if the format `x` given to `time_↵`  
`put::put()` only uses month, day, and year. This function is a hook for derived classes to change the value returned.

##### Returns

A member of `time_base::dateorder`.

Definition at line 627 of file `locale_facets_nonio.tcc`.

Referenced by `std::time_get< _CharT, _InIter >::date_order()`.

#### 4.967.4.3 do\_get()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get (
 iter_type __s,
 iter_type __end,
 ios_base & __f,
 ios_base::iostate & __err,
 tm * __tm,
 char __format,
 char __modifier) const [inline], [protected]
```

Parse input string according to format.

This function parses the string according to the provided format and optional modifier. This function is a hook for derived classes to change the value returned.

##### See also

`get()` for more details.

##### Parameters

|                         |                                  |
|-------------------------|----------------------------------|
| <code>__s</code>        | Start of string to parse.        |
| <code>__end</code>      | End of string to parse.          |
| <code>__f</code>        | Source of the locale.            |
| <code>__err</code>      | Error flags to set.              |
| <code>__tm</code>       | Pointer to struct tm to fill in. |
| <code>__format</code>   | Format specifier.                |
| <code>__modifier</code> | Format modifier.                 |

**Returns**

Iterator to first char not parsed.

Definition at line 1241 of file locale\_facets\_nonio.tcc.

References std::ios\_base::\_M\_getloc(), std::ios\_base::eofbit, std::ios\_base::goodbit, and std::\_\_ctype\_abstract\_base< \_CharT >::widen().

Referenced by std::time\_get< \_CharT, \_InIter >::get().

**4.967.4.4 do\_get\_date()**

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get_date (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm) const [protected], [virtual]
```

Parse input date string.

This function parses a date according to the format *X* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

**See also**

get\_date() for details.

**Parameters**

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond date string.

Definition at line 1077 of file locale\_facets\_nonio.tcc.

References std::ios\_base::\_M\_getloc(), and std::ios\_base::eofbit.

Referenced by std::time\_get< \_CharT, \_InIter >::get\_date().

#### 4.967.4.5 do\_get\_monthname()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get_monthname (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm) const [protected], [virtual]
```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

#### See also

[get\\_monthname\(\)](#) for details.

#### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

#### Returns

Iterator to first char beyond month name.

Definition at line 1120 of file locale\_facets\_nonio.tcc.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::failbit](#), and [std::ios\\_base::goodbit](#).

Referenced by [std::time\\_get< \\_CharT, \\_InIter >::get\\_monthname\(\)](#).

#### 4.967.4.6 do\_get\_time()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get_time (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm) const [protected], [virtual]
```

Parse input time string.

This function parses a time according to the format `x` and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get\_time() for details.

#### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

#### Returns

Iterator to first char beyond time string.

Definition at line 1060 of file locale\_facets\_nonio.tcc.

References `std::ios_base::_M_getloc()`, and `std::ios_base::eofbit`.

Referenced by `std::time_get< _CharT, _InIter >::get_time()`.

#### 4.967.4.7 do\_get\_weekday()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get_weekday (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm) const [protected], [virtual]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get\_weekday() for details.

#### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond weekday name.

Definition at line 1094 of file locale\_facets\_nonio.tcc.

References `std::ios_base::_M_getloc()`, `std::ios_base::eofbit`, `std::ios_base::failbit`, and `std::ios_base::goodbit`.

Referenced by `std::time_get<_CharT, _InIter>::get_weekday()`.

**4.967.4.8 do\_get\_year()**

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get_year (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm) const [protected], [virtual]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

**See also**

`get_year()` for details.

**Parameters**

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond year.

Definition at line 1146 of file locale\_facets\_nonio.tcc.

References `std::ios_base::eofbit`, `std::ios_base::failbit`, and `std::ios_base::goodbit`.

Referenced by `std::time_get<_CharT, _InIter>::get_year()`.

## 4.967.4.9 get() [1/2]

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get (
 iter_type __s,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm,
 char __format,
 char __modifier = 0) const [inline]
```

Parse input string according to format.

This function calls time\_get::do\_get with the provided parameters.

## See also

do\_get() and get().

## Parameters

|                         |                                  |
|-------------------------|----------------------------------|
| <code>__s</code>        | Start of string to parse.        |
| <code>__end</code>      | End of string to parse.          |
| <code>__io</code>       | Source of the locale.            |
| <code>__err</code>      | Error flags to set.              |
| <code>__tm</code>       | Pointer to struct tm to fill in. |
| <code>__format</code>   | Format specifier.                |
| <code>__modifier</code> | Format modifier.                 |

## Returns

Iterator to first char not parsed.

Definition at line 559 of file locale\_facets\_nonio.h.

References std::time\_get< \_CharT, \_InIter >::do\_get().

## 4.967.4.10 get() [2/2]

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::get (
 iter_type __s,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm,
```

```
const char_type * __fmt,
const char_type * __fmtend) const [inline]
```

Parse input string according to format.

This function parses the input string according to a provided format string. It does the inverse of `time_put::put`. The format string follows the format specified for `strptime(3)/strptime(3)`. The actual parsing is done by `time_get::do_get`.

#### Parameters

|                       |                                               |
|-----------------------|-----------------------------------------------|
| <code>__s</code>      | Start of string to parse.                     |
| <code>__end</code>    | End of string to parse.                       |
| <code>__io</code>     | Source of the locale.                         |
| <code>__err</code>    | Error flags to set.                           |
| <code>__tm</code>     | Pointer to struct <code>tm</code> to fill in. |
| <code>__fmt</code>    | Start of the format string.                   |
| <code>__fmtend</code> | End of the format string.                     |

#### Returns

Iterator to first char not parsed.

Definition at line 1169 of file `locale_facets_nonio.tcc`.

References `std::ios_base::M_getloc()`, `std::ios_base::eofbit`, `std::ios_base::failbit`, `std::ios_base::goodbit`, `std::__ctype_abstract_base< _CharT >::is()`, `std::__ctype_abstract_base< _CharT >::narrow()`, `std::__ctype_abstract_base< _CharT >::tolower()`, and `std::__ctype_abstract_base< _CharT >::toupper()`.

#### 4.967.4.11 `get_date()`

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_date (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm) const [inline]
```

Parse input date string.

This function parses a date according to the format `x` and puts the results into a user-supplied struct `tm`. The result is returned by calling `time_get::do_get_date()`.

If there is a valid date string according to format `x`, `tm` will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, `err` |= `ios_base::failbit`. If parsing reads all the characters, `err` |= `ios_base::eofbit`.

## Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

## Returns

Iterator to first char beyond date string.

Definition at line 455 of file locale\_facets\_nonio.h.

References `std::time_get< _CharT, _InIter >::do_get_date()`.

## 4.967.4.12 get\_monthname()

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_monthname (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm) const [inline]
```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_monthname()`.

Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

## Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond month name.

Definition at line 512 of file locale\_facets\_nonio.h.

References `std::time_get<_CharT, _InIter >::do_get_monthname()`.

**4.967.4.13 get\_time()**

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_time (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm) const [inline]
```

Parse input time string.

This function parses a time according to the format *X* and puts the results into a user-supplied struct *tm*. The result is returned by calling `time_get::do_get_time()`.

If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

**Parameters**

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__beg</code> | Start of string to parse.               |
| <code>__end</code> | End of string to parse.                 |
| <code>__io</code>  | Source of the locale.                   |
| <code>__err</code> | Error flags to set.                     |
| <code>__tm</code>  | Pointer to struct <i>tm</i> to fill in. |

**Returns**

Iterator to first char beyond time string.

Definition at line 430 of file locale\_facets\_nonio.h.

References `std::time_get<_CharT, _InIter >::do_get_time()`.

## 4.967.4.14 get\_weekday()

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_weekday (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm) const [inline]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. The result is returned by calling time\_get::do\_get\_weekday().

Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, err |= ios\_base::failbit. If parsing reads all the characters, err |= ios\_base::eofbit.

## Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

## Returns

Iterator to first char beyond weekday name.

Definition at line 483 of file locale\_facets\_nonio.h.

References std::time\_get< \_CharT, \_InIter >::do\_get\_weekday().

## 4.967.4.15 get\_year()

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_year (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm) const [inline]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_year()`.

4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

#### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

#### Returns

Iterator to first char beyond year.

Definition at line 538 of file `locale_facets_nonio.h`.

References `std::time_get<_CharT, _InIter>::do_get_year()`.

### 4.967.5 Member Data Documentation

#### 4.967.5.1 id

```
template<typename _CharT , typename _InIter >
locale::id std::time_get< _CharT, _InIter >::id [static]
```

Numpunct facet id.

## 4.968.1 Detailed Description

```
template<typename _CharT, typename _InIter>
class std::time_get_byname< _CharT, _InIter >
```

class time\_get\_byname [22.2.5.2].

Definition at line 760 of file locale\_facets\_nonio.h.

## 4.968.2 Member Function Documentation

### 4.968.2.1 date\_order()

```
template<typename _CharT , typename _InIter >
dateorder std::time_get< _CharT, _InIter >::date_order () const [inline], [inherited]
```

Return preferred order of month, day, and year.

This function returns an enum from time\_base::dateorder giving the preferred ordering if the format x given to time\_get::put() only uses month, day, and year. If the format x for the associated locale uses other fields, this function returns time\_base::dateorder::noorder.

NOTE: The library always returns noorder at the moment.

#### Returns

A member of time\_base::dateorder.

Definition at line 406 of file locale\_facets\_nonio.h.

References std::time\_get< \_CharT, \_InIter >::do\_date\_order().

### 4.968.2.2 do\_date\_order()

```
template<typename _CharT , typename _InIter >
_GLIBCXX_END_NAMESPACE_LDBL_OR_CXX11 time_base::dateorder std::time_get< _CharT, _InIter >::do_
date_order () const [protected], [virtual], [inherited]
```

Return preferred order of month, day, and year.

This function returns an enum from time\_base::dateorder giving the preferred ordering if the format x given to time\_get::put() only uses month, day, and year. This function is a hook for derived classes to change the value returned.

#### Returns

A member of time\_base::dateorder.

Definition at line 627 of file locale\_facets\_nonio.tcc.

Referenced by std::time\_get< \_CharT, \_InIter >::date\_order().

#### 4.968.2.3 do\_get()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get (
 iter_type __s,
 iter_type __end,
 ios_base & __f,
 ios_base::iostate & __err,
 tm * __tm,
 char __format,
 char __modifier) const [inline], [protected], [inherited]
```

Parse input string according to format.

This function parses the string according to the provided format and optional modifier. This function is a hook for derived classes to change the value returned.

#### See also

`get()` for more details.

#### Parameters

|                         |                                  |
|-------------------------|----------------------------------|
| <code>__s</code>        | Start of string to parse.        |
| <code>__end</code>      | End of string to parse.          |
| <code>__f</code>        | Source of the locale.            |
| <code>__err</code>      | Error flags to set.              |
| <code>__tm</code>       | Pointer to struct tm to fill in. |
| <code>__format</code>   | Format specifier.                |
| <code>__modifier</code> | Format modifier.                 |

#### Returns

Iterator to first char not parsed.

Definition at line 1241 of file locale\_facets\_nonio.tcc.

References `std::ios_base::_M_getloc()`, `std::ios_base::eofbit`, `std::ios_base::goodbit`, and `std::__ctype_abstract_base<_CharT >::widen()`.

Referenced by `std::time_get<_CharT, _InIter >::get()`.

## 4.968.2.4 do\_get\_date()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get_date (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm) const [protected], [virtual], [inherited]
```

Parse input date string.

This function parses a date according to the format *X* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get\_date() for details.

## Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

## Returns

Iterator to first char beyond date string.

Definition at line 1077 of file locale\_facets\_nonio.tcc.

References `std::ios_base::_M_getloc()`, and `std::ios_base::eofbit`.

Referenced by `std::time_get< _CharT, _InIter >::get_date()`.

## 4.968.2.5 do\_get\_monthname()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get_monthname (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm) const [protected], [virtual], [inherited]
```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

`get_monthname()` for details.

Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

Returns

Iterator to first char beyond month name.

Definition at line 1120 of file `locale_facets_nonio.tcc`.

References `std::ios_base::_M_getloc()`, `std::ios_base::eofbit`, `std::ios_base::failbit`, and `std::ios_base::goodbit`.

Referenced by `std::time_get<_CharT, _InIter>::get_monthname()`.

#### 4.968.2.6 `do_get_time()`

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get_time (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm) const [protected], [virtual], [inherited]
```

Parse input time string.

This function parses a time according to the format `x` and puts the results into a user-supplied struct `tm`. This function is a hook for derived classes to change the value returned.

See also

`get_time()` for details.

Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond time string.

Definition at line 1060 of file locale\_facets\_nonio.tcc.

References std::ios\_base::\_M\_getloc(), and std::ios\_base::eofbit.

Referenced by std::time\_get< \_CharT, \_InIter >::get\_time().

**4.968.2.7 do\_get\_weekday()**

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get_weekday (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm) const [protected], [virtual], [inherited]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

**See also**

get\_weekday() for details.

**Parameters**

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond weekday name.

Definition at line 1094 of file locale\_facets\_nonio.tcc.

References std::ios\_base::\_M\_getloc(), std::ios\_base::eofbit, std::ios\_base::failbit, and std::ios\_base::goodbit.

Referenced by std::time\_get< \_CharT, \_InIter >::get\_weekday().

#### 4.968.2.8 do\_get\_year()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get_year (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm) const [protected], [virtual], [inherited]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

`get_year()` for details.

##### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

##### Returns

Iterator to first char beyond year.

Definition at line 1146 of file `locale_facets_nonio.tcc`.

References `std::ios_base::eofbit`, `std::ios_base::failbit`, and `std::ios_base::goodbit`.

Referenced by `std::time_get< _CharT, _InIter >::get_year()`.

#### 4.968.2.9 get() [1/2]

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get (
 iter_type __s,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm,
 char __format,
 char __modifier = 0) const [inline], [inherited]
```

Parse input string according to format.

This function calls `time_get::do_get` with the provided parameters.

See also

do\_get() and get().

#### Parameters

|                         |                                  |
|-------------------------|----------------------------------|
| <code>__s</code>        | Start of string to parse.        |
| <code>__end</code>      | End of string to parse.          |
| <code>__io</code>       | Source of the locale.            |
| <code>__err</code>      | Error flags to set.              |
| <code>__tm</code>       | Pointer to struct tm to fill in. |
| <code>__format</code>   | Format specifier.                |
| <code>__modifier</code> | Format modifier.                 |

#### Returns

Iterator to first char not parsed.

Definition at line 559 of file locale\_facets\_nonio.h.

References std::time\_get< \_CharT, \_InIter >::do\_get().

#### 4.968.2.10 get() [2/2]

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::get (
 iter_type __s,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm,
 const char_type * __fmt,
 const char_type * __fmtend) const [inline], [inherited]
```

Parse input string according to format.

This function parses the input string according to a provided format string. It does the inverse of time\_put::put. The format string follows the format specified for strftime(3)/strptime(3). The actual parsing is done by time\_get::do\_get.

#### Parameters

|                       |                                  |
|-----------------------|----------------------------------|
| <code>__s</code>      | Start of string to parse.        |
| <code>__end</code>    | End of string to parse.          |
| <code>__io</code>     | Source of the locale.            |
| <code>__err</code>    | Error flags to set.              |
| <code>__tm</code>     | Pointer to struct tm to fill in. |
| <code>__fmt</code>    | Start of the format string.      |
| <code>__fmtend</code> | End of the format string.        |

**Returns**

Iterator to first char not parsed.

Definition at line 1169 of file locale\_facets\_nonio.tcc.

References `std::ios_base::_M_getloc()`, `std::ios_base::eofbit`, `std::ios_base::failbit`, `std::ios_base::goodbit`, `std::__ctype_abstract_base<_CharT>::is()`, `std::__ctype_abstract_base<_CharT>::narrow()`, `std::__ctype_abstract_base<_CharT>::tolower()`, and `std::__ctype_abstract_base<_CharT>::toupper()`.

**4.968.2.11 get\_date()**

```
template<typename _CharT, typename _InIter >
iter_type std::time_get<_CharT, _InIter>::get_date (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm) const [inline], [inherited]
```

Parse input date string.

This function parses a date according to the format *x* and puts the results into a user-supplied struct *tm*. The result is returned by calling `time_get::do_get_date()`.

If there is a valid date string according to format *x*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

**Parameters**

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__beg</code> | Start of string to parse.               |
| <code>__end</code> | End of string to parse.                 |
| <code>__io</code>  | Source of the locale.                   |
| <code>__err</code> | Error flags to set.                     |
| <code>__tm</code>  | Pointer to struct <i>tm</i> to fill in. |

**Returns**

Iterator to first char beyond date string.

Definition at line 455 of file locale\_facets\_nonio.h.

References `std::time_get<_CharT, _InIter>::do_get_date()`.

## 4.968.2.12 get\_monthname()

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_monthname (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm) const [inline], [inherited]
```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. The result is returned by calling time\_get::do\_get\_monthname().

Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, err |= ios\_base::failbit. If parsing reads all the characters, err |= ios\_base::eofbit.

## Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

## Returns

Iterator to first char beyond month name.

Definition at line 512 of file locale\_facets\_nonio.h.

References std::time\_get< \_CharT, \_InIter >::do\_get\_monthname().

## 4.968.2.13 get\_time()

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_time (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm) const [inline], [inherited]
```

Parse input time string.

This function parses a time according to the format *X* and puts the results into a user-supplied struct *tm*. The result is returned by calling `time_get::do_get_time()`.

If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, `err != ios_base::failbit`. If parsing reads all the characters, `err != ios_base::eofbit`.

#### Parameters

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__beg</code> | Start of string to parse.               |
| <code>__end</code> | End of string to parse.                 |
| <code>__io</code>  | Source of the locale.                   |
| <code>__err</code> | Error flags to set.                     |
| <code>__tm</code>  | Pointer to struct <i>tm</i> to fill in. |

#### Returns

Iterator to first char beyond time string.

Definition at line 430 of file `locale_facets_nonio.h`.

References `std::time_get<_CharT, _InIter>::do_get_time()`.

#### 4.968.2.14 `get_weekday()`

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_weekday (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm) const [inline], [inherited]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct *tm*. The result is returned by calling `time_get::do_get_weekday()`.

Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err != ios_base::failbit`. If parsing reads all the characters, `err != ios_base::eofbit`.

#### Parameters

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__beg</code> | Start of string to parse.               |
| <code>__end</code> | End of string to parse.                 |
| <code>__io</code>  | Source of the locale.                   |
| <code>__err</code> | Error flags to set.                     |
| <code>__tm</code>  | Pointer to struct <i>tm</i> to fill in. |

**Returns**

Iterator to first char beyond weekday name.

Definition at line 483 of file locale\_facets\_nonio.h.

References std::time\_get< \_CharT, \_InIter >::do\_get\_weekday().

**4.968.2.15 get\_year()**

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_year (
 iter_type __beg,
 iter_type __end,
 ios_base & __io,
 ios_base::iostate & __err,
 tm * __tm) const [inline], [inherited]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling time\_get::do\_get\_year().

4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.

If an error occurs before the end, err |= ios\_base::failbit. If parsing reads all the characters, err |= ios\_base::eofbit.

**Parameters**

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond year.

Definition at line 538 of file locale\_facets\_nonio.h.

References std::time\_get< \_CharT, \_InIter >::do\_get\_year().

#### 4.970.1 Detailed Description

```
template<typename _CharT, typename _Outiter>
class std::time_put< _CharT, _Outiter >
```

Primary class template `time_put`.

This facet encapsulates the code to format and output dates and times according to formats used by `strftime()`.

The `time_put` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `time_put` facet.

Definition at line 797 of file `locale_facets_nonio.h`.

#### 4.970.2 Member Typedef Documentation

#### 4.970.2.1 char\_type

```
template<typename _CharT , typename _OutIter >
typedef _CharT std::time_put< _CharT, _OutIter >::char_type
```

Public typedefs.

Definition at line 803 of file locale\_facets\_nonio.h.

#### 4.970.2.2 iter\_type

```
template<typename _CharT , typename _OutIter >
typedef _OutIter std::time_put< _CharT, _OutIter >::iter_type
```

Public typedefs.

Definition at line 804 of file locale\_facets\_nonio.h.

### 4.970.3 Constructor & Destructor Documentation

#### 4.970.3.1 time\_put()

```
template<typename _CharT , typename _OutIter >
std::time_put< _CharT, _OutIter >::time_put (
 size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

Definition at line 818 of file locale\_facets\_nonio.h.

#### 4.970.3.2 ~time\_put()

```
template<typename _CharT , typename _OutIter >
virtual std::time_put< _CharT, _OutIter >::~~time_put () [inline], [protected], [virtual]
```

Destructor.

Definition at line 864 of file locale\_facets\_nonio.h.

#### 4.970.4 Member Function Documentation

##### 4.970.4.1 do\_put()

```
template<typename _CharT , typename _OutIter >
_OutIter std::time_put< _CharT, _OutIter >::do_put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 const tm * __tm,
 char __format,
 char __mod) const [protected], [virtual]
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. This function is a hook for derived classes to change the value returned.

##### See also

`put()` for more details.

##### Parameters

|                       |                                              |
|-----------------------|----------------------------------------------|
| <code>__s</code>      | The stream to write to.                      |
| <code>__io</code>     | Source of locale.                            |
| <code>__fill</code>   | <code>char_type</code> to use for padding.   |
| <code>__tm</code>     | Struct tm with date and time info to format. |
| <code>__format</code> | Format char.                                 |
| <code>__mod</code>    | Optional modifier char.                      |

##### Returns

Iterator after writing.

Definition at line 1309 of file `locale_facets_nonio.tcc`.

References `std::ios_base::_M_getloc()`, and `std::__ctype_abstract_base< _CharT >::widen()`.

Referenced by `std::time_put< _CharT, _OutIter >::put()`.

## 4.970.4.2 put() [1/2]

```
template<typename _CharT , typename _OutIter >
_OutIter std::time_put< _CharT, _OutIter >::put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 const tm * __tm,
 const _CharT * __beg,
 const _CharT * __end) const
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format string. The format string is interpreted as by `strftime()`.

## Parameters

|                     |                                              |
|---------------------|----------------------------------------------|
| <code>__s</code>    | The stream to write to.                      |
| <code>__io</code>   | Source of locale.                            |
| <code>__fill</code> | <code>char_type</code> to use for padding.   |
| <code>__tm</code>   | Struct tm with date and time info to format. |
| <code>__beg</code>  | Start of format string.                      |
| <code>__end</code>  | End of format string.                        |

## Returns

Iterator after writing.

Definition at line 1274 of file `locale_facets_nonio.tcc`.

References `std::ios_base::_M_getloc()`, and `std::__ctype_abstract_base< _CharT >::narrow()`.

## 4.970.4.3 put() [2/2]

```
template<typename _CharT , typename _OutIter >
iter_type std::time_put< _CharT, _OutIter >::put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 const tm * __tm,
 char __format,
 char __mod = 0) const [inline]
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. The format and modifier are interpreted as by `strftime()`. It does so by returning `time_put::do_put()`.

**Parameters**

|                       |                                                           |
|-----------------------|-----------------------------------------------------------|
| <code>__s</code>      | The stream to write to.                                   |
| <code>__io</code>     | Source of locale.                                         |
| <code>__fill</code>   | <code>char_type</code> to use for padding.                |
| <code>__tm</code>     | Struct <code>tm</code> with date and time info to format. |
| <code>__format</code> | Format char.                                              |
| <code>__mod</code>    | Optional modifier char.                                   |

**Returns**

Iterator after writing.

Definition at line 857 of file `locale_facets_nonio.h`.

References `std::time_put<_CharT, _OutIter >::do_put()`.

**4.970.5 Member Data Documentation****4.970.5.1 id**

```
template<typename _CharT , typename _OutIter >
locale::id std::time_put<_CharT, _OutIter >::id [static]
```

Numpunct facet id.

### 4.971.1 Detailed Description

```
template<typename _CharT, typename _OutIter>
class std::time_put_byname< _CharT, _OutIter >
```

class time\_put\_byname [22.2.5.4].

Definition at line 893 of file locale\_facets\_nonio.h.

### 4.971.2 Member Function Documentation

#### 4.971.2.1 do\_put()

```
template<typename _CharT , typename _OutIter >
_OutIter std::time_put< _CharT, _OutIter >::do_put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 const tm * __tm,
 char __format,
 char __mod) const [protected], [virtual], [inherited]
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. This function is a hook for derived classes to change the value returned.

#### See also

`put()` for more details.

#### Parameters

|                       |                                              |
|-----------------------|----------------------------------------------|
| <code>__s</code>      | The stream to write to.                      |
| <code>__io</code>     | Source of locale.                            |
| <code>__fill</code>   | char_type to use for padding.                |
| <code>__tm</code>     | Struct tm with date and time info to format. |
| <code>__format</code> | Format char.                                 |
| <code>__mod</code>    | Optional modifier char.                      |

**Returns**

Iterator after writing.

Definition at line 1309 of file locale\_facets\_nonio.tcc.

References std::ios\_base::\_M\_getloc(), and std::\_\_ctype\_abstract\_base< \_CharT >::widen().

Referenced by std::time\_put< \_CharT, \_OutIter >::put().

**4.971.2.2 put()** [1/2]

```
template<typename _CharT , typename _OutIter >
_OutIter std::time_put< _CharT, _OutIter >::put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 const tm * __tm,
 const _CharT * __beg,
 const _CharT * __end) const [inherited]
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format string. The format string is interpreted as by strftime().

**Parameters**

|                     |                                              |
|---------------------|----------------------------------------------|
| <code>__s</code>    | The stream to write to.                      |
| <code>__io</code>   | Source of locale.                            |
| <code>__fill</code> | char_type to use for padding.                |
| <code>__tm</code>   | Struct tm with date and time info to format. |
| <code>__beg</code>  | Start of format string.                      |
| <code>__end</code>  | End of format string.                        |

**Returns**

Iterator after writing.

Definition at line 1274 of file locale\_facets\_nonio.tcc.

References std::ios\_base::\_M\_getloc(), and std::\_\_ctype\_abstract\_base< \_CharT >::narrow().

#### 4.971.2.3 put() [2/2]

```
template<typename _CharT , typename _OutIter >
iter_type std::time_put< _CharT, _OutIter >::put (
 iter_type __s,
 ios_base & __io,
 char_type __fill,
 const tm * __tm,
 char __format,
 char __mod = 0) const [inline], [inherited]
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. The format and modifier are interpreted as by strftime(). It does so by returning time\_put::do\_put().

##### Parameters

|                       |                                              |
|-----------------------|----------------------------------------------|
| <code>__s</code>      | The stream to write to.                      |
| <code>__io</code>     | Source of locale.                            |
| <code>__fill</code>   | char_type to use for padding.                |
| <code>__tm</code>     | Struct tm with date and time info to format. |
| <code>__format</code> | Format char.                                 |
| <code>__mod</code>    | Optional modifier char.                      |

##### Returns

Iterator after writing.

Definition at line 857 of file locale\_facets\_nonio.h.

References std::time\_put< \_CharT, \_OutIter >::do\_put().

#### 4.971.3 Member Data Documentation

##### 4.971.3.1 id

```
template<typename _CharT , typename _OutIter >
locale::id std::time_put< _CharT, _OutIter >::id [static], [inherited]
```

Numpunct facet id.

Definition at line 808 of file locale\_facets\_nonio.h.

The documentation for this class was generated from the following file:

- [locale\\_facets\\_nonio.h](#)

## 4.972 `std::timed_mutex` Class Reference

### Public Member Functions

- **timed\_mutex** (const [timed\\_mutex](#) &)=delete
- void **lock** ()
- [timed\\_mutex](#) & **operator=** (const [timed\\_mutex](#) &)=delete
- bool **try\_lock** ()

bool **try\_lock\_until** (const [chrono::time\\_point](#)< \_Clock, \_Duration > &\_\_atime)
- void **unlock** ()

### 4.972.1 Detailed Description

`timed_mutex`

Definition at line 343 of file `mutex`.

The documentation for this class was generated from the following file:

- [mutex](#)

## 4.973 `std::to_chars_result` Struct Reference

### Public Attributes

- `errc` **ec**
- `char *` **ptr**

### 4.973.1 Detailed Description

Result type of `std::to_chars`.

Definition at line 55 of file `charconv`.

The documentation for this struct was generated from the following file:

- [charconv](#)

#### 4.974 `std::chrono::treat_as_floating_point<_Rep>` Struct Template Reference

Inheritance diagram for `std::chrono::treat_as_floating_point<_Rep>`:

##### 4.974.1 Detailed Description

```
template<typename _Rep>
struct std::chrono::treat_as_floating_point<_Rep>
```

`treat_as_floating_point`

Definition at line 268 of file `chrono`.

The documentation for this struct was generated from the following file:

- [chrono](#)

#### 4.975 `__gnu_pbds::tree<Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc>` Class Template Reference

Inheritance diagram for `__gnu_pbds::tree<Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc>`:

## Public Types

- typedef Cmp\_Fn [cmp\\_fn](#)
- typedef [detail::tree\\_traits](#)< Key, Mapped, Cmp\_Fn, Node\_Update, Tag, \_Alloc > ::node\_update **node\_update**

## Public Member Functions

- [tree](#) (const [cmp\\_fn](#) &c)
- template<typename It >  
[tree](#) (It first, It last)
- template<typename It >  
[tree](#) (It first, It last, const [cmp\\_fn](#) &c)
- **tree** (const [tree](#) &other)
- [tree](#) & **operator=** (const [tree](#) &other)
- void **swap** ([tree](#) &other)

## 4.975.1 Detailed Description

```
template<typename Key, typename Mapped, typename Cmp_Fn = std::less<Key>, typename Tag = rb_tree_tag, template< typename
Node_Cltr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc > class Node_Update = null_node_update, typename _Alloc =
std::allocator<char>>>
class __gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >
```

A tree-based container.

## Template Parameters

|                    |                                                                                                                                          |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Key</i>         | Key type.                                                                                                                                |
| <i>Mapped</i>      | Map type.                                                                                                                                |
| <i>Cmp_Fn</i>      | Comparison functor.                                                                                                                      |
| <i>Tag</i>         | Instantiating data structure type, see <a href="#">container_tag</a> .                                                                   |
| <i>Node_Update</i> | Updates tree internal-nodes, restores invariants when invalidated. XXX See <a href="#">design::tree-based-containersnode</a> invariants. |
| <i>_Alloc</i>      | Allocator type.                                                                                                                          |

Base tag choices are: [ov\\_tree\\_tag](#), [rb\\_tree\\_tag](#), [splay\\_tree\\_tag](#).

Base is [basic\\_branch](#).

Definition at line 635 of file [assoc\\_container.hpp](#).

## 4.975.2 Member Typedef Documentation

#### 4.975.2.1 cmp\_fn

```
template<typename Key , typename Mapped , typename Cmp_Fn = std::less<Key>, typename Tag = rb←
_tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
typedef Cmp_Fn __gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::cmp_fn
```

Comparison functor type.

Definition at line 642 of file assoc\_container.hpp.

#### 4.975.3 Constructor & Destructor Documentation

##### 4.975.3.1 tree() [1/3]

```
template<typename Key , typename Mapped , typename Cmp_Fn = std::less<Key>, typename Tag = rb←
_tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
__gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::tree (
 const cmp_fn & c) [inline]
```

Constructor taking some policy objects. r\_cmp\_fn will be copied by the Cmp\_Fn object of the container object.

Definition at line 648 of file assoc\_container.hpp.

##### 4.975.3.2 tree() [2/3]

```
template<typename Key , typename Mapped , typename Cmp_Fn = std::less<Key>, typename Tag = rb←
_tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
template<typename It >
__gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::tree (
 It first,
 It last) [inline]
```

Constructor taking \_\_iterators to a range of value\_types. The value\_types between first\_it and last\_it will be inserted into the container object.

Definition at line 655 of file assoc\_container.hpp.

4.975.3.3 `tree()` [3/3]

```
template<typename Key , typename Mapped , typename Cmp_Fn = std::less<Key>, typename Tag = rb←
_tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>>
template<typename It >
__gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::tree (
 It first,
 It last,
 const cmp_fn & c) [inline]
```

Constructor taking \_\_iterators to a range of value\_types and some policy objects The value\_types between first\_it and last\_it will be inserted into the container object. r\_cmp\_fn will be copied by the cmp\_fn object of the container object.

Definition at line 663 of file `assoc_container.hpp`.

The documentation for this class was generated from the following file:

- [assoc\\_container.hpp](#)

4.976 `__gnu_pbds::detail::tree_metadata_helper< Node_Update, _BTp >` Struct Template Reference

## 4.976.1 Detailed Description

```
template<typename Node_Update, bool _BTp>
struct __gnu_pbds::detail::tree_metadata_helper< Node_Update, _BTp >
```

Tree metadata helper.

Definition at line 58 of file `tree_policy/node_metadata_selector.hpp`.

The documentation for this struct was generated from the following file:

- [tree\\_policy/node\\_metadata\\_selector.hpp](#)

4.977 `__gnu_pbds::detail::tree_metadata_helper< Node_Update, false >` Struct Template Reference

## Public Types

- `typedef Node_Update::metadata_type type`

#### 4.977.1 Detailed Description

```
template<typename Node_Update>
struct __gnu_pbds::detail::tree_metadata_helper< Node_Update, false >
```

Specialization, false.

Definition at line 62 of file tree\_policy/node\_metadata\_selector.hpp.

The documentation for this struct was generated from the following file:

- [tree\\_policy/node\\_metadata\\_selector.hpp](#)

#### 4.978 \_\_gnu\_pbds::detail::tree\_metadata\_helper< Node\_Update, true > Struct Template Reference

##### Public Types

- typedef [null\\_type](#) **type**

#### 4.978.1 Detailed Description

```
template<typename Node_Update>
struct __gnu_pbds::detail::tree_metadata_helper< Node_Update, true >
```

Specialization, true.

Definition at line 69 of file tree\_policy/node\_metadata\_selector.hpp.

The documentation for this struct was generated from the following file:

- [tree\\_policy/node\\_metadata\\_selector.hpp](#)

#### 4.979 \_\_gnu\_pbds::detail::tree\_node\_metadata\_dispatch< Key, Data, Cmp\_Fn, Node\_Update, \_Alloc > Struct Template Reference

##### Public Types

- typedef [tree\\_metadata\\_helper](#)< \_\_node\_u, null\_update >::type **type**

#### 4.979.1 Detailed Description

```
template<typename Key, typename Data, typename Cmp_Fn, template< typename Node_Cltr, typename Const_Iterator, typename
Cmp_Fn, typename _Alloc_ > class Node_Update, typename _Alloc>
struct __gnu_pbds::detail::tree_node_metadata_dispatch< Key, Data, Cmp_Fn, Node_Update, _Alloc >
```

Tree node metadata dispatch.

Definition at line 84 of file `tree_policy/node_metadata_selector.hpp`.

The documentation for this struct was generated from the following file:

- [tree\\_policy/node\\_metadata\\_selector.hpp](#)

#### 4.980 `__gnu_pbds::tree_order_statistics_node_update< Node_Cltr, Node_Itr, Cmp_Fn, _Alloc > Class` Template Reference

Inheritance diagram for `__gnu_pbds::tree_order_statistics_node_update< Node_Cltr, Node_Itr, Cmp_Fn, _Alloc >`:

#### 4.980.1 Detailed Description

```
template<typename Node_Cltr, typename Node_Itr, typename Cmp_Fn, typename _Alloc>
class __gnu_pbds::tree_order_statistics_node_update< Node_Cltr, Node_Itr, Cmp_Fn, _Alloc >
```

Functor updating ranks of entrees.

Definition at line 64 of file tree\_policy.hpp.

#### 4.980.2 Member Function Documentation

#### 4.980.2.1 `find_by_order()` [1/2]

```
template<typename Node_CIttr , typename Node_Itr , typename Cmp_Fn , typename _Alloc >
__gnu_pbds::tree_order_statistics_node_update< Node_CIttr, Node_Itr, Cmp_Fn, _Alloc >::const_iterator __gnu_pbds::tree_order_statistics_node_update<
Node_CIttr, Node_Itr, Cmp_Fn, _Alloc >::find_by_order (
 size_type order) const [inline]
```

Finds an entry by `__order`. Returns a `const_iterator` to the entry with the `__order` order, or a `const_iterator` to the container object's end if order is at least the size of the container object.

Definition at line 74 of file `tree_policy.hpp`.

#### 4.980.2.2 `find_by_order()` [2/2]

```
template<typename Node_CIttr , typename Node_Itr , typename Cmp_Fn , typename _Alloc >
__gnu_pbds::tree_order_statistics_node_update< Node_CIttr, Node_Itr, Cmp_Fn, _Alloc >::iterator __gnu_pbds::tree_order_statistics_node_update<
Node_CIttr, Node_Itr, Cmp_Fn, _Alloc >::find_by_order (
 size_type order) [inline]
```

Finds an entry by `__order`. Returns an `iterator` to the entry with the `__order` order, or an `iterator` to the container object's end if order is at least the size of the container object.

Definition at line 47 of file `tree_policy.hpp`.

#### 4.980.2.3 `operator()()`

```
template<typename Node_CIttr , typename Node_Itr , typename Cmp_Fn , typename _Alloc >
void __gnu_pbds::tree_order_statistics_node_update< Node_CIttr, Node_Itr, Cmp_Fn, _Alloc >::operator()
(
 node_iterator node_it,
 node_const_iterator end_nd_it) const [inline], [protected]
```

Updates the rank of a node through a `node_iterator` `node_it`; `end_nd_it` is the end node iterator.

Definition at line 110 of file `tree_policy.hpp`.

#### 4.980.2.4 `order_of_key()`

```
template<typename Node_CIttr , typename Node_Itr , typename Cmp_Fn , typename _Alloc >
__gnu_pbds::tree_order_statistics_node_update< Node_CIttr, Node_Itr, Cmp_Fn, _Alloc >::size_type __gnu_pbds::tree_order_statistics_node_update<
Node_CIttr, Node_Itr, Cmp_Fn, _Alloc >::order_of_key (
 key_const_reference r_key) const [inline]
```

Returns the order of a key within a sequence. For example, if `r_key` is the smallest key, this method will return 0; if `r_key` is a key between the smallest and next key, this method will return 1; if `r_key` is a key larger than the largest key, this method will return the size of `r_c`.

Definition at line 80 of file `tree_policy.hpp`.

The documentation for this class was generated from the following file:

- [tree\\_policy.hpp](#)

#### 4.981 `__gnu_pbds::tree_tag` Struct Reference

Inheritance diagram for `__gnu_pbds::tree_tag`:

##### 4.981.1 Detailed Description

Basic tree structure.

Definition at line 150 of file `tag_and_trait.hpp`.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

#### 4.982 `__gnu_pbds::detail::tree_traits< Key, Data, Cmp_Fn, Node_Update, Tag, _Alloc >` Struct Template Reference

##### 4.982.1 Detailed Description

```

template<typename Key, typename Data, typename Cmp_Fn, template< typename Node_Cltr, typename Node_Itr, typename Cmp_
Fn, typename _Alloc > class Node_Update, typename Tag, typename _Alloc>
struct __gnu_pbds::detail::tree_traits< Key, Data, Cmp_Fn, Node_Update, Tag, _Alloc >

```

Tree traits class, primary template.

Definition at line 70 of file `branch_policy/traits.hpp`.

The documentation for this struct was generated from the following file:

- [branch\\_policy/traits.hpp](#)

## 4.983 `__gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc >` Struct Template Reference

### Public Types

- typedef `tree_node_metadata_dispatch< Key, Mapped, Cmp_Fn, Node_Update, _Alloc >::type` **metadata\_type**
- typedef `ov_tree_node_const_it_< value_type, metadata_type, _Alloc >` **node\_const\_iterator**
- typedef `ov_tree_node_it_< value_type, metadata_type, _Alloc >` **node\_iterator**
- typedef `Node_Update< node_const_iterator, node_iterator, Cmp_Fn, _Alloc >` **node\_update**
- typedef `__gnu_pbds::null_node_update< node_const_iterator, node_iterator, Cmp_Fn, _Alloc > * null_node_`  
`_update_pointer`

### 4.983.1 Detailed Description

```
template<typename Key, typename Mapped, class Cmp_Fn, template< typename Node_Cltr, class Node_Itr, class Cmp_Fn_, typename
Alloc > class Node_Update, typename _Alloc>
struct __gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc >
```

Tree traits.

Definition at line 61 of file `ov_tree_map_/traits.hpp`.

### 4.983.2 Member Typedef Documentation

#### 4.983.2.1 `node_const_iterator`

```
template<typename Key , typename Mapped , class Cmp_Fn , template< typename Node_Cltr, class
Node_Itr, class Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc >
typedef ov_tree_node_const_it_< value_type, metadata_type, _Alloc> __gnu_pbds::detail::tree_traits<
Key, Mapped, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc >::node_const_iterator
```

This is an iterator to an iterator: it iterates over nodes, and de-referencing it returns one of the tree's iterators.

Definition at line 95 of file `ov_tree_map_/traits.hpp`.

The documentation for this struct was generated from the following file:

- [ov\\_tree\\_map\\_/traits.hpp](#)

#### 4.984 `__gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, rb_tree_tag, _Alloc >` Struct Template Reference

Inheritance diagram for `__gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, rb_tree_tag, _Alloc >`:

#### Public Types

- typedef `bin_search_tree_const_it< typename node_alloc_traits::pointer, typename type_traits::value_type, typename type_traits::pointer, typename type_traits::const_pointer, typename type_traits::reference, typename type_traits::const_reference, false, _Alloc >` **const\_reverse\_iterator**
- typedef `rb_tree_node< types_traits< Key, Mapped, _Alloc, false >::value_type, tree_node_metadata_dispatch< Key, Mapped, Cmp_Fn, Node_Update, _Alloc >::type, _Alloc >` **node**
- typedef `bin_search_tree_const_node_it< rb_tree_node< types_traits< Key, Mapped, _Alloc, false >::value_type, tree_node_metadata_dispatch< Key, Mapped, Cmp_Fn, Node_Update, _Alloc >::type, _Alloc >, point_const_iterator, point_iterator, _Alloc >` **node\_const\_iterator**
- typedef `bin_search_tree_node_it< rb_tree_node< types_traits< Key, Mapped, _Alloc, false >::value_type, tree_node_metadata_dispatch< Key, Mapped, Cmp_Fn, Node_Update, _Alloc >::type, _Alloc >, point_const_iterator, point_iterator, _Alloc >` **node\_iterator**
- typedef `Node_Update< node_const_iterator, node_iterator, Cmp_Fn, _Alloc >` **node\_update**
- typedef `__gnu_pbds::null_node_update< node_const_iterator, node_iterator, Cmp_Fn, _Alloc > * null_node_update_pointer`
- typedef `bin_search_tree_const_it< typename node_alloc_traits::pointer, typename type_traits::value_type, typename type_traits::pointer, typename type_traits::const_pointer, typename type_traits::reference, typename type_traits::const_reference, true, _Alloc >` **point\_const\_iterator**
- typedef `bin_search_tree_it< typename node_alloc_traits::pointer, typename type_traits::value_type, typename type_traits::pointer, typename type_traits::const_pointer, typename type_traits::reference, typename type_traits::const_reference, true, _Alloc >` **point\_iterator**
- typedef `bin_search_tree_it< typename node_alloc_traits::pointer, typename type_traits::value_type, typename type_traits::pointer, typename type_traits::const_pointer, typename type_traits::reference, typename type_traits::const_reference, false, _Alloc >` **reverse\_iterator**

#### 4.984.1 Detailed Description

```

template<typename Key, typename Mapped, typename Cmp_Fn, template< typename Node_Cltr, typename Node_Itr, typename Cmp_Fn, typename _Alloc > class Node_Update, typename _Alloc>
struct __gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, rb_tree_tag, _Alloc >

```

Specialization.

Definition at line 61 of file `rb_tree_map_traits.hpp`.

#### 4.984.2 Member Typedef Documentation

##### 4.984.2.1 `node_const_iterator`

```
typedef bin_search_tree_const_node_it< rb_tree_node< types_traits< Key, Mapped, _Alloc, false
>::value_type, tree_node_metadata_dispatch< Key, Mapped, Cmp_Fn, Node_Update, _Alloc >::type, _↵
Alloc > , point_const_iterator, point_iterator, _Alloc> __gnu_pbds::detail::bin_search_tree_traits<
Key, Mapped, Cmp_Fn, Node_Update, rb_tree_node< types_traits< Key, Mapped, _Alloc, false >↵
::value_type, tree_node_metadata_dispatch< Key, Mapped, Cmp_Fn, Node_Update, _Alloc >::type, _↵
Alloc > , _Alloc >::node_const_iterator [inherited]
```

This is an iterator to an iterator: it iterates over nodes, and de-referencing it returns one of the tree's iterators.

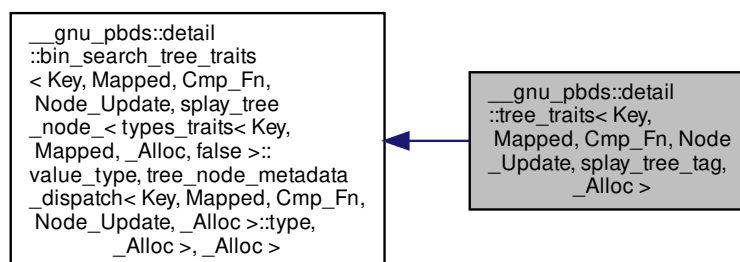

Definition at line 128 of file `bin_search_tree_/traits.hpp`.

The documentation for this struct was generated from the following file:

- [rb\\_tree\\_map\\_/traits.hpp](#)

#### 4.985 `__gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, splay_tree_tag, _Alloc >` Struct Template Reference

## 4.985.1 Detailed Description

```
template<typename Key, typename Mapped, typename Cmp_Fn, template< typename Node_Cltr, typename Node_Itr, typename Cmp_Fn, typename _Alloc > class Node_Update, typename _Alloc>
struct __gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, splay_tree_tag, _Alloc >
```

Specialization.

Definition at line 61 of file [splay\\_tree\\_/traits.hpp](#).

## 4.985.2 Member Typedef Documentation

## 4.985.2.1 node\_const\_iterator

```
typedef bin_search_tree_const_node_it < splay_tree_node < types_traits < Key, Mapped, _Alloc, false >::value_type, tree_node_metadata_dispatch < Key, Mapped, Cmp_Fn, Node_Update, _Alloc >::type, _Alloc >, point_const_iterator, point_iterator, _Alloc > __gnu_pbds::detail::bin_search_tree_traits < Key, Mapped, Cmp_Fn, Node_Update, splay_tree_node < types_traits < Key, Mapped, _Alloc, false >::value_type, tree_node_metadata_dispatch < Key, Mapped, Cmp_Fn, Node_Update, _Alloc >::type, _Alloc >, _Alloc >::node_const_iterator [inherited]
```

This is an iterator to an iterator: it iterates over nodes, and de-referencing it returns one of the tree's iterators.

Definition at line 128 of file [bin\\_search\\_tree\\_/traits.hpp](#).

The documentation for this struct was generated from the following file:

- [splay\\_tree\\_/traits.hpp](#)

## 4.986 `__gnu_pbds::detail::tree_traits< Key, null_type, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc >` Struct Template Reference

### Public Types

- typedef `tree_node_metadata_dispatch< Key, null_type, Cmp_Fn, Node_Update, _Alloc >::type` **metadata\_type**
- typedef `ov_tree_node_const_it_< value_type, metadata_type, _Alloc >` **node\_const\_iterator**
- typedef `node_const_iterator` **node\_iterator**
- typedef `Node_Update< node_const_iterator, node_const_iterator, Cmp_Fn, _Alloc >` **node\_update**
- typedef `__gnu_pbds::null_node_update< node_const_iterator, node_iterator, Cmp_Fn, _Alloc > * null_node_update_pointer`

### 4.986.1 Detailed Description

```
template<typename Key, class Cmp_Fn, template< typename Node_CItr, class Node_Itr, class Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
struct __gnu_pbds::detail::tree_traits< Key, null_type, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc >
```

Specialization.

Definition at line 132 of file `ov_tree_map_/traits.hpp`.

### 4.986.2 Member Typedef Documentation

#### 4.986.2.1 `node_const_iterator`

```
template<typename Key , class Cmp_Fn , template< typename Node_CItr, class Node_Itr, class Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc >
typedef ov_tree_node_const_it_< value_type, metadata_type, _Alloc> __gnu_pbds::detail::tree_traits<
Key, null_type, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc >::node_const_iterator
```

This is an iterator to an iterator: it iterates over nodes, and de-referencing it returns one of the tree's iterators.

Definition at line 166 of file `ov_tree_map_/traits.hpp`.

The documentation for this struct was generated from the following file:

- [ov\\_tree\\_map\\_/traits.hpp](#)

#### 4.989 `__gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >` Class Template Reference

Inheritance diagram for `__gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >`:

## Public Types

- typedef `_ATraits` `access_traits`
- typedef `detail::trie_traits` < Key, Mapped, `_ATraits`, Node\_Update, Tag, `_Alloc` > ::node\_update **node\_update**

## Public Member Functions

- **trie** (const **access\_traits** &)
- template<typename It >  
**trie** (It first, It last)
- template<typename It >  
**trie** (It first, It last, const **access\_traits** &)
- **trie** (const **trie** &other)
- **trie** & **operator=** (const **trie** &other)
- void **swap** (**trie** &other)

#### 4.989.1 Detailed Description

```
template<typename Key, typename Mapped, typename _ATraits = typename detail::default_trie_access_traits<Key>::type, typename
Tag = pat_trie_tag, template< typename Node_Cltr, typename Node_Itr, typename _ATraits_, typename _Alloc_ > class Node_Update
= null_node_update, typename _Alloc = std::allocator<char>>
class __gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >
```

A trie-based container.

## Template Parameters

|                    |                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------|
| <i>Key</i>         | Key type.                                                                                                                |
| <i>Mapped</i>      | Map type.                                                                                                                |
| <i>ATraits</i>     | Element access traits.                                                                                                   |
| <i>Tag</i>         | Instantiating data structure type, see container_tag.                                                                    |
| <i>Node_Update</i> | Updates trie internal-nodes, restores invariants when invalidated. XXX See design::tree-based-containersnode invariants. |

Base tag choice is pat\_trie\_tag.

Base is basic\_branch.

Definition at line 731 of file assoc\_container.hpp.

## 4.989.2 Member Typedef Documentation

### 4.989.2.1 access\_traits

```
template<typename Key , typename Mapped , typename _ATraits = typename detail::default_trie_↵
access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CItr, typename
Node_Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename
_Alloc = std::allocator<char>>>
typedef _ATraits __gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::access_traits
```

Element access traits type.

Definition at line 738 of file assoc\_container.hpp.

## 4.989.3 Constructor & Destructor Documentation

### 4.989.3.1 trie() [1/3]

```
template<typename Key , typename Mapped , typename _ATraits = typename detail::default_trie_↵
access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CItr, typename
Node_Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename
_Alloc = std::allocator<char>>>
__gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::trie (
 const access_traits & t) [inline]
```

Constructor taking some policy objects. r\_access\_traits will be copied by the \_ATraits object of the container object.

Definition at line 744 of file assoc\_container.hpp.

4.989.3.2 `trie()` [2/3]

```
template<typename Key , typename Mapped , typename _ATraits = typename detail::default_trie_↵
access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CItr, typename
Node_Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename
_Alloc = std::allocator<char>>>
template<typename It >
__gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::trie (
 It first,
 It last) [inline]
```

Constructor taking `__iterators` to a range of `value_types`. The `value_types` between `first_it` and `last_it` will be inserted into the container object.

Definition at line 751 of file `assoc_container.hpp`.

4.989.3.3 `trie()` [3/3]

```
template<typename Key , typename Mapped , typename _ATraits = typename detail::default_trie_↵
access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CItr, typename
Node_Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename
_Alloc = std::allocator<char>>>
template<typename It >
__gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::trie (
 It first,
 It last,
 const access_traits & t) [inline]
```

Constructor taking `__iterators` to a range of `value_types` and some policy objects. The `value_types` between `first_it` and `last_it` will be inserted into the container object.

Definition at line 758 of file `assoc_container.hpp`.

#### 4.994.1 Detailed Description

```
template<typename Node_CIttr, typename Node_Itr, typename _ATraits, typename _Alloc>
class __gnu_pbds::trie_order_statistics_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >
```

Functor updating ranks of entrees.

Definition at line 253 of file `trie_policy.hpp`.

#### 4.994.2 Member Function Documentation

##### 4.994.2.1 `find_by_order()` [1/2]

```
template<typename Node_CIttr , typename Node_Itr , typename _ATraits , typename _Alloc >
trie_order_statistics_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >::const_iterator __gnu_pbds::trie_order
Node_CIttr, Node_Itr, _ATraits, _Alloc >::find_by_order (
 size_type order) const [inline]
```

Finds an entry by `__order`. Returns a `const_iterator` to the entry with the `__order` order, or a `const_iterator` to the container object's end if order is at least the size of the container object.

Definition at line 81 of file `trie_policy.hpp`.

##### 4.994.2.2 `find_by_order()` [2/2]

```
template<typename Node_CIttr , typename Node_Itr , typename _ATraits , typename _Alloc >
trie_order_statistics_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >::iterator __gnu_pbds::trie_order_stat
Node_CIttr, Node_Itr, _ATraits, _Alloc >::find_by_order (
 size_type order) [inline]
```

Finds an entry by `__order`. Returns an iterator to the entry with the `__order` order, or an iterator to the container object's end if order is at least the size of the container object.

Definition at line 47 of file `trie_policy.hpp`.

##### 4.994.2.3 `operator()()`

```
template<typename Node_CIttr , typename Node_Itr , typename _ATraits , typename _Alloc >
void __gnu_pbds::trie_order_statistics_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >↵
::operator() (
 node_iterator nd_it,
 node_const_iterator) const [inline], [protected]
```

Updates the rank of a node through a `node_iterator` `node_it`; `end_nd_it` is the end node iterator.

Definition at line 154 of file `trie_policy.hpp`.

#### 4.994.2.4 order\_of\_key()

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
__gnu_pbds::trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::size_type
__gnu_pbds::trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::order_of_key (
 key_const_reference r_key) const [inline]
```

Returns the order of a key within a sequence. For example, if `r_key` is the smallest key, this method will return 0; if `r_key` is a key between the smallest and next key, this method will return 1; if `r_key` is a key larger than the largest key, this method will return the size of `r_c`.

Definition at line 87 of file `trie_policy.hpp`.

#### 4.994.2.5 order\_of\_prefix()

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
__gnu_pbds::trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::size_type
__gnu_pbds::trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::order_of_prefix (
 a_const_iterator b,
 a_const_iterator e) const [inline]
```

Returns the order of a prefix within a sequence. For example, if `[b, e]` is the smallest prefix, this method will return 0; if `r_key` is a key between the smallest and next key, this method will return 1; if `r_key` is a key larger than the largest key, this method will return the size of `r_c`.

Definition at line 98 of file `trie_policy.hpp`.

#### 4.996.1 Detailed Description

```
template<typename Node_Citr, typename Node_Itr, typename _ATraits, typename _Alloc>
class __gnu_pbds::trie_prefix_search_node_update< Node_Citr, Node_Itr, _ATraits, _Alloc >
```

A node updator that allows tries to be searched for the range of values that match a certain prefix.

Definition at line 155 of file trie\_policy.hpp.

#### 4.996.2 Member Typedef Documentation

##### 4.996.2.1 a\_const\_iterator

```
template<typename Node_Citr, typename Node_Itr, typename _ATraits, typename _Alloc>
typedef access_traits::const_iterator __gnu_pbds::trie_prefix_search_node_update< Node_Citr,
Node_Itr, _ATraits, _Alloc >::a_const_iterator
```

Const element iterator.

Definition at line 168 of file trie\_policy.hpp.

##### 4.996.2.2 access\_traits

```
template<typename Node_Citr, typename Node_Itr, typename _ATraits, typename _Alloc>
typedef _ATraits __gnu_pbds::trie_prefix_search_node_update< Node_Citr, Node_Itr, _ATraits, _
Alloc >::access_traits
```

Element access traits.

Definition at line 165 of file trie\_policy.hpp.

##### 4.996.2.3 allocator\_type

```
template<typename Node_Citr, typename Node_Itr, typename _ATraits, typename _Alloc>
typedef _Alloc __gnu_pbds::trie_prefix_search_node_update< Node_Citr, Node_Itr, _ATraits, _Alloc
>::allocator_type
```

\_Alloc type.

Definition at line 171 of file trie\_policy.hpp.

#### 4.996.2.4 `size_type`

```
template<typename Node_CIter, typename Node_Itr, typename _ATraits, typename _Alloc>
typedef allocator_type::size_type __gnu_pbds::trie_prefix_search_node_update< Node_CIter, Node_Itr, _ATraits, _Alloc >::size_type
```

Size type.

Definition at line 174 of file `trie_policy.hpp`.

### 4.996.3 Member Function Documentation

#### 4.996.3.1 `operator()`

```
template<typename Node_CIter , typename Node_Itr , typename _ATraits , typename _Alloc >
void __gnu_pbds::trie_prefix_search_node_update< Node_CIter, Node_Itr, _ATraits, _Alloc >::operator()
(
 node_iterator node_it,
 node_const_iterator end_nd_it) const [inline], [protected]
```

Called to update a node's metadata.

Definition at line 141 of file `trie_policy.hpp`.

#### 4.996.3.2 `prefix_range()` [1/4]

```
template<typename Node_CIter , typename Node_Itr , typename _ATraits , typename _Alloc >
std::pair< typename trie_prefix_search_node_update< Node_CIter, Node_Itr, _ATraits, _Alloc >::const_iterator,
typename trie_prefix_search_node_update< Node_CIter, Node_Itr, _ATraits, _Alloc >::const_iterator > __gnu_pbds::trie_prefix_search_node_update< Node_CIter, Node_Itr, _ATraits, _Alloc >::prefix_range (
 key_const_reference r_key) const
```

Finds the const iterator range corresponding to all values whose prefixes match `r_key`.

Definition at line 49 of file `trie_policy.hpp`.

#### 4.996.3.3 `prefix_range()` [2/4]

```
template<typename Node_CIter , typename Node_Itr , typename _ATraits , typename _Alloc >
std::pair< typename trie_prefix_search_node_update< Node_CIter, Node_Itr, _ATraits, _Alloc >::iterator,
typename trie_prefix_search_node_update< Node_CIter, Node_Itr, _ATraits, _Alloc >::iterator > __gnu_pbds::trie_prefix_search_node_update< Node_CIter, Node_Itr, _ATraits, _Alloc >::prefix_range (
 key_const_reference r_key)
```

Finds the iterator range corresponding to all values whose prefixes match `r_key`.

Definition at line 60 of file `trie_policy.hpp`.

4.996.3.4 `prefix_range()` [3/4]

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
std::pair< typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >↵
::const_iterator, typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc
>::const_iterator > __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, ↵
_Alloc >::prefix_range (
 a_const_iterator b,
 a_const_iterator e) const
```

Finds the const iterator range corresponding to all values whose prefixes match [b, e).

Definition at line 71 of file `trie_policy.hpp`.

4.996.3.5 `prefix_range()` [4/4]

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
std::pair< typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >↵
::iterator, typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >↵
::iterator > __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc
>::prefix_range (
 a_const_iterator b,
 a_const_iterator e)
```

Finds the iterator range corresponding to all values whose prefixes match [b, e).

Definition at line 86 of file `trie_policy.hpp`.

The documentation for this class was generated from the following file:

- [trie\\_policy.hpp](#)

4.997 `__gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >` Struct Template Reference

## Public Types

- enum { **reverse** }
- enum { **min\_e\_val**, **max\_e\_val**, **max\_size** }
- typedef detail::\_\_conditional\_type< Reverse, typename String::const\_reverse\_iterator, typename String::const↵\_iterator >::\_\_type **const\_iterator**

- typedef detail::rebind\_traits< \_Alloc, key\_type >::const\_reference **key\_const\_reference**
- typedef String **key\_type**
- typedef \_Alloc::size\_type **size\_type**

## Static Public Member Functions

- static `const_iterator begin` (key\_const\_reference)
- static `size_type e_pos` (e\_type e)
- static `const_iterator end` (key\_const\_reference)

## 4.997.1 Detailed Description

```
template<typename String = std::string, typename String::value_type Min_E_Val = detail::__numeric_traits<typename String::value_type>::__min, typename String::value_type Max_E_Val = detail::__numeric_traits<typename String::value_type>::__max, bool Reverse = false, typename _Alloc = std::allocator<char>>>
struct __gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >
```

Element access traits for string types.

## Template Parameters

|                  |                                                   |
|------------------|---------------------------------------------------|
| <i>String</i>    | String type.                                      |
| <i>Min_E_Val</i> | Minimal element value.                            |
| <i>Max_E_Val</i> | Maximum element value.                            |
| <i>Reverse</i>   | Reverse iteration should be used. Default: false. |
| <i>_Alloc</i>    | Allocator type.                                   |

Definition at line 74 of file `trie_policy.hpp`.

## 4.997.2 Member Typedef Documentation

4.997.2.1 `const_iterator`

```
template<typename String = std::string, typename String::value_type Min_E_Val = detail::__numeric_traits<typename String::value_type>::__min, typename String::value_type Max_E_Val = detail::__numeric_traits<typename String::value_type>::__max, bool Reverse = false, typename _Alloc = std::allocator<char>>>
typedef detail::__conditional_type<Reverse, typename String::const_reverse_iterator, typename String::const_iterator>::__type __gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::const_iterator
```

Element const iterator type.

Definition at line 90 of file `trie_policy.hpp`.

#### 4.997.2.2 e\_type

```
template<typename String = std::string, typename String::value_type Min_E_Val = detail::__↵
numeric_traits<typename String::value_type>::__min, typename String::value_type Max_E_Val = detail↵
::__numeric_traits<typename String::value_type>::__max, bool Reverse = false, typename _Alloc =
std::allocator<char>>
typedef std::iterator_traits<const_iterator>::value_type __gnu_pbds::trie_string_access_traits<
String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::e_type
```

Element type.

Definition at line 93 of file trie\_policy.hpp.

#### 4.997.3 Member Function Documentation

##### 4.997.3.1 begin()

```
template<typename String , typename String::value_type Min_E_Val, typename String::value_type
Max_E_Val, bool Reverse, typename _Alloc >
__gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::const_iterator __gnu_pbds::trie_string_access_traits<
String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::begin (
 key_const_reference r_key) [inline], [static]
```

Returns a const\_iterator to the first element of key\_const\_reference agumnet.

Definition at line 59 of file trie\_policy.hpp.

##### 4.997.3.2 e\_pos()

```
template<typename String , typename String::value_type Min_E_Val, typename String::value_type
Max_E_Val, bool Reverse, typename _Alloc >
__gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::size_type __gnu_pbds::trie_string_access_traits<
String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::e_pos (
 e_type e) [inline], [static]
```

Maps an element to a position.

Definition at line 51 of file trie\_policy.hpp.

## 4.997.3.3 end()

```
template<typename String , typename String::value_type Min_E_Val, typename String::value_type
Max_E_Val, bool Reverse, typename _Alloc >
trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::const_iterator __gnu_pbds::trie_string_access_traits<
String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::end (
 key_const_reference r_key) [inline], [static]
```

Returns a const\_iterator to the after-last element of key\_const\_reference argument.

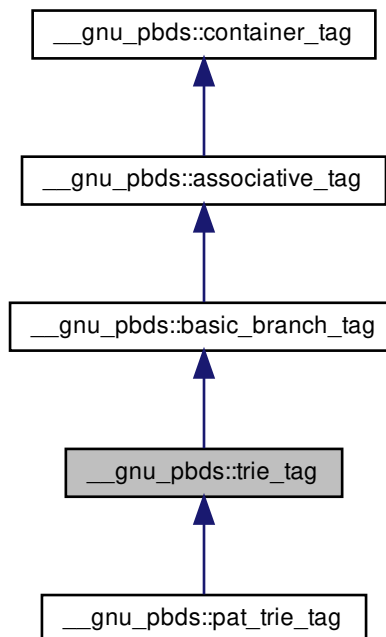

Definition at line 67 of file trie\_policy.hpp.

The documentation for this struct was generated from the following file:

- [trie\\_policy.hpp](#)

## 4.998 \_\_gnu\_pbds::trie\_tag Struct Reference

Inheritance diagram for \_\_gnu\_pbds::trie\_tag:

#### 4.998.1 Detailed Description

Basic trie structure.

Definition at line 162 of file tag\_and\_trait.hpp.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

### 4.999 `__gnu_pbds::detail::trie_traits< Key, Data, _ATraits, Node_Update, Tag, _Alloc >` Struct Template Reference

#### 4.999.1 Detailed Description

```
template<typename Key, typename Data, typename _ATraits, template< typename Node_Cltr, typename Node_Itr, typename _ATraits←
_, typename _Alloc > class Node_Update, typename Tag, typename _Alloc>
struct __gnu_pbds::detail::trie_traits< Key, Data, _ATraits, Node_Update, Tag, _Alloc >
```

Trie traits class, primary template.

Definition at line 83 of file branch\_policy/traits.hpp.

The documentation for this struct was generated from the following file:

- [branch\\_policy/traits.hpp](#)

### 4.1000 `__gnu_pbds::detail::trie_traits< Key, Mapped, _ATraits, Node_Update, pat_trie_tag, _Alloc >` Struct Template Reference

### 4.1001.1 Detailed Description

```
template<typename Key, typename _ATraits, template< typename Node_Cltr, typename Node_Itr, typename Cmp_Fn_, typename _↵
Alloc > class Node_Update, typename _Alloc>
struct __gnu_pbds::detail::trie_traits< Key, null_type, _ATraits, Node_Update, pat_trie_tag, _Alloc >
```

Specialization.

Definition at line 109 of file `pat_trie_/traits.hpp`.

### 4.1001.2 Member Typedef Documentation

#### 4.1001.2.1 `node_const_iterator`

```
template<typename Key , typename _ATraits , template< typename Node_Cltr, typename Node_Itr,
typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc >
typedef base_type::_Node_citer<node, leaf, head, inode, const_iterator, iterator, _Alloc> __gnu_pbds::detail::tr
Key, null_type, _ATraits, Node_Update, pat_trie_tag, _Alloc >::node_const_iterator
```

This is an iterator to an iterator: it iterates over nodes, and de-referencing it returns one of the tree's iterators.

Definition at line 135 of file `pat_trie_/traits.hpp`.

#### 4.1001.2.2 `node_update`

```
template<typename Key , typename _ATraits , template< typename Node_CItr, typename Node_Itr,
typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc >
typedef Node_Update<node_const_iterator, node_iterator, _ATraits, _Alloc> __gnu_pbds::detail::trie_traits<
Key, null_type, _ATraits, Node_Update, pat_trie_tag, _Alloc >::node_update
```

Type for node update.

Definition at line 140 of file `pat_trie_/traits.hpp`.

#### 4.1001.2.3 `synth_access_traits`

```
template<typename Key , typename _ATraits , template< typename Node_CItr, typename Node_Itr,
typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc >
typedef __gnu_pbds::detail::synth_access_traits<type_traits, true, access_traits> __gnu_pbds::detail::trie_traits<
Key, null_type, _ATraits, Node_Update, pat_trie_tag, _Alloc >::synth_access_traits
```

Type for synthesized traits.

Definition at line 121 of file `pat_trie_/traits.hpp`.

#### 4.1005.1 Detailed Description

```
template<typename _T1, typename _T2>
class std::tuple< _T1, _T2 >
```

Partial specialization, 2-element tuple. Includes construction and assignment from a pair.

Definition at line 891 of file tuple.

The documentation for this class was generated from the following file:

- [tuple](#)

#### 4.1006 std::tuple\_element< \_Int, \_Tp > Struct Template Reference

##### 4.1006.1 Detailed Description

```
template<std::size_t _Int, typename _Tp>
struct std::tuple_element< _Int, _Tp >
```

tuple\_element

Gives the type of the ith element of a given tuple type.

Definition at line 428 of file array.

The documentation for this struct was generated from the following file:

- [array](#)

#### 4.1007 std::tuple\_element< 0, std::pair< \_Tp1, \_Tp2 > > Struct Template Reference

##### Public Types

- typedef \_Tp1 **type**

##### 4.1007.1 Detailed Description

```
template<class _Tp1, class _Tp2>
struct std::tuple_element< 0, std::pair< _Tp1, _Tp2 > >
```

Partial specialization for std::pair.

Definition at line 162 of file utility.

The documentation for this struct was generated from the following file:

- [utility](#)

## 4.1008 `std::tuple_element< 0, tuple< _Head, _Tail... > >` Struct Template Reference

### Public Types

- `typedef _Head type`

#### 4.1008.1 Detailed Description

```
template<typename _Head, typename... _Tail>
struct std::tuple_element< 0, tuple< _Head, _Tail... > >
```

Basis case for `tuple_element`: The first element is the one we're seeking.

Definition at line 1270 of file `tuple`.

The documentation for this struct was generated from the following file:

- [tuple](#)

## 4.1009 `std::tuple_element< 1, std::pair< _Tp1, _Tp2 > >` Struct Template Reference

### Public Types

- `typedef _Tp2 type`

#### 4.1009.1 Detailed Description

```
template<class _Tp1, class _Tp2>
struct std::tuple_element< 1, std::pair< _Tp1, _Tp2 > >
```

Partial specialization for `std::pair`.

Definition at line 167 of file `utility`.

The documentation for this struct was generated from the following file:

- [utility](#)

#### 4.1010 `std::tuple_element< __i, tuple< _Head, _Tail... > >` Struct Template Reference

Inheritance diagram for `std::tuple_element< __i, tuple< _Head, _Tail... > >`:

##### 4.1010.1 Detailed Description

```
template<std::size_t __i, typename _Head, typename... _Tail>
struct std::tuple_element< __i, tuple< _Head, _Tail... > >
```

Recursive case for `tuple_element`: strip off the first element in the tuple and retrieve the (i-1)th element of the remaining tuple.

Definition at line 1263 of file `tuple`.

The documentation for this struct was generated from the following file:

- [tuple](#)

#### 4.1011 `std::tuple_element< __i, tuple<> >` Struct Template Reference

##### 4.1011.1 Detailed Description

```
template<size_t __i>
struct std::tuple_element< __i, tuple<> >
```

Error case for `tuple_element`: invalid index.

Definition at line 1279 of file `tuple`.

The documentation for this struct was generated from the following file:

- [tuple](#)

## 4.1012 `std::tuple_element<_Int, ::array<_Tp, _Nm>>` Struct Template Reference

#### 4.1021.1 Detailed Description

Part of RTTI.

The `type_info` class describes type information generated by an implementation.

Definition at line 88 of file `typeinfo`.

#### 4.1021.2 Constructor & Destructor Documentation

##### 4.1021.2.1 ~type\_info()

```
virtual std::type_info::~~type_info () [virtual]
```

Destructor first. Being the first non-inline virtual function, this controls in which translation unit the vtable is emitted. The compiler makes use of that information to know where to emit the runtime-mandated `type_info` structures in the new-abi.

#### 4.1021.3 Member Function Documentation

##### 4.1021.3.1 name()

```
const char* std::type_info::name () const [inline], [noexcept]
```

Returns an *implementation-defined* byte string; this is not portable between compilers!

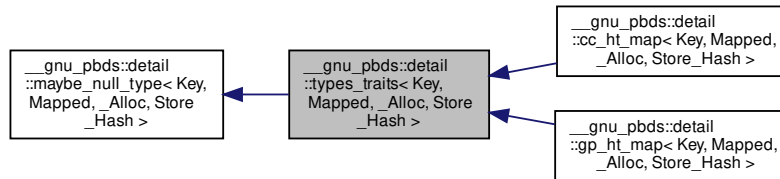

Definition at line 99 of file `typeinfo`.

The documentation for this class was generated from the following file:

- [typeinfo](#)

## 4.1022 \_\_gnu\_pbds::detail::types\_traits&lt; Key, Mapped, \_Alloc, Store\_Hash &gt; Struct Template Reference

## 4.1023.1 Detailed Description

```
template<class _Operation1, class _Operation2>
class __gnu_cxx::unary_compose<_Operation1, _Operation2>
```

An [SGI extension](#).

Definition at line 117 of file ext/functional.

## 4.1023.2 Member Typedef Documentation

## 4.1023.2.1 argument\_type

```
typedef _Operation2::argument_type std::unary_function<_Operation2::argument_type, _Operation1↔
::result_type>::argument_type [inherited]
```

argument\_type is the type of the argument

Definition at line 108 of file stl\_function.h.

## 4.1023.2.2 result\_type

```
typedef _Operation1::result_type std::unary_function<_Operation2::argument_type, _Operation1↔
::result_type>::result_type [inherited]
```

result\_type is the return type

Definition at line 111 of file stl\_function.h.

The documentation for this class was generated from the following file:

- [ext/functional](#)

## 4.1024 std::unary\_function&lt;\_Arg, \_Result&gt; Struct Template Reference

Inheritance diagram for std::unary\_function<\_Arg, \_Result>:

## Public Types

- typedef `_Arg` [argument\\_type](#)
- typedef `_Result` [result\\_type](#)

### 4.1024.1 Detailed Description

```
template<typename _Arg, typename _Result>
struct std::unary_function< _Arg, _Result >
```

This is one of the [functor base classes](#).

Definition at line 105 of file `stl_function.h`.

### 4.1024.2 Member Typedef Documentation

#### 4.1024.2.1 `argument_type`

```
template<typename _Arg, typename _Result>
typedef _Arg std::unary_function< _Arg, _Result >::argument_type
```

`argument_type` is the type of the argument

Definition at line 108 of file `stl_function.h`.

#### 4.1024.2.2 `result_type`

```
template<typename _Arg, typename _Result>
typedef _Result std::unary_function< _Arg, _Result >::result_type
```

`result_type` is the return type

Definition at line 111 of file `stl_function.h`.

The documentation for this struct was generated from the following file:

- [stl\\_function.h](#)

## 4.1025 std::unary\_negate&lt; \_Predicate &gt; Class Template Reference

Inheritance diagram for std::unary\_negate< \_Predicate >:

## Public Types

- typedef `_Predicate::argument_type` [argument\\_type](#)
- typedef `bool` [result\\_type](#)

## Public Member Functions

- constexpr **unary\_negate** (`const _Predicate & __x`)
- constexpr `bool` **operator()** (`const typename _Predicate::argument_type & __x`) const

## Protected Attributes

- `_Predicate` **\_M\_pred**

## 4.1025.1 Detailed Description

```
template<typename _Predicate>
class std::unary_negate< _Predicate >
```

One of the [negation functors](#).

Definition at line 1003 of file `stl_function.h`.

## 4.1025.2 Member Typedef Documentation

#### 4.1025.2.1 `argument_type`

```
typedef _Predicate::argument_type std::unary_function< _Predicate::argument_type , bool >::argument_type
[inherited]
```

`argument_type` is the type of the argument

Definition at line 108 of file `stl_function.h`.

#### 4.1025.2.2 `result_type`

```
typedef bool std::unary_function< _Predicate::argument_type , bool >::result_type [inherited]
```

`result_type` is the return type

Definition at line 111 of file `stl_function.h`.

The documentation for this class was generated from the following file:

- [stl\\_function.h](#)

#### 4.1026 `__gnu_parallel::unbalanced_tag` Struct Reference

Inheritance diagram for `__gnu_parallel::unbalanced_tag`:

#### Public Member Functions

- [\\_ThreadIndex](#) `__get_num_threads` ()
- void `set_num_threads` ([\\_ThreadIndex](#) `__num_threads`)

#### 4.1026.1 Detailed Description

Recommends parallel execution using static load-balancing at compile time.

Definition at line 92 of file tags.h.

#### 4.1026.2 Member Function Documentation

##### 4.1026.2.1 \_\_get\_num\_threads()

```
_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads () [inline], [inherited]
```

Find out desired number of threads.

##### Returns

Desired number of threads.

Definition at line 63 of file tags.h.

Referenced by `__gnu_parallel::__parallel_sort()`.

##### 4.1026.2.2 set\_num\_threads()

```
void __gnu_parallel::parallel_tag::set_num_threads (
 _ThreadIndex __num_threads) [inline], [inherited]
```

Set the desired number of threads.

##### Parameters

|                                   |                            |
|-----------------------------------|----------------------------|
| <code><i>__num_threads</i></code> | Desired number of threads. |
|-----------------------------------|----------------------------|

Definition at line 73 of file tags.h.

The documentation for this struct was generated from the following file:

## 4.1027 std::underflow\_error Class Reference

Inheritance diagram for std::underflow\_error:

### Public Member Functions

- **underflow\_error** (const [string](#) &\_\_arg) \_GLIBCXX\_TXN\_SAFE
- **underflow\_error** (const char \*) \_GLIBCXX\_TXN\_SAFE
- **underflow\_error** (const [underflow\\_error](#) &)=default
- **underflow\_error** ([underflow\\_error](#) &&)=default
- [underflow\\_error](#) & **operator=** (const [underflow\\_error](#) &)=default
- [underflow\\_error](#) & **operator=** ([underflow\\_error](#) &&)=default
- virtual const char \* [what](#) () const noexcept

### 4.1027.1 Detailed Description

Thrown to indicate arithmetic underflow.

Definition at line 288 of file stdexcept.

### 4.1027.2 Member Function Documentation

4.1027.2.1 `what()`

```
virtual const char* std::runtime_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::experimental::filesystem::v1::filesystem\\_error](#).

The documentation for this class was generated from the following file:

- [stdexcept](#)

4.1028 `std::underlying_type< _Tp >` Struct Template Reference

Inherits `std::__underlying_type_impl< _Tp, bool >`.

## Public Types

- using **type** = `__underlying_type(_Tp)`

## 4.1028.1 Detailed Description

```
template<typename _Tp>
struct std::underlying_type< _Tp >
```

The underlying type of an enum.

Definition at line 2324 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

4.1029 `std::uniform_int_distribution< _IntType >` Class Template Reference

- void [reset](#) ()

## Friends

- bool [operator==](#) (const [uniform\\_int\\_distribution](#) &\_\_d1, const [uniform\\_int\\_distribution](#) &\_\_d2)

## 4.1029.1 Detailed Description

```
template<typename _IntType = int>
class std::uniform_int_distribution< _IntType >
```

Uniform discrete distribution for random numbers. A discrete random distribution on the range  $[min, max]$  with equal probability throughout the range.

Definition at line 74 of file `uniform_int_dist.h`.

## 4.1029.2 Member Typedef Documentation

## 4.1029.2.1 result\_type

```
template<typename _IntType = int>
typedef _IntType std::uniform_int_distribution< _IntType >::result_type
```

The type of the range of the distribution.

Definition at line 77 of file `uniform_int_dist.h`.

### 4.1029.3 Constructor & Destructor Documentation

#### 4.1029.3.1 `uniform_int_distribution()` [1/2]

```
template<typename _IntType = int>
std::uniform_int_distribution< _IntType >::uniform_int_distribution () [inline]
```

Constructs a uniform distribution object.

Definition at line 122 of file `uniform_int_dist.h`.

#### 4.1029.3.2 `uniform_int_distribution()` [2/2]

```
template<typename _IntType = int>
std::uniform_int_distribution< _IntType >::uniform_int_distribution (
 _IntType __a,
 _IntType __b = numeric_limits<_IntType>::max()) [inline], [explicit]
```

Constructs a uniform distribution object.

Definition at line 128 of file `uniform_int_dist.h`.

### 4.1029.4 Member Function Documentation

#### 4.1029.4.1 `max()`

```
template<typename _IntType = int>
result_type std::uniform_int_distribution< _IntType >::max () const [inline]
```

Returns the inclusive upper bound of the distribution range.

Definition at line 180 of file `uniform_int_dist.h`.

#### 4.1029.4.2 `min()`

```
template<typename _IntType = int>
result_type std::uniform_int_distribution< _IntType >::min () const [inline]
```

Returns the inclusive lower bound of the distribution range.

Definition at line 173 of file `uniform_int_dist.h`.

#### 4.1029.4.3 operator()

```
template<typename _IntType = int>
template<typename _UniformRandomNumberGenerator >
result_type std::uniform_int_distribution< _IntType >::operator() (
 _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Definition at line 188 of file uniform\_int\_dist.h.

#### 4.1029.4.4 param() [1/2]

```
template<typename _IntType = int>
param_type std::uniform_int_distribution< _IntType >::param () const [inline]
```

Returns the parameter set of the distribution.

Definition at line 158 of file uniform\_int\_dist.h.

Referenced by std::operator>>().

#### 4.1029.4.5 param() [2/2]

```
template<typename _IntType = int>
void std::uniform_int_distribution< _IntType >::param (
 const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

##### Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

Definition at line 166 of file uniform\_int\_dist.h.

#### 4.1029.4.6 reset()

```
template<typename _IntType = int>
void std::uniform_int_distribution< _IntType >::reset () [inline]
```

Resets the distribution state.

Does nothing for the uniform integer distribution.

Definition at line 144 of file uniform\_int\_dist.h.

## 4.1029.5 Friends And Related Function Documentation

## 4.1029.5.1 operator==

```
template<typename _IntType = int>
bool operator== (
 const uniform_int_distribution< _IntType > & __d1,
 const uniform_int_distribution< _IntType > & __d2) [friend]
```

Return true if two uniform integer distributions have the same parameters.

Definition at line 223 of file uniform\_int\_dist.h.

The documentation for this class was generated from the following file:

- [uniform\\_int\\_dist.h](#)

### 4.1030.1 Detailed Description

```
template<typename _RealType = double>
class std::uniform_real_distribution< _RealType >
```

Uniform continuous distribution for random numbers.

A continuous random distribution on the range [min, max) with equal probability throughout the range. The URNG should be real-valued and deliver number in the range [0, 1).

Definition at line 1740 of file random.h.

### 4.1030.2 Member Typedef Documentation

#### 4.1030.2.1 result\_type

```
template<typename _RealType = double>
typedef _RealType std::uniform_real_distribution< _RealType >::result_type
```

The type of the range of the distribution.

Definition at line 1743 of file random.h.

### 4.1030.3 Constructor & Destructor Documentation

#### 4.1030.3.1 uniform\_real\_distribution() [1/2]

```
template<typename _RealType = double>
std::uniform_real_distribution< _RealType >::uniform_real_distribution () [inline]
```

Constructs a `uniform_real_distribution` object.

The lower bound is set to 0.0 and the upper bound to 1.0

Definition at line 1790 of file random.h.

#### 4.1030.3.2 uniform\_real\_distribution() [2/2]

```
template<typename _RealType = double>
std::uniform_real_distribution< _RealType >::uniform_real_distribution (
 _RealType __a,
 _RealType __b = _RealType(1)) [inline], [explicit]
```

Constructs a `uniform_real_distribution` object.

## Parameters

|                       |                                           |
|-----------------------|-------------------------------------------|
| <code>↵<br/>_a</code> | [IN] The lower bound of the distribution. |
| <code>↵<br/>_b</code> | [IN] The upper bound of the distribution. |

Definition at line 1799 of file `random.h`.

## 4.1030.4 Member Function Documentation

4.1030.4.1 `max()`

```
template<typename _RealType = double>
result_type std::uniform_real_distribution<_RealType>::max () const [inline]
```

Returns the inclusive upper bound of the distribution range.

Definition at line 1850 of file `random.h`.

4.1030.4.2 `min()`

```
template<typename _RealType = double>
result_type std::uniform_real_distribution<_RealType>::min () const [inline]
```

Returns the inclusive lower bound of the distribution range.

Definition at line 1843 of file `random.h`.

4.1030.4.3 `operator()()`

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::uniform_real_distribution<_RealType>::operator() (
 _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Definition at line 1858 of file `random.h`.

**4.1030.4.4** `param()` [1/2]

```
template<typename _RealType = double>
param_type std::uniform_real_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

Definition at line 1828 of file random.h.

Referenced by `std::operator>>()`.

**4.1030.4.5** `param()` [2/2]

```
template<typename _RealType = double>
void std::uniform_real_distribution< _RealType >::param (
 const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

Definition at line 1836 of file random.h.

**4.1030.4.6** `reset()`

```
template<typename _RealType = double>
void std::uniform_real_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

Does nothing for the uniform real distribution.

Definition at line 1814 of file random.h.

**4.1030.5** Friends And Related Function Documentation

## 4.1030.5.1 operator==

```
template<typename _RealType = double>
bool operator== (
 const uniform_real_distribution< _RealType > & __d1,
 const uniform_real_distribution< _RealType > & __d2) [friend]
```

Return true if two uniform real distributions have the same parameters.

Definition at line 1898 of file random.h.

## Related Functions

(Note that these are not member functions.)

- `template<typename _Mutex >`  
`void swap(unique_lock<_Mutex> &__x, unique_lock<_Mutex> &__y) noexcept`

### 4.1031.1 Detailed Description

```
template<typename _Mutex>
class std::unique_lock<_Mutex>
```

A movable scoped lock type.

A `unique_lock` controls mutex ownership within a scope. Ownership of the mutex can be delayed until after construction and can be transferred to another `unique_lock` by move construction or move assignment. If a mutex lock is owned when the destructor runs ownership will be released.

Definition at line 56 of file `unique_lock.h`.

### 4.1031.2 Friends And Related Function Documentation

#### 4.1031.2.1 swap()

```
template<typename _Mutex >
void swap (
 unique_lock<_Mutex> & __x,
 unique_lock<_Mutex> & __y) [related]
```

Swap overload for `unique_lock` objects.

Definition at line 235 of file `unique_lock.h`.

The documentation for this class was generated from the following file:

- [unique\\_lock.h](#)

#### 4.1032.1 Detailed Description

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
class std::unique_ptr< _Tp, _Dp >
```

20.7.1.2 unique\_ptr for single objects.

Definition at line 242 of file unique\_ptr.h.

## 4.1032.2 Constructor &amp; Destructor Documentation

## 4.1032.2.1 unique\_ptr() [1/7]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
constexpr std::unique_ptr< _Tp, _Dp >::unique_ptr () [inline], [noexcept]
```

Default constructor, creates a unique\_ptr that owns nothing.

Definition at line 269 of file unique\_ptr.h.

## 4.1032.2.2 unique\_ptr() [2/7]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
 pointer __p) [inline], [explicit], [noexcept]
```

Takes ownership of a pointer.

## Parameters

|                                                                                            |                                        |
|--------------------------------------------------------------------------------------------|----------------------------------------|
| <br>__p | A pointer to an object of element_type |
|--------------------------------------------------------------------------------------------|----------------------------------------|

The deleter will be value-initialized.

Definition at line 281 of file unique\_ptr.h.

## 4.1032.2.3 unique\_ptr() [3/7]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = deleter_type, typename = _Require<is_copy_constructible<_Del>>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
 pointer __p,
 const deleter_type & __d) [inline], [noexcept]
```

Takes ownership of a pointer.

## Parameters

|                                                                                            |                                        |
|--------------------------------------------------------------------------------------------|----------------------------------------|
| <br>__p | A pointer to an object of element_type |
| <br>__d | A reference to a deleter.              |
| Generated by Doxygen                                                                       |                                        |

The deleter will be initialized with `__d`

Definition at line 294 of file `unique_ptr.h`.

#### 4.1032.2.4 `unique_ptr()` [4/7]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = deleter_type, typename = _Require<is_move_constructible<_Del>>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
 pointer __p,
 __enable_if_t<!is_lvalue_reference< _Del >::value, _Del && > __d) [inline], [noexcept]
```

Takes ownership of a pointer.

##### Parameters

|                  |                                                     |
|------------------|-----------------------------------------------------|
| <code>__p</code> | A pointer to an object of <code>element_type</code> |
| <code>__d</code> | An rvalue reference to a (non-reference) deleter.   |

The deleter will be initialized with `std::move(__d)`

Definition at line 306 of file `unique_ptr.h`.

#### 4.1032.2.5 `unique_ptr()` [5/7]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
constexpr std::unique_ptr< _Tp, _Dp >::unique_ptr (
 nullptr_t) [inline], [noexcept]
```

Creates a `unique_ptr` that owns nothing.

Definition at line 320 of file `unique_ptr.h`.

#### 4.1032.2.6 `unique_ptr()` [6/7]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
 unique_ptr< _Tp, _Dp > &&) [default]
```

Move constructor.

## 4.1032.2.7 unique\_ptr() [7/7]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Up, typename _Ep, typename = _Require< __safe_conversion_up<_Up, _Ep>,
typename conditional<is_reference<_Dp>::value, is_same<_Ep, _Dp>, is_convertible<_Ep, _Dp>><_
::type>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
 unique_ptr< _Up, _Ep > && __u) [inline], [noexcept]
```

Converting constructor from another type.

Requires that the pointer owned by \_\_u is convertible to the type of pointer owned by this object, \_\_u does not own an array, and \_\_u has a compatible deleter type.

Definition at line 340 of file unique\_ptr.h.

## 4.1032.2.8 ~unique\_ptr()

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
std::unique_ptr< _Tp, _Dp >::~~unique_ptr () [inline], [noexcept]
```

Destructor, invokes the deleter if the stored pointer is not null.

Definition at line 355 of file unique\_ptr.h.

## 4.1032.3 Member Function Documentation

## 4.1032.3.1 get()

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
pointer std::unique_ptr< _Tp, _Dp >::get (
 void) const [inline], [noexcept]
```

Return the stored pointer.

Definition at line 421 of file unique\_ptr.h.

Referenced by std::unique\_ptr< \_Result< \_Res > >::operator bool(), std::unique\_ptr< \_Tp[], \_Dp >::operator bool(), std::unique\_ptr< \_Result< \_Res > >::operator!(), std::unique\_ptr< \_Result< \_Res > >::operator<(), std::unique\_ptr< \_Result< \_Res > >::operator==(), and std::unique\_ptr< \_Result< \_Res > >::operator>().

**4.1032.3.2** `get_deleter()` [1/2]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
deleter_type& std::unique_ptr< _Tp, _Dp >::get_deleter () [inline], [noexcept]
```

Return a reference to the stored deleter.

Definition at line 426 of file `unique_ptr.h`.

Referenced by `std::unique_ptr< _Result< _Res > >::operator=()`, `std::unique_ptr< _Tp[], _Dp >::operator=()`, `std::unique_ptr< _Result< _Res > >::~~unique_ptr()`, and `std::unique_ptr< _Tp[], _Dp >::~~unique_ptr()`.

**4.1032.3.3** `get_deleter()` [2/2]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
const deleter_type& std::unique_ptr< _Tp, _Dp >::get_deleter () const [inline], [noexcept]
```

Return a reference to the stored deleter.

Definition at line 431 of file `unique_ptr.h`.

**4.1032.3.4** `operator bool()`

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
std::unique_ptr< _Tp, _Dp >::operator bool () const [inline], [explicit], [noexcept]
```

Return `true` if the stored pointer is not null.

Definition at line 435 of file `unique_ptr.h`.

**4.1032.3.5** `operator*()`

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
add_lvalue_reference<element_type>::type std::unique_ptr< _Tp, _Dp >::operator* () const [inline]
```

Dereference the stored pointer.

Definition at line 405 of file `unique_ptr.h`.

**4.1032.3.6 operator->()**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
pointer std::unique_ptr<_Tp, _Dp>::operator-> () const [inline], [noexcept]
```

Return the stored pointer.

Definition at line 413 of file unique\_ptr.h.

**4.1032.3.7 operator=()** [1/3]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
unique_ptr& std::unique_ptr<_Tp, _Dp>::operator= (
 unique_ptr<_Tp, _Dp> &&) [default]
```

Move assignment operator.

Invokes the deleter if this object owns a pointer.

**4.1032.3.8 operator=()** [2/3]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Up, typename _Ep >
enable_if< __and< __safe_conversion_up<_Up, _Ep>, is_assignable<deleter_type&, _Ep&&> >&
::value, unique_ptr&::type std::unique_ptr<_Tp, _Dp>::operator= (
 unique_ptr<_Up, _Ep> && __u) [inline], [noexcept]
```

Assignment from another type.

**Parameters**

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <b><code>__u</code></b> | The object to transfer ownership from, which owns a convertible pointer to a non-array object. |
|-------------------------|------------------------------------------------------------------------------------------------|

Invokes the deleter if this object owns a pointer.

Definition at line 386 of file unique\_ptr.h.

**4.1032.3.9 operator=()** [3/3]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
unique_ptr& std::unique_ptr<_Tp, _Dp>::operator= (
 nullptr_t) [inline], [noexcept]
```

Reset the unique\_ptr to empty, invoking the deleter if necessary.

Definition at line 395 of file unique\_ptr.h.

#### 4.1032.3.10 `release()`

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
pointer std::unique_ptr<_Tp, _Dp>::release () [inline], [noexcept]
```

Release ownership of any stored pointer.

Definition at line 442 of file `unique_ptr.h`.

#### 4.1032.3.11 `reset()`

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
void std::unique_ptr<_Tp, _Dp>::reset (
 pointer __p = pointer()) [inline], [noexcept]
```

Replace the stored pointer.

##### Parameters

|                  |                           |
|------------------|---------------------------|
| <code>__p</code> | The new pointer to store. |
|------------------|---------------------------|

The deleter will be invoked if a pointer is already owned.

Definition at line 452 of file `unique_ptr.h`.

Referenced by `std::unique_ptr<_Result<_Res>>::operator=()`, and `std::unique_ptr<_Tp[], _Dp>::operator=()`.

#### 4.1032.3.12 `swap()`

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
void std::unique_ptr<_Tp, _Dp>::swap (
 unique_ptr<_Tp, _Dp> & __u) [inline], [noexcept]
```

Exchange the pointer and deleter with another object.

Definition at line 461 of file `unique_ptr.h`.

The documentation for this class was generated from the following files:

- [unique\\_ptr.h](#)
- [auto\\_ptr.h](#)

#### 4.1033.1 Detailed Description

```
template<typename _Tp, typename _Dp>
class std::unique_ptr< _Tp[], _Dp >
```

##### 20.7.1.3 unique\_ptr for array objects with a runtime length

Definition at line 477 of file `unique_ptr.h`.

#### 4.1033.2 Constructor & Destructor Documentation

##### 4.1033.2.1 unique\_ptr() [1/6]

```
template<typename _Tp, typename _Dp >
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
constexpr std::unique_ptr< _Tp[], _Dp >::unique_ptr () [inline], [noexcept]
```

Default constructor, creates a `unique_ptr` that owns nothing.

Definition at line 530 of file `unique_ptr.h`.

##### 4.1033.2.2 unique\_ptr() [2/6]

```
template<typename _Tp, typename _Dp >
template<typename _Up, typename _Vp = _Dp, typename = _DeleterConstraint<_Vp>, typename = typename
enable_if< __safe_conversion_raw<_Up>::value, bool>::type>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
 _Up __p) [inline], [explicit], [noexcept]
```

Takes ownership of a pointer.

#### Parameters

|                  |                                                                                             |
|------------------|---------------------------------------------------------------------------------------------|
| <code>__p</code> | A pointer to an array of a type safely convertible to an array of <code>element_type</code> |
|------------------|---------------------------------------------------------------------------------------------|

The deleter will be value-initialized.

Definition at line 547 of file unique\_ptr.h.

#### 4.1033.2.3 unique\_ptr() [3/6]

```
template<typename _Tp , typename _Dp >
template<typename _Up , typename _Del = deleter_type, typename = _Require<__safe_conversion_↵
raw<_Up>, is_copy_constructible<_Del>>>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
 _Up __p,
 const deleter_type & __d) [inline], [noexcept]
```

Takes ownership of a pointer.

##### Parameters

|                    |                                                                                |
|--------------------|--------------------------------------------------------------------------------|
| $\leftarrow$<br>_p | A pointer to an array of a type safely convertible to an array of element_type |
| $\leftarrow$<br>_d | A reference to a deleter.                                                      |

The deleter will be initialized with \_\_d

Definition at line 562 of file unique\_ptr.h.

#### 4.1033.2.4 unique\_ptr() [4/6]

```
template<typename _Tp , typename _Dp >
template<typename _Up , typename _Del = deleter_type, typename = _Require<__safe_conversion_↵
raw<_Up>, is_move_constructible<_Del>>>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
 _Up __p,
 __enable_if_t<!is_lvalue_reference< _Del >::value, _Del && > __d) [inline], [noexcept]
```

Takes ownership of a pointer.

##### Parameters

|                    |                                                                                |
|--------------------|--------------------------------------------------------------------------------|
| $\leftarrow$<br>_p | A pointer to an array of a type safely convertible to an array of element_type |
| $\leftarrow$<br>_d | A reference to a deleter.                                                      |

The deleter will be initialized with std::move(\_\_d)

Definition at line 576 of file `unique_ptr.h`.

#### 4.1033.2.5 `unique_ptr()` [5/6]

```
template<typename _Tp , typename _Dp >
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
 unique_ptr< _Tp[], _Dp > &&) [default]
```

Move constructor.

#### 4.1033.2.6 `unique_ptr()` [6/6]

```
template<typename _Tp , typename _Dp >
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
constexpr std::unique_ptr< _Tp[], _Dp >::unique_ptr (
 nullptr_t) [inline], [noexcept]
```

Creates a `unique_ptr` that owns nothing.

Definition at line 594 of file `unique_ptr.h`.

#### 4.1033.2.7 `~unique_ptr()`

```
template<typename _Tp , typename _Dp >
std::unique_ptr< _Tp[], _Dp >::~~unique_ptr () [inline]
```

Destructor, invokes the deleter if the stored pointer is not null.

Definition at line 608 of file `unique_ptr.h`.

References `std::unique_ptr< _Tp, _Dp >::get_deleter()`.

### 4.1033.3 Member Function Documentation

#### 4.1033.3.1 `get()`

```
template<typename _Tp , typename _Dp >
pointer std::unique_ptr< _Tp[], _Dp >::get (
 void) const [inline], [noexcept]
```

Return the stored pointer.

Definition at line 665 of file `unique_ptr.h`.

## 4.1033.3.2 get\_deleter() [1/2]

```
template<typename _Tp , typename _Dp >
deleter_type& std::unique_ptr< _Tp[], _Dp >::get_deleter () [inline], [noexcept]
```

Return a reference to the stored deleter.

Definition at line 670 of file unique\_ptr.h.

## 4.1033.3.3 get\_deleter() [2/2]

```
template<typename _Tp , typename _Dp >
const deleter_type& std::unique_ptr< _Tp[], _Dp >::get_deleter () const [inline], [noexcept]
```

Return a reference to the stored deleter.

Definition at line 675 of file unique\_ptr.h.

## 4.1033.3.4 operator bool()

```
template<typename _Tp , typename _Dp >
std::unique_ptr< _Tp[], _Dp >::operator bool () const [inline], [explicit], [noexcept]
```

Return `true` if the stored pointer is not null.

Definition at line 679 of file unique\_ptr.h.

References `std::unique_ptr< _Tp, _Dp >::get()`.

## 4.1033.3.5 operator=() [1/3]

```
template<typename _Tp , typename _Dp >
unique_ptr& std::unique_ptr< _Tp[], _Dp >::operator= (
 unique_ptr< _Tp[], _Dp > &&) [default]
```

Move assignment operator.

Invokes the deleter if this object owns a pointer.

## 4.1033.3.6 operator=() [2/3]

```
template<typename _Tp , typename _Dp >
template<typename _Up , typename _Ep >
enable_if<__and<__safe_conversion_up<_Up, _Ep>, is_assignable<deleter_type&, _Ep&&> >::value,
unique_ptr&>::type std::unique_ptr< _Tp[], _Dp >::operator= (
 unique_ptr< _Up, _Ep > && __u) [inline], [noexcept]
```

Assignment from another type.

## Parameters

|                                   |                                                                                             |
|-----------------------------------|---------------------------------------------------------------------------------------------|
| <code>↵</code><br><code>_U</code> | The object to transfer ownership from, which owns a convertible pointer to an array object. |
|-----------------------------------|---------------------------------------------------------------------------------------------|

Invokes the deleter if this object owns a pointer.

Definition at line 638 of file `unique_ptr.h`.

References `std::unique_ptr<_Tp, _Dp>::get_deleter()`, and `std::unique_ptr<_Tp, _Dp>::reset()`.

4.1033.3.7 `operator=()` [3/3]

```
template<typename _Tp , typename _Dp >
unique_ptr& std::unique_ptr< _Tp[], _Dp >::operator= (
 nullptr_t) [inline], [noexcept]
```

Reset the `unique_ptr` to empty, invoking the deleter if necessary.

Definition at line 647 of file `unique_ptr.h`.

References `std::unique_ptr<_Tp, _Dp>::reset()`.

4.1033.3.8 `operator[]()`

```
template<typename _Tp , typename _Dp >
std::add_lvalue_reference<element_type>::type std::unique_ptr< _Tp[], _Dp >::operator[] (
 size_t __i) const [inline]
```

Access an element of owned array.

Definition at line 657 of file `unique_ptr.h`.

4.1033.3.9 `release()`

```
template<typename _Tp , typename _Dp >
pointer std::unique_ptr< _Tp[], _Dp >::release () [inline], [noexcept]
```

Release ownership of any stored pointer.

Definition at line 686 of file `unique_ptr.h`.

4.1033.3.10 `reset()`

```
template<typename _Tp , typename _Dp >
template<typename _Up , typename = _Require< __or_<is_same<_Up, pointer>, __and_<is_same<pointer,
element_type*>, is_pointer<_Up>, is_convertible< typename remove_pointer<_Up>::type(*)[], element↵
_type(*)[] > > > >>
void std::unique_ptr< _Tp[], _Dp >::reset (
 _Up __p) [inline], [noexcept]
```

Replace the stored pointer.

## Parameters

|                                                                                                   |                           |
|---------------------------------------------------------------------------------------------------|---------------------------|
| <a href="#"></a> | The new pointer to store. |
| <a href="#">_p</a>                                                                                |                           |

The deleter will be invoked if a pointer is already owned.

Definition at line 708 of file unique\_ptr.h.

References [std::move\(\)](#).

## 4.1033.3.11 swap()

```
template<typename _Tp , typename _Dp >
void std::unique_ptr< _Tp[], _Dp >::swap (
 unique_ptr< _Tp[], _Dp > & __u) [inline], [noexcept]
```

Exchange the pointer and deleter with another object.

Definition at line 716 of file unique\_ptr.h.

#### 4.1034.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc =
allocator<std::pair<const _Key, _Tp>>>>
class std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >
```

A standard container composed of unique keys (containing at most one of each key value) that associates values of another type with the keys.

## Template Parameters

|                     |                                                                                                   |
|---------------------|---------------------------------------------------------------------------------------------------|
| <code>_Key</code>   | Type of key objects.                                                                              |
| <code>_Tp</code>    | Type of mapped objects.                                                                           |
| <code>_Hash</code>  | Hashing function object type, defaults to <code>hash&lt;_Value&gt;</code> .                       |
| <code>_Pred</code>  | Predicate function object type, defaults to <code>equal_to&lt;_Value&gt;</code> .                 |
| <code>_Alloc</code> | Allocator type, defaults to <code>std::allocator&lt;std::pair&lt;const _Key, _Tp&gt;&gt;</code> . |

Meets the requirements of a [container](#), and [unordered associative container](#)

The resulting value type of the container is `std::pair<const _Key, _Tp>`.

Base is `_Hashtable`, dispatched at compile time via template alias `__umap_hashtable`.

Definition at line 102 of file `unordered_map.h`.

## 4.1034.2 Member Typedef Documentation

## 4.1034.2.1 allocator\_type

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::allocator_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::allocator_type
```

Public typedefs.

Definition at line 116 of file `unordered_map.h`.

## 4.1034.2.2 const\_iterator

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::const_iterator
```

Iterator-related typedefs.

Definition at line 126 of file `unordered_map.h`.

#### 4.1034.2.3 const\_local\_iterator

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::const_local_iterator
```

Iterator-related typedefs.

Definition at line 128 of file unordered\_map.h.

#### 4.1034.2.4 const\_pointer

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::const_pointer std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::const_pointer
```

Iterator-related typedefs.

Definition at line 122 of file unordered\_map.h.

#### 4.1034.2.5 const\_reference

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::const_reference std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::const_reference
```

Iterator-related typedefs.

Definition at line 124 of file unordered\_map.h.

#### 4.1034.2.6 difference\_type

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::difference_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::difference_type
```

Iterator-related typedefs.

Definition at line 130 of file unordered\_map.h.

#### 4.1034.2.7 hasher

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
typedef _Hashtable::hasher std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::hasher
```

Public typedefs.

Definition at line 114 of file unordered\_map.h.

#### 4.1034.2.8 iterator

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
typedef _Hashtable::iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::iterator
```

Iterator-related typedefs.

Definition at line 125 of file unordered\_map.h.

#### 4.1034.2.9 key\_equal

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
typedef _Hashtable::key_equal std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::key_equal
```

Public typedefs.

Definition at line 115 of file unordered\_map.h.

#### 4.1034.2.10 key\_type

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
typedef _Hashtable::key_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::key_type
```

Public typedefs.

Definition at line 111 of file unordered\_map.h.

#### 4.1034.2.11 local\_iterator

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::local_iterator
```

Iterator-related typedefs.

Definition at line 127 of file unordered\_map.h.

#### 4.1034.2.12 mapped\_type

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::mapped_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::mapped_type
```

Public typedefs.

Definition at line 113 of file unordered\_map.h.

#### 4.1034.2.13 pointer

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::pointer std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::pointer
```

Iterator-related typedefs.

Definition at line 121 of file unordered\_map.h.

#### 4.1034.2.14 reference

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::reference std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::reference
```

Iterator-related typedefs.

Definition at line 123 of file unordered\_map.h.

## 4.1034.2.15 size\_type

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
typedef _Hashtable::size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::size_type
```

Iterator-related typedefs.

Definition at line 129 of file unordered\_map.h.

## 4.1034.2.16 value\_type

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
typedef _Hashtable::value_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::value_type
```

Public typedefs.

Definition at line 112 of file unordered\_map.h.

## 4.1034.3 Constructor &amp; Destructor Documentation

## 4.1034.3.1 unordered\_map() [1/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map () [default]
```

Default constructor.

## 4.1034.3.2 unordered\_map() [2/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
 size_type __n,
 const hasher & __hf = hasher(),
 const key_equal & __eq1 = key_equal(),
 const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Default constructor creates no elements.

## Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eqf</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

Definition at line 151 of file `unordered_map.h`.

4.1034.3.3 `unordered_map()` [3/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator >
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
 _InputIterator __first,
 _InputIterator __last,
 size_type __n = 0,
 const hasher & __hf = hasher(),
 const key_equal & __eqf = key_equal(),
 const allocator_type & __a = allocator_type()) [inline]
```

Builds an `unordered_map` from a range.

## Parameters

|                      |                                    |
|----------------------|------------------------------------|
| <code>__first</code> | An input iterator.                 |
| <code>__last</code>  | An input iterator.                 |
| <code>__n</code>     | Minimal initial number of buckets. |
| <code>__hf</code>    | A hash functor.                    |
| <code>__eqf</code>   | A key equality functor.            |
| <code>__a</code>     | An allocator object.               |

Create an `unordered_map` consisting of copies of the elements from `[__first,__last)`. This is linear in N (where N is `distance(__first,__last)`).

Definition at line 172 of file `unordered_map.h`.

4.1034.3.4 `unordered_map()` [4/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
 const unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > &) [default]
```

Copy constructor.

## 4.1034.3.5 unordered\_map() [5/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
 unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > &&) [default]
```

Move constructor.

## 4.1034.3.6 unordered\_map() [6/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
 const allocator_type & __a) [inline], [explicit]
```

Creates an unordered\_map with no elements.

## Parameters

|                  |                      |
|------------------|----------------------|
| <code>__a</code> | An allocator object. |
|------------------|----------------------|

Definition at line 191 of file unordered\_map.h.

## 4.1034.3.7 unordered\_map() [7/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
 initializer_list< value_type > __l,
 size_type __n = 0,
 const hasher & __hf = hasher(),
 const key_equal & __eq1 = key_equal(),
 const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_map from an initializer\_list.

## Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__l</code>   | An initializer_list.               |
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eq1</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

Create an `unordered_map` consisting of copies of the elements in the list. This is linear in  $N$  (where  $N$  is `__l.size()`).

Definition at line 226 of file `unordered_map.h`.

#### 4.1034.4 Member Function Documentation

##### 4.1034.4.1 `at()` [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
mapped_type& std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::at (
 const key_type & __k) [inline]
```

Access to `unordered_map` data.

##### Parameters

|                  |                                             |
|------------------|---------------------------------------------|
| <code>__k</code> | The key for which data should be retrieved. |
|------------------|---------------------------------------------|

##### Returns

A reference to the data whose key is equal to `__k`, if such a data is present in the `unordered_map`.

##### Exceptions

|                                |                             |
|--------------------------------|-----------------------------|
| <code>std::out_of_range</code> | If no such data is present. |
|--------------------------------|-----------------------------|

Definition at line 1000 of file `unordered_map.h`.

##### 4.1034.4.2 `at()` [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
const mapped_type& std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::at (
 const key_type & __k) const [inline]
```

Access to `unordered_map` data.

##### Parameters

|                  |                                             |
|------------------|---------------------------------------------|
| <code>__k</code> | The key for which data should be retrieved. |
|------------------|---------------------------------------------|

**Returns**

A reference to the data whose key is equal to `__k`, if such a data is present in the `unordered_map`.

**Exceptions**

|                                |                             |
|--------------------------------|-----------------------------|
| <code>std::out_of_range</code> | If no such data is present. |
|--------------------------------|-----------------------------|

Definition at line 1004 of file `unordered_map.h`.

**4.1034.4.3 begin()** [1/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin () [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the `unordered_map`.

Definition at line 324 of file `unordered_map.h`.

**4.1034.4.4 begin()** [2/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_map`.

Definition at line 333 of file `unordered_map.h`.

**4.1034.4.5 begin()** [3/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (
 size_type __n) [inline]
```

Returns a read/write iterator pointing to the first bucket element.

**Parameters**

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

**Returns**

A read/write local iterator.

Definition at line 1045 of file unordered\_map.h.

**4.1034.4.6 begin()** [4/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (
 size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

|                 |                   |
|-----------------|-------------------|
| <code>_↵</code> | The bucket index. |
| <code>_n</code> |                   |

**Returns**

A read-only local iterator.

Definition at line 1056 of file unordered\_map.h.

**4.1034.4.7 bucket\_count()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::bucket_count () const [inline],
[noexcept]
```

Returns the number of buckets of the unordered\_map.

Definition at line 1012 of file unordered\_map.h.

**4.1034.4.8 cbegin()** [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_map.

Definition at line 337 of file unordered\_map.h.

## 4.1034.4.9 cbegin() [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cbegin (
 size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

## Parameters

|                 |                   |
|-----------------|-------------------|
| <code>_↵</code> | The bucket index. |
| <code>_n</code> |                   |

## Returns

A read-only local iterator.

Definition at line 1060 of file unordered\_map.h.

## 4.1034.4.10 cend() [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cend () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_map.

Definition at line 359 of file unordered\_map.h.

## 4.1034.4.11 cend() [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cend (
 size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

## Parameters

|                 |                   |
|-----------------|-------------------|
| <code>_↵</code> | The bucket index. |
| <code>_n</code> |                   |

**Returns**

A read-only local iterator.

Definition at line 1086 of file unordered\_map.h.

**4.1034.4.12 clear()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in an unordered\_map. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 841 of file unordered\_map.h.

**4.1034.4.13 count()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::count (
 const key_type & __x) const [inline]
```

Finds the number of elements.

**Parameters**

|                  |               |
|------------------|---------------|
| <code>__x</code> | Key to count. |
|------------------|---------------|

**Returns**

Number of elements with specified key.

This function only makes sense for unordered\_multimap; for unordered\_map the result will either be 0 (not present) or 1 (present).

Definition at line 937 of file unordered\_map.h.

4.1034.4.14 `emplace()`

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename... _Args>
std::pair<iterator, bool> std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::emplace (
 _Args &&... __args) [inline]
```

Attempts to build and insert a `std::pair` into the `unordered_map`.

## Parameters

|                     |                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__args</code> | Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor). |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|

## Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the `unordered_map`. An `unordered_map` relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the `unordered_map`.

Insertion requires amortized constant time.

Definition at line 387 of file `unordered_map.h`.

4.1034.4.15 `emplace_hint()`

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename... _Args>
iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint (
 const_iterator __pos,
 _Args &&... __args) [inline]
```

Attempts to build and insert a `std::pair` into the `unordered_map`.

## Parameters

|                     |                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the pair should be inserted.                                                                             |
| <code>__args</code> | Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor). |

## Returns

An iterator that points to the element with key of the `std::pair` built from `__args` (may or may not be that `std::pair`).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 418 of file `unordered_map.h`.

#### 4.1034.4.16 `empty()`

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
bool std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::empty () const [inline], [noexcept]
```

Returns true if the `unordered_map` is empty.

Definition at line 304 of file `unordered_map.h`.

#### 4.1034.4.17 `end()` [1/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the `unordered_map`.

Definition at line 346 of file `unordered_map.h`.

#### 4.1034.4.18 `end()` [2/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::end () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_map`.

Definition at line 355 of file `unordered_map.h`.

#### 4.1034.4.19 `end()` [3/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::end (
 size_type __n) [inline]
```

Returns a read/write iterator pointing to one past the last bucket elements.

## Parameters

|                 |                   |
|-----------------|-------------------|
| <code>_↵</code> | The bucket index. |
| <code>_n</code> |                   |

## Returns

A read/write local iterator.

Definition at line 1071 of file unordered\_map.h.

## 4.1034.4.20 end() [4/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::end (
 size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

## Parameters

|                 |                   |
|-----------------|-------------------|
| <code>_↵</code> | The bucket index. |
| <code>_n</code> |                   |

## Returns

A read-only local iterator.

Definition at line 1082 of file unordered\_map.h.

## 4.1034.4.21 equal\_range() [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair<iterator, iterator> std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::equal_range
(
 const key_type & __x) [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_X</code> |                    |

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for `unordered_multimap`.

Definition at line 961 of file `unordered_map.h`.

**4.1034.4.22 `equal_range()`** [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair<const_iterator, const_iterator> std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc
>::equal_range (
 const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_X</code> |                    |

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for `unordered_multimap`.

Definition at line 965 of file `unordered_map.h`.

**4.1034.4.23 `erase()`** [1/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
 const_iterator __position) [inline]
```

Erases an element from an `unordered_map`.

## Parameters

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

## Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_map`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 791 of file `unordered_map.h`.

4.1034.4.24 `erase()` [2/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
 iterator __position) [inline]
```

Erases an element from an `unordered_map`.

## Parameters

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

## Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_map`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 796 of file `unordered_map.h`.

4.1034.4.25 `erase()` [3/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
 const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

|                 |                              |
|-----------------|------------------------------|
| <code>_↵</code> | Key of element to be erased. |
| <code>_X</code> |                              |

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_map`. For an `unordered_map` the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 813 of file `unordered_map.h`.

**4.1034.4.26 erase()** [4/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
 const_iterator __first,
 const_iterator __last) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_map`.

**Parameters**

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

**Returns**

The iterator `__last`.

This function erases a sequence of elements from an `unordered_map`. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 831 of file `unordered_map.h`.

## 4.1034.4.27 find() [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
 const key_type & __x) [inline]
```

Tries to locate an element in an unordered\_map.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_X</code> |                    |

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 919 of file `unordered_map.h`.

**4.1034.4.28 find()** [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
 const key_type & __x) const [inline]
```

Tries to locate an element in an `unordered_map`.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_X</code> |                    |

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 923 of file `unordered_map.h`.

**4.1034.4.29 get\_allocator()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
allocator_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::get_allocator () const
[inline], [noexcept]
```

Returns the allocator object used by the `unordered_map`.

Definition at line 297 of file `unordered_map.h`.

## 4.1034.4.30 hash\_function()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
hasher std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::hash_function () const [inline]
```

Returns the hash functor object with which the unordered\_map was constructed.

Definition at line 895 of file unordered\_map.h.

## 4.1034.4.31 insert() [1/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair<iterator, bool> std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
 const value_type & __x) [inline]
```

Attempts to insert a std::pair into the unordered\_map.

## Parameters

|                  |                                                                      |
|------------------|----------------------------------------------------------------------|
| <code>__x</code> | Pair to be inserted (see std::make_pair for easy creation of pairs). |
|------------------|----------------------------------------------------------------------|

## Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the unordered\_map. An unordered\_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered\_map.

Insertion requires amortized constant time.

Definition at line 579 of file unordered\_map.h.

## 4.1034.4.32 insert() [2/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair<iterator, bool> std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
 value_type && __x) [inline]
```

Attempts to insert a std::pair into the unordered\_map.

**Parameters**

|                                    |                                                                                   |
|------------------------------------|-----------------------------------------------------------------------------------|
| <code>_↵</code><br><code>_X</code> | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |
|------------------------------------|-----------------------------------------------------------------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the `unordered_map`. An `unordered_map` relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the `unordered_map`.

Insertion requires amortized constant time.

Definition at line 585 of file `unordered_map.h`.

**4.1034.4.33 insert()** [3/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Pair >
__enable_if_t<is_constructible<value_type, _Pair&&>::value, pair<iterator, bool> > std::unordered_map<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
 _Pair && __x) [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

**Parameters**

|                                    |                                                                                   |
|------------------------------------|-----------------------------------------------------------------------------------|
| <code>_↵</code><br><code>_X</code> | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |
|------------------------------------|-----------------------------------------------------------------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the `unordered_map`. An `unordered_map` relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the `unordered_map`.

Insertion requires amortized constant time.

Definition at line 591 of file `unordered_map.h`.

## 4.1034.4.34 insert() [4/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
 const_iterator __hint,
 const value_type & __x) [inline]
```

Attempts to insert a std::pair into the unordered\_map.

## Parameters

|                     |                                                                            |
|---------------------|----------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the pair should be inserted. |
| <code>__x</code>    | Pair to be inserted (see std::make_pair for easy creation of pairs).       |

## Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 618 of file unordered\_map.h.

## 4.1034.4.35 insert() [5/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
 const_iterator __hint,
 value_type && __x) [inline]
```

Attempts to insert a std::pair into the unordered\_map.

## Parameters

|                     |                                                                            |
|---------------------|----------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the pair should be inserted. |
| <code>__x</code>    | Pair to be inserted (see std::make_pair for easy creation of pairs).       |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 624 of file `unordered_map.h`.

**4.1034.4.36 insert()** [6/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Pair >
__enable_if_t<is_constructible<value_type, _Pair&&>::value, iterator> std::unordered_map< _Key,
_Tp, _Hash, _Pred, _Alloc >::insert (
 const_iterator __hint,
 _Pair && __x) [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

**Parameters**

|                     |                                                                                   |
|---------------------|-----------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the pair should be inserted.        |
| <code>__x</code>    | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 629 of file `unordered_map.h`.

## 4.1034.4.37 insert() [7/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator >
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
 _InputIterator __first,
 _InputIterator __last) [inline]
```

A template function that attempts to insert a range of elements.

## Parameters

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

Definition at line 644 of file unordered\_map.h.

## 4.1034.4.38 insert() [8/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
 initializer_list< value_type > __l) [inline]
```

Attempts to insert a list of elements into the unordered\_map.

## Parameters

|                                                                                        |                                                                 |
|----------------------------------------------------------------------------------------|-----------------------------------------------------------------|
| <code>↵</code><br><code>↵</code><br><code>↵</code><br><code>↵</code><br><code>/</code> | A std::initializer_list<value_type> of elements to be inserted. |
|----------------------------------------------------------------------------------------|-----------------------------------------------------------------|

Complexity similar to that of the range constructor.

Definition at line 655 of file unordered\_map.h.

## 4.1034.4.39 key\_eq()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
key_equal std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::key_eq () const [inline]
```

Returns the key comparison object with which the `unordered_map` was constructed.

Definition at line 901 of file `unordered_map.h`.

#### 4.1034.4.40 `load_factor()`

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
float std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::load_factor () const [inline],
[noexcept]
```

Returns the average number of elements per bucket.

Definition at line 1094 of file `unordered_map.h`.

#### 4.1034.4.41 `max_bucket_count()`

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_bucket_count () const [inline],
[noexcept]
```

Returns the maximum number of buckets of the `unordered_map`.

Definition at line 1017 of file `unordered_map.h`.

#### 4.1034.4.42 `max_load_factor()` [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
float std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor () const [inline],
[noexcept]
```

Returns a positive number that the `unordered_map` tries to keep the load factor less than or equal to.

Definition at line 1100 of file `unordered_map.h`.

#### 4.1034.4.43 `max_load_factor()` [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor (
 float __z) [inline]
```

Change the `unordered_map` maximum load factor.

## Parameters

|                 |                              |
|-----------------|------------------------------|
| <code>_Z</code> | The new maximum load factor. |
|-----------------|------------------------------|

Definition at line 1108 of file unordered\_map.h.

## 4.1034.4.44 max\_size()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_size () const [inline],
[noexcept]
```

Returns the maximum size of the unordered\_map.

Definition at line 314 of file unordered\_map.h.

## 4.1034.4.45 operator=() [1/3]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_map& std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
 const unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > &) [default]
```

Copy assignment operator.

## 4.1034.4.46 operator=() [2/3]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_map& std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
 unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > &&) [default]
```

Move assignment operator.

## 4.1034.4.47 operator=() [3/3]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_map& std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
 initializer_list< value_type > & __l) [inline]
```

Unordered\_map list assignment operator.

## Parameters

|                |                      |
|----------------|----------------------|
| <code>↵</code> | An initializer_list. |
| <code>↵</code> |                      |
| <code>↵</code> |                      |
| <code>↵</code> |                      |
| <code>/</code> |                      |

This function fills an unordered\_map with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the unordered\_map and that the resulting unordered\_map's size is the same as the number of elements assigned.

Definition at line 289 of file unordered\_map.h.

4.1034.4.48 `operator[]()` [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
mapped_type& std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::operator[] (
 const key_type & __k) [inline]
```

Subscript ( `[]` ) access to unordered\_map data.

## Parameters

|                                   |                                             |
|-----------------------------------|---------------------------------------------|
| <code>↵</code><br><code>_k</code> | The key for which data should be retrieved. |
|-----------------------------------|---------------------------------------------|

## Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ( `[]` ) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires constant time.

Definition at line 983 of file unordered\_map.h.

4.1034.4.49 `operator[]()` [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
mapped_type& std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::operator[] (
 key_type && __k) [inline]
```

Subscript ( `[]` ) access to unordered\_map data.

## Parameters

|                       |                                             |
|-----------------------|---------------------------------------------|
| <code>↵<br/>_k</code> | The key for which data should be retrieved. |
|-----------------------|---------------------------------------------|

## Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ( [] )operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires constant time.

Definition at line 987 of file unordered\_map.h.

## 4.1034.4.50 rehash()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::rehash (
 size_type __n) [inline]
```

May rehash the unordered\_map.

## Parameters

|                       |                            |
|-----------------------|----------------------------|
| <code>↵<br/>_n</code> | The new number of buckets. |
|-----------------------|----------------------------|

Rehash will occur only if the new number of buckets respect the unordered\_map maximum load factor.

Definition at line 1119 of file unordered\_map.h.

## 4.1034.4.51 reserve()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::reserve (
 size_type __n) [inline]
```

Prepare the unordered\_map for a specified number of elements.

**Parameters**

|                        |                              |
|------------------------|------------------------------|
| <code>_↔<br/>_n</code> | Number of elements required. |
|------------------------|------------------------------|

Same as `rehash(ceil(n / max_load_factor()))`.

Definition at line 1130 of file `unordered_map.h`.

**4.1034.4.52 `size()`**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↔
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the `unordered_map`.

Definition at line 309 of file `unordered_map.h`.

**4.1034.4.53 `swap()`**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↔
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::swap (
 unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another `unordered_map`.

**Parameters**

|                        |                                                                        |
|------------------------|------------------------------------------------------------------------|
| <code>_↔<br/>_X</code> | An <code>unordered_map</code> of the same element and allocator types. |
|------------------------|------------------------------------------------------------------------|

This exchanges the elements between two `unordered_map` in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

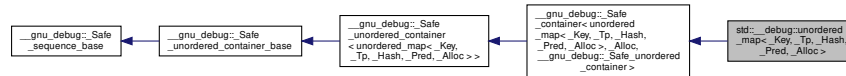

Definition at line 855 of file `unordered_map.h`.

The documentation for this class was generated from the following file:

- [unordered\\_map.h](#)

## 4.1035 std::\_\_debug::unordered\_map&lt; \_Key, \_Tp, \_Hash, \_Pred, \_Alloc &gt; Class Template Reference

Inheritance diagram for std::\_\_debug::unordered\_map< \_Key, \_Tp, \_Hash, \_Pred, \_Alloc >:

class `::__gnu_debug::Safe_local_iterator`

## 4.1035.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Hash = std::hash<_Key>, typename _Pred = std::equal_to<_Key>, typename
_Alloc = std::allocator<std::pair<const _Key, _Tp>>>
class std::__debug::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>
```

Class `std::unordered_map` with safety/checking/debug instrumentation.

Definition at line 41 of file `debug/unordered_map`.

## 4.1035.2 Member Function Documentation

#### 4.1035.2.1 `_M_detach_all()`

```
void __gnu_debug::_Safe_unordered_container_base::_M_detach_all () [protected], [inherited]
```

Detach all iterators, leaving them singular.

#### 4.1035.2.2 `_M_detach_singular()`

```
void __gnu_debug::_Safe_sequence_base::_M_detach_singular () [protected], [inherited]
```

Detach all singular iterators.

#### Postcondition

for all iterators *i* attached to this sequence, *i*->\_M\_version == \_M\_version.

#### 4.1035.2.3 `_M_get_mutex()`

```
__gnu_cxx::mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex () throw () [protected],
[inherited]
```

For use in `_Safe_sequence`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

#### 4.1035.2.4 `_M_invalidate_all()`

```
void __gnu_debug::_Safe_sequence_base::_M_invalidate_all () const [inline], [protected], [inherited]
```

Invalidates all iterators.

Definition at line 256 of file `safe_base.h`.

References `__gnu_debug::_Safe_sequence_base::_M_version`.

#### 4.1035.2.5 `_M_invalidate_if()`

```
void __gnu_debug::_Safe_unordered_container< unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >
>::_M_invalidate_if (
 _Predicate __pred) [protected], [inherited]
```

Invalidates all iterators *x* that reference this container, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

Definition at line 38 of file `safe_unordered_container.tcc`.

## 4.1035.2.6 \_M\_invalidate\_local\_if()

```
void __gnu_debug::_Safe_unordered_container< unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >
>::_M_invalidate_local_if (
 _Predicate __pred) [protected], [inherited]
```

Invalidates all local iterators  $x$  that reference this container, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal local iterators nested in the safe ones.

Definition at line 70 of file `safe_unordered_container.tcc`.

## 4.1035.2.7 \_M\_revalidate\_singular()

```
void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular () [protected], [inherited]
```

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

## 4.1035.2.8 \_M\_swap() [1/2]

```
void __gnu_debug::_Safe_unordered_container_base::_M_swap (
 _Safe_unordered_container_base & __x) [protected], [noexcept], [inherited]
```

Swap this container with the given container. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

## 4.1035.2.9 \_M\_swap() [2/2]

```
void __gnu_debug::_Safe_sequence_base::_M_swap (
 _Safe_sequence_base & __x) [protected], [noexcept], [inherited]
```

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

## 4.1035.3 Member Data Documentation

## 4.1035.3.1 \_M\_const\_iterators

```
_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_iterators [inherited]
```

The list of constant iterators that reference this container.

Definition at line 197 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

#### 4.1035.3.2 `_M_const_local_iterators`

```
_Safe_iterator_base* __gnu_debug::_Safe_unordered_container_base::_M_const_local_iterators [inherited]
```

The list of constant local iterators that reference this container.

Definition at line 130 of file `safe_unordered_base.h`.

#### 4.1035.3.3 `_M_iterators`

```
_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators [inherited]
```

The list of mutable iterators that reference this container.

Definition at line 194 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

#### 4.1035.3.4 `_M_local_iterators`

```
_Safe_iterator_base* __gnu_debug::_Safe_unordered_container_base::_M_local_iterators [inherited]
```

The list of mutable local iterators that reference this container.

Definition at line 127 of file `safe_unordered_base.h`.

#### 4.1035.3.5 `_M_version`

```
unsigned int __gnu_debug::_Safe_sequence_base::_M_version [mutable], [inherited]
```

The container version number. This number may never be 0.

Definition at line 200 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence_base::_M_invalidate_all()`.

#### Friends

- [template<typename \\_Key1, typename \\_Tp1, typename \\_Hash1, typename \\_Pred1, typename \\_Alloc1 > bool operator==](#) (const [unordered\\_multimap](#)< \_Key1, \_Tp1, \_Hash1, \_Pred1, \_Alloc1 > &, const [unordered\\_multimap](#)< \_Key1, \_Tp1, \_Hash1, \_Pred1, \_Alloc1 > &)

#### 4.1036.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc =
allocator<std::pair<const _Key, _Tp>>>>
class std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >
```

A standard container composed of equivalent keys (possibly containing multiple of each key value) that associates values of another type with the keys.

### Template Parameters

|                     |                                                                                                   |
|---------------------|---------------------------------------------------------------------------------------------------|
| <code>_Key</code>   | Type of key objects.                                                                              |
| <code>_Tp</code>    | Type of mapped objects.                                                                           |
| <code>_Hash</code>  | Hashing function object type, defaults to <code>hash&lt;_Value&gt;</code> .                       |
| <code>_Pred</code>  | Predicate function object type, defaults to <code>equal_to&lt;_Value&gt;</code> .                 |
| <code>_Alloc</code> | Allocator type, defaults to <code>std::allocator&lt;std::pair&lt;const _Key, _Tp&gt;&gt;</code> . |

Meets the requirements of a `container`, and `unordered associative container`

The resulting value type of the container is `std::pair<const _Key, _Tp>`.

Base is `_Hashtable`, dispatched at compile time via template alias `__ummap_hashtable`.

Definition at line 73 of file `unordered_map.h`.

## 4.1036.2 Member Typedef Documentation

### 4.1036.2.1 `allocator_type`

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵

### 4.1036.3 Constructor & Destructor Documentation

#### 4.1036.3.1 unordered\_multimap() [1/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap () [default]
```

Default constructor.

#### 4.1036.3.2 unordered\_multimap() [2/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
 size_type __n,
 const hasher & __hf = hasher(),
 const key_equal & __eq1 = key_equal(),
 const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Default constructor creates no elements.

## Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eqf</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

Definition at line 1297 of file `unordered_map.h`.

## 4.1036.3.3 unordered\_multimap() [3/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator >
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
 _InputIterator __first,
 _InputIterator __last,
 size_type __n = 0,
 const hasher & __hf = hasher(),
 const key_equal & __eqf = key_equal(),
 const allocator_type & __a = allocator_type()) [inline]
```

Builds an `unordered_multimap` from a range.

## Parameters

|                      |                                    |
|----------------------|------------------------------------|
| <code>__first</code> | An input iterator.                 |
| <code>__last</code>  | An input iterator.                 |
| <code>__n</code>     | Minimal initial number of buckets. |
| <code>__hf</code>    | A hash functor.                    |
| <code>__eqf</code>   | A key equality functor.            |
| <code>__a</code>     | An allocator object.               |

Create an `unordered_multimap` consisting of copies of the elements from `[__first,__last)`. This is linear in N (where N is `distance(__first,__last)`).

Definition at line 1318 of file `unordered_map.h`.

## 4.1036.3.4 unordered\_multimap() [4/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
 const unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > &) [default]
```

Copy constructor.

**4.1036.3.5 unordered\_multimap()** [5/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
 unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > &&) [default]
```

Move constructor.

**4.1036.3.6 unordered\_multimap()** [6/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
 const allocator_type & __a) [inline], [explicit]
```

Creates an unordered\_multimap with no elements.

**Parameters**

|                                   |                      |
|-----------------------------------|----------------------|
| <code>↵</code><br><code>_a</code> | An allocator object. |
|-----------------------------------|----------------------|

Definition at line 1337 of file unordered\_map.h.

**4.1036.3.7 unordered\_multimap()** [7/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
 initializer_list< value_type > __l,
 size_type __n = 0,
 const hasher & __hf = hasher(),
 const key_equal & __eq1 = key_equal(),
 const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_multimap from an initializer\_list.

**Parameters**

|                    |                                    |
|--------------------|------------------------------------|
| <code>__l</code>   | An initializer_list.               |
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eq1</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

Create an unordered\_multimap consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

Definition at line 1372 of file unordered\_map.h.

#### 4.1036.4 Member Function Documentation

##### 4.1036.4.1 begin() [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin () [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the unordered\_multimap.

Definition at line 1470 of file unordered\_map.h.

##### 4.1036.4.2 begin() [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_multimap.

Definition at line 1479 of file unordered\_map.h.

##### 4.1036.4.3 begin() [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (
 size_type __n) [inline]
```

Returns a read/write iterator pointing to the first bucket element.

#### Parameters

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

**Returns**

A read/write local iterator.

Definition at line 1895 of file unordered\_map.h.

**4.1036.4.4 begin()** [4/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (
 size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

|                        |                   |
|------------------------|-------------------|
| <code>↵<br/>__n</code> | The bucket index. |
|------------------------|-------------------|

**Returns**

A read-only local iterator.

Definition at line 1906 of file unordered\_map.h.

**4.1036.4.5 bucket\_count()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::bucket_count () const
[inline], [noexcept]
```

Returns the number of buckets of the unordered\_multimap.

Definition at line 1862 of file unordered\_map.h.

**4.1036.4.6 cbegin()** [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::cbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_multimap.

Definition at line 1483 of file unordered\_map.h.

## 4.1036.4.7 cbegin() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::cbegin (
 size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

## Parameters

|                  |                   |
|------------------|-------------------|
| <code>_↵</code>  | The bucket index. |
| <code>__n</code> |                   |

## Returns

A read-only local iterator.

Definition at line 1910 of file unordered\_map.h.

## 4.1036.4.8 cend() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::cend () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_multimap.

Definition at line 1505 of file unordered\_map.h.

## 4.1036.4.9 cend() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::cend (
 size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

## Parameters

|                  |                   |
|------------------|-------------------|
| <code>_↵</code>  | The bucket index. |
| <code>__n</code> |                   |

**Returns**

A read-only local iterator.

Definition at line 1936 of file unordered\_map.h.

**4.1036.4.10 clear()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in an unordered\_multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1734 of file unordered\_map.h.

**4.1036.4.11 count()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::count (
 const key_type & __x) const [inline]
```

Finds the number of elements.

**Parameters**

|                 |               |
|-----------------|---------------|
| <code>_↔</code> | Key to count. |
| <code>_X</code> |               |

**Returns**

Number of elements with specified key.

Definition at line 1828 of file unordered\_map.h.

**4.1036.4.12 emplace()**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename... _Args>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace (
 _Args &&... __args) [inline]
```

Attempts to build and insert a std::pair into the unordered\_multimap.

## Parameters

|                     |                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__args</code> | Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor). |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|

## Returns

An iterator that points to the inserted pair.

This function attempts to build and insert a (key, value) pair into the `unordered_multimap`.

Insertion requires amortized constant time.

Definition at line 1528 of file `unordered_map.h`.

4.1036.4.13 `emplace_hint()`

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename... _Args>
iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint (
 const_iterator __pos,
 _Args &&... __args) [inline]
```

Attempts to build and insert a `std::pair` into the `unordered_multimap`.

## Parameters

|                     |                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the pair should be inserted.                                                                             |
| <code>__args</code> | Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor). |

## Returns

An iterator that points to the element with key of the `std::pair` built from `__args`.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 1555 of file `unordered_map.h`.

**4.1036.4.14** `empty()`

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
bool std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::empty () const [inline], [noexcept]
```

Returns true if the `unordered_multimap` is empty.

Definition at line 1450 of file `unordered_map.h`.

**4.1036.4.15** `end()` [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the `unordered_multimap`.

Definition at line 1492 of file `unordered_map.h`.

**4.1036.4.16** `end()` [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_multimap`.

Definition at line 1501 of file `unordered_map.h`.

**4.1036.4.17** `end()` [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end (
 size_type __n) [inline]
```

Returns a read/write iterator pointing to one past the last bucket elements.

**Parameters**

|                 |                   |
|-----------------|-------------------|
| <code>_↵</code> | The bucket index. |
| <code>_n</code> |                   |

**Returns**

A read/write local iterator.

Definition at line 1921 of file unordered\_map.h.

**4.1036.4.18 end()** [ 4 / 4 ]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end (
 size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

|                       |                   |
|-----------------------|-------------------|
| <b>↵</b><br><b>_n</b> | The bucket index. |
|-----------------------|-------------------|

**Returns**

A read-only local iterator.

Definition at line 1932 of file unordered\_map.h.

**4.1036.4.19 equal\_range()** [ 1 / 2 ]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair<iterator, iterator> std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::equal_↵
_range (
 const key_type & __x) [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                       |                    |
|-----------------------|--------------------|
| <b>↵</b><br><b>_x</b> | Key to be located. |
|-----------------------|--------------------|

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1850 of file unordered\_map.h.

#### 4.1036.4.20 equal\_range() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair<const_iterator, const_iterator> std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _↵
Alloc >::equal_range (
 const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

##### Parameters

|                  |                    |
|------------------|--------------------|
| <code>↵</code>   | Key to be located. |
| <code>__x</code> |                    |

##### Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1854 of file unordered\_map.h.

#### 4.1036.4.21 erase() [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
 const_iterator __position) [inline]
```

Erases an element from an unordered\_multimap.

##### Parameters

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

##### Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an unordered\_multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1684 of file unordered\_map.h.

#### 4.1036.4.22 erase() [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
 iterator __position) [inline]
```

Erases an element from an unordered\_multimap.

##### Parameters

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

##### Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an unordered\_multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1689 of file unordered\_map.h.

#### 4.1036.4.23 erase() [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
 const key_type & __x) [inline]
```

Erases elements according to the provided key.

##### Parameters

|                  |                               |
|------------------|-------------------------------|
| <code>__x</code> | Key of elements to be erased. |
|------------------|-------------------------------|

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_multimap`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1705 of file `unordered_map.h`.

**4.1036.4.24 erase()** [4/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
 const_iterator __first,
 const_iterator __last) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_multimap`.

**Parameters**

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

**Returns**

The iterator `__last`.

This function erases a sequence of elements from an `unordered_multimap`. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1724 of file `unordered_map.h`.

**4.1036.4.25 find()** [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
 const key_type & __x) [inline]
```

Tries to locate an element in an `unordered_multimap`.

## Parameters

|                   |                    |
|-------------------|--------------------|
| <code>_Key</code> | Key to be located. |
| <code>_X</code>   |                    |

## Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 1814 of file `unordered_map.h`.

## 4.1036.4.26 find() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
 const key_type & __x) const [inline]
```

Tries to locate an element in an `unordered_multimap`.

## Parameters

|                   |                    |
|-------------------|--------------------|
| <code>_Key</code> | Key to be located. |
| <code>_X</code>   |                    |

## Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 1818 of file `unordered_map.h`.

## 4.1036.4.27 get\_allocator()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
allocator_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::get_allocator ()
const [inline], [noexcept]
```

Returns the allocator object used by the `unordered_multimap`.

Definition at line 1443 of file `unordered_map.h`.

**4.1036.4.28** `hash_function()`

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
hasher std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::hash_function () const [inline]
```

Returns the hash functor object with which the `unordered_multimap` was constructed.

Definition at line 1790 of file `unordered_map.h`.

**4.1036.4.29** `insert()` [1/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
 const value_type & __x) [inline]
```

Inserts a `std::pair` into the `unordered_multimap`.

**Parameters**

|                        |                                                                                   |
|------------------------|-----------------------------------------------------------------------------------|
| <code>↵<br/>__x</code> | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |
|------------------------|-----------------------------------------------------------------------------------|

**Returns**

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

Definition at line 1569 of file `unordered_map.h`.

**4.1036.4.30** `insert()` [2/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
 value_type && __x) [inline]
```

Inserts a `std::pair` into the `unordered_multimap`.

**Parameters**

|                        |                                                                                   |
|------------------------|-----------------------------------------------------------------------------------|
| <code>↵<br/>__x</code> | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |
|------------------------|-----------------------------------------------------------------------------------|

**Returns**

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

Definition at line 1573 of file unordered\_map.h.

References std::move().

**4.1036.4.31 insert()** [3/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _Pair >
__enable_if_t<is_constructible<value_type, _Pair&&>::value, iterator> std::unordered_multimap<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
 _Pair && __x) [inline]
```

Inserts a std::pair into the unordered\_multimap.

**Parameters**

|                       |                                                                      |
|-----------------------|----------------------------------------------------------------------|
| <b>↔</b><br><b>_x</b> | Pair to be inserted (see std::make_pair for easy creation of pairs). |
|-----------------------|----------------------------------------------------------------------|

**Returns**

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

Definition at line 1578 of file unordered\_map.h.

**4.1036.4.32 insert()** [4/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
 const_iterator __hint,
 const value_type & __x) [inline]
```

Inserts a std::pair into the unordered\_multimap.

**Parameters**

|                     |                                                                                   |
|---------------------|-----------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the pair should be inserted.        |
| <code>__x</code>    | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 1603 of file `unordered_map.h`.

**4.1036.4.33 insert()** [5/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
 const_iterator __hint,
 value_type && __x) [inline]
```

Inserts a `std::pair` into the `unordered_multimap`.

**Parameters**

|                     |                                                                                   |
|---------------------|-----------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the pair should be inserted.        |
| <code>__x</code>    | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 1609 of file `unordered_map.h`.

References `std::move()`.

## 4.1036.4.34 insert() [6/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _Pair >
__enable_if_t<is_constructible<value_type, _Pair&&>::value, iterator> std::unordered_multimap<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
 const_iterator __hint,
 _Pair && __x) [inline]
```

Inserts a std::pair into the unordered\_multimap.

## Parameters

|                     |                                                                            |
|---------------------|----------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the pair should be inserted. |
| <code>__x</code>    | Pair to be inserted (see std::make_pair for easy creation of pairs).       |

## Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 1614 of file unordered\_map.h.

## 4.1036.4.35 insert() [7/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _InputIterator >
void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
 _InputIterator __first,
 _InputIterator __last) [inline]
```

A template function that attempts to insert a range of elements.

## Parameters

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

Definition at line 1629 of file unordered\_map.h.

#### 4.1036.4.36 insert() [8/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
 initializer_list< value_type > __l) [inline]
```

Attempts to insert a list of elements into the unordered\_multimap.

##### Parameters

|    |                                                                 |
|----|-----------------------------------------------------------------|
| ↵  | A std::initializer_list<value_type> of elements to be inserted. |
| _↵ |                                                                 |
| ↵  |                                                                 |
| _↵ |                                                                 |
| /  |                                                                 |

Complexity similar to that of the range constructor.

Definition at line 1641 of file unordered\_map.h.

#### 4.1036.4.37 key\_eq()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
key_equal std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::key_eq () const [inline]
```

Returns the key comparison object with which the unordered\_multimap was constructed.

Definition at line 1796 of file unordered\_map.h.

#### 4.1036.4.38 load\_factor()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
float std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::load_factor () const [inline],
[noexcept]
```

Returns the average number of elements per bucket.

Definition at line 1944 of file unordered\_map.h.

**4.1036.4.39** max\_bucket\_count()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
size_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::max_bucket_count () const
[inline], [noexcept]
```

Returns the maximum number of buckets of the unordered\_multimap.

Definition at line 1867 of file unordered\_map.h.

**4.1036.4.40** max\_load\_factor() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
float std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor () const [inline],
[noexcept]
```

Returns a positive number that the unordered\_multimap tries to keep the load factor less than or equal to.

Definition at line 1950 of file unordered\_map.h.

**4.1036.4.41** max\_load\_factor() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor (
 float __z) [inline]
```

Change the unordered\_multimap maximum load factor.

**Parameters**

|                  |                              |
|------------------|------------------------------|
| <b>_↔<br/>_z</b> | The new maximum load factor. |
|------------------|------------------------------|

Definition at line 1958 of file unordered\_map.h.

**4.1036.4.42** max\_size()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
size_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::max_size () const [inline],
[noexcept]
```

Returns the maximum size of the unordered\_multimap.

Definition at line 1460 of file unordered\_map.h.

#### 4.1036.4.43 operator=() [1/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_multimap& std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
 const unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > &) [default]
```

Copy assignment operator.

#### 4.1036.4.44 operator=() [2/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_multimap& std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
 unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > &&) [default]
```

Move assignment operator.

#### 4.1036.4.45 operator=() [3/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_multimap& std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
 initializer_list< value_type > __l) [inline]
```

Unordered\_multimap list assignment operator.

##### Parameters

|    |                      |
|----|----------------------|
| ↵  | An initializer_list. |
| _↵ |                      |
| ↵  |                      |
| _↵ |                      |
| /  |                      |

This function fills an unordered\_multimap with copies of the elements in the initializer list \_\_l.

Note that the assignment completely changes the unordered\_multimap and that the resulting unordered\_multimap's size is the same as the number of elements assigned.

Definition at line 1435 of file unordered\_map.h.

#### 4.1036.4.46 rehash()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::rehash (
 size_type __n) [inline]
```

May rehash the unordered\_multimap.

##### Parameters

|                        |                            |
|------------------------|----------------------------|
| <code>↵<br/>__n</code> | The new number of buckets. |
|------------------------|----------------------------|

Rehash will occur only if the new number of buckets respect the unordered\_multimap maximum load factor.

Definition at line 1969 of file unordered\_map.h.

#### 4.1036.4.47 reserve()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::reserve (
 size_type __n) [inline]
```

Prepare the unordered\_multimap for a specified number of elements.

##### Parameters

|                        |                              |
|------------------------|------------------------------|
| <code>↵<br/>__n</code> | Number of elements required. |
|------------------------|------------------------------|

Same as rehash(ceil(n / max\_load\_factor())).

Definition at line 1980 of file unordered\_map.h.

#### 4.1036.4.48 size()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
```

```
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::size () const [inline],
[noexcept]
```

Returns the size of the unordered\_multimap.

Definition at line 1455 of file unordered\_map.h.

#### 4.1036.4.49 swap()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::swap (
 unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another unordered\_multimap.

#### Parameters

|                  |                                                                |
|------------------|----------------------------------------------------------------|
| <code>↵</code>   | An unordered_multimap of the same element and allocator types. |
| <code>__X</code> |                                                                |

This exchanges the elements between two unordered\_multimap in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

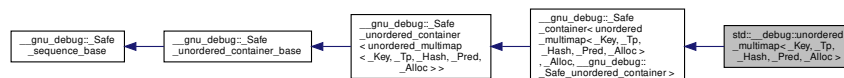

Definition at line 1748 of file unordered\_map.h.

The documentation for this class was generated from the following file:

- [unordered\\_map.h](#)

#### 4.1037 std::\_\_debug::unordered\_multimap< \_Key, \_Tp, \_Hash, \_Pred, \_Alloc > Class Template Reference

Inheritance diagram for `std::__debug::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >`:

## Public Types

- typedef \_Base::allocator\_type **allocator\_type**

## 4.1037.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Hash = std::hash<_Key>, typename _Pred = std::equal_to<_Key>, typename
_Alloc = std::allocator<std::pair<const _Key, _Tp>>>
class std::__debug::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>
```

Class std::unordered\_multimap with safety/checking/debug instrumentation.

Definition at line 44 of file debug/unordered\_map.

## 4.1037.2 Member Function Documentation

4.1037.2.1 [\\_M\\_detach\\_all\(\)](#)

```
void __gnu_debug::_Safe_unordered_container_base::_M_detach_all () [protected], [inherited]
```

Detach all iterators, leaving them singular.

#### 4.1037.2.2 `_M_detach_singular()`

```
void __gnu_debug::_Safe_sequence_base::_M_detach_singular () [protected], [inherited]
```

Detach all singular iterators.

##### Postcondition

for all iterators `i` attached to this sequence, `i->_M_version == _M_version`.

#### 4.1037.2.3 `_M_get_mutex()`

```
__gnu_cxx::__mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex () throw () [protected],
[inherited]
```

For use in `_Safe_sequence`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

#### 4.1037.2.4 `_M_invalidate_all()`

```
void __gnu_debug::_Safe_sequence_base::_M_invalidate_all () const [inline], [protected], [inherited]
```

Invalidates all iterators.

Definition at line 256 of file `safe_base.h`.

References `__gnu_debug::_Safe_sequence_base::_M_version`.

#### 4.1037.2.5 `_M_invalidate_if()`

```
void __gnu_debug::_Safe_unordered_container< unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc
> >::_M_invalidate_if (
 _Predicate __pred) [protected], [inherited]
```

Invalidates all iterators `x` that reference this container, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

Definition at line 38 of file `safe_unordered_container.tcc`.

## 4.1037.2.6 \_M\_invalidate\_local\_if()

```
void __gnu_debug::_Safe_unordered_container< unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc
> >::_M_invalidate_local_if (
 _Predicate __pred) [protected], [inherited]
```

Invalidates all local iterators  $x$  that reference this container, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal local iterators nested in the safe ones.

Definition at line 70 of file `safe_unordered_container.tcc`.

## 4.1037.2.7 \_M\_revalidate\_singular()

```
void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular () [protected], [inherited]
```

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

## 4.1037.2.8 \_M\_swap() [1/2]

```
void __gnu_debug::_Safe_unordered_container_base::_M_swap (
 _Safe_unordered_container_base & __x) [protected], [noexcept], [inherited]
```

Swap this container with the given container. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

## 4.1037.2.9 \_M\_swap() [2/2]

```
void __gnu_debug::_Safe_sequence_base::_M_swap (
 _Safe_sequence_base & __x) [protected], [noexcept], [inherited]
```

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

## 4.1037.3 Member Data Documentation

## 4.1037.3.1 \_M\_const\_iterators

```
_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_iterators [inherited]
```

The list of constant iterators that reference this container.

Definition at line 197 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

#### 4.1037.3.2 `_M_const_local_iterators`

```
_Safe_iterator_base* __gnu_debug::_Safe_unordered_container_base::_M_const_local_iterators [inherited]
```

The list of constant local iterators that reference this container.

Definition at line 130 of file `safe_unordered_base.h`.

#### 4.1037.3.3 `_M_iterators`

```
_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators [inherited]
```

The list of mutable iterators that reference this container.

Definition at line 194 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

#### 4.1037.3.4 `_M_local_iterators`

```
_Safe_iterator_base* __gnu_debug::_Safe_unordered_container_base::_M_local_iterators [inherited]
```

The list of mutable local iterators that reference this container.

Definition at line 127 of file `safe_unordered_base.h`.

#### 4.1037.3.5 `_M_version`

```
unsigned int __gnu_debug::_Safe_sequence_base::_M_version [mutable], [inherited]
```

The container version number. This number may never be 0.

Definition at line 200 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence_base::_M_invalidate_all()`.

- `template<typename _Value1, typename _Hash1, typename _Pred1, typename _Alloc1 >  
bool operator==(const unordered_multiset< _Value1, _Hash1, _Pred1, _Alloc1 > &, const unordered_multiset< _Value1, _Hash1, _Pred1, _Alloc1 > &)`

#### 4.1038.1 Detailed Description

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc =
allocator<_Value>>
class std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >
```

A standard container composed of equivalent keys (possibly containing multiple of each key value) in which the elements' keys are the elements themselves.

**Template Parameters**

|                     |                                                                                   |
|---------------------|-----------------------------------------------------------------------------------|
| <code>_Value</code> | Type of key objects.                                                              |
| <code>_Hash</code>  | Hashing function object type, defaults to <code>hash&lt;_Value&gt;</code> .       |
| <code>_Pred</code>  | Predicate function object type, defaults to <code>equal_to&lt;_Value&gt;</code> . |
| <code>_Alloc</code> | Allocator type, defaults to <code>allocator&lt;_Key&gt;</code> .                  |

Meets the requirements of a `container`, and `unordered associative container`

Base is `_Hashtable`, dispatched at compile time via template alias `__umset_hashtable`.

Definition at line 70 of file `unordered_set.h`.

**4.1038.2 Member Typedef Documentation****4.1038.2.1 allocator\_type**

```

Iterator-related typedefs.

Definition at line 938 of file `unordered_set.h`.

#### 4.1038.2.15 value\_type

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::value_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::value_type
```

Public typedefs.

Definition at line 922 of file unordered\_set.h.

### 4.1038.3 Constructor & Destructor Documentation

#### 4.1038.3.1 unordered\_multiset() [1/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset () [default]
```

Default constructor.

#### 4.1038.3.2 unordered\_multiset() [2/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
 size_type __n,
 const hasher & __hf = hasher(),
 const key_equal & __eqf = key_equal(),
 const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Default constructor creates no elements.

##### Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eqf</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

Definition at line 959 of file unordered\_set.h.

## 4.1038.3.3 unordered\_multiset() [3/7]

```

template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator >
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
 _InputIterator __first,
 _InputIterator __last,
 size_type __n = 0,
 const hasher & __hf = hasher(),
 const key_equal & __eq1 = key_equal(),
 const allocator_type & __a = allocator_type()) [inline]

```

Builds an unordered\_multiset from a range.

## Parameters

|                      |                                    |
|----------------------|------------------------------------|
| <code>__first</code> | An input iterator.                 |
| <code>__last</code>  | An input iterator.                 |
| <code>__n</code>     | Minimal initial number of buckets. |
| <code>__hf</code>    | A hash functor.                    |
| <code>__eq1</code>   | A key equality functor.            |
| <code>__a</code>     | An allocator object.               |

Create an unordered\_multiset consisting of copies of the elements from [`__first`,`__last`). This is linear in N (where N is distance(`__first`,`__last`)).

Definition at line 980 of file unordered\_set.h.

## 4.1038.3.4 unordered\_multiset() [4/7]

```

template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
 const unordered_multiset< _Value, _Hash, _Pred, _Alloc > &) [default]

```

Copy constructor.

## 4.1038.3.5 unordered\_multiset() [5/7]

```

template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
 unordered_multiset< _Value, _Hash, _Pred, _Alloc > &&) [default]

```

Move constructor.

## 4.1038.3.6 unordered\_multiset() [6/7]

```

template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
 initializer_list< value_type > __l,
 size_type __n = 0,
 const hasher & __hf = hasher(),
 const key_equal & __eqf = key_equal(),
 const allocator_type & __a = allocator_type()) [inline]

```

Builds an unordered\_multiset from an initializer\_list.

## Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__l</code>   | An initializer_list.               |
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eqf</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

Create an unordered\_multiset consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

Definition at line 1005 of file unordered\_set.h.

## 4.1038.3.7 unordered\_multiset() [7/7]

```

template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
 const allocator_type & __a) [inline], [explicit]

```

Creates an unordered\_multiset with no elements.

## Parameters

|                  |                      |
|------------------|----------------------|
| <code>__a</code> | An allocator object. |
|------------------|----------------------|

Definition at line 1026 of file unordered\_set.h.

## 4.1038.4 Member Function Documentation

**4.1038.4.1** begin() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin () [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_multiset.

Definition at line 1133 of file unordered\_set.h.

**4.1038.4.2** begin() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_multiset.

Definition at line 1137 of file unordered\_set.h.

**4.1038.4.3** begin() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin (
 size_type __n) [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

**Returns**

A read-only local iterator.

Definition at line 1530 of file unordered\_set.h.

**4.1038.4.4** `begin()` [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin (
 size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

**Returns**

A read-only local iterator.

Definition at line 1534 of file `unordered_set.h`.

**4.1038.4.5** `bucket_count()`

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::bucket_count () const [inline],
[noexcept]
```

Returns the number of buckets of the `unordered_multiset`.

Definition at line 1496 of file `unordered_set.h`.

**4.1038.4.6** `cbegin()` [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_multiset`.

Definition at line 1160 of file `unordered_set.h`.

**4.1038.4.7** `cbegin()` [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cbegin (
 size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

## Parameters

|       |                   |
|-------|-------------------|
| $\_n$ | The bucket index. |
|-------|-------------------|

## Returns

A read-only local iterator.

Definition at line 1538 of file unordered\_set.h.

## 4.1038.4.8 cend() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_multiset.

Definition at line 1168 of file unordered\_set.h.

## 4.1038.4.9 cend() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend (
 size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

## Parameters

|       |                   |
|-------|-------------------|
| $\_n$ | The bucket index. |
|-------|-------------------|

## Returns

A read-only local iterator.

Definition at line 1558 of file unordered\_set.h.

#### 4.1038.4.10 clear()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in an unordered\_multiset.

Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1369 of file unordered\_set.h.

#### 4.1038.4.11 count()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::count (
 const key_type & __x) const [inline]
```

Finds the number of elements.

##### Parameters

|                                                                                                      |                     |
|------------------------------------------------------------------------------------------------------|---------------------|
|  <code>__x</code> | Element to located. |
|------------------------------------------------------------------------------------------------------|---------------------|

##### Returns

Number of elements with specified key.

Definition at line 1462 of file unordered\_set.h.

#### 4.1038.4.12 emplace()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::emplace (
 _Args &&... __args) [inline]
```

Builds and insert an element into the unordered\_multiset.

##### Parameters

|                     |                                        |
|---------------------|----------------------------------------|
| <code>__args</code> | Arguments used to generate an element. |
|---------------------|----------------------------------------|

**Returns**

An iterator that points to the inserted element.

Insertion requires amortized constant time.

Definition at line 1182 of file unordered\_set.h.

**4.1038.4.13   emplace\_hint()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::emplace_hint (
 const_iterator __pos,
 _Args &&... __args) [inline]
```

Inserts an element into the unordered\_multiset.

**Parameters**

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__args</code> | Arguments used to generate the element to be inserted.                        |

**Returns**

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires amortized constant time.

Definition at line 1204 of file unordered\_set.h.

**4.1038.4.14   empty()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
bool std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::empty () const [inline], [noexcept]
```

Returns true if the unordered\_multiset is empty.

Definition at line 1112 of file unordered\_set.h.

**4.1038.4.15** `end()` [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end () [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_multiset`.

Definition at line 1147 of file `unordered_set.h`.

**4.1038.4.16** `end()` [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_multiset`.

Definition at line 1151 of file `unordered_set.h`.

**4.1038.4.17** `end()` [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end (
 size_type __n) [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

**Returns**

A read-only local iterator.

Definition at line 1550 of file `unordered_set.h`.

**4.1038.4.18** end() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end (
 size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

|                 |                   |
|-----------------|-------------------|
| <code>_↵</code> | The bucket index. |
| <code>_n</code> |                   |

**Returns**

A read-only local iterator.

Definition at line 1554 of file unordered\_set.h.

**4.1038.4.19** equal\_range() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair<iterator, iterator> std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::equal_↵
range (
 const key_type & __x) [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_x</code> |                    |

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1484 of file unordered\_set.h.

**4.1038.4.20** equal\_range() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
std::pair<const_iterator, const_iterator> std::unordered_multiset< _Value, _Hash, _Pred, _Alloc
>::equal_range (
 const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

#### Parameters

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

#### Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1488 of file unordered\_set.h.

#### 4.1038.4.21 erase() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
 const_iterator __position) [inline]
```

Erases an element from an unordered\_multiset.

#### Parameters

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

#### Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an unordered\_multiset.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1315 of file unordered\_set.h.

## 4.1038.4.22 erase() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
 iterator __position) [inline]
```

Erases an element from an unordered\_multiset.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1320 of file `unordered_set.h`.

**4.1038.4.23 erase()** [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
 const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

|                  |                              |
|------------------|------------------------------|
| <code>__x</code> | Key of element to be erased. |
|------------------|------------------------------|

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1338 of file `unordered_set.h`.

## 4.1038.4.24 erase() [ 4/4 ]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
 const_iterator __first,
 const_iterator __last) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_multiset`.

**Parameters**

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

**Returns**

The iterator `__last`.

This function erases a sequence of elements from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1358 of file `unordered_set.h`.

**4.1038.4.25 find()** [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (
 const key_type & __x) [inline]
```

Tries to locate an element in an `unordered_multiset`.

**Parameters**

|                  |                        |
|------------------|------------------------|
| <code>__x</code> | Element to be located. |
|------------------|------------------------|

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 1448 of file `unordered_set.h`.

**4.1038.4.26 find()** [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (
 const key_type & __x) const [inline]
```

Tries to locate an element in an `unordered_multiset`.

## Parameters

|                 |                        |
|-----------------|------------------------|
| <code>_↵</code> | Element to be located. |
| <code>_X</code> |                        |

## Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 1452 of file `unordered_set.h`.

4.1038.4.27 `get_allocator()`

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
allocator_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::get_allocator () const
[inline], [noexcept]
```

Returns the allocator object used by the `unordered_multiset`.

Definition at line 1105 of file `unordered_set.h`.

4.1038.4.28 `hash_function()`

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
hasher std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::hash_function () const [inline]
```

Returns the hash functor object with which the `unordered_multiset` was constructed.

Definition at line 1424 of file `unordered_set.h`.

4.1038.4.29 `insert()` [1/6]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
 const value_type & __x) [inline]
```

Inserts an element into the `unordered_multiset`.

**Parameters**

|                                                                                   |                         |
|-----------------------------------------------------------------------------------|-------------------------|
|  | Element to be inserted. |
|  |                         |

**Returns**

An iterator that points to the inserted element.

Insertion requires amortized constant time.

Definition at line 1216 of file unordered\_set.h.

**4.1038.4.30 insert()** [2/6]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
 value_type && __x) [inline]
```

Inserts an element into the unordered\_multiset.

**Parameters**

|                                                                                     |                         |
|-------------------------------------------------------------------------------------|-------------------------|
|  | Element to be inserted. |
|  |                         |

**Returns**

An iterator that points to the inserted element.

Insertion requires amortized constant time.

Definition at line 1220 of file unordered\_set.h.

References std::move().

**4.1038.4.31 insert()** [3/6]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
 const_iterator __hint,
 const value_type & __x) [inline]
```

Inserts an element into the unordered\_multiset.

## Parameters

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>    | Element to be inserted.                                                       |

## Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires amortized constant.

Definition at line 1242 of file unordered\_set.h.

## 4.1038.4.32 insert() [4/6]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
 const_iterator __hint,
 value_type && __x) [inline]
```

Inserts an element into the unordered\_multiset.

## Parameters

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>    | Element to be inserted.                                                       |

## Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires amortized constant.

Definition at line 1246 of file unordered\_set.h.

References std::move().

**4.1038.4.33 insert()** [5/6]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator >
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
 _InputIterator __first,
 _InputIterator __last) [inline]
```

A template function that inserts a range of elements.

**Parameters**

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

Definition at line 1260 of file unordered\_set.h.

**4.1038.4.34 insert()** [6/6]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
 initializer_list< value_type > __l) [inline]
```

Inserts a list of elements into the unordered\_multiset.

**Parameters**

|                          |                                                                 |
|--------------------------|-----------------------------------------------------------------|
| <pre>↔ __↔ ↔ __↔ /</pre> | A std::initializer_list<value_type> of elements to be inserted. |
|--------------------------|-----------------------------------------------------------------|

Complexity similar to that of the range constructor.

Definition at line 1271 of file unordered\_set.h.

**4.1038.4.35 key\_eq()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
key_equal std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::key_eq () const [inline]
```

Returns the key comparison object with which the unordered\_multiset was constructed.

Definition at line 1430 of file unordered\_set.h.

#### 4.1038.4.36 load\_factor()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::load_factor () const [inline],
[noexcept]
```

Returns the average number of elements per bucket.

Definition at line 1566 of file unordered\_set.h.

#### 4.1038.4.37 max\_bucket\_count()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_bucket_count () const
[inline], [noexcept]
```

Returns the maximum number of buckets of the unordered\_multiset.

Definition at line 1501 of file unordered\_set.h.

#### 4.1038.4.38 max\_load\_factor() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_load_factor () const [inline],
[noexcept]
```

Returns a positive number that the unordered\_multiset tries to keep the load factor less than or equal to.

Definition at line 1572 of file unordered\_set.h.

#### 4.1038.4.39 max\_load\_factor() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_load_factor (
 float __z) [inline]
```

Change the unordered\_multiset maximum load factor.

**Parameters**

|                                                                                                   |                              |
|---------------------------------------------------------------------------------------------------|------------------------------|
| <a href="#"></a> | The new maximum load factor. |
| <a href="#">_Z</a>                                                                                |                              |

Definition at line 1580 of file unordered\_set.h.

**4.1038.4.40 max\_size()**

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_size () const [inline],
[noexcept]
```

Returns the maximum size of the unordered\_multiset.

Definition at line 1122 of file unordered\_set.h.

**4.1038.4.41 operator=()** [1/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_multiset& std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
 const unordered_multiset< _Value, _Hash, _Pred, _Alloc > &) [default]
```

Copy assignment operator.

**4.1038.4.42 operator=()** [2/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_multiset& std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
 unordered_multiset< _Value, _Hash, _Pred, _Alloc > &&) [default]
```

Move assignment operator.

**4.1038.4.43 operator=()** [3/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_multiset& std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
 initializer_list< value_type > __l) [inline]
```

Unordered\_multiset list assignment operator.

## Parameters

|                                                                                   |                      |
|-----------------------------------------------------------------------------------|----------------------|
|  | An initializer_list. |
|  |                      |
|  |                      |
|  |                      |
|  |                      |

This function fills an unordered\_multiset with copies of the elements in the initializer list \_\_l.

Note that the assignment completely changes the unordered\_multiset and that the resulting unordered\_multiset's size is the same as the number of elements assigned.

Definition at line 1097 of file unordered\_set.h.

## 4.1038.4.44 rehash()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::rehash (
 size_type __n) [inline]
```

May rehash the unordered\_multiset.

## Parameters

|                                                                                                                                                                            |                            |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <br> | The new number of buckets. |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|

Rehash will occur only if the new number of buckets respect the unordered\_multiset maximum load factor.

Definition at line 1591 of file unordered\_set.h.

## 4.1038.4.45 reserve()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::reserve (
 size_type __n) [inline]
```

Prepare the unordered\_multiset for a specified number of elements.

## Parameters

|                                                                                                                                                                            |                              |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <br> | Number of elements required. |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|

Same as `rehash(ceil(n / max_load_factor()))`.

Definition at line 1602 of file `unordered_set.h`.

#### 4.1038.4.46 `size()`

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::size () const [inline],
[noexcept]
```

Returns the size of the `unordered_multiset`.

Definition at line 1117 of file `unordered_set.h`.

#### 4.1038.4.47 `swap()`

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::swap (
 unordered_multiset< _Value, _Hash, _Pred, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another `unordered_multiset`.

##### Parameters

|                  |                                                                             |
|------------------|-----------------------------------------------------------------------------|
| <code>__x</code> | An <code>unordered_multiset</code> of the same element and allocator types. |
|------------------|-----------------------------------------------------------------------------|

This exchanges the elements between two sets in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

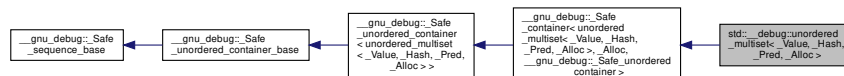

Definition at line 1382 of file `unordered_set.h`.

The documentation for this class was generated from the following file:

- [unordered\\_set.h](#)

#### 4.1039 `std::__debug::unordered_multiset< _Value, _Hash, _Pred, _Alloc >` Class Template Reference

### 4.1039.1 Detailed Description

```
template<typename _Value, typename _Hash = std::hash<_Value>, typename _Pred = std::equal_to<_Value>, typename _Alloc =
std::allocator<_Value>>
class std::__debug::unordered_multiset< _Value, _Hash, _Pred, _Alloc >
```

Class `std::unordered_multiset` with safety/checking/debug instrumentation.

Definition at line 42 of file `debug/unordered_set`.

### 4.1039.2 Member Function Documentation

#### 4.1039.2.1 `_M_detach_all()`

```
void __gnu_debug::_Safe_unordered_container_base::_M_detach_all () [protected], [inherited]
```

Detach all iterators, leaving them singular.

#### 4.1039.2.2 `_M_detach_singular()`

```
void __gnu_debug::_Safe_sequence_base::_M_detach_singular () [protected], [inherited]
```

Detach all singular iterators.

## Postcondition

for all iterators `i` attached to this sequence, `i->_M_version == _M_version`.

#### 4.1039.2.3 `_M_get_mutex()`

```
__gnu_cxx::__mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex () throw () [protected],
[inherited]
```

For use in `_Safe_sequence`.

Referenced by `__gnu_debug::_Safe_sequence< map<_Key, _Tp, _Compare, _Allocator> >::_M_transfer_from_if()`.

#### 4.1039.2.4 `_M_invalidate_all()`

```
void __gnu_debug::_Safe_sequence_base::_M_invalidate_all () const [inline], [protected], [inherited]
```

Invalidates all iterators.

Definition at line 256 of file `safe_base.h`.

References `__gnu_debug::_Safe_sequence_base::_M_version`.

#### 4.1039.2.5 `_M_invalidate_if()`

```
void __gnu_debug::_Safe_unordered_container< unordered_multiset< _Value, _Hash, _Pred, _Alloc >
>::_M_invalidate_if (
 _Predicate __pred) [protected], [inherited]
```

Invalidates all iterators `x` that reference this container, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

Definition at line 38 of file `safe_unordered_container.tcc`.

#### 4.1039.2.6 `_M_invalidate_local_if()`

```
void __gnu_debug::_Safe_unordered_container< unordered_multiset< _Value, _Hash, _Pred, _Alloc >
>::_M_invalidate_local_if (
 _Predicate __pred) [protected], [inherited]
```

Invalidates all local iterators `x` that reference this container, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal local iterators nested in the safe ones.

Definition at line 70 of file `safe_unordered_container.tcc`.

#### 4.1039.2.7 `_M_revalidate_singular()`

```
void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular () [protected], [inherited]
```

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

#### 4.1039.2.8 `_M_swap()` [1/2]

```
void __gnu_debug::_Safe_unordered_container_base::_M_swap (
 _Safe_unordered_container_base & __x) [protected], [noexcept], [inherited]
```

Swap this container with the given container. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

#### 4.1039.2.9 \_M\_swap() [2/2]

```
void __gnu_debug::_Safe_sequence_base::_M_swap (
 _Safe_sequence_base & __x) [protected], [noexcept], [inherited]
```

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

### 4.1039.3 Member Data Documentation

#### 4.1039.3.1 \_M\_const\_iterators

```
_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_iterators [inherited]
```

The list of constant iterators that reference this container.

Definition at line 197 of file safe\_base.h.

Referenced by \_\_gnu\_debug::\_Safe\_sequence< map< \_Key, \_Tp, \_Compare, \_Allocator > >::\_M\_transfer\_from\_if().

#### 4.1039.3.2 \_M\_const\_local\_iterators

```
_Safe_iterator_base* __gnu_debug::_Safe_unordered_container_base::_M_const_local_iterators [inherited]
```

The list of constant local iterators that reference this container.

Definition at line 130 of file safe\_unordered\_base.h.

#### 4.1039.3.3 \_M\_iterators

```
_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators [inherited]
```

The list of mutable iterators that reference this container.

Definition at line 194 of file safe\_base.h.

Referenced by \_\_gnu\_debug::\_Safe\_sequence< map< \_Key, \_Tp, \_Compare, \_Allocator > >::\_M\_transfer\_from\_if().

#### 4.1039.3.4 `_M_local_iterators`

`_Safe_iterator_base* __gnu_debug::_Safe_unordered_container_base::_M_local_iterators` [inherited]

The list of mutable local iterators that reference this container.

Definition at line 127 of file `safe_unordered_base.h`.

#### 4.1039.3.5 `_M_version`

`unsigned int __gnu_debug::_Safe_sequence_base::_M_version` [mutable], [inherited]

The container version number. This number may never be 0.

Definition at line 200 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence_base::_M_invalidate_all()`.

The documentation for this class was generated from the following file:

## Friends

- template<typename \_Value1, typename \_Hash1, typename \_Pred1, typename \_Alloc1 >  
bool **operator==** (const unordered\_set< \_Value1, \_Hash1, \_Pred1, \_Alloc1 > &, const unordered\_set< \_Value1, \_Hash1, \_Pred1, \_Alloc1 > &)

## 4.1040.1 Detailed Description

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc =
allocator<_Value>>
```

```
class std::unordered_set< _Value, _Hash, _Pred, _Alloc >
```

A standard container composed of unique keys (containing at most one of each key value) in which the elements' keys are the elements themselves.

## Template Parameters

|               |                                                               |
|---------------|---------------------------------------------------------------|
| <i>_Value</i> | Type of key objects.                                          |
| <i>_Hash</i>  | Hashing function object type, defaults to hash<_Value>.       |
| <i>_Pred</i>  | Predicate function object type, defaults to equal_to<_Value>. |
| <i>_Alloc</i> | Allocator type, defaults to allocator<_Key>.                  |

Meets the requirements of a [container](#), and [unordered associative container](#)

Base is \_Hashtable, dispatched at compile time via template alias \_\_uset\_hashtable.

Definition at line 97 of file unordered\_set.h.

## 4.1040.2 Member Typedef Documentation

## 4.1040.2.1 allocator\_type

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::allocator_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::allocator_type
```

Public typedefs.

Definition at line 110 of file unordered\_set.h.

#### 4.1040.2.2 `const_iterator`

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::const_iterator
```

Iterator-related typedefs.

Definition at line 120 of file `unordered_set.h`.

#### 4.1040.2.3 `const_local_iterator`

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >↵
::const_local_iterator
```

Iterator-related typedefs.

Definition at line 122 of file `unordered_set.h`.

#### 4.1040.2.4 `const_pointer`

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::const_pointer std::unordered_set< _Value, _Hash, _Pred, _Alloc >::const_pointer
```

Iterator-related typedefs.

Definition at line 116 of file `unordered_set.h`.

#### 4.1040.2.5 `const_reference`

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::const_reference std::unordered_set< _Value, _Hash, _Pred, _Alloc >::const_reference
```

Iterator-related typedefs.

Definition at line 118 of file `unordered_set.h`.

#### 4.1040.2.6 `difference_type`

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::difference_type std::unordered_set<_Value, _Hash, _Pred, _Alloc>::difference_type
```

Iterator-related typedefs.

Definition at line 124 of file `unordered_set.h`.

#### 4.1040.2.7 `hasher`

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::hasher std::unordered_set<_Value, _Hash, _Pred, _Alloc>::hasher
```

Public typedefs.

Definition at line 108 of file `unordered_set.h`.

#### 4.1040.2.8 `iterator`

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::iterator
```

Iterator-related typedefs.

Definition at line 119 of file `unordered_set.h`.

#### 4.1040.2.9 `key_equal`

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::key_equal std::unordered_set<_Value, _Hash, _Pred, _Alloc>::key_equal
```

Public typedefs.

Definition at line 109 of file `unordered_set.h`.

#### 4.1040.2.10 key\_type

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::key_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::key_type
```

Public typedefs.

Definition at line 106 of file unordered\_set.h.

#### 4.1040.2.11 local\_iterator

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::local_iterator
```

Iterator-related typedefs.

Definition at line 121 of file unordered\_set.h.

#### 4.1040.2.12 pointer

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::pointer std::unordered_set< _Value, _Hash, _Pred, _Alloc >::pointer
```

Iterator-related typedefs.

Definition at line 115 of file unordered\_set.h.

#### 4.1040.2.13 reference

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::reference std::unordered_set< _Value, _Hash, _Pred, _Alloc >::reference
```

Iterator-related typedefs.

Definition at line 117 of file unordered\_set.h.

## 4.1040.2.14 size\_type

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::size_type
```

Iterator-related typedefs.

Definition at line 123 of file unordered\_set.h.

## 4.1040.2.15 value\_type

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::value_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::value_type
```

Public typedefs.

Definition at line 107 of file unordered\_set.h.

## 4.1040.3 Constructor &amp; Destructor Documentation

## 4.1040.3.1 unordered\_set() [1/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set () [default]
```

Default constructor.

## 4.1040.3.2 unordered\_set() [2/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
 size_type __n,
 const hasher & __hf = hasher(),
 const key_equal & __eq1 = key_equal(),
 const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Default constructor creates no elements.

**Parameters**

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eqf</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

Definition at line 145 of file `unordered_set.h`.

**4.1040.3.3 `unordered_set()`** [3/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator >
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
 _InputIterator __first,
 _InputIterator __last,
 size_type __n = 0,
 const hasher & __hf = hasher(),
 const key_equal & __eqf = key_equal(),
 const allocator_type & __a = allocator_type()) [inline]
```

Builds an `unordered_set` from a range.

**Parameters**

|                      |                                    |
|----------------------|------------------------------------|
| <code>__first</code> | An input iterator.                 |
| <code>__last</code>  | An input iterator.                 |
| <code>__n</code>     | Minimal initial number of buckets. |
| <code>__hf</code>    | A hash functor.                    |
| <code>__eqf</code>   | A key equality functor.            |
| <code>__a</code>     | An allocator object.               |

Create an `unordered_set` consisting of copies of the elements from `[__first,__last)`. This is linear in `N` (where `N` is `distance(__first,__last)`).

Definition at line 166 of file `unordered_set.h`.

**4.1040.3.4 `unordered_set()`** [4/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
 const unordered_set< _Value, _Hash, _Pred, _Alloc > &) [default]
```

Copy constructor.

## 4.1040.3.5 unordered\_set() [5/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
 unordered_set< _Value, _Hash, _Pred, _Alloc > &&) [default]
```

Move constructor.

## 4.1040.3.6 unordered\_set() [6/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
 const allocator_type & __a) [inline], [explicit]
```

Creates an unordered\_set with no elements.

## Parameters

|                  |                      |
|------------------|----------------------|
| $\leftarrow$     | An allocator object. |
| <code>__a</code> |                      |

Definition at line 185 of file unordered\_set.h.

## 4.1040.3.7 unordered\_set() [7/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
 initializer_list< value_type > __l,
 size_type __n = 0,
 const hasher & __hf = hasher(),
 const key_equal & __eq1 = key_equal(),
 const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_set from an initializer\_list.

## Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__l</code>   | An initializer_list.               |
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eq1</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

Create an `unordered_set` consisting of copies of the elements in the list. This is linear in  $N$  (where  $N$  is `l.size()`).

Definition at line 220 of file `unordered_set.h`.

#### 4.1040.4 Member Function Documentation

##### 4.1040.4.1 `begin()` [1/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin () [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_set`.

Definition at line 319 of file `unordered_set.h`.

##### 4.1040.4.2 `begin()` [2/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_set`.

Definition at line 323 of file `unordered_set.h`.

##### 4.1040.4.3 `begin()` [3/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin (
 size_type __n) [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

#### Parameters

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

**Returns**

A read-only local iterator.

Definition at line 737 of file unordered\_set.h.

**4.1040.4.4 begin()** [4/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin (
 size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

|                   |                   |
|-------------------|-------------------|
| $\leftrightarrow$ | The bucket index. |
| $n$               |                   |

**Returns**

A read-only local iterator.

Definition at line 741 of file unordered\_set.h.

**4.1040.4.5 bucket\_count()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::bucket_count () const [inline],
[noexcept]
```

Returns the number of buckets of the unordered\_set.

Definition at line 703 of file unordered\_set.h.

**4.1040.4.6 cbegin()** [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_set.

Definition at line 346 of file unordered\_set.h.

**4.1040.4.7   cbegin()** [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cbegin (
 size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

|                                  |                   |
|----------------------------------|-------------------|
| $\leftarrow$<br><code>__n</code> | The bucket index. |
|----------------------------------|-------------------|

**Returns**

A read-only local iterator.

Definition at line 745 of file `unordered_set.h`.

**4.1040.4.8   cend()** [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cend () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_set`.

Definition at line 354 of file `unordered_set.h`.

**4.1040.4.9   cend()** [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cend (
 size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

|                                  |                   |
|----------------------------------|-------------------|
| $\leftarrow$<br><code>__n</code> | The bucket index. |
|----------------------------------|-------------------|

**Returns**

A read-only local iterator.

Definition at line 765 of file unordered\_set.h.

**4.1040.4.10 clear()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in an unordered\_set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 572 of file unordered\_set.h.

**4.1040.4.11 count()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::count (
 const key_type & __x) const [inline]
```

Finds the number of elements.

**Parameters**

|                  |                     |
|------------------|---------------------|
| <code>__x</code> | Element to located. |
|------------------|---------------------|

**Returns**

Number of elements with specified key.

This function only makes sense for unordered\_multisets; for unordered\_set the result will either be 0 (not present) or 1 (present).

Definition at line 667 of file unordered\_set.h.

#### 4.1040.4.12 `emplace()`

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
std::pair<iterator, bool> std::unordered_set<_Value, _Hash, _Pred, _Alloc >::emplace (
 _Args &&... __args) [inline]
```

Attempts to build and insert an element into the `unordered_set`.

##### Parameters

|                     |                                        |
|---------------------|----------------------------------------|
| <code>__args</code> | Arguments used to generate an element. |
|---------------------|----------------------------------------|

##### Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a `bool` that is true if the element was actually inserted.

This function attempts to build and insert an element into the `unordered_set`. An `unordered_set` relies on unique keys and thus an element is only inserted if it is not already present in the `unordered_set`.

Insertion requires amortized constant time.

Definition at line 376 of file `unordered_set.h`.

#### 4.1040.4.13 `emplace_hint()`

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc >::emplace_hint (
 const_iterator __pos,
 _Args &&... __args) [inline]
```

Attempts to insert an element into the `unordered_set`.

##### Parameters

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__args</code> | Arguments used to generate the element to be inserted.                        |

##### Returns

An iterator that points to the element with key equivalent to the one generated from `__args` (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert_hints)

Insertion requires amortized constant time.

Definition at line 402 of file `unordered_set.h`.

#### 4.1040.4.14 `empty()`

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
bool std::unordered_set< _Value, _Hash, _Pred, _Alloc >::empty () const [inline], [noexcept]
```

Returns true if the `unordered_set` is empty.

Definition at line 298 of file `unordered_set.h`.

#### 4.1040.4.15 `end()` [1/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end () [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_set`.

Definition at line 333 of file `unordered_set.h`.

#### 4.1040.4.16 `end()` [2/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_set`.

Definition at line 337 of file `unordered_set.h`.

#### 4.1040.4.17 `end()` [3/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end (
 size_type __n) [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

|       |                   |
|-------|-------------------|
| $\_n$ | The bucket index. |
|-------|-------------------|

**Returns**

A read-only local iterator.

Definition at line 757 of file unordered\_set.h.

**4.1040.4.18 end()** [4/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc >::end (
 size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

|       |                   |
|-------|-------------------|
| $\_n$ | The bucket index. |
|-------|-------------------|

**Returns**

A read-only local iterator.

Definition at line 761 of file unordered\_set.h.

**4.1040.4.19 equal\_range()** [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair<iterator, iterator> std::unordered_set<_Value, _Hash, _Pred, _Alloc >::equal_range (
 const key_type & __x) [inline]
```

Finds a subsequence matching given key.

**Parameters**

|       |                    |
|-------|--------------------|
| $\_x$ | Key to be located. |
|-------|--------------------|

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

Definition at line 691 of file unordered\_set.h.

**4.1040.4.20 equal\_range()** [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair<const_iterator, const_iterator> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::
equal_range (
 const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

Definition at line 695 of file unordered\_set.h.

**4.1040.4.21 erase()** [1/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
 const_iterator __position) [inline]
```

Erases an element from an unordered\_set.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 522 of file `unordered_set.h`.

**4.1040.4.22 erase()** [2/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
 iterator __position) [inline]
```

Erases an element from an `unordered_set`.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 527 of file `unordered_set.h`.

**4.1040.4.23 erase()** [3/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
 const key_type & __x) [inline]
```

Erases elements according to the provided key.

## Parameters

|                    |                              |
|--------------------|------------------------------|
| <code>__key</code> | Key of element to be erased. |
| <code>__x</code>   |                              |

## Returns

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_set`. For an `unordered_set` the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 544 of file `unordered_set.h`.

4.1040.4.24 `erase()` [4/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
 const_iterator __first,
 const_iterator __last) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_set`.

## Parameters

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

## Returns

The iterator `__last`.

This function erases a sequence of elements from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 562 of file `unordered_set.h`.

**4.1040.4.25** `find()` [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc >::find (
 const key_type & __x) [inline]
```

Tries to locate an element in an `unordered_set`.

## Parameters

|                 |                        |
|-----------------|------------------------|
| <code>_↔</code> | Element to be located. |
| <code>_X</code> |                        |

## Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 649 of file `unordered_set.h`.

## 4.1040.4.26 find() [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::find (
 const key_type & __x) const [inline]
```

Tries to locate an element in an `unordered_set`.

## Parameters

|                 |                        |
|-----------------|------------------------|
| <code>_↔</code> | Element to be located. |
| <code>_X</code> |                        |

## Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 653 of file `unordered_set.h`.

## 4.1040.4.27 get\_allocator()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
allocator_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::get_allocator () const [inline],
[noexcept]
```

Returns the allocator object used by the `unordered_set`.

Definition at line 291 of file `unordered_set.h`.

**4.1040.4.28** `hash_function()`

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
hasher std::unordered_set< _Value, _Hash, _Pred, _Alloc >::hash_function () const [inline]
```

Returns the hash functor object with which the `unordered_set` was constructed.

Definition at line 625 of file `unordered_set.h`.

**4.1040.4.29** `insert()` [1/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair<iterator, bool> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
 const value_type & __x) [inline]
```

Attempts to insert an element into the `unordered_set`.

**Parameters**

|                  |                         |
|------------------|-------------------------|
| <code>__x</code> | Element to be inserted. |
|------------------|-------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a `bool` that is true if the element was actually inserted.

This function attempts to insert an element into the `unordered_set`. An `unordered_set` relies on unique keys and thus an element is only inserted if it is not already present in the `unordered_set`.

Insertion requires amortized constant time.

Definition at line 420 of file `unordered_set.h`.

**4.1040.4.30** `insert()` [2/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair<iterator, bool> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
 value_type && __x) [inline]
```

Attempts to insert an element into the `unordered_set`.

## Parameters

|                  |                         |
|------------------|-------------------------|
| <code>__x</code> | Element to be inserted. |
|------------------|-------------------------|

## Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the unordered\_set. An unordered\_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered\_set.

Insertion requires amortized constant time.

Definition at line 424 of file unordered\_set.h.

References std::move().

## 4.1040.4.31 insert() [3/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
 const_iterator __hint,
 const value_type & __x) [inline]
```

Attempts to insert an element into the unordered\_set.

## Parameters

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>    | Element to be inserted.                                                       |

## Returns

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert_hints)

Insertion requires amortized constant.

Definition at line 449 of file unordered\_set.h.

**4.1040.4.32** `insert()` [4/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
 const_iterator __hint,
 value_type && __x) [inline]
```

Attempts to insert an element into the `unordered_set`.

**Parameters**

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>    | Element to be inserted.                                                       |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↔html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↔html#containers.associative.insert_hints)

Insertion requires amortized constant.

Definition at line 453 of file `unordered_set.h`.

References `std::move()`.

**4.1040.4.33** `insert()` [5/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator >
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
 _InputIterator __first,
 _InputIterator __last) [inline]
```

A template function that attempts to insert a range of elements.

**Parameters**

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

Definition at line 468 of file unordered\_set.h.

#### 4.1040.4.34 insert() [6/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
 initializer_list< value_type > __l) [inline]
```

Attempts to insert a list of elements into the unordered\_set.

##### Parameters

|   |                                                                 |
|---|-----------------------------------------------------------------|
| ↔ | A std::initializer_list<value_type> of elements to be inserted. |
| ↔ |                                                                 |
| ↔ |                                                                 |
| ↔ |                                                                 |
| / |                                                                 |

Complexity similar to that of the range constructor.

Definition at line 479 of file unordered\_set.h.

#### 4.1040.4.35 key\_eq()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
key_equal std::unordered_set< _Value, _Hash, _Pred, _Alloc >::key_eq () const [inline]
```

Returns the key comparison object with which the unordered\_set was constructed.

Definition at line 631 of file unordered\_set.h.

#### 4.1040.4.36 load\_factor()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_set< _Value, _Hash, _Pred, _Alloc >::load_factor () const [inline], [noexcept]
```

Returns the average number of elements per bucket.

Definition at line 773 of file unordered\_set.h.

**4.1040.4.37 max\_bucket\_count()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_bucket_count () const [inline],
[noexcept]
```

Returns the maximum number of buckets of the unordered\_set.

Definition at line 708 of file unordered\_set.h.

**4.1040.4.38 max\_load\_factor()** [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_load_factor () const [inline],
[noexcept]
```

Returns a positive number that the unordered\_set tries to keep the load factor less than or equal to.

Definition at line 779 of file unordered\_set.h.

**4.1040.4.39 max\_load\_factor()** [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_load_factor (
 float __z) [inline]
```

Change the unordered\_set maximum load factor.

**Parameters**

|           |                              |
|-----------|------------------------------|
| <b>_z</b> | The new maximum load factor. |
|-----------|------------------------------|

Definition at line 787 of file unordered\_set.h.

**4.1040.4.40 max\_size()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_size () const [inline], [noexcept]
```

Returns the maximum size of the unordered\_set.

Definition at line 308 of file unordered\_set.h.

#### 4.1040.4.41 operator=() [1/3]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_set& std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
 const unordered_set< _Value, _Hash, _Pred, _Alloc > &) [default]
```

Copy assignment operator.

#### 4.1040.4.42 operator=() [2/3]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_set& std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
 unordered_set< _Value, _Hash, _Pred, _Alloc > &&) [default]
```

Move assignment operator.

#### 4.1040.4.43 operator=() [3/3]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_set& std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
 initializer_list< value_type > __l) [inline]
```

Unordered\_set list assignment operator.

##### Parameters

|   |                      |
|---|----------------------|
| ↩ | An initializer_list. |
| ↩ |                      |
| ↩ |                      |
| ↩ |                      |
| / |                      |

This function fills an unordered\_set with copies of the elements in the initializer list \_\_l.

Note that the assignment completely changes the unordered\_set and that the resulting unordered\_set's size is the same as the number of elements assigned.

Definition at line 283 of file unordered\_set.h.

#### 4.1040.4.44 rehash()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::rehash (
 size_type __n) [inline]
```

May rehash the unordered\_set.

##### Parameters

|                  |                            |
|------------------|----------------------------|
| <code>__n</code> | The new number of buckets. |
|------------------|----------------------------|

Rehash will occur only if the new number of buckets respect the unordered\_set maximum load factor.

Definition at line 798 of file unordered\_set.h.

#### 4.1040.4.45 reserve()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::reserve (
 size_type __n) [inline]
```

Prepare the unordered\_set for a specified number of elements.

##### Parameters

|                  |                              |
|------------------|------------------------------|
| <code>__n</code> | Number of elements required. |
|------------------|------------------------------|

Same as rehash(ceil(n / max\_load\_factor())).

Definition at line 809 of file unordered\_set.h.

#### 4.1040.4.46 size()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the unordered\_set.

Definition at line 303 of file unordered\_set.h.

#### 4.1040.4.47 swap()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::swap (
 unordered_set< _Value, _Hash, _Pred, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another unordered\_set.

#### Parameters

|                  |                                                           |
|------------------|-----------------------------------------------------------|
| <code>__x</code> | An unordered_set of the same element and allocator types. |
|------------------|-----------------------------------------------------------|

This exchanges the elements between two sets in constant time. Note that the global std::swap() function is specialized such that std::swap(s1,s2) will feed to this function.

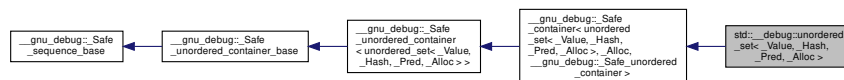

Definition at line 585 of file unordered\_set.h.

#### 4.1041.1 Detailed Description

```
template<typename _Value, typename _Hash = std::hash<_Value>, typename _Pred = std::equal_to<_Value>, typename _Alloc =
std::allocator<_Value>>>
class std::__debug::unordered_set<_Value, _Hash, _Pred, _Alloc >
```

Class std::unordered\_set with safety/checking/debug instrumentation.

Definition at line 40 of file debug/unordered\_set.

#### 4.1041.2 Member Function Documentation

##### 4.1041.2.1 \_M\_detach\_all()

```
void __gnu_debug::_Safe_unordered_container_base::_M_detach_all () [protected], [inherited]
```

Detach all iterators, leaving them singular.

##### 4.1041.2.2 \_M\_detach\_singular()

```
void __gnu_debug::_Safe_sequence_base::_M_detach_singular () [protected], [inherited]
```

Detach all singular iterators.

#### Postcondition

for all iterators i attached to this sequence, i->\_M\_version == \_M\_version.

##### 4.1041.2.3 \_M\_get\_mutex()

```
__gnu_cxx::__mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex () throw () [protected],
[inherited]
```

For use in \_Safe\_sequence.

Referenced by \_\_gnu\_debug::\_Safe\_sequence< map< \_Key, \_Tp, \_Compare, \_Allocator > >::\_M\_transfer\_from\_if().

## 4.1041.2.4 \_M\_invalidate\_all()

```
void __gnu_debug::_Safe_sequence_base::_M_invalidate_all () const [inline], [protected], [inherited]
```

Invalidates all iterators.

Definition at line 256 of file safe\_base.h.

References `__gnu_debug::_Safe_sequence_base::_M_version`.

## 4.1041.2.5 \_M\_invalidate\_if()

```
void __gnu_debug::_Safe_unordered_container< unordered_set< _Value, _Hash, _Pred, _Alloc > >::↵
_M_invalidate_if (
 _Predicate __pred) [protected], [inherited]
```

Invalidates all iterators `x` that reference this container, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

Definition at line 38 of file safe\_unordered\_container.tcc.

## 4.1041.2.6 \_M\_invalidate\_local\_if()

```
void __gnu_debug::_Safe_unordered_container< unordered_set< _Value, _Hash, _Pred, _Alloc > >::↵
_M_invalidate_local_if (
 _Predicate __pred) [protected], [inherited]
```

Invalidates all local iterators `x` that reference this container, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal local iterators nested in the safe ones.

Definition at line 70 of file safe\_unordered\_container.tcc.

## 4.1041.2.7 \_M\_revalidate\_singular()

```
void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular () [protected], [inherited]
```

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

## 4.1041.2.8 \_M\_swap() [1/2]

```
void __gnu_debug::_Safe_unordered_container_base::_M_swap (
 _Safe_unordered_container_base & __x) [protected], [noexcept], [inherited]
```

Swap this container with the given container. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

#### 4.1041.2.9 `_M_swap()` [2/2]

```
void __gnu_debug::_Safe_sequence_base::_M_swap (
 _Safe_sequence_base & __x) [protected], [noexcept], [inherited]
```

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

### 4.1041.3 Member Data Documentation

#### 4.1041.3.1 `_M_const_iterators`

```
_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_iterators [inherited]
```

The list of constant iterators that reference this container.

Definition at line 197 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

#### 4.1041.3.2 `_M_const_local_iterators`

```
_Safe_iterator_base* __gnu_debug::_Safe_unordered_container_base::_M_const_local_iterators [inherited]
```

The list of constant local iterators that reference this container.

Definition at line 130 of file `safe_unordered_base.h`.

#### 4.1041.3.3 `_M_iterators`

```
_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators [inherited]
```

The list of mutable iterators that reference this container.

Definition at line 194 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

4.1041.3.4 `_M_local_iterators`

```
_Safe_iterator_base* __gnu_debug::_Safe_unordered_container_base::_M_local_iterators [inherited]
```

The list of mutable local iterators that reference this container.

Definition at line 127 of file `safe_unordered_base.h`.

4.1041.3.5 `_M_version`

```
unsigned int __gnu_debug::_Safe_sequence_base::_M_version [mutable], [inherited]
```

The container version number. This number may never be 0.

Definition at line 200 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence_base::_M_invalidate_all()`.

## Friends

- `class _Array<_Tp>`

## 4.1044.1 Detailed Description

```
template<class _Tp>
class std::valarray< _Tp >
```

Smart array designed to support numeric processing.

A valarray is an array that provides constraints intended to allow for effective optimization of numeric array processing by reducing the aliasing that can result from pointer representations. It represents a one-dimensional array from which different multidimensional subsets can be accessed and modified.

## Template Parameters

|                  |                              |
|------------------|------------------------------|
| <code>_Tp</code> | Type of object in the array. |
|------------------|------------------------------|

Definition at line 89 of file valarray.

## 4.1044.2 Constructor &amp; Destructor Documentation

## 4.1044.2.1 valarray()

```
template<class _Tp>
std::valarray< _Tp >::valarray (
 const _Tp * __restrict__,
 size_t)
```

Construct an array initialized to the first  $n$  elements of  $t$ .

The documentation for this class was generated from the following file:

- [valarray](#)

## 4.1045.1 Detailed Description

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
class std::vector<_Tp, _Alloc>
```

A standard container which offers fixed time access to individual elements in any order.

## Template Parameters

|                     |                                                                 |
|---------------------|-----------------------------------------------------------------|
| <code>_Tp</code>    | Type of element.                                                |
| <code>_Alloc</code> | Allocator type, defaults to <code>allocator&lt;_Tp&gt;</code> . |

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#) with the exception of `push_front` and `pop_front`.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting ( `[]` ) access is also provided as with C-style arrays.

Definition at line 389 of file `std_vector.h`.

## 4.1045.2 Constructor &amp; Destructor Documentation

4.1045.2.1 `vector()` [1/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc>::vector () [default]
```

Creates a vector with no elements.

4.1045.2.2 `vector()` [2/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc>::vector (
 const allocator_type & __a) [inline], [explicit], [noexcept]
```

Creates a vector with no elements.

## Parameters

|                  |                      |
|------------------|----------------------|
| <code>__a</code> | An allocator object. |
|------------------|----------------------|

Definition at line 497 of file `stl_vector.h`.

#### 4.1045.2.3 `vector()` [3/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
 size_type __n,
 const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Creates a vector with default constructed elements.

##### Parameters

|                  |                                             |
|------------------|---------------------------------------------|
| <code>__n</code> | The number of elements to initially create. |
| <code>__a</code> | An allocator.                               |

This constructor fills the vector with `__n` default constructed elements.

Definition at line 510 of file `stl_vector.h`.

#### 4.1045.2.4 `vector()` [4/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
 size_type __n,
 const value_type & __value,
 const allocator_type & __a = allocator_type()) [inline]
```

Creates a vector with copies of an exemplar element.

##### Parameters

|                      |                                             |
|----------------------|---------------------------------------------|
| <code>__n</code>     | The number of elements to initially create. |
| <code>__value</code> | An element to copy.                         |
| <code>__a</code>     | An allocator.                               |

This constructor fills the vector with `__n` copies of `__value`.

Definition at line 522 of file `stl_vector.h`.

## 4.1045.2.5 vector() [5/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc >::vector (
 const vector<_Tp, _Alloc > & __x) [inline]
```

Vector copy constructor.

## Parameters

|                  |                                                    |
|------------------|----------------------------------------------------|
| <code>__x</code> | A vector of identical element and allocator types. |
|------------------|----------------------------------------------------|

All the elements of `__x` are copied, but any unused capacity in `__x` will not be copied (i.e. `capacity() == size()` in the new vector).

The newly-created vector uses a copy of the allocator object used by `__x` (unless the allocator traits dictate a different object).

Definition at line 553 of file `stl_vector.h`.

## 4.1045.2.6 vector() [6/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc >::vector (
 vector<_Tp, _Alloc > &&) [default], [noexcept]
```

Vector move constructor.

The newly-created vector contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified vector.

## 4.1045.2.7 vector() [7/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc >::vector (
 const vector<_Tp, _Alloc > & __x,
 const allocator_type & __a) [inline]
```

Copy constructor with alternative allocator.

Definition at line 575 of file `stl_vector.h`.

**4.1045.2.8 vector()** [8/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
 vector< _Tp, _Alloc > && __rv,
 const allocator_type & __m) [inline], [noexcept]
```

Move constructor with alternative allocator.

Definition at line 607 of file `stl_vector.h`.

**4.1045.2.9 vector()** [9/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
 initializer_list< value_type > __l,
 const allocator_type & __a = allocator_type()) [inline]
```

Builds a vector from an initializer list.

**Parameters**

|                  |                      |
|------------------|----------------------|
| <code>__l</code> | An initializer_list. |
| <code>__a</code> | An allocator.        |

Create a vector consisting of copies of the elements in the initializer\_list `__l`.

This will call the element type's copy constructor N times (where N is `__l.size()`) and do no memory reallocation.

Definition at line 625 of file `stl_vector.h`.

**4.1045.2.10 vector()** [10/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator , typename = std::RequireInputIter<_InputIterator>>
std::vector< _Tp, _Alloc >::vector (
 _InputIterator __first,
 _InputIterator __last,
 const allocator_type & __a = allocator_type()) [inline]
```

Builds a vector from a range.

**Parameters**

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |
| <code>__a</code>     | An allocator.      |

Create a vector consisting of copies of the elements from `[first,last)`.

If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor  $N$  times (where  $N$  is `distance(first,last)`) and do no memory reallocation. But if only input iterators are used, then this will do at most  $2N$  calls to the copy constructor, and  $\log N$  memory reallocations.

Definition at line 653 of file `std_vector.h`.

#### 4.1045.2.11 `~vector()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc>::~~vector () [inline], [noexcept]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 678 of file `std_vector.h`.

### 4.1045.3 Member Function Documentation

#### 4.1045.3.1 `_M_allocate_and_copy()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _ForwardIterator >
pointer std::vector<_Tp, _Alloc>::_M_allocate_and_copy (
 size_type __n,
 _ForwardIterator __first,
 _ForwardIterator __last) [inline], [protected]
```

Memory expansion handler. Uses the member allocation function to obtain  $n$  bytes of memory, and then copies `[first,last)` into it.

Definition at line 1508 of file `std_vector.h`.

#### 4.1045.3.2 `_M_range_check()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc>::_M_range_check (
 size_type __n) const [inline], [protected]
```

Safety check used only from `at()`.

Definition at line 1070 of file `std_vector.h`.

Referenced by `std::vector< sub_match<_Bi_iter>, allocator< sub_match<_Bi_iter>>>::at()`.

#### 4.1045.3.3 `assign()` [1/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc>::assign (
 size_type __n,
 const value_type & __val) [inline]
```

Assigns a given value to a vector.

**Parameters**

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Number of elements to be assigned. |
| <code>__val</code> | Value to be assigned.              |

This function fills a vector with `__n` copies of the given value. Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

Definition at line 749 of file `stl_vector.h`.

**4.1045.3.4 assign()** [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
void std::vector<_Tp, _Alloc>::assign (
 _InputIterator __first,
 _InputIterator __last) [inline]
```

Assigns a range to a vector.

**Parameters**

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

This function fills a vector with copies of the elements in the range `[__first,__last)`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

Definition at line 768 of file `stl_vector.h`.

**4.1045.3.5 assign()** [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc>::assign (
 initializer_list<value_type> __l) [inline]
```

Assigns an initializer list to a vector.

## Parameters

|                |                      |
|----------------|----------------------|
| <code>↵</code> | An initializer_list. |
| <code>↵</code> |                      |
| <code>↵</code> |                      |
| <code>↵</code> |                      |
| <code>/</code> |                      |

This function fills a vector with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

Definition at line 794 of file `stl_vector.h`.

4.1045.3.6 `at()` [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::vector<_Tp, _Alloc>::at (
 size_type __n) [inline]
```

Provides access to the data contained in the vector.

## Parameters

|                  |                                                             |
|------------------|-------------------------------------------------------------|
| <code>↵</code>   | The index of the element for which data should be accessed. |
| <code>__n</code> |                                                             |

## Returns

Read/write reference to data.

## Exceptions

|                                |                                          |
|--------------------------------|------------------------------------------|
| <code>std::out_of_range</code> | If <code>__n</code> is an invalid index. |
|--------------------------------|------------------------------------------|

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws `out_of_range` if the check fails.

Definition at line 1092 of file `stl_vector.h`.

4.1045.3.7 `at()` [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::vector<_Tp, _Alloc>::at (
 size_type __n) const [inline]
```

Provides access to the data contained in the vector.

## Parameters

|                                    |                                                             |
|------------------------------------|-------------------------------------------------------------|
| <code>_↵</code><br><code>_n</code> | The index of the element for which data should be accessed. |
|------------------------------------|-------------------------------------------------------------|

## Returns

Read-only (constant) reference to data.

## Exceptions

|                                |                                          |
|--------------------------------|------------------------------------------|
| <code>std::out_of_range</code> | If <code>__n</code> is an invalid index. |
|--------------------------------|------------------------------------------|

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws `out_of_range` if the check fails.

Definition at line 1110 of file `stl_vector.h`.

4.1045.3.8 `back()` [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::vector<_Tp, _Alloc>::back () [inline], [noexcept]
```

Returns a read/write reference to the data at the last element of the vector.

Definition at line 1143 of file `stl_vector.h`.

Referenced by `std::piecewise_constant_distribution<_RealType>::max()`, and `std::piecewise_linear_distribution<↵_RealType>::max()`.

4.1045.3.9 `back()` [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::vector<_Tp, _Alloc>::back () const [inline], [noexcept]
```

Returns a read-only (constant) reference to the data at the last element of the vector.

Definition at line 1154 of file `stl_vector.h`.

**4.1045.3.10 begin()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>>
iterator std::vector< _Tp, _Alloc >::begin () [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 811 of file `stl_vector.h`.

Referenced by `std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::crend()`, `std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::empty()`, `std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::erase()`, `std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::insert()`, `std::operator<()`, `std::operator==()`, `std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::rend()`, and `std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::vector()`.

**4.1045.3.11 begin()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>>
const_iterator std::vector< _Tp, _Alloc >::begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 820 of file `stl_vector.h`.

**4.1045.3.12 capacity()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>>
size_type std::vector< _Tp, _Alloc >::capacity () const [inline], [noexcept]
```

Returns the total number of elements that the vector can hold before needing to allocate more memory.

Definition at line 998 of file `stl_vector.h`.

**4.1045.3.13 cbegin()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>>
const_iterator std::vector< _Tp, _Alloc >::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 884 of file `stl_vector.h`.

Referenced by `std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::erase()`, and `std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::insert()`.

4.1045.3.14 `cend()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::vector< _Tp, _Alloc >::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 893 of file `stl_vector.h`.

4.1045.3.15 `clear()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::clear () [inline], [noexcept]
```

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1498 of file `stl_vector.h`.

4.1045.3.16 `crbegin()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector< _Tp, _Alloc >::crbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 902 of file `stl_vector.h`.

4.1045.3.17 `crend()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector< _Tp, _Alloc >::crend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 911 of file `stl_vector.h`.

#### 4.1045.3.18 data()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
_Tp* std::vector<_Tp, _Alloc>::data () [inline], [noexcept]
```

Returns a pointer such that [data(), data() + size()) is a valid range. For a non-empty vector, data() == &front().

Definition at line 1168 of file stl\_vector.h.

Referenced by std::regex\_traits<\_CharType>::transform\_primary().

#### 4.1045.3.19 emplace()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename... _Args>
iterator std::vector<_Tp, _Alloc>::emplace (
 const_iterator __position,
 _Args &&... __args) [inline]
```

Inserts an object in vector before specified iterator.

##### Parameters

|                         |                                   |
|-------------------------|-----------------------------------|
| <code>__position</code> | A const_iterator into the vector. |
| <code>__args</code>     | Arguments.                        |

##### Returns

An iterator that points to the inserted data.

This function will insert an object of type T constructed with T(std::forward<Args>(args)...) before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.

Definition at line 1248 of file stl\_vector.h.

#### 4.1045.3.20 empty()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
bool std::vector<_Tp, _Alloc>::empty () const [inline], [noexcept]
```

Returns true if the vector is empty. (Thus begin() would equal end().)

Definition at line 1007 of file stl\_vector.h.

Referenced by std::piecewise\_constant\_distribution<\_RealType>::densities(), std::piecewise\_linear\_distribution<\_RealType>::densities(), std::piecewise\_constant\_distribution<\_RealType>::intervals(), std::piecewise\_linear\_distribution<\_RealType>::intervals(), std::discrete\_distribution<\_IntType>::max(), std::piecewise\_constant\_distribution<\_RealType>::max(), std::piecewise\_linear\_distribution<\_RealType>::max(), std::piecewise\_constant\_distribution<\_RealType>::min(), std::piecewise\_linear\_distribution<\_RealType>::min(), and std::discrete\_distribution<\_IntType>::probabilities().

**4.1045.3.21** `end()` [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector<_Tp, _Alloc>::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 829 of file `stl_vector.h`.

Referenced by `std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::cbegin()`, `std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::empty()`, `std::operator<()`, `std::operator==(, std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::rbegin()`, `std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::resize()`, and `std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::vector()`.

**4.1045.3.22** `end()` [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::vector<_Tp, _Alloc>::end () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 838 of file `stl_vector.h`.

**4.1045.3.23** `erase()` [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector<_Tp, _Alloc>::erase (
 const_iterator __position) [inline]
```

Remove element at given position.

**Parameters**

|                         |                                            |
|-------------------------|--------------------------------------------|
| <code>__position</code> | Iterator pointing to element to be erased. |
|-------------------------|--------------------------------------------|

**Returns**

An iterator pointing to the next element (or `end()`).

This function will erase the element at the given position and thus shorten the vector by one.

Note This operation could be expensive and if it is frequently used the user should consider using `std::list`. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1430 of file `stl_vector.h`.

#### 4.1045.3.24 `erase()` [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::erase (
 const_iterator __first,
 const_iterator __last) [inline]
```

Remove a range of elements.

##### Parameters

|                      |                                                              |
|----------------------|--------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the first element to be erased.         |
| <code>__last</code>  | Iterator pointing to one past the last element to be erased. |

##### Returns

An iterator pointing to the element pointed to by `__last` prior to erasing (or `end()`).

This function will erase the elements in the range `[__first,__last)` and shorten the vector accordingly.

Note This operation could be expensive and if it is frequently used the user should consider using `std::list`. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1457 of file `stl_vector.h`.

#### 4.1045.3.25 `front()` [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::vector< _Tp, _Alloc >::front () [inline], [noexcept]
```

Returns a read/write reference to the data at the first element of the vector.

Definition at line 1121 of file `stl_vector.h`.

Referenced by `std::piecewise_constant_distribution< _RealType >::min()`, and `std::piecewise_linear_distribution< _RealType >::min()`.

**4.1045.3.26** `front()` [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::vector<_Tp, _Alloc>::front () const [inline], [noexcept]
```

Returns a read-only (constant) reference to the data at the first element of the vector.

Definition at line 1132 of file `std_vector.h`.

**4.1045.3.27** `get_allocator()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
allocator_type std::_Vector_base<_Tp, _Alloc>::get_allocator [inline], [noexcept]
```

Get a copy of the memory allocation object.

Definition at line 284 of file `std_vector.h`.

**4.1045.3.28** `insert()` [1/5]

```
template<typename _Tp , typename _Alloc >
vector<_Tp, _Alloc>::iterator vector::insert (
 const_iterator __position,
 const value_type & __x)
```

Inserts given value into vector before specified iterator.

**Parameters**

|                         |                                                |
|-------------------------|------------------------------------------------|
| <code>__position</code> | A <code>const_iterator</code> into the vector. |
| <code>__x</code>        | Data to be inserted.                           |

**Returns**

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 132 of file `vector.tcc`.

**4.1045.3.29** `insert()` [2/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::insert (
 const_iterator __position,
 value_type && __x) [inline]
```

Inserts given rvalue into vector before specified iterator.

**Parameters**

|                         |                                   |
|-------------------------|-----------------------------------|
| <code>__position</code> | A const_iterator into the vector. |
| <code>__x</code>        | Data to be inserted.              |

**Returns**

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1293 of file `stl_vector.h`.

**4.1045.3.30** `insert()` [3/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::insert (
 const_iterator __position,
 initializer_list< value_type > __l) [inline]
```

Inserts an `initializer_list` into the vector.

**Parameters**

|                         |                                    |
|-------------------------|------------------------------------|
| <code>__position</code> | An iterator into the vector.       |
| <code>__l</code>        | An <code>initializer_list</code> . |

This function will insert copies of the data in the `initializer_list l` into the vector before the location specified by *position*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1310 of file `stl_vector.h`.

## 4.1045.3.31 insert() [ 4/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::insert (
 const_iterator __position,
 size_type __n,
 const value_type & __x) [inline]
```

Inserts a number of copies of given data into the vector.

## Parameters

|                         |                                    |
|-------------------------|------------------------------------|
| <code>__position</code> | A const_iterator into the vector.  |
| <code>__n</code>        | Number of elements to be inserted. |
| <code>__x</code>        | Data to be inserted.               |

## Returns

An iterator that points to the inserted data.

This function will insert a specified number of copies of the given data before the location specified by *position*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1335 of file `stl_vector.h`.

## 4.1045.3.32 insert() [ 5/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>>
iterator std::vector< _Tp, _Alloc >::insert (
 const_iterator __position,
 _InputIterator __first,
 _InputIterator __last) [inline]
```

Inserts a range into the vector.

## Parameters

|                         |                                   |
|-------------------------|-----------------------------------|
| <code>__position</code> | A const_iterator into the vector. |
| <code>__first</code>    | An input iterator.                |
| <code>__last</code>     | An input iterator.                |

**Returns**

An iterator that points to the inserted data.

This function will insert copies of the data in the range `[__first,__last)` into the vector before the location specified by *pos*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1379 of file `stl_vector.h`.

**4.1045.3.33 `max_size()`**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::vector< _Tp, _Alloc >::max_size () const [inline], [noexcept]
```

Returns the `size()` of the largest possible vector.

Definition at line 923 of file `stl_vector.h`.

**4.1045.3.34 `operator=()` [1/3]**

```
template<typename _Tp , typename _Alloc >
vector< _Tp, _Alloc > & vector::operator= (
 const vector< _Tp, _Alloc > & __x)
```

Vector assignment operator.

**Parameters**

|                  |                                                    |
|------------------|----------------------------------------------------|
| <code>__x</code> | A vector of identical element and allocator types. |
|------------------|----------------------------------------------------|

All the elements of `__x` are copied, but any unused capacity in `__x` will not be copied.

Whether the allocator is copied depends on the allocator traits.

Definition at line 199 of file `vector.tcc`.

**4.1045.3.35 `operator=()` [2/3]**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
vector& std::vector< _Tp, _Alloc >::operator= (
 vector< _Tp, _Alloc > && __x) [inline], [noexcept]
```

Vector move assignment operator.

## Parameters

|                  |                                                    |
|------------------|----------------------------------------------------|
| <code>__x</code> | A vector of identical element and allocator types. |
|------------------|----------------------------------------------------|

The contents of `__x` are moved into this vector (without copying, if the allocators permit it). Afterwards `__x` is a valid, but unspecified vector.

Whether the allocator is moved depends on the allocator traits.

Definition at line 709 of file `std_vector.h`.

## 4.1045.3.36 operator=() [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
vector& std::vector< _Tp, _Alloc >::operator= (
 initializer_list< value_type > __l) [inline]
```

Vector list assignment operator.

## Parameters

|                  |                      |
|------------------|----------------------|
| <code>__l</code> | An initializer_list. |
|------------------|----------------------|

This function fills a vector with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

Definition at line 730 of file `std_vector.h`.

## 4.1045.3.37 operator[]() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::vector< _Tp, _Alloc >::operator[] (
 size_type __n) [inline], [noexcept]
```

Subscript access to the data contained in the vector.

**Parameters**

|                                                                                                      |                                                             |
|------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|
| <br><code>_n</code> | The index of the element for which data should be accessed. |
|------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|

**Returns**

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Definition at line 1043 of file `stl_vector.h`.

**4.1045.3.38 operator[]()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::vector< _Tp, _Alloc >::operator[] (
 size_type __n) const [inline], [noexcept]
```

Subscript access to the data contained in the vector.

**Parameters**

|                                                                                                        |                                                             |
|--------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|
| <br><code>_n</code> | The index of the element for which data should be accessed. |
|--------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|

**Returns**

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Definition at line 1061 of file `stl_vector.h`.

**4.1045.3.39 pop\_back()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::pop_back () [inline], [noexcept]
```

Removes last element.

This is a typical stack operation. It shrinks the vector by one.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before `pop_back()` is called.

Definition at line 1225 of file `stl_vector.h`.

4.1045.3.40 `push_back()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc>::push_back (
 const value_type & __x) [inline]
```

Add data to the end of the vector.

## Parameters

|                  |                   |
|------------------|-------------------|
| <code>__x</code> | Data to be added. |
|------------------|-------------------|

This is a typical stack operation. The function creates an element at the end of the vector and assigns the given data to it. Due to the nature of a vector this operation can be done in constant time if the vector has preallocated space available.

Definition at line 1187 of file `stl_vector.h`.

4.1045.3.41 `rbegin()` [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::vector<_Tp, _Alloc>::rbegin () [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 847 of file `stl_vector.h`.

4.1045.3.42 `rbegin()` [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector<_Tp, _Alloc>::rbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 856 of file `stl_vector.h`.

4.1045.3.43 `rend()` [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::vector<_Tp, _Alloc>::rend () [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 865 of file `stl_vector.h`.

**4.1045.3.44** `rend()` [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector< _Tp, _Alloc >::rend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 874 of file `stl_vector.h`.

**4.1045.3.45** `reserve()`

```
template<typename _Tp , typename _Alloc >
void vector::reserve (
 size_type __n)
```

Attempt to preallocate enough memory for specified number of elements.

**Parameters**

|                  |                              |
|------------------|------------------------------|
| <code>__n</code> | Number of elements required. |
|------------------|------------------------------|

**Exceptions**

|                                |                                                     |
|--------------------------------|-----------------------------------------------------|
| <code>std::length_error</code> | If <code>n</code> exceeds <code>max_size()</code> . |
|--------------------------------|-----------------------------------------------------|

This function attempts to reserve enough memory for the vector to hold the specified number of elements. If the number requested is more than `max_size()`, `length_error` is thrown.

The advantage of this function is that if optimal code is a necessity and the user can determine the number of elements that will be required, the user can reserve the memory in advance, and thus prevent a possible reallocation of memory and copying of vector data.

Definition at line 67 of file `vector.tcc`.

**4.1045.3.46** `resize()` [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::resize (
 size_type __new_size) [inline]
```

Resizes the vector to the specified number of elements.

## Parameters

|                         |                                               |
|-------------------------|-----------------------------------------------|
| <code>__new_size</code> | Number of elements the vector should contain. |
|-------------------------|-----------------------------------------------|

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise default constructed elements are appended.

Definition at line 937 of file `stl_vector.h`.

Referenced by `__gnu_parallel::__shrink_and_double()`.

4.1045.3.47 `resize()` [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::resize (
 size_type __new_size,
 const value_type & __x) [inline]
```

Resizes the vector to the specified number of elements.

## Parameters

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__new_size</code> | Number of elements the vector should contain.     |
| <code>__x</code>        | Data with which new elements should be populated. |

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise the vector is extended and new elements are populated with given data.

Definition at line 957 of file `stl_vector.h`.

4.1045.3.48 `shrink_to_fit()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::shrink_to_fit () [inline]
```

A non-binding request to reduce `capacity()` to `size()`.

Definition at line 989 of file `stl_vector.h`.

#### 4.1045.3.49 `size()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>>
size_type std::vector< _Tp, _Alloc >::size () const [inline], [noexcept]
```

Returns the number of elements in the vector.

Definition at line 918 of file `stl_vector.h`.

Referenced by `__gnu_parallel::__shrink()`, `__gnu_parallel::__shrink_and_double()`, `std::vector< sub_match< _Bi_↵  
iter >, allocator< sub_match< _Bi_iter > > >::M_range_check()`, `__gnu_parallel::list_partition()`, `std::discrete_↵  
distribution< _IntType >::max()`, `std::operator==()`, `std::vector< sub_match< _Bi_iter >, allocator< sub_match< _↵  
Bi_iter > > >::resize()`, and `std::regex_traits< _CharType >::transform_primary()`.

#### 4.1045.3.50 `swap()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>>
void std::vector< _Tp, _Alloc >::swap (
 vector< _Tp, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another vector.

##### Parameters

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>_↵<br/>__x</code> | A vector of the same element and allocator types. |
|-------------------------|---------------------------------------------------|

This exchanges the elements between two vectors in constant time. (Three pointers, so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(v1,v2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

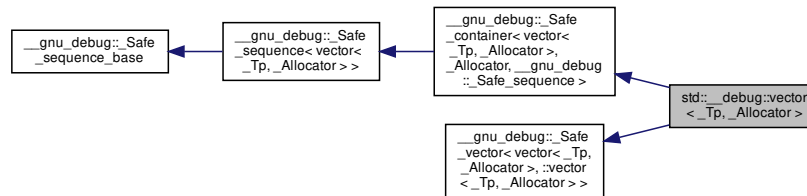

Definition at line 1480 of file `stl_vector.h`.

## 4.1046.1 Detailed Description

```
template<typename _Tp, typename _Allocator = std::allocator<_Tp>>
class std::__debug::vector<_Tp, _Allocator>
```

Class `std::vector` with safety/checking/debug instrumentation.

Definition at line 36 of file `debug/vector`.

## 4.1046.2 Constructor &amp; Destructor Documentation

4.1046.2.1 `vector()`

```
template<typename _Tp, typename _Allocator = std::allocator<_Tp>>
std::__debug::vector<_Tp, _Allocator>::vector (
 const _Base & __x) [inline]
```

Construction from a normal-mode vector.

Definition at line 224 of file `debug/vector`.

### 4.1046.3 Member Function Documentation

#### 4.1046.3.1 `_M_detach_all()`

```
void __gnu_debug::_Safe_sequence_base::_M_detach_all () [protected], [inherited]
```

Detach all iterators, leaving them singular.

Referenced by `__gnu_debug::_Safe_sequence_base::~~Safe_sequence_base()`.

#### 4.1046.3.2 `_M_detach_singular()`

```
void __gnu_debug::_Safe_sequence_base::_M_detach_singular () [protected], [inherited]
```

Detach all singular iterators.

#### Postcondition

for all iterators `i` attached to this sequence, `i->_M_version == _M_version`.

#### 4.1046.3.3 `_M_get_mutex()`

```
__gnu_cxx::__mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex () throw () [protected],
[inherited]
```

For use in `_Safe_sequence`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

#### 4.1046.3.4 `_M_invalidate_all()`

```
void __gnu_debug::_Safe_sequence_base::_M_invalidate_all () const [inline], [protected], [inherited]
```

Invalidates all iterators.

Definition at line 256 of file `safe_base.h`.

References `__gnu_debug::_Safe_sequence_base::_M_version`.

## 4.1046.3.5 \_M\_invalidate\_if()

```
void __gnu_debug::_Safe_sequence< vector< _Tp, _Allocator > >::_M_invalidate_if (
 _Predicate __pred) [inherited]
```

Invalidates all iterators *x* that reference this sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

Definition at line 38 of file `safe_sequence.tcc`.

## 4.1046.3.6 \_M\_revalidate\_singular()

```
void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular () [protected], [inherited]
```

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

## 4.1046.3.7 \_M\_swap()

```
void __gnu_debug::_Safe_sequence_base::_M_swap (
 _Safe_sequence_base & __x) [protected], [noexcept], [inherited]
```

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

## 4.1046.3.8 \_M\_transfer\_from\_if()

```
void __gnu_debug::_Safe_sequence< vector< _Tp, _Allocator > >::_M_transfer_from_if (
 _Safe_sequence< vector< _Tp, _Allocator > > & __from,
 _Predicate __pred) [inherited]
```

Transfers all iterators *x* that reference *from* sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

Definition at line 69 of file `safe_sequence.tcc`.

## 4.1046.4 Member Data Documentation

## 4.1046.4.1 \_M\_const\_iterators

```
_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_iterators [inherited]
```

The list of constant iterators that reference this container.

Definition at line 197 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

#### 4.1046.4.2 `_M_iterators`

```
_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators [inherited]
```

The list of mutable iterators that reference this container.

Definition at line 194 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`.

#### 4.1046.4.3 `_M_version`

```
unsigned int __gnu_debug::_Safe_sequence_base::_M_version [mutable], [inherited]
```

The container version number. This number may never be 0.

Definition at line 200 of file `safe_base.h`.

Referenced by `__gnu_debug::_Safe_sequence_base::_M_invalidate_all()`.

#### 4.1047.1 Detailed Description

```
template<typename _Alloc>
class std::vector< bool, _Alloc >
```

A specialization of vector for booleans which offers fixed time access to individual elements in any order.

#### Template Parameters

|                     |                 |
|---------------------|-----------------|
| <code>_Alloc</code> | Allocator type. |
|---------------------|-----------------|

Note that `vector<bool>` does not actually meet the requirements for being a container. This is because the reference and pointer types are not really references and pointers to `bool`. See DR96 for details.

#### See also

[vector](#) for function documentation.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting ( `[]` ) access is also provided as with C-style arrays.

Definition at line 615 of file `stl_bvector.h`.

The documentation for this class was generated from the following files:

- [stl\\_bvector.h](#)
- [vector.tcc](#)

#### 4.1048.1 Detailed Description

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
class std::wbuffer_convert< _Codecvt, _Elem, _Tr >
```

Buffer conversions.

Definition at line 387 of file `locale_conv.h`.

#### 4.1048.2 Member Typedef Documentation

##### 4.1048.2.1 `__streambuf_type`

```
typedef basic_streambuf<char_type, traits_type> std::basic_streambuf< _Elem , _Tr >::__streambuf_type
[inherited]
```

This is a non-standard type.

Definition at line 140 of file `streambuf`.

#### 4.1048.2.2 `char_type`

```
typedef _Elem std::basic_streambuf< _Elem , _Tr >::char_type [inherited]
```

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

Definition at line 131 of file streambuf.

#### 4.1048.2.3 `int_type`

```
typedef traits_type::int_type std::basic_streambuf< _Elem , _Tr >::int_type [inherited]
```

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

Definition at line 133 of file streambuf.

#### 4.1048.2.4 `off_type`

```
typedef traits_type::off_type std::basic_streambuf< _Elem , _Tr >::off_type [inherited]
```

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

Definition at line 135 of file streambuf.

#### 4.1048.2.5 `pos_type`

```
typedef traits_type::pos_type std::basic_streambuf< _Elem , _Tr >::pos_type [inherited]
```

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

Definition at line 134 of file streambuf.

#### 4.1048.2.6 `traits_type`

```
typedef _Tr std::basic_streambuf< _Elem , _Tr >::traits_type [inherited]
```

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

Definition at line 132 of file streambuf.

#### 4.1048.3 Constructor & Destructor Documentation

##### 4.1048.3.1 `wbuffer_convert()` [1/2]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert () [inline]
```

Default constructor.

Definition at line 395 of file `locale_conv.h`.

##### 4.1048.3.2 `wbuffer_convert()` [2/2]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert (
 streambuf * __bytebuf,
 _Codecvt * __pcvt = new _Codecvt,
 state_type __state = state_type()) [inline], [explicit]
```

Constructor.

###### Parameters

|                        |                                    |
|------------------------|------------------------------------|
| <code>__bytebuf</code> | The underlying byte stream buffer. |
| <code>__pcvt</code>    | The facet to use for conversions.  |
| <code>__state</code>   | Initial conversion state.          |

Takes ownership of `__pcvt` and will delete it in the destructor.

Definition at line 406 of file `locale_conv.h`.

References `std::basic_streambuf< _Elem, _Tr >::setg()`, and `std::basic_streambuf< _Elem, _Tr >::setp()`.

#### 4.1048.4 Member Function Documentation

##### 4.1048.4.1 `eback()`

```
char_type* std::basic_streambuf< _Elem , _Tr >::eback () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Definition at line 489 of file `streambuf`.

#### 4.1048.4.2 `egptr()`

```
char_type* std::basic_streambuf<_Elem, _Tr>::egptr () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Definition at line 495 of file `streambuf`.

#### 4.1048.4.3 `epptr()`

```
char_type* std::basic_streambuf<_Elem, _Tr>::epptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

Definition at line 542 of file `streambuf`.

#### 4.1048.4.4 `gbump()`

```
void std::basic_streambuf<_Elem, _Tr>::gbump (
 int __n) [inline], [protected], [inherited]
```

Moving the read position.

**Parameters**

|                 |                             |
|-----------------|-----------------------------|
| <code>_↵</code> | The delta by which to move. |
| <code>_n</code> |                             |

This just advances the read position without returning any data.

Definition at line 505 of file streambuf.

**4.1048.4.5 getloc()**

```
locale std::basic_streambuf< _Elem , _Tr >::getloc () const [inline], [inherited]
```

Locale access.

**Returns**

The current locale in effect.

If `pubimbue(loc)` has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.

Definition at line 233 of file streambuf.

**4.1048.4.6 gptr()**

```
char_type* std::basic_streambuf< _Elem , _Tr >::gptr () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Definition at line 492 of file streambuf.

**4.1048.4.7 imbue()**

```
virtual void std::basic_streambuf< _Elem , _Tr >::imbue (
 const locale & __loc) [inline], [protected], [virtual], [inherited]
```

Changes translations.

## Parameters

|                    |               |
|--------------------|---------------|
| <code>__loc</code> | A new locale. |
|--------------------|---------------|

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

## Note

Base class version does nothing.

Definition at line 583 of file streambuf.

## 4.1048.4.8 in\_avail()

```
streamsize std::basic_streambuf<_Elem, _Tr>::in_avail () [inline], [inherited]
```

Looking ahead into the stream.

## Returns

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

Definition at line 291 of file streambuf.

## 4.1048.4.9 overflow()

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
_Wide_streambuf::int_type std::wbuffer_convert<_Codecvt, _Elem, _Tr>::overflow (
 typename _Wide_streambuf::int_type __c) [inline], [protected], [virtual]
```

Consumes data from the buffer; writes to the controlled sequence.

## Parameters

|                  |                                     |
|------------------|-------------------------------------|
| <code>__c</code> | An additional character to consume. |
|------------------|-------------------------------------|

**Returns**

`eof()` to indicate failure, something else (usually `__c`, or `not_eof()`)

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character `c` is also written out, if `__c` is not `eof()`.

For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.

A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from [std::basic\\_streambuf<\\_Elem, \\_Tr>](#).

Definition at line 450 of file `locale_conv.h`.

References [std::basic\\_streambuf<\\_Elem, \\_Tr>::sputc\(\)](#).

**4.1048.4.10 pbackfail()**

```
virtual int_type std::basic_streambuf<_Elem, _Tr>::pbackfail (
 int_type __c = traits_type::eof()) [inline], [protected], [virtual], [inherited]
```

Tries to back up the input sequence.

**Parameters**

|                  |                                                      |
|------------------|------------------------------------------------------|
| <code>__c</code> | The character to be inserted back into the sequence. |
|------------------|------------------------------------------------------|

**Returns**

`eof()` on failure, *some other value* on success

**Postcondition**

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

**Note**

Base class version does nothing, returns `eof()`.

Definition at line 731 of file `streambuf`.

## 4.1048.4.11 pbase()

```
char_type* std::basic_streambuf<_Elem, _Tr>::pbase () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Definition at line 536 of file streambuf.

## 4.1048.4.12 pbump()

```
void std::basic_streambuf<_Elem, _Tr>::pbump (
 int __n) [inline], [protected], [inherited]
```

Moving the write position.

## Parameters

|                  |                             |
|------------------|-----------------------------|
| <code>__n</code> | The delta by which to move. |
|------------------|-----------------------------|

This just advances the write position without returning any data.

Definition at line 552 of file streambuf.

## 4.1048.4.13 pptr()

```
char_type* std::basic_streambuf<_Elem, _Tr>::pptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Definition at line 539 of file streambuf.

#### 4.1048.4.14 pubimbue()

```
locale std::basic_streambuf< _Elem , _Tr >::pubimbue (
 const locale & __loc) [inline], [inherited]
```

Entry point for imbue().

##### Parameters

|                    |                 |
|--------------------|-----------------|
| <code>__loc</code> | The new locale. |
|--------------------|-----------------|

##### Returns

The previous locale.

Calls the derived imbue(\_\_loc).

Definition at line 216 of file streambuf.

#### 4.1048.4.15 pubseekoff()

```
pos_type std::basic_streambuf< _Elem , _Tr >::pubseekoff (
 off_type __off,
 ios_base::seekdir __way,
 ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

##### Parameters

|                     |                               |
|---------------------|-------------------------------|
| <code>__off</code>  | Offset.                       |
| <code>__way</code>  | Value for ios_base::seekdir.  |
| <code>__mode</code> | Value for ios_base::openmode. |

Calls virtual seekoff function.

Definition at line 258 of file streambuf.

#### 4.1048.4.16 pubseekpos()

```
pos_type std::basic_streambuf< _Elem , _Tr >::pubseekpos (
 pos_type __sp,
 ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

## Parameters

|                     |                                             |
|---------------------|---------------------------------------------|
| <code>__sp</code>   | Position                                    |
| <code>__mode</code> | Value for <code>ios_base::openmode</code> . |

Calls virtual `seekpos` function.

Definition at line 270 of file `streambuf`.

4.1048.4.17 `pubsetbuf()`

```
basic_streambuf* std::basic_streambuf<_Elem, _Tr>::pubsetbuf (
 char_type * __s,
 streamsize __n) [inline], [inherited]
```

Entry points for derived buffer functions.

The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.

Definition at line 246 of file `streambuf`.

4.1048.4.18 `pubsync()`

```
int std::basic_streambuf<_Elem, _Tr>::pubsync () [inline], [inherited]
```

Calls virtual `sync` function.

Definition at line 278 of file `streambuf`.

4.1048.4.19 `sbumpc()`

```
int_type std::basic_streambuf<_Elem, _Tr>::sbumpc () [inline], [inherited]
```

Getting the next character.

## Returns

The next character, or `eof`.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `uflow()`.

Definition at line 323 of file `streambuf`.

#### 4.1048.4.20 seekoff()

```
virtual pos_type std::basic_streambuf< _Elem , _Tr >::seekoff (
 off_type ,
 ios_base::seekdir ,
 ios_base::openmode = ios_base::in | ios_base::out) [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

##### Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Definition at line 609 of file `streambuf`.

#### 4.1048.4.21 seekpos()

```
virtual pos_type std::basic_streambuf< _Elem , _Tr >::seekpos (
 pos_type ,
 ios_base::openmode = ios_base::in | ios_base::out) [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

##### Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Definition at line 621 of file `streambuf`.

#### 4.1048.4.22 setbuf()

```
virtual basic_streambuf<char_type,_Tr >* std::basic_streambuf< _Elem , _Tr >::setbuf (
 char_type * ,
 streamsize) [inline], [protected], [virtual], [inherited]
```

Manipulates the buffer.

Each derived class provides its own appropriate behavior. See the next-to-last paragraph of <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.streambuf.buffering> for more on this function.

##### Note

Base class version does nothing, returns `this`.

Definition at line 598 of file `streambuf`.

## 4.1048.4.23 setg()

```
void std::basic_streambuf<_Elem, _Tr>::setg (
 char_type * __gbeg,
 char_type * __gnext,
 char_type * __gend) [inline], [protected], [inherited]
```

Setting the three read area pointers.

## Parameters

|                      |            |
|----------------------|------------|
| <code>__gbeg</code>  | A pointer. |
| <code>__gnext</code> | A pointer. |
| <code>__gend</code>  | A pointer. |

## Postcondition

`__gbeg == eback()`, `__gnext == gptr()`, and `__gend == egptr()`

Definition at line 516 of file streambuf.

## 4.1048.4.24 setp()

```
void std::basic_streambuf<_Elem, _Tr>::setp (
 char_type * __pbeg,
 char_type * __pend) [inline], [protected], [inherited]
```

Setting the three write area pointers.

## Parameters

|                     |            |
|---------------------|------------|
| <code>__pbeg</code> | A pointer. |
| <code>__pend</code> | A pointer. |

## Postcondition

`__pbeg == pbase()`, `__pbeg == pptr()`, and `__pend == epptr()`

Definition at line 562 of file streambuf.

## 4.1048.4.25 sgetc()

```
int_type std::basic_streambuf<_Elem, _Tr>::sgetc () [inline], [inherited]
```

Getting the next character.

**Returns**

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.

Definition at line 345 of file `streambuf`.

**4.1048.4.26 `sgetn()`**

```
streamsize std::basic_streambuf< _Elem , _Tr >::sgetn (
 char_type * __s,
 streamsize __n) [inline], [inherited]
```

Entry point for `xsgetn`.

**Parameters**

|                  |                |
|------------------|----------------|
| <code>__s</code> | A buffer area. |
| <code>__n</code> | A count.       |

Returns `xsgetn(__s,__n)`. The effect is to fill `__s[0]` through `__s[__n-1]` with characters from the input sequence, if possible.

Definition at line 364 of file `streambuf`.

**4.1048.4.27 `showmanyc()`**

```
virtual streamsize std::basic_streambuf< _Elem , _Tr >::showmanyc () [inline], [protected],
[virtual], [inherited]
```

Investigating the data available.

**Returns**

An estimate of the number of characters available in the input sequence, or -1.

*If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been supplied. If `showmanyc()` returns -1, then calls to `underflow()` or `uflow()` will fail. [27.5.2.4.3]/1*

**Note**

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to `underflow` or `uflow`] will not return `eof()` but that they will return immediately.*

The standard adds that *the morphemes of `showmanyc` are **es-how-many-see**, not **show-manic**.*

Definition at line 656 of file `streambuf`.

## 4.1048.4.28 snextc()

```
int_type std::basic_streambuf<_Elem, _Tr>::snextc () [inline], [inherited]
```

Getting the next character.

**Returns**

The next character, or eof.

Calls `sbumpc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.

Definition at line 305 of file `streambuf`.

## 4.1048.4.29 sputbackc()

```
int_type std::basic_streambuf<_Elem, _Tr>::sputbackc (
 char_type __c) [inline], [inherited]
```

Pushing characters back into the input stream.

**Parameters**

|                  |                             |
|------------------|-----------------------------|
| <code>__c</code> | The character to push back. |
|------------------|-----------------------------|

**Returns**

The previous character, if possible.

Similar to `sungetc()`, but `__c` is pushed onto the stream instead of *the previous character*. If successful, the next character fetched from the input stream will be `__c`.

Definition at line 379 of file `streambuf`.

## 4.1048.4.30 sputc()

```
int_type std::basic_streambuf<_Elem, _Tr>::sputc (
 char_type __c) [inline], [inherited]
```

Entry point for all single-character output functions.

**Parameters**

|                  |                        |
|------------------|------------------------|
| <code>__c</code> | A character to output. |
|------------------|------------------------|

**Returns**

`__c`, if possible.

One of two public output functions.

If a write position is available for the output sequence (i.e., the buffer is not full), stores `__c` in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(__c)`.

Definition at line 431 of file `streambuf`.

**4.1048.4.31 sputn()**

```
streamsize std::basic_streambuf<_Elem, _Tr>::sputn (
 const char_type * __s,
 streamsize __n) [inline], [inherited]
```

Entry point for all single-character output functions.

**Parameters**

|                  |                     |
|------------------|---------------------|
| <code>__s</code> | A buffer read area. |
| <code>__n</code> | A count.            |

One of two public output functions.

Returns `xsgputn(__s, __n)`. The effect is to write `__s[0]` through `__s[__n-1]` to the output sequence, if possible.

Definition at line 457 of file `streambuf`.

**4.1048.4.32 state()**

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
state_type std::wbuffer_convert<_Codecvt, _Elem, _Tr>::state () const [inline], [noexcept]
```

The conversion state following the last conversion.

Definition at line 442 of file `locale_conv.h`.

## 4.1048.4.33 sungetc()

```
int_type std::basic_streambuf< _Elem, _Tr >::sungetc () [inline], [inherited]
```

Moving backwards in the input stream.

**Returns**

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns pbackfail(). The effect is to *unget* the last character *gotten*.

Definition at line 404 of file streambuf.

## 4.1048.4.34 sync()

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
int std::wbuffer_convert< _Codecvt, _Elem, _Tr >::sync (
 void) [inline], [protected], [virtual]
```

Synchronizes the buffer arrays with the controlled sequences.

**Returns**

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

**Note**

Base class version does nothing, returns zero.

Reimplemented from `std::basic_streambuf< _Elem, _Tr >`.

Definition at line 446 of file locale\_conv.h.

References `std::basic_streambuf< _CharT, _Traits >::pubsync()`.

#### 4.1048.4.35 uflow()

```
virtual int_type std::basic_streambuf< _Elem , _Tr >::uflow () [inline], [protected], [virtual], [inherited]
```

Fetches more data from the controlled sequence.

##### Returns

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.

Definition at line 707 of file `streambuf`.

#### 4.1048.4.36 underflow()

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
_Wide_streambuf::int_type std::wbuffer_convert< _Codecvt, _Elem, _Tr >::underflow () [inline], [protected], [virtual]
```

Fetches more data from the controlled sequence.

##### Returns

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.

For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.

A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html>

##### Note

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf< _Elem, _Tr >`.

Definition at line 460 of file `locale_conv.h`.

References `std::basic_streambuf< _Elem, _Tr >::egptr()`, and `std::basic_streambuf< _Elem, _Tr >::gptr()`.

#### 4.1048.4.37 xsgetn()

```
streamsize std::basic_streambuf< _Elem , _Tr >::xsgetn (
 char_type * __s,
 streamsize __n) [protected], [virtual], [inherited]
```

Multiple character extraction.

## Parameters

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__s</code> | A buffer area.                          |
| <code>__n</code> | Maximum number of characters to assign. |

## Returns

The number of characters assigned.

Fills `__s[0]` through `__s[__n-1]` with characters from the input sequence, as if by `sbumpc()`. Stops when either `__n` characters have been copied, or when `traits::eof()` would be copied.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Definition at line 46 of file `streambuf.tcc`.

4.1048.4.38 `xspn()`

```
streamsize std::basic_streambuf<_Elem, _Tr>::xspn (
 const char_type * __s,
 streamsize __n) [protected], [virtual], [inherited]
```

Multiple character insertion.

## Parameters

|                  |                                        |
|------------------|----------------------------------------|
| <code>__s</code> | A buffer area.                         |
| <code>__n</code> | Maximum number of characters to write. |

## Returns

The number of characters written.

Writes `__s[0]` through `__s[__n-1]` to the output sequence, as if by `sputc()`. Stops when either `n` characters have been copied, or when `sputc()` would return `traits::eof()`.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Definition at line 80 of file `streambuf.tcc`.

## 4.1048.5 Member Data Documentation

#### 4.1048.5.1 `_M_buf_locale`

`locale std::basic_streambuf< _Elem , _Tr >::_M_buf_locale` [protected], [inherited]

Current locale setting.

### 4.1049.1 Detailed Description

```
template<typename _Tp>
class std::weak_ptr<_Tp>
```

A non-owning observer for a pointer owned by a `shared_ptr`.

A `weak_ptr` provides a safe alternative to a raw pointer when you want a non-owning reference to an object that is managed by a `shared_ptr`.

Unlike a raw pointer, a `weak_ptr` can be converted to a new `shared_ptr` that shares ownership with every other `shared_ptr` that already owns the pointer. In other words you can upgrade from a non-owning "weak" reference to an owning `shared_ptr`, without having access to any of the existing `shared_ptr` objects.

Also unlike a raw pointer, a `weak_ptr` does not become "dangling" after the object it points to has been destroyed. Instead, a `weak_ptr` becomes *expired* and can no longer be converted to a `shared_ptr` that owns the freed pointer, so you cannot accidentally access the pointed-to object after it has been destroyed.

Definition at line 685 of file `bits/shared_ptr.h`.

## 4.1050.1 Detailed Description

```
template<typename _RealType = double>
class std::weibull_distribution<_RealType>
```

A weibull\_distribution random number distribution.

The formula for the normal probability density function is:

$$p(x|\alpha, \beta) = \frac{\alpha}{\beta} \left(\frac{x}{\beta}\right)^{\alpha-1} \exp\left(-\left(\frac{x}{\beta}\right)^\alpha\right)$$

Definition at line 4860 of file random.h.

## 4.1050.2 Member Typedef Documentation

#### 4.1050.2.1 `result_type`

```
template<typename _RealType = double>
typedef _RealType std::weibull_distribution< _RealType >::result_type
```

The type of the range of the distribution.

Definition at line 4863 of file random.h.

#### 4.1050.3 Member Function Documentation

##### 4.1050.3.1 `a()`

```
template<typename _RealType = double>
_RealType std::weibull_distribution< _RealType >::a () const [inline]
```

Return the  $a$  parameter of the distribution.

Definition at line 4925 of file random.h.

##### 4.1050.3.2 `b()`

```
template<typename _RealType = double>
_RealType std::weibull_distribution< _RealType >::b () const [inline]
```

Return the  $b$  parameter of the distribution.

Definition at line 4932 of file random.h.

##### 4.1050.3.3 `max()`

```
template<typename _RealType = double>
result_type std::weibull_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

Definition at line 4961 of file random.h.

References `std::numeric_limits<_Tp>::max()`.

4.1050.3.4 `min()`

```
template<typename _RealType = double>
result_type std::weibull_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

Definition at line 4954 of file random.h.

4.1050.3.5 `operator()()`

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::weibull_distribution< _RealType >::operator() (
 _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Definition at line 4969 of file random.h.

4.1050.3.6 `param()` [1/2]

```
template<typename _RealType = double>
param_type std::weibull_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

Definition at line 4939 of file random.h.

Referenced by `std::operator>>()`.

4.1050.3.7 `param()` [2/2]

```
template<typename _RealType = double>
void std::weibull_distribution< _RealType >::param (
 const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

## Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

Definition at line 4947 of file random.h.

#### 4.1050.3.8 `reset()`

```
template<typename _RealType = double>
void std::weibull_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

Definition at line 4918 of file random.h.

### 4.1050.4 Friends And Related Function Documentation

#### 4.1050.4.1 `operator==`

```
template<typename _RealType = double>
bool operator== (
 const weibull_distribution< _RealType > & __d1,
 const weibull_distribution< _RealType > & __d2) [friend]
```

Return true if two Weibull distributions have the same parameters.

Definition at line 5004 of file random.h.

The documentation for this class was generated from the following files:

- [random.h](#)
- [bits/random.tcc](#)

## 4.1051.1 Detailed Description

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>, typename _Byte_alloc =
allocator<char>>
```

```
class std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >
```

String conversions.

Definition at line 232 of file `locale_conv.h`.

## 4.1051.2 Constructor &amp; Destructor Documentation

4.1051.2.1 `wstring_convert`() [1/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert () [inline]
```

Default constructor.

Definition at line 241 of file `locale_conv.h`.

**4.1051.2.2 wstring\_convert()** [2/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert (
 _Codecvt * __pcvt) [inline], [explicit]
```

Constructor.

**Parameters**

|                     |                                   |
|---------------------|-----------------------------------|
| <code>__pcvt</code> | The facet to use for conversions. |
|---------------------|-----------------------------------|

Takes ownership of `__pcvt` and will delete it in the destructor.

Definition at line 250 of file `locale_conv.h`.

**4.1051.2.3 `wstring_convert()`** [3/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert (
 _Codecvt * __pcvt,
 state_type __state) [inline]
```

Construct with an initial conversion state.

**Parameters**

|                      |                                   |
|----------------------|-----------------------------------|
| <code>__pcvt</code>  | The facet to use for conversions. |
| <code>__state</code> | Initial conversion state.         |

Takes ownership of `__pcvt` and will delete it in the destructor. The object's conversion state will persist between conversions.

Definition at line 264 of file `locale_conv.h`.

**4.1051.2.4 `wstring_convert()`** [4/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert (
 const byte_string & __byte_err,
 const wide_string & __wide_err = wide_string()) [inline], [explicit]
```

Construct with error strings.

**Parameters**

|                         |                                                |
|-------------------------|------------------------------------------------|
| <code>__byte_err</code> | A string to return on failed conversions.      |
| <code>__wide_err</code> | A wide string to return on failed conversions. |

Definition at line 277 of file `locale_conv.h`.

### 4.1051.3 Member Function Documentation

#### 4.1051.3.1 converted()

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>>
size_t std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::converted () const
[inline], [noexcept]
```

The number of elements successfully converted in the last conversion.

Definition at line 367 of file locale\_conv.h.

#### 4.1051.3.2 from\_bytes() [1/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>>
wide_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
 char __byte) [inline]
```

Convert from bytes.

Definition at line 296 of file locale\_conv.h.

Referenced by std::wstring\_convert< \_Codecvt, \_Elem, \_Wide\_alloc, \_Byte\_alloc >::from\_bytes().

#### 4.1051.3.3 from\_bytes() [2/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>>
wide_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
 const char * __ptr) [inline]
```

Convert from bytes.

Definition at line 303 of file locale\_conv.h.

References std::wstring\_convert< \_Codecvt, \_Elem, \_Wide\_alloc, \_Byte\_alloc >::from\_bytes().

## 4.1051.3.4 from\_bytes() [3/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
wide_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
 const byte_string & __str) [inline]
```

Convert from bytes.

Definition at line 307 of file locale\_conv.h.

References std::basic\_string< \_CharT, \_Traits, \_Alloc >::data(), std::wstring\_convert< \_Codecvt, \_Elem, \_Wide\_alloc, \_Byte\_alloc >::from\_bytes(), and std::basic\_string< \_CharT, \_Traits, \_Alloc >::size().

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
wide_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
 const char * __first,
 const char * __last) [inline]
```

Convert from bytes.

Definition at line 314 of file locale\_conv.h.

References std::basic\_string< \_CharT, \_Traits, \_Alloc >::get\_allocator().

## 4.1051.3.6 state()

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
state_type std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::state () const
[inline]
```

The final conversion state of the last conversion.

Definition at line 370 of file locale\_conv.h.

## 4.1051.3.7 to\_bytes() [1/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
byte_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes (
 _Elem __wchar) [inline]
```

Convert to bytes.

Definition at line 330 of file locale\_conv.h.

Referenced by std::wstring\_convert< \_Codecvt, \_Elem, \_Wide\_alloc, \_Byte\_alloc >::to\_bytes().

**4.1051.3.8 to\_bytes()** [2/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
byte_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes (
 const _Elem * __ptr) [inline]
```

Convert to bytes.

Definition at line 337 of file locale\_conv.h.

References `std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes()`.

**4.1051.3.9 to\_bytes()** [3/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
byte_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes (
 const wide_string & __wstr) [inline]
```

Convert to bytes.

Definition at line 343 of file locale\_conv.h.

References `std::basic_string< _CharT, _Traits, _Alloc >::data()`, `std::basic_string< _CharT, _Traits, _Alloc >::size()`, and `std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes()`.

**4.1051.3.10 to\_bytes()** [4/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
byte_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes (
 const _Elem * __first,
 const _Elem * __last) [inline]
```

Convert to bytes.

Definition at line 350 of file locale\_conv.h.

References `std::basic_string< _CharT, _Traits, _Alloc >::get_allocator()`.

### 5.1.1 Detailed Description

Parallel STL function calls corresponding to the `stl_algo.h` header.

The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

### 5.29.1 Detailed Description

Implementation of a dynamically load-balanced parallel quicksort.

It works in-place and needs only logarithmic extra memory. The algorithm is similar to the one proposed in

P. Tsigas and Y. Zhang. A simple, fast parallel implementation of quicksort and its performance evaluation on SUN enterprise 10000. In 11th Euromicro Conference on Parallel, Distributed and Network-Based Processing, page 372, 2003.

This file is a GNU parallel extension to the Standard C++ Library.

### 5.39.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<functional>`.

## 5.40 binomial\_heap\_.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::binomial\\_heap< Value\\_Type, Cmp\\_Fn, \\_Alloc >](#)

### Namespaces

- [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`

### 5.40.1 Detailed Description

Contains an implementation class for a binomial heap.

## 5.41 binomial\_heap\_base\_.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::binomial\\_heap\\_base< Value\\_Type, Cmp\\_Fn, \\_Alloc >](#)

## Namespaces

- [\\_\\_gnu\\_pbds](#)

## Macros

- `#define PB_DS_ASSERT_BASE_NODE_CONSISTENT(_Node, _Bool)`
- `#define PB_DS_ASSERT_VALID_COND(X, _StrictlyBinomial)`
- `#define PB_DS_B_HEAP_BASE`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`

## 5.41.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

## 5.42 bit File Reference

## Namespaces

- [std](#)

## Macros

- `#define _GLIBCXX_BIT`

## 5.42.1 Detailed Description

This is a Standard C++ Library header.

## 5.43 bitmap\_allocator.h File Reference

## Classes

- class [\\_\\_gnu\\_cxx::\\_\\_detail::\\_\\_mini\\_vector<\\_Tp>](#)
- class [\\_\\_gnu\\_cxx::\\_\\_detail::\\_\\_Bitmap\\_counter<\\_Tp>](#)
- class [\\_\\_gnu\\_cxx::\\_\\_detail::\\_\\_Ffit\\_finder<\\_Tp>](#)
- class [\\_\\_gnu\\_cxx::bitmap\\_allocator<\\_Tp>](#)
- class [\\_\\_gnu\\_cxx::bitmap\\_allocator<\\_Tp>](#)
- class [\\_\\_gnu\\_cxx::free\\_list](#)

## Namespaces

- [\\_\\_gnu\\_cxx](#)
- [\\_\\_gnu\\_cxx::\\_\\_detail](#)

## Macros

- `#define \_BALLOC\_ALIGN\_BYTES`

## Enumerations

- `enum { bits\_per\_byte, bits\_per\_block }`

## Functions

- `void \_\_gnu\_cxx::\_\_detail::\_\_bit\_allocate (std::size_t *__pmap, std::size_t __pos) throw ()`
- `void \_\_gnu\_cxx::\_\_detail::\_\_bit\_free (std::size_t *__pmap, std::size_t __pos) throw ()`
- `template<typename _ForwardIterator, typename _Tp, typename _Compare >  
_ForwardIterator \_\_gnu\_cxx::\_\_detail::\_\_lower\_bound (_ForwardIterator __first, _ForwardIterator __last, const  
_Tp &__val, _Compare __comp)`
- `template<typename _AddrPair >  
std::size_t \_\_gnu\_cxx::\_\_detail::\_\_num\_bitmaps (_AddrPair __ap)`
- `template<typename _AddrPair >  
std::size_t \_\_gnu\_cxx::\_\_detail::\_\_num\_blocks (_AddrPair __ap)`
- `std::size_t \_\_gnu\_cxx::\_\_Bit\_scan\_forward (std::size_t __num)`
- `template<typename _Tp1, typename _Tp2 >  
bool \_\_gnu\_cxx::operator!= (const bitmap_allocator< _Tp1 > &, const bitmap_allocator< _Tp2 > &) throw ()`
- `template<typename _Tp1, typename _Tp2 >  
bool \_\_gnu\_cxx::operator== (const bitmap_allocator< _Tp1 > &, const bitmap_allocator< _Tp2 > &) throw ()`

### 5.43.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

### 5.43.2 Macro Definition Documentation

#### 5.43.2.1 [\\_BALLOC\\_ALIGN\\_BYTES](#)

```
#define _BALLOC_ALIGN_BYTES
```

The constant in the expression below is the alignment required in bytes.

Definition at line 43 of file `bitmap_allocator.h`.

## 5.44 **bitset** File Reference

### Classes

- struct [std::\\_Base\\_bitset< \\_Nw >](#)
- struct [std::\\_Base\\_bitset< 0 >](#)

## Typedefs

- typedef `__PTRDIFF_TYPE__` **std::ptrdiff\_t**
- typedef `__SIZE_TYPE__` **std::size\_t**

## Variables

- decltype(nullptr) typedef **std::nullptr\_t**

## 5.52.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<version>`.

5.53 `c++io.h` File Reference

## Namespaces

- [std](#)

## Typedefs

- typedef FILE **std::\_\_c\_file**
- typedef `__gthread_mutex_t` **std::\_\_c\_lock**

## 5.53.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<ios>`.

5.54 `c++locale.h` File Reference

## Namespaces

- [std](#)

## Macros

- #define **\_GLIBCXX\_C\_LOCALE\_GNU**
- #define **\_GLIBCXX\_NUM\_CATEGORIES**

### Typedefs

- typedef `__locale_t` **std::\_\_c\_locale**

### Functions

- int **std::\_\_convert\_from\_v** (const `__c_locale` &`__cloc`, char \*`__out`, const int `__size`, const char \*`__fmt`,...)

#### 5.54.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<locale>`.

## 5.55 `c++locale_internal.h` File Reference

### Namespaces

- [std](#)

### Functions

- Catalogs & **std::get\_catalogs** ()

#### 5.55.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<locale>`.

## 5.56 `cassert` File Reference

#### 5.56.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `assert.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 5.57 `cast.h` File Reference

### Classes

- struct [\\_\\_gnu\\_cxx::Caster<\\_ToType>](#)

## Namespaces

- [\\_\\_gnu\\_cxx](#)

## Functions

- `template<typename _ToType, typename _FromType >  
_ToType \_\_gnu\_cxx::\_\_const\_pointer\_cast (const _FromType &__arg)`
- `template<typename _ToType, typename _FromType >  
_ToType \_\_gnu\_cxx::\_\_const\_pointer\_cast (_FromType *__arg)`
- `template<typename _ToType, typename _FromType >  
_ToType \_\_gnu\_cxx::\_\_dynamic\_pointer\_cast (const _FromType &__arg)`
- `template<typename _ToType, typename _FromType >

_ToType \_\_gnu\_cxx::\_\_reinterpret\_pointer\_cast (const _FromType &__arg)`
- `template<typename _ToType, typename _FromType >  
_ToType \_\_gnu\_cxx::\_\_reinterpret\_pointer\_cast (_FromType *__arg)`
- `template<typename _ToType, typename _FromType >  
_ToType \_\_gnu\_cxx::\_\_static\_pointer\_cast (const _FromType &__arg)`
- `template<typename _ToType, typename _FromType >  
_ToType \_\_gnu\_cxx::\_\_static\_pointer\_cast (_FromType *__arg)`

## 5.57.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<ext/pointer.h>`.

## 5.58 cc\_hash\_max\_collision\_check\_resize\_trigger\_imp.hpp File Reference

## 5.58.1 Detailed Description

Contains a resize trigger implementation.

## 5.59 cc\_ht\_map.hpp File Reference

## Classes

- class [\\_\\_gnu\\_pbds::detail::cc\\_ht\\_map](#)< Key, Mapped, Hash\_Fn, Eq\_Fn, \_Alloc, Store\_Hash, Comb\_Hash\_Fn, Resize\_Policy >

## Namespaces

- [\\_\\_gnu\\_pbds](#)

## Macros

- `#define PB_DS_CC_HASH_NAME`
- `#define PB_DS_CC_HASH_TRAITS_BASE`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_GEN_POS`
- `#define PB_DS_HASH_EQ_FN_C_DEC`
- `#define PB_DS_RANGED_HASH_FN_C_DEC`

### 5.59.1 Detailed Description

Contains an implementation class for `cc_ht_map_`.

## 5.60 `ccomplex` File Reference

### Macros

- `#define _GLIBCXX_CCOMPLEX`

### 5.60.1 Detailed Description

This is a Standard C++ Library header.

## 5.61 `ccomplex` File Reference

### Macros

- `#define _GLIBCXX_TR1_CCOMPLEX`

### 5.61.1 Detailed Description

This is a TR1 C++ Library header.

## 5.62 `cctype` File Reference

### Namespaces

- [std](#)

## Macros

- `#define _GLIBCXX_CCTYPE`

## 5.62.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `ctype.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

5.63 `cctype` File Reference

## Macros

- `#define _GLIBCXX_TR1_CCTYPE`

## 5.63.1 Detailed Description

This is a TR1 C++ Library header.

5.64 `cerrno` File Reference

## Macros

- `#define _GLIBCXX_CERRNO`
- `#define errno`

## 5.64.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `errno.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

5.65 `cfenv` File Reference

## Macros

- `#define _GLIBCXX_CFENV`

#### 5.65.1 Detailed Description

This is a Standard C++ Library header.

### 5.66 `cfenv` File Reference

#### Macros

- `#define _GLIBCXX_TR1_CFENV`

#### 5.66.1 Detailed Description

This is a TR1 C++ Library header.

### 5.67 `cfloat` File Reference

#### Macros

- `#define _GLIBCXX_CFLOAT`
- `#define DECIMAL_DIG`
- `#define FLT_EVAL_METHOD`

#### 5.67.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `float.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

### 5.68 `cfloat` File Reference

#### Macros

- `#define _GLIBCXX_TR1_CFLOAT`

#### 5.68.1 Detailed Description

This is a TR1 C++ Library header.

## 5.69 char\_traits.h File Reference

### Classes

- struct [\\_\\_gnu\\_cxx::\\_Char\\_types<\\_CharT>](#)
- struct [std::char\\_traits<\\_CharT>](#)
- struct [\\_\\_gnu\\_cxx::char\\_traits<\\_CharT>](#)

#### 5.73.1 Detailed Description

This is a Standard C++ Library header.

## 5.74 chrono File Reference

### Namespaces

- [std](#)
- [std::chrono](#)

#### Macros

- `#define _GLIBCXX_EXPERIMENTAL_CHRONO`

#### Variables

- `template<typename _Rep >`  
`constexpr bool std::chrono::experimental::fundamentals_v1::treat_as_floating_point_v`

#### 5.74.1 Detailed Description

This is a TS C++ Library header.

### 5.75 cinttypes File Reference

#### Macros

- `#define _GLIBCXX_CINTTYPES`

#### 5.75.1 Detailed Description

This is a Standard C++ Library header.

### 5.76 cinttypes File Reference

#### Macros

- `#define _GLIBCXX_TR1_CINTTYPES`

#### 5.76.1 Detailed Description

This is a TR1 C++ Library header.

### 5.77 ciso646 File Reference

#### 5.77.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `iso646.h`, which is empty in C++.

## 5.78 climits File Reference

### Macros

- `#define _GLIBCXX_CLIMITS`
- `#define LLONG_MAX`
- `#define LLONG_MIN`
- `#define ULLONG_MAX`

#### 5.78.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `limits.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 5.79 climits File Reference

### Macros

- `#define _GLIBCXX_TR1_CLIMITS`

#### 5.79.1 Detailed Description

This is a TR1 C++ Library header.

## 5.80 clocale File Reference

### Namespaces

- `std`

### Macros

- `#define _GLIBCXX_CLOCALE`

#### 5.80.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `locale.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 5.81 cmath File Reference

### 5.81.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `math.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 5.82 cmath File Reference

### Namespaces

- [\\_\\_gnu\\_cxx](#)

### Macros

- `#define _EXT_CMATH`

### 5.82.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

## 5.83 cmath File Reference

### Namespaces

- [std](#)
- [std::tr1](#)

### Macros

- `#define _GLIBCXX_TR1_CMATH`

## Functions

- `template<typename _Tp >`

### Functions

- `template<typename _Tp>  
size_t std::__iconv_adapter (size_t(*__func)(iconv_t, _Tp, size_t *, char **, size_t *), iconv_t __cd, char **↵  
__inbuf, size_t *__inbytes, char **__outbuf, size_t *__outbytes)`

### 5.87.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

## 5.88 `compare` File Reference

### 5.88.1 Detailed Description

This is a Standard C++ Library header.

## 5.89 `compatibility.h` File Reference

### 5.89.1 Detailed Description

This is an internal header file, included by other library sources. You should not attempt to use it directly.

## 5.90 compatibility.h File Reference

### Namespaces

- [\\_\\_gnu\\_parallel](#)

### Functions

- `template<typename _Tp >`  
`_Tp __gnu_parallel::__add_omp (volatile _Tp *__ptr, _Tp __addend)`
- `template<typename _Tp >`  
`bool __gnu_parallel::__cas_omp (volatile _Tp *__ptr, _Tp __comparand, _Tp __replacement)`
- `template<typename _Tp >`  
`bool __gnu_parallel::__compare_and_swap (volatile _Tp *__ptr, _Tp __comparand, _Tp __replacement)`
- `template<typename _Tp >`  
`_Tp __gnu_parallel::__fetch_and_add (volatile _Tp *__ptr, _Tp __addend)`
- `void __gnu_parallel::__yield ()`

#### 5.90.1 Detailed Description

Compatibility layer, mostly concerned with atomic operations.

This file is a GNU parallel extension to the Standard C++ Library and contains implementation details for the library's internal use.

## 5.91 compiletime\_settings.h File Reference

### Macros

- `#define _GLIBCXX_CALL(__n)`
- `#define _GLIBCXX_PARALLEL_ASSERTIONS`
- `#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1`
- `#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB`
- `#define _GLIBCXX_SCALE_DOWN_FPU`
- `#define _GLIBCXX_VERBOSE_LEVEL`

#### 5.91.1 Detailed Description

Defines on options concerning debugging and performance, at compile-time. This file is a GNU parallel extension to the Standard C++ Library.

#### 5.91.2 Macro Definition Documentation

##### 5.91.2.1 \_GLIBCXX\_CALL

```
#define _GLIBCXX_CALL(
 __n)
```

Macro to produce log message when entering a function.

**Parameters**

|                        |             |
|------------------------|-------------|
| <code>_↔<br/>_n</code> | Input size. |
|------------------------|-------------|

**See also**

`_GLIBCXX_VERBOSE_LEVEL`

Definition at line 44 of file `completetime_settings.h`.

**5.91.2.2 `_GLIBCXX_PARALLEL_ASSERTIONS`**

```
#define _GLIBCXX_PARALLEL_ASSERTIONS
```

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Should be switched on only locally.

Definition at line 61 of file `completetime_settings.h`.

**5.91.2.3 `_GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1`**

```
#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1
```

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Consider the size of the L1 cache for `gnu_↔  
parallel::__parallel_random_shuffle()`.

Definition at line 68 of file `completetime_settings.h`.

**5.91.2.4 `_GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB`**

```
#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB
```

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Consider the size of the TLB for `gnu_parallel_↔  
::__parallel_random_shuffle()`.

Definition at line 74 of file `completetime_settings.h`.

### 5.91.2.5 \_GLIBCXX\_SCALE\_DOWN\_FPU

```
#define _GLIBCXX_SCALE_DOWN_FPU
```

Use floating-point scaling instead of modulo for mapping random numbers to a range. This can be faster on certain CPUs.

Definition at line 55 of file `completime_settings.h`.

### 5.91.2.6 \_GLIBCXX\_VERBOSE\_LEVEL

```
#define _GLIBCXX_VERBOSE_LEVEL
```

Determine verbosity level of the parallel mode. Level 1 prints a message each time a parallel-mode function is entered.

Definition at line 37 of file `completime_settings.h`.

### 5.92.1 Detailed Description

This is a Standard C++ Library header.

## 5.93 complex File Reference

### Namespaces

- [std](#)
- [std::tr1](#)

### Macros

- `#define _GLIBCXX_TR1_COMPLEX`

### Functions

- `template<typename _Tp >`  
`std::complex< _Tp > std::tr1::conj (const std::complex< _Tp > &__z)`
- `template<typename _Tp >`  
`std::complex< typename __gnu_cxx::__promote< _Tp >::__type > std::tr1::conj (_Tp __x)`
- `template<typename _Tp >`  
`std::complex< _Tp > std::tr1::fabs (const std::complex< _Tp > &__z)`
- `template<typename _Tp, typename _Up >`  
`std::complex< typename __gnu_cxx::__promote_2< _Tp, _Up >::__type > std::tr1::polar (const _Tp &__rho,`  
`const _Up &__theta)`
- `template<typename _Tp, typename _Up >`  
`std::complex< typename __gnu_cxx::__promote_2< _Tp, _Up >::__type > std::tr1::pow (const std::complex<`  
`_Tp > &__x, const _Up &__y)`
- `template<typename _Tp, typename _Up >`  
`std::complex< typename __gnu_cxx::__promote_2< _Tp, _Up >::__type > std::tr1::pow (const _Tp &__x,`  
`const std::complex< _Up > &__y)`
- `template<typename _Tp, typename _Up >`  
`std::complex< typename __gnu_cxx::__promote_2< _Tp, _Up >::__type > std::tr1::pow (const std::complex<`  
`_Tp > &__x, const std::complex< _Up > &__y)`
- `template<typename _Tp >`  
`std::complex< _Tp > std::tr1::pow (const std::complex< _Tp > &__x, const _Tp &__y)`
- `template<typename _Tp >`  
`std::complex< _Tp > std::tr1::pow (const _Tp &__x, const std::complex< _Tp > &__y)`
- `template<typename _Tp >`  
`std::complex< _Tp > std::tr1::pow (const std::complex< _Tp > &__x, const std::complex< _Tp > &__y)`

#### 5.93.1 Detailed Description

This is a TR1 C++ Library header.

## 5.94 complex.h File Reference

### Macros

- `#define _GLIBCXX_COMPLEX_H`

#### 5.94.1 Detailed Description

This is a Standard C++ Library header.

### 5.95 `concept_check.h` File Reference

#### Macros

- `#define __glibcxx_class_requires(_a, _b)`
- `#define __glibcxx_class_requires2(_a, _b, _c)`
- `#define __glibcxx_class_requires3(_a, _b, _c, _d)`
- `#define __glibcxx_class_requires4(_a, _b, _c, _d, _e)`
- `#define __glibcxx_function_requires(...)`

#### 5.95.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iterator>`.

### 5.96 `concepts` File Reference

#### Macros

- `#define _GLIBCXX_CONCEPTS`

#### 5.96.1 Detailed Description

This is a Standard C++ Library header.

### 5.97 `concurrency.h` File Reference

#### Classes

- class [`\_\_gnu\_cxx::\_\_scoped\_lock`](#)

#### Namespaces

- [`\_\_gnu\_cxx`](#)

#### Enumerations

- enum `_Lock_policy` { `_S_single`, `_S_mutex`, `_S_atomic` }

#### Functions

- void `__gnu_cxx::__throw_concurrency_lock_error()`
- void `__gnu_cxx::__throw_concurrency_unlock_error()`

#### Variables

- static const `_Lock_policy` `__gnu_cxx::__default_lock_policy`

#### 5.97.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

### 5.98 `cond_dealtor.hpp` File Reference

#### Classes

- class `__gnu_pbds::detail::cond_dealtor< Entry, _Alloc >`

#### Namespaces

- `__gnu_pbds`

#### 5.98.1 Detailed Description

Contains a conditional deallocator.

### 5.99 `cond_key_dtor_entry_dealtor.hpp` File Reference

#### Classes

- class `__gnu_pbds::detail::cond_dealtor< Entry, _Alloc >`

#### Namespaces

- `__gnu_pbds`

#### 5.99.1 Detailed Description

Contains a conditional key destructor, used for exception handling.

## 5.100 condition\_variable File Reference

### Classes

- class [std::condition\\_variable](#)
- class [std::\\_V2::condition\\_variable\\_any](#)

### Namespaces

- [std](#)

### Macros

- `#define _GLIBCXX_CONDITION_VARIABLE`

### Enumerations

- enum [std::cv\\_status](#) { `no_timeout`, `timeout` }

### Functions

- void **std::notify\_all\_at\_thread\_exit** (condition\_variable &, unique\_lock< mutex >)

#### 5.100.1 Detailed Description

This is a Standard C++ Library header.

## 5.101 const\_iterator.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::binary\\_heap\\_const\\_iterator\\_](#)< Value\_Type, Entry, Simple, \_Alloc >

### Namespaces

- [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_BIN_HEAP_CIT_BASE`

#### 5.101.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

### 5.102 `const_iterator.hpp` File Reference

#### Classes

- class [\\_\\_gnu\\_pbds::detail::left\\_child\\_next\\_sibling\\_heap\\_const\\_iterator\\_< Node, \\_Alloc >](#)

#### Namespaces

- [\\_\\_gnu\\_pbds](#)

#### Macros

- `#define PB_DS_BASIC_HEAP_CIT_BASE`
- `#define PB_DS_CLASS_C_DEC`

#### 5.102.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

### 5.103 `const_iterator.hpp` File Reference

#### 5.103.1 Detailed Description

Contains an iterator class used for const ranging over the elements of the table.

This file is intended to be included inside a class definition, with `PB_DS_CLASS_C_DEC` defined to the name of the enclosing class.

### 5.104 `constructor_destructor_fn_imps.hpp` File Reference

#### 5.104.1 Detailed Description

Contains implementations of `cc_ht_map_`'s constructors, destructor, and related functions.

## 5.105 constructor\_destructor\_fn\_imps.hpp File Reference

### 5.105.1 Detailed Description

Contains implementations of gp\_ht\_map\_'s constructors, destructor, and related functions.

## 5.106 constructor\_destructor\_fn\_imps.hpp File Reference

## 5.107 constructor\_destructor\_no\_store\_hash\_fn\_imps.hpp File Reference

### 5.107.1 Detailed Description

Contains implementations of cc\_ht\_map\_'s constructors, destructor, and related functions.

## 5.108 constructor\_destructor\_no\_store\_hash\_fn\_imps.hpp File Reference

### 5.108.1 Detailed Description

Contains implementations of gp\_ht\_map\_'s constructors, destructor, and related functions.

## 5.109 constructor\_destructor\_store\_hash\_fn\_imps.hpp File Reference

### 5.109.1 Detailed Description

Contains implementations of cc\_ht\_map\_'s constructors, destructor, and related functions.

## 5.110 constructor\_destructor\_store\_hash\_fn\_imps.hpp File Reference

### 5.110.1 Detailed Description

Contains implementations of gp\_ht\_map\_'s constructors, destructor, and related functions.

## 5.111 constructors\_destructor\_fn\_imps.hpp File Reference

### 5.111.1 Detailed Description

Contains an implementation class for binary\_heap\_.

## 5.112 constructors\_destructor\_fn\_imps.hpp File Reference

### 5.112.1 Detailed Description

Contains an implementation for binomial\_heap\_.

## 5.113 constructors\_destructor\_fn\_imps.hpp File Reference

### 5.113.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

## 5.114 constructors\_destructor\_fn\_imps.hpp File Reference

### 5.114.1 Detailed Description

Contains an implementation class for bin\_search\_tree\_.

## 5.115 constructors\_destructor\_fn\_imps.hpp File Reference

### 5.115.1 Detailed Description

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

## 5.116 constructors\_destructor\_fn\_imps.hpp File Reference

### 5.116.1 Detailed Description

Contains an implementation class for ov\_tree\_.

## 5.117 constructors\_destructor\_fn\_imps.hpp File Reference

### 5.117.1 Detailed Description

Contains an implementation class for a pairing heap.

**5.118 constructors\_destructor\_fn\_imps.hpp File Reference****5.118.1 Detailed Description**

Contains an implementation class for pat\_trie.

**5.119 constructors\_destructor\_fn\_imps.hpp File Reference****5.119.1 Detailed Description**

Contains an implementation for rb\_tree\_.

**5.120 constructors\_destructor\_fn\_imps.hpp File Reference****5.120.1 Detailed Description**

Contains an implementation for rc\_binomial\_heap\_.

**5.121 constructors\_destructor\_fn\_imps.hpp File Reference****5.121.1 Detailed Description**

Contains an implementation class for splay\_tree\_.

**5.122 constructors\_destructor\_fn\_imps.hpp File Reference****5.122.1 Detailed Description**

Contains an implementation for thin\_heap\_.

**5.123 container\_base\_dispatch.hpp File Reference****Classes**

- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, Mapped, \\_Alloc, cc\\_hash\\_tag, Policy\\_TI >](#)

- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, null\\_type, \\_Alloc, ov\\_tree\\_tag, Policy\\_TI >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, null\\_type, \\_Alloc, pat\\_trie\\_tag, Policy\\_TI >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, null\\_type, \\_Alloc, rb\\_tree\\_tag, Policy\\_TI >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, null\\_type, \\_Alloc, splay\\_tree\\_tag, Policy\\_TI >](#)

## Namespaces

- [\\_\\_gnu\\_pbds](#)

## Macros

- `#define PB_DS_ASSERT_VALID(X)`
- `#define PB_DS_CHECK_KEY_DOES_NOT_EXIST(_Key)`
- `#define PB_DS_CHECK_KEY_EXISTS(_Key)`
- `#define PB_DS_DATA_FALSE_INDICATOR`
- `#define PB_DS_DATA_TRUE_INDICATOR`
- `#define PB_DS_DEBUG_VERIFY(_Cond)`
- `#define PB_DS_EP2VP(X)`
- `#define PB_DS_EP2VP(X)`
- `#define PB_DS_V2F(X)`
- `#define PB_DS_V2F(X)`
- `#define PB_DS_V2S(X)`
- `#define PB_DS_V2S(X)`

### 5.123.1 Detailed Description

Contains associative container dispatching.

## 5.124 `cpp_type_traits.h` File Reference

### Classes

- struct [std::iterator\\_traits<\\_Iterator>](#)

### Namespaces

- [std](#)

### Macros

- `#define __INT_N(TYPE)`

### Functions

- `template<typename _Iterator>`  
`constexpr _Iterator std::__miter_base (_Iterator __it)`

#### 5.124.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<ext/type_traits>`.

### 5.125 `cpu_defines.h` File Reference

#### 5.125.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iosfwd>`.

### 5.126 `csetjmp` File Reference

#### Namespaces

- [std](#)

#### Macros

- `#define _GLIBCXX_CSETJMP`
- `#define setjmp(env)`

#### 5.126.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `setjmp.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

### 5.127 `csignal` File Reference

#### Namespaces

- [std](#)

#### Macros

- `#define _GLIBCXX_CSIGNAL`

#### 5.127.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `signal.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

### 5.128 `cstdalign` File Reference

#### Macros

- `#define _GLIBCXX_CSTDALIGN`

#### 5.128.1 Detailed Description

This is a Standard C++ Library header.

### 5.129 `cstdarg` File Reference

#### Namespaces

- [std](#)

#### Macros

- `#define _GLIBCXX_CSTDARG`
- `#define va_end(ap)`

#### 5.129.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `stdarg.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

### 5.130 `cstdarg` File Reference

#### Macros

- `#define _GLIBCXX_TR1_CSTDARG`

## 5.130.1 Detailed Description

This is a TR1 C++ Library header.

5.131 `cstdbool` File Reference

## Macros

- `#define _GLIBCXX_CSTDBOOL`

## 5.131.1 Detailed Description

This is a Standard C++ Library header.

5.132 `cstdbool` File Reference

## Macros

- `#define _GLIBCXX_TR1_CSTDBOOL`

## 5.132.1 Detailed Description

This is a TR1 C++ Library header.

5.133 `cstddef` File Reference

## Namespaces

- [std](#)

## Macros

- `#define _GLIBCXX_CSTDDEF`

## 5.133.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `stddef.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 5.134 cstdint File Reference

### Namespaces

- [std](#)

### Macros

- `#define _GLIBCXX_CSTDINT`

### 5.134.1 Detailed Description

This is a Standard C++ Library header.

## 5.135 cstdint File Reference

### Namespaces

- [std](#)
- [std::tr1](#)

### Macros

- `#define _GLIBCXX_TR1_CSTDINT`

### 5.135.1 Detailed Description

This is a TR1 C++ Library header.

## 5.136 cstdio File Reference

### Namespaces

- [std](#)

### Macros

- `#define _GLIBCXX_CSTDIO`

#### 5.136.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `stdio.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

### 5.137 **cstdio File Reference**

#### Macros

- `#define _GLIBCXX_TR1_CSTDIO`

#### 5.137.1 Detailed Description

This is a TR1 C++ Library header.

### 5.138 **cstdlib File Reference**

#### Namespaces

- [std](#)

#### Macros

- `#define _GLIBCXX_CSTDLIB`
- `#define EXIT_FAILURE`
- `#define EXIT_SUCCESS`

#### Functions

- void **std::abort** (void) throw ()
- int **std::atexit** (void(\*) (void)) throw ()
- void **std::exit** (int) throw ()

#### 5.138.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `stdlib.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 5.139 cstdlib File Reference

### Macros

- `#define _GLIBCXX_TR1_CSTDLIB`

### 5.139.1 Detailed Description

This is a TR1 C++ Library header.

## 5.140 cstring File Reference

### Namespaces

- [std](#)

### Macros

- `#define _GLIBCXX_CSTRING`

### Functions

- `void * std::memchr (void *__s, int __c, size_t __n)`
- `char * std::strchr (char *__s, int __n)`
- `char * std::strpbrk (char *__s1, const char *__s2)`
- `char * std::strrchr (char *__s, int __n)`
- `char * std::strstr (char *__s1, const char *__s2)`

### 5.140.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `string.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 5.141 ctgmath File Reference

### Macros

- `#define _GLIBCXX_CTGMATH`

## 5.141.1 Detailed Description

This is a Standard C++ Library header.

5.142 `ctgmath` File Reference

## Macros

- `#define _GLIBCXX_TR1_CTGMATH`

## 5.142.1 Detailed Description

This is a TR1 C++ Library header.

5.143 `ctime` File Reference

## Namespaces

- `std`

## Macros

- `#define _GLIBCXX_CTIME`

## 5.143.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `time.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

5.144 `ctime` File Reference

## Macros

- `#define _GLIBCXX_TR1_CTIME`

## 5.144.1 Detailed Description

This is a TR1 C++ Library header.

## 5.145 ctype\_base.h File Reference

### Classes

- struct [std::ctype\\_base](#)

### Namespaces

- [std](#)

#### 5.145.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<locale>`.

## 5.146 ctype\_inline.h File Reference

### Namespaces

- [std](#)

#### 5.146.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<locale>`.

## 5.147 cuchar File Reference

### Macros

- `#define _GLIBCXX_CUCHAR`

#### 5.147.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `uchar.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 5.148 `wchar` File Reference

### Namespaces

- [std](#)

### Macros

- `#define _GLIBCXX_CWCHAR`

### Functions

- `wchar_t * std::wcschr` (`wchar_t *__p`, `wchar_t __c`)
- `wchar_t * std::wcspbrk` (`wchar_t *__s1`, `const wchar_t *__s2`)
- `wchar_t * std::wcsrchr` (`wchar_t *__p`, `wchar_t __c`)
- `wchar_t * std::wcsstr` (`wchar_t *__s1`, `const wchar_t *__s2`)
- `wchar_t * std::wmemchr` (`wchar_t *__p`, `wchar_t __c`, `size_t __n`)

#### 5.148.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `wchar.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 5.149 `wchar` File Reference

### Namespaces

- [std](#)
- [std::tr1](#)

### Macros

- `#define _GLIBCXX_TR1_CWCHAR`

#### 5.149.1 Detailed Description

This is a TR1 C++ Library header.

## 5.150 `cwctype` File Reference

### Namespaces

- [std](#)

### Macros

- `#define _GLIBCXX_CWCTYPE`

#### 5.150.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `wctype.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 5.151 `cwctype` File Reference

### Namespaces

- [std](#)
- [std::tr1](#)

### Macros

- `#define _GLIBCXX_TR1_CWCTYPE`

#### 5.151.1 Detailed Description

This is a TR1 C++ Library header.

## 5.152 `cxxabi.h` File Reference

### Classes

### 5.152.1 Detailed Description

The header provides an interface to the C++ ABI.

### 5.152.2 Function Documentation

#### 5.152.2.1 `__cxa_demangle()`

```
char* __cxxabiv1::__cxa_demangle (
 const char * __mangled_name,
 char * __output_buffer,
 size_t * __length,
 int * __status)
```

Demangling routine. ABI-mandated entry point in the C++ runtime library for demangling.

#### Parameters

|                              |                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__mangled_name</code>  | A NUL-terminated character string containing the name to be demangled.                                                                                                                                                                                                                                                                                                                                   |
| <code>__output_buffer</code> | A region of memory, allocated with <code>malloc</code> , of <code>*__length</code> bytes, into which the demangled name is stored. If <code>__output_buffer</code> is not long enough, it is expanded using <code>realloc</code> . <code>__output_buffer</code> may instead be <code>NULL</code> ; in that case, the demangled name is placed in a region of memory allocated with <code>malloc</code> . |
| <code>__length</code>        | If <code>__length</code> is non-null, the length of the buffer containing the demangled name is placed in <code>*__length</code> .                                                                                                                                                                                                                                                                       |
| <code>__status</code>        | If <code>__status</code> is non-null, <code>*__status</code> is set to one of the following values: 0: The demangling operation succeeded. -1: A memory allocation failure occurred. -2: <code>mangled_name</code> is not a valid name under the C++ ABI mangling rules. -3: One of the arguments is invalid.                                                                                            |

#### Returns

A pointer to the start of the NUL-terminated demangled name, or `NULL` if the demangling fails. The caller is responsible for deallocating this memory using `free`.

The demangling is performed using the C++ ABI mangling rules, with GNU extensions. For example, this function is used in `__gnu_cxx::__verbose_terminate_handler`.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/ext\\_demangling.html](https://gcc.gnu.org/onlinedocs/libstdc++/manual/ext_demangling.html) for other examples of use.

#### Note

The same demangling functionality is available via `libiberty` (`<libiberty/demangle.h>` and `libiberty`.↵a) in GCC 3.1 and later, but that requires explicit installation (`-enable-install-libiberty`) and uses a different API, although the ABI is unchanged.

## 5.153 `cxxabi_forced.h` File Reference

### Classes

- class [\\_\\_cxxabiv1::\\_\\_forced\\_unwind](#)

#### 5.153.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<cxxabi.h>`.

## 5.157.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

5.158 `debug_fn_imps.hpp` File Reference

## 5.158.1 Detailed Description

Contains an implementation class for a `binary_heap`.

5.159 `debug_fn_imps.hpp` File Reference

## 5.159.1 Detailed Description

Contains an implementation for `binomial_heap_`.

5.160 `debug_fn_imps.hpp` File Reference

## 5.160.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

5.161 `debug_fn_imps.hpp` File Reference

## 5.161.1 Detailed Description

Contains an implementation class for `bin_search_tree_`.

## 5.162 `debug_fn_imps.hpp` File Reference

### 5.162.1 Detailed Description

Contains implementations of `cc_ht_map_`'s debug-mode functions.

## 5.163 `debug_fn_imps.hpp` File Reference

### 5.163.1 Detailed Description

Contains implementations of `gp_ht_map_`'s debug-mode functions.

## 5.164 `debug_fn_imps.hpp` File Reference

### 5.164.1 Detailed Description

Contains an implementation class for `left_child_next_sibling_heap_`.

## 5.165 `debug_fn_imps.hpp` File Reference

### 5.165.1 Detailed Description

Contains implementations of `cc_ht_map_`'s debug-mode functions.

## 5.166 `debug_fn_imps.hpp` File Reference

### 5.166.1 Detailed Description

Contains an implementation class for `ov_tree_`.

## 5.167 `debug_fn_imps.hpp` File Reference

### 5.167.1 Detailed Description

Contains an implementation class for a pairing heap.

## 5.168 `debug_fn_imps.hpp` File Reference

### 5.168.1 Detailed Description

Contains an implementation class for `pat_trie_`.

## 5.169 `debug_fn_imps.hpp` File Reference

### 5.169.1 Detailed Description

Contains an implementation for `rb_tree_`.

## 5.170 `debug_fn_imps.hpp` File Reference

### 5.170.1 Detailed Description

Contains an implementation for `rc_binomial_heap_`.

## 5.171 `debug_fn_imps.hpp` File Reference

### 5.171.1 Detailed Description

Contains an implementation class for `splay_tree_`.

## 5.172 `debug_fn_imps.hpp` File Reference

### 5.172.1 Detailed Description

Contains an implementation for `thin_heap_`.

## 5.173 `debug_map_base.hpp` File Reference

### 5.173.1 Detailed Description

Contains a debug-mode base for all maps.

### 5.174 `debug_no_store_hash_fn_imps.hpp` File Reference

#### 5.174.1 Detailed Description

Contains implementations of `cc_ht_map_`'s debug-mode functions.

### 5.175 `debug_no_store_hash_fn_imps.hpp` File Reference

#### 5.175.1 Detailed Description

Contains implementations of `gp_ht_map_`'s debug-mode functions.

### 5.176 `debug_store_hash_fn_imps.hpp` File Reference

#### 5.176.1 Detailed Description

Contains implementations of `cc_ht_map_`'s debug-mode functions.

### 5.177 `debug_store_hash_fn_imps.hpp` File Reference

#### 5.177.1 Detailed Description

Contains implementations of `gp_ht_map_`'s debug-mode functions.

### 5.178 `decimal` File Reference

### 5.178.1 Detailed Description

This is a Standard C++ Library header.

## 5.179 deque File Reference

### Macros

- `#define _GLIBCXX_DEQUE`

### 5.179.1 Detailed Description

This is a Standard C++ Library header.

## 5.180 deque File Reference

### Classes

- class [std::\\_\\_debug::deque<\\_Tp, \\_Allocator >](#)
- class [std::\\_\\_debug::deque<\\_Tp, \\_Allocator >](#)

### Namespaces

- [std](#)
- [std::\\_\\_debug](#)

### Macros

- `#define _GLIBCXX_DEBUG_DEQUE`

### Functions

- `template<typename _Tp, typename _Alloc >  
bool std::__debug::operator!= (const deque<_Tp, _Alloc > &__lhs, const deque<_Tp, _Alloc > &__rhs)`
- `template<typename _Tp, typename _Alloc >  
bool std::__debug::operator< (const deque<_Tp, _Alloc > &__lhs, const deque<_Tp, _Alloc > &__rhs)`

#### 5.194.1 Detailed Description

This file is a GNU parallel extension to the Standard C++ Library.

## 5.195 erase\_fn\_imps.hpp File Reference

#### 5.195.1 Detailed Description

Contains an implementation class for a binary\_heap.

## 5.196 `erase_fn_imps.hpp` File Reference

### 5.196.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

## 5.197 `erase_fn_imps.hpp` File Reference

### 5.197.1 Detailed Description

Contains an implementation class for `bin_search_tree_`.

## 5.198 `erase_fn_imps.hpp` File Reference

### 5.198.1 Detailed Description

Contains implementations of `cc_ht_map_`'s erase related functions.

## 5.199 `erase_fn_imps.hpp` File Reference

### 5.199.1 Detailed Description

Contains implementations of `gp_ht_map_`'s erase related functions.

## 5.200 `erase_fn_imps.hpp` File Reference

### 5.200.1 Detailed Description

Contains an implementation class for `left_child_next_sibling_heap_`.

## 5.201 `erase_fn_imps.hpp` File Reference

### 5.201.1 Detailed Description

Contains implementations of `lu_map_`.

## 5.202 erase\_fn\_imps.hpp File Reference

### 5.202.1 Detailed Description

Contains an implementation class for ov\_tree\_.

## 5.203 erase\_fn\_imps.hpp File Reference

### 5.203.1 Detailed Description

Contains an implementation class for a pairing heap.

## 5.204 erase\_fn\_imps.hpp File Reference

### 5.204.1 Detailed Description

Contains an implementation class for pat\_trie.

## 5.205 erase\_fn\_imps.hpp File Reference

### 5.205.1 Detailed Description

Contains an implementation for rb\_tree\_.

## 5.206 erase\_fn\_imps.hpp File Reference

### 5.206.1 Detailed Description

Contains an implementation for rc\_binomial\_heap\_.

## 5.207 erase\_fn\_imps.hpp File Reference

### 5.207.1 Detailed Description

Contains an implementation class for splay\_tree\_.

## 5.208 `erase_fn_imps.hpp` File Reference

### 5.208.1 Detailed Description

Contains an implementation for `thin_heap_`.

## 5.209 `erase_if.h` File Reference

### Namespaces

- [std](#)

## Functions

- `template<typename _Tp >`  
`void` [\\_\\_gnu\\_cxx::swap](#) (\_ExtPtr\_allocator<\_Tp> &\_\_larg, \_ExtPtr\_allocator<\_Tp> &\_\_rarg)

### 5.221.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

## Author

Bob Walters

An example allocator which uses an alternative pointer type from `bits/pointer.h`. Supports test cases which confirm container support for alternative pointers.

## 5.222 features.h File Reference

### Macros

- `#define _GLIBCXX_BAL_QUICKSORT`
- `#define _GLIBCXX_FIND_CONSTANT_SIZE_BLOCKS`
- `#define _GLIBCXX_FIND_EQUAL_SPLIT`
- `#define _GLIBCXX_FIND_GROWING_BLOCKS`
- `#define _GLIBCXX_MERGESORT`
- `#define _GLIBCXX_QUICKSORT`
- `#define _GLIBCXX_TREE_DYNAMIC_BALANCING`
- `#define _GLIBCXX_TREE_FULL_COPY`
- `#define _GLIBCXX_TREE_INITIAL_SPLITTING`

### 5.222.1 Detailed Description

Defines on whether to include algorithm variants.

Less variants reduce executable size and compile time. This file is a GNU parallel extension to the Standard C++ Library.

### 5.222.2 Macro Definition Documentation

#### 5.222.2.1 \_GLIBCXX\_BAL\_QUICKSORT

```
#define _GLIBCXX_BAL_QUICKSORT
```

Include parallel dynamically load-balanced quicksort.

#### See also

`__gnu_parallel::Settings::sort_algorithm`

Definition at line 55 of file features.h.

#### 5.222.2.2 \_GLIBCXX\_FIND\_CONSTANT\_SIZE\_BLOCKS

```
#define _GLIBCXX_FIND_CONSTANT_SIZE_BLOCKS
```

Include the equal-sized blocks variant for `std::find`.

#### See also

`__gnu_parallel::Settings::find_algorithm`

Definition at line 67 of file features.h.

#### 5.222.2.3 `_GLIBCXX_FIND_EQUAL_SPLIT`

```
#define _GLIBCXX_FIND_EQUAL_SPLIT
```

Include the equal splitting variant for `std::find`.

See also

`__gnu_parallel::_Settings::find_algorithm`

Definition at line 74 of file `features.h`.

#### 5.222.2.4 `_GLIBCXX_FIND_GROWING_BLOCKS`

```
#define _GLIBCXX_FIND_GROWING_BLOCKS
```

Include the growing blocks variant for `std::find`.

See also

`__gnu_parallel::_Settings::find_algorithm`

Definition at line 61 of file `features.h`.

#### 5.222.2.5 `_GLIBCXX_MERGESORT`

```
#define _GLIBCXX_MERGESORT
```

Include parallel multi-way mergesort.

See also

`__gnu_parallel::_Settings::sort_algorithm`

Definition at line 41 of file `features.h`.

#### 5.222.2.6 `_GLIBCXX_QUICKSORT`

```
#define _GLIBCXX_QUICKSORT
```

Include parallel unbalanced quicksort.

See also

`__gnu_parallel::_Settings::sort_algorithm`

Definition at line 48 of file `features.h`.

#### 5.222.2.7 \_GLIBCXX\_TREE\_DYNAMIC\_BALANCING

```
#define _GLIBCXX_TREE_DYNAMIC_BALANCING
```

Include the dynamic balancing variant for `_Rb_tree::insert_unique(_Iter beg, _Iter __end)`.

See also

`__gnu_parallel::_Rb_tree`

Definition at line 91 of file `features.h`.

#### 5.222.2.8 \_GLIBCXX\_TREE\_FULL\_COPY

```
#define _GLIBCXX_TREE_FULL_COPY
```

In order to sort the input sequence of `_Rb_tree::insert_unique(_Iter beg, _Iter __end)` a full copy of the input elements is done.

See also

`__gnu_parallel::_Rb_tree`

Definition at line 100 of file `features.h`.

#### 5.222.2.9 \_GLIBCXX\_TREE\_INITIAL\_SPLITTING

```
#define _GLIBCXX_TREE_INITIAL_SPLITTING
```

Include the initial splitting variant for `_Rb_tree::insert_unique(_Iter beg, _Iter __end)`.

See also

`__gnu_parallel::_Rb_tree`

Definition at line 83 of file `features.h`.

### 5.223 fenv.h File Reference

#### 5.223.1 Detailed Description

This is a Standard C++ Library header.

## 5.224 filesystem File Reference

### Macros

- `#define _GLIBCXX_FILESYSTEM`

### 5.224.1 Detailed Description

This is a Standard C++ Library header.

## 5.225 filesystem File Reference

### Macros

- `#define __cpp_lib_experimental_filesystem`
- `#define _GLIBCXX_EXPERIMENTAL_FILESYSTEM`

### 5.225.1 Detailed Description

This is a TS C++ Library header.

`std::pair<_RAIter1, _RAIter2 > \_\_gnu\_parallel::find\_template (_RAIter1 __begin1, _RAIter1 __end1, _RAIter2 __begin2, _Pred __pred, _Selector __selector, constant_size_blocks_tag)`

#### 5.226.1 Detailed Description

Parallel implementation base for `std::find()`, `std::equal()` and related functions. This file is a GNU parallel extension to the Standard C++ Library.

### 5.227 find\_fn\_imps.hpp File Reference

#### 5.227.1 Detailed Description

Contains an implementation class for a `binary_heap`.

### 5.228 find\_fn\_imps.hpp File Reference

#### 5.228.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

### 5.229 find\_fn\_imps.hpp File Reference

#### 5.229.1 Detailed Description

Contains an implementation class for `bin_search_tree_`.

### 5.230 find\_fn\_imps.hpp File Reference

#### 5.230.1 Detailed Description

Contains implementations of `cc_ht_map_`'s find related functions.

### 5.231 find\_fn\_imps.hpp File Reference

#### 5.231.1 Detailed Description

Contains implementations of `gp_ht_map_`'s find related functions.

### 5.232 find\_fn\_imps.hpp File Reference

#### 5.232.1 Detailed Description

Contains implementations of `lu_map_`.

### 5.233 `find_fn_imps.hpp` File Reference

#### 5.233.1 Detailed Description

Contains an implementation class for a pairing heap.

### 5.234 `find_fn_imps.hpp` File Reference

#### 5.234.1 Detailed Description

Contains an implementation class for `pat_trie`.

### 5.235 `find_fn_imps.hpp` File Reference

#### 5.235.1 Detailed Description

Contains an implementation for `rb_tree_`.

### 5.236 `find_fn_imps.hpp` File Reference

#### 5.236.1 Detailed Description

Contains an implementation class for `splay_tree_`.

### 5.237 `find_fn_imps.hpp` File Reference

#### 5.237.1 Detailed Description

Contains an implementation for `thin_heap_`.

### 5.238 `find_no_store_hash_fn_imps.hpp` File Reference

#### 5.238.1 Detailed Description

Contains implementations of `gp_ht_map_`'s find related functions, when the hash value is not stored.

## 5.239 find\_selectors.h File Reference

### 5.242.1 Detailed Description

Main interface for embarrassingly parallel functions.

The explicit implementation are in other header files, like `workstealing.h`, `par_loop.h`, `omp_loop.h`, and `omp_loop_↔static.h`. This file is a GNU parallel extension to the Standard C++ Library.

### 5.261.1 Detailed Description

This is a TS C++ Library header.

### 5.261.2 Function Documentation

#### 5.261.2.1 `make_boyer_moore_horspool_searcher()`

```
template<typename _RAIter , typename _Hash = std::hash<typename std::iterator_traits<_RAIter>↵
::value_type>, typename _BinaryPredicate = equal_to<>>>
boyer_moore_horspool_searcher<_RAIter, _Hash, _BinaryPredicate> std::experimental::fundamentals↵
_v1::make_boyer_moore_horspool_searcher (
 _RAIter __pat_first,
 _RAIter __pat_last,
 _Hash __hf = _Hash(),
 _BinaryPredicate __pred = _BinaryPredicate()) [inline]
```

Generator function for `boyer_moore_horspool_searcher`.

Definition at line 303 of file `experimental/functional`.

#### 5.261.2.2 `make_boyer_moore_searcher()`

```
template<typename _RAIter , typename _Hash = std::hash<typename std::iterator_traits<_RAIter>↵
::value_type>, typename _BinaryPredicate = equal_to<>>>
boyer_moore_searcher<_RAIter, _Hash, _BinaryPredicate> std::experimental::fundamentals_v1::make↵
_boyer_moore_searcher (
 _RAIter __pat_first,
 _RAIter __pat_last,
 _Hash __hf = _Hash(),
 _BinaryPredicate __pred = _BinaryPredicate()) [inline]
```

Generator function for `boyer_moore_searcher`.

Definition at line 293 of file `experimental/functional`.

#### 5.261.2.3 `make_default_searcher()`

```
template<typename _ForwardIterator , typename _BinaryPredicate = std::equal_to<>>>
default_searcher<_ForwardIterator, _BinaryPredicate> std::experimental::fundamentals_v1::make_↵
default_searcher (
 _ForwardIterator __pat_first,
 _ForwardIterator __pat_last,
 _BinaryPredicate __pred = _BinaryPredicate()) [inline]
```

Generator function for `default_searcher`.

Definition at line 283 of file `experimental/functional`.

## 5.261.2.4 not\_fn()

```
template<typename _Fn >
auto std::experimental::fundamentals_v2::not_fn (
 _Fn && __fn) [inline], [noexcept]
```

[func.not\_fn] Function template not\_fn

Definition at line 372 of file experimental/functional.

## 5.261.3 Variable Documentation

## 5.261.3.1 is\_bind\_expression\_v

```
template<typename _Tp >
constexpr bool std::experimental::fundamentals_v1::is_bind_expression_v
```

Variable template for std::is\_bind\_expression.

Definition at line 61 of file experimental/functional.

## 5.261.3.2 is\_placeholder\_v

```
template<typename _Tp >
constexpr int std::experimental::fundamentals_v1::is_placeholder_v
```

Variable template for std::is\_placeholder.

Definition at line 65 of file experimental/functional.

## Standard Stream Objects

The `<iostream>` header declares the eight standard stream objects. For other declarations, see <http://gcc.gnu.org/onlinedocs/libstdc++/manual/io.html> and the [I/O forward declarations](#)

They are required by default to cooperate with the global C library's `FILE` streams, and to be available during program startup and termination. For more information, see the section of the manual linked to above.

- `istream` [std::cin](#)
- `ostream` [std::cout](#)
- `ostream` [std::cerr](#)

`ostream_joiner< decay\_t< \_DelimT >, \_CharT, \_Traits > std::experimental::fundamentals\_v2::make\_ostream\_joiner`  
`(basic\_ostream< \_CharT, \_Traits > &__os, \_DelimT &&__delimiter)`

### 5.323.1 Detailed Description

This is a TS C++ Library header.

### 5.323.2 Function Documentation

#### 5.323.2.1 `make_ostream_joiner()`

```
template<typename _CharT , typename _Traits , typename _DelimT >
ostream_joiner<decay_t<_DelimT>, _CharT, _Traits> std::experimental::fundamentals_v2::make_ostream_joiner (
 basic_ostream< _CharT, _Traits > & __os,
 _DelimT && __delimiter) [inline]
```

Object generator for `ostream_joiner`.

Definition at line 104 of file `experimental/iterator`.

### 5.324 `iterator.h` File Reference

#### Classes

- class [\\_\\_gnu\\_parallel::\\_IteratorPair<\\_Iterator1, \\_Iterator2, \\_IteratorCategory >](#)
- class [\\_\\_gnu\\_parallel::\\_IteratorTriple<\\_Iterator1, \\_Iterator2, \\_Iterator3, \\_IteratorCategory >](#)

#### Namespaces

- [\\_\\_gnu\\_parallel](#)

#### 5.324.1 Detailed Description

Helper iterator classes for the `std::transform()` functions. This file is a GNU parallel extension to the Standard C++ Library.

### 5.325 `iterator.hpp` File Reference

#### 5.325.1 Detailed Description

Contains an `iterator_` class used for ranging over the elements of the table.

This file is intended to be included inside a class definition, with `PB_DS_CLASS_C_DEC` defined to the name of the enclosing class.

### 5.326 `iterator_concepts.h` File Reference

#### 5.326.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iterator>`.

## 5.327 iterator\_fn\_imps.hpp File Reference

### 5.327.1 Detailed Description

Contains implementations of gp\_ht\_map\_'s iterators related functions, e.g., begin().

## 5.328 iterators\_fn\_imps.hpp File Reference

### 5.328.1 Detailed Description

Contains an implementation class for a binary\_heap.

## 5.329 iterators\_fn\_imps.hpp File Reference

### 5.329.1 Detailed Description

Contains an implementation class for bin\_search\_tree\_.

## 5.330 iterators\_fn\_imps.hpp File Reference

### 5.330.1 Detailed Description

Contains implementations of cc\_ht\_map\_'s iterators related functions, e.g., begin().

## 5.331 iterators\_fn\_imps.hpp File Reference

### 5.331.1 Detailed Description

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

## 5.332 iterators\_fn\_imps.hpp File Reference

### 5.332.1 Detailed Description

Contains implementations of lu\_map\_.

### 5.333 `iterators_fn_imps.hpp` File Reference

#### 5.333.1 Detailed Description

Contains an implementation class for `ov_tree_`.

### 5.334 `iterators_fn_imps.hpp` File Reference

#### 5.334.1 Detailed Description

Contains an implementation class for `pat_trie`.

### 5.335 `left_child_next_sibling_heap_.hpp` File Reference

#### Classes

- class [\\_\\_gnu\\_pbds::detail::left\\_child\\_next\\_sibling\\_heap< Value\\_Type, Cmp\\_Fn, Node\\_Metadata, \\_Alloc >](#)

#### Namespaces

- [\\_\\_gnu\\_pbds](#)

#### Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`

#### 5.335.1 Detailed Description

Contains an implementation class for a basic heap.

### 5.336 `lfts_config.h` File Reference

#### 5.336.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly.

### 5.357.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

## 5.357.2 Macro Definition Documentation

### 5.357.2.1 `__glibcxx_check_erase`

```
#define __glibcxx_check_erase(
 _Position)
```

Verify that we can erase the element referenced by the iterator `_Position`. We can erase the element if the `_Position` iterator is dereferenceable and references this sequence.

Definition at line 216 of file macros.h.

### 5.357.2.2 `__glibcxx_check_erase_after`

```
#define __glibcxx_check_erase_after(
 _Position)
```

Verify that we can erase the element after the iterator `_Position`. We can erase the element if the `_Position` iterator is before a dereferenceable one and references this sequence.

Definition at line 230 of file macros.h.

### 5.357.2.3 `__glibcxx_check_erase_range`

```
#define __glibcxx_check_erase_range(
 _First,
 _Last)
```

Verify that we can erase the elements in the iterator range `[_First, _Last)`. We can erase the elements if `[_First, _Last)` is a valid iterator range within this sequence.

Definition at line 244 of file macros.h.

### 5.357.2.4 `__glibcxx_check_erase_range_after`

```
#define __glibcxx_check_erase_range_after(
 _First,
 _Last)
```

Verify that we can erase the elements in the iterator range `(_First, _Last)`. We can erase the elements if `(_First, _Last)` is a valid iterator range within this sequence.

Definition at line 256 of file macros.h.

**5.357.2.5 \_\_glibcxx\_check\_heap\_pred**

```
#define __glibcxx_check_heap_pred(
 _First,
 _Last,
 _Pred)
```

Verify that the iterator range `[_First, _Last)` is a heap w.r.t. the predicate `_Pred`.

Definition at line 441 of file macros.h.

**5.357.2.6 \_\_glibcxx\_check\_insert**

```
#define __glibcxx_check_insert(
 _Position)
```

Verify that we can insert into `*this` with the iterator `_Position`. Insertion into a container at a specific position requires that the iterator be nonsingular, either dereferenceable or past-the-end, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_iterator`.

Definition at line 150 of file macros.h.

**5.357.2.7 \_\_glibcxx\_check\_insert\_after**

```
#define __glibcxx_check_insert_after(
 _Position)
```

Verify that we can insert into `*this` after the iterator `_Position`. Insertion into a container after a specific position requires that the iterator be nonsingular, either dereferenceable or before-begin, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_iterator`.

Definition at line 167 of file macros.h.

**5.357.2.8 \_\_glibcxx\_check\_insert\_range**

```
#define __glibcxx_check_insert_range(
 _Position,
 _First,
 _Last,
 _Dist)
```

Verify that we can insert the values in the iterator range `[_First, _Last)` into `*this` with the iterator `_Position`. Insertion into a container at a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range `[_First, _Last)` is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the `_Position` iterator is a `_Safe_iterator`.

Definition at line 184 of file macros.h.

### 5.357.2.9 \_\_glibcxx\_check\_insert\_range\_after

```
#define __glibcxx_check_insert_range_after(
 _Position,
 _First,
 _Last,
 _Dist)
```

Verify that we can insert the values in the iterator range `[_First, _Last)` into `*this` after the iterator `_Position`. Insertion into a container after a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range `[_First, _Last)` is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the `_Position` iterator is a `_Safe_iterator`.

Definition at line 203 of file `macros.h`.

### 5.357.2.10 \_\_glibcxx\_check\_partitioned\_lower

```
#define __glibcxx_check_partitioned_lower(
 _First,
 _Last,
 _Value)
```

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value`.

Definition at line 385 of file `macros.h`.

### 5.357.2.11 \_\_glibcxx\_check\_partitioned\_lower\_pred

```
#define __glibcxx_check_partitioned_lower_pred(
 _First,
 _Last,
 _Value,
 _Pred)
```

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value` and predicate `_Pred`.

Definition at line 407 of file `macros.h`.

### 5.357.2.12 \_\_glibcxx\_check\_partitioned\_upper\_pred

```
#define __glibcxx_check_partitioned_upper_pred(
 _First,
 _Last,
 _Value,
 _Pred)
```

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value` and predicate `_Pred`.

Definition at line 420 of file `macros.h`.

### 5.357.2.13 `__glibcxx_check_sorted_pred`

```
#define __glibcxx_check_sorted_pred(
 _First,
 _Last,
 _Pred)
```

Verify that the iterator range `[_First, _Last)` is sorted by the predicate `_Pred`.

Definition at line 350 of file `macros.h`.

### 5.357.2.14 `_GLIBCXX_DEBUG_VERIFY_COND_AT`

```
#define _GLIBCXX_DEBUG_VERIFY_COND_AT(
 _Cond,
 _ErrMsg,
 _File,
 _Line,
 _Func)
```

Macros used by the implementation to verify certain properties. These macros may only be used directly by the debug wrappers. Note that these are macros (instead of the more obviously *correct* choice of making them functions) because we need line and file information at the call site, to minimize the distance between the user error and where the error is reported.

Definition at line 50 of file `macros.h`.

### 5.378.1 Detailed Description

Functions to find elements of a certain global \_\_rank in multiple sorted sequences. Also serves for splitting such sequence sets.

The algorithm description can be found in

P. J. Varman, S. D. Scheufler, B. R. Iyer, and G. R. Ricard. Merging Multiple Lists on Hierarchical-Memory Multiprocessors. Journal of Parallel and Distributed Computing, 12(2):171-177, 1991.

This file is a GNU parallel extension to the Standard C++ Library.

### 5.380.1 Detailed Description

Implementation of sequential and parallel multiway merge.

Explanations on the high-speed merging routines in the appendix of

P. Sanders. Fast priority queues for cached memory. ACM Journal of Experimental Algorithmics, 5, 2000.

This file is a GNU parallel extension to the Standard C++ Library.

### 5.380.2 Macro Definition Documentation

#### 5.380.2.1 \_GLIBCXX\_PARALLEL\_LENGTH

```
#define _GLIBCXX_PARALLEL_LENGTH(
 __s)
```

Length of a sequence described by a pair of iterators.

Definition at line 54 of file multiway\_merge.h.

## Variables

- const nothrow\_t **std::nothrow**

### 5.385.1 Detailed Description

This is a Standard C++ Library header.

The header `new` defines several functions to manage dynamic memory and handling memory allocation errors; see [https://gcc.gnu.org/onlinedocs/libstdc++/manual/dynamic\\_memory.html](https://gcc.gnu.org/onlinedocs/libstdc++/manual/dynamic_memory.html) for more.

### 5.385.2 Function Documentation

**5.385.2.1 operator delete()** [1/3]

```
void operator delete (
 void *) [noexcept]
```

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

**5.385.2.2 operator delete()** [2/3]

```
void operator delete (
 void * ,
 const std::nothrow_t &) [noexcept]
```

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

**5.385.2.3 operator delete()** [3/3]

```
void operator delete (
 void * ,
 void *) [inline], [noexcept]
```

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

Definition at line 180 of file `new`.

**5.385.2.4 operator delete[]()** [1/3]

```
void operator delete[] (
 void *) [noexcept]
```

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

**5.385.2.5 operator delete[]()** [2/3]

```
void operator delete[] (
 void * ,
 const std::nothrow_t &) [noexcept]
```

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

**5.385.2.6 operator delete[]()** [3/3]

```
void operator delete[] (
 void * ,
 void *) [inline], [noexcept]
```

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

Definition at line 181 of file new.

**5.385.2.7 operator new()** [1/3]

```
void* operator new (
 std::size_t)
```

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

**5.385.2.8 operator new()** [2/3]

```
void* operator new (
 std::size_t ,
 const std::nothrow_t &) [nothrow]
```

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

**5.385.2.9 operator new()** [3/3]

```
void* operator new (
 std::size_t ,
 void * __p) [inline], [nothrow]
```

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

Definition at line 174 of file new.

**5.385.2.10 operator new[]()** [1/3]

```
void* operator new[] (
 std::size_t)
```

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

**5.385.2.11 operator new[]()** [2/3]

```
void* operator new[] (
 std::size_t ,
 const std::nothrow_t &) [nothrow]
```

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

**5.385.2.12 operator new[]()** [3/3]

```
void* operator new[] (
 std::size_t ,
 void * __p) [inline], [nothrow]
```

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

Definition at line 176 of file `new`.

### 5.399.1 Detailed Description

Parallel STL function calls corresponding to `stl_numeric.h`. The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

## 5.400 numeric File Reference

`constexpr common_type_t<_Mn, _Nn> std::experimental::fundamentals\_v2::lcm (_Mn __m, _Nn __n)`

#### 5.400.1 Detailed Description

This is a TS C++ Library header.

#### 5.400.2 Function Documentation

##### 5.400.2.1 gcd()

```
template<typename _Mn, typename _Nn >
constexpr common_type_t<_Mn, _Nn> std::experimental::fundamentals_v2::gcd (
 _Mn __m,
 _Nn __n) [noexcept]
```

Greatest common divisor.

Definition at line 57 of file experimental/numeric.

##### 5.400.2.2 lcm()

```
template<typename _Mn, typename _Nn >
constexpr common_type_t<_Mn, _Nn> std::experimental::fundamentals_v2::lcm (
 _Mn __m,
 _Nn __n)
```

Least common multiple.

Definition at line 75 of file experimental/numeric.

#### Macros

- `#define PB_DS_ASSERT_NODE_CONSISTENT(_Node, _Bool)`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_P_HEAP_BASE`

#### 5.415.1 Detailed Description

Contains an implementation class for a pairing heap.

### 5.416 `par_loop.h` File Reference

#### Namespaces

- [\\_\\_gnu\\_parallel](#)

#### Functions

- `template<typename _RAIter, typename _Op, typename _Fu, typename _Red, typename _Result >  
_Op \_\_gnu\_parallel::\_\_for\_each\_template\_random\_access\_ed (_RAIter __begin, _RAIter __end, _Op __o, _Fu  
&__f, _Red __r, _Result __base, _Result &__output, typename std::iterator\_traits< _RAIter >::difference_type  
__bound)`

#### 5.416.1 Detailed Description

Parallelization of embarrassingly parallel execution by means of equal splitting. This file is a GNU parallel extension to the Standard C++ Library.

## 5.417 parallel.h File Reference

### 5.417.1 Detailed Description

End-user include file. Provides advanced settings and tuning options. This file is a GNU parallel extension to the Standard C++ Library.

## 5.418 parse\_numbers.h File Reference

### Namespaces

- [std](#)

### Typedefs

- `template<unsigned long long _Val>`  
using **std::\_\_parse\_int::\_\_ull\_constant** = integral\_constant< unsigned long long, \_Val >
- `template<char... _Digs>`  
using **std::\_\_select\_int::Select\_int** = typename \_Select\_int\_base< \_\_parse\_int::Parse\_int< \_Digs... >::value, unsigned char, unsigned short, unsigned int, unsigned long, unsigned long long >::type

### 5.418.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<chrono>`.

## 5.419 partial\_sum.h File Reference

### Namespaces

- [\\_\\_gnu\\_parallel](#)

### Functions

- `template<typename _Iter, typename _OutputIterator, typename _BinaryOperation >`  
`_OutputIterator \_\_gnu\_parallel::\_\_parallel\_partial\_sum (_Iter __begin, _Iter __end, _OutputIterator __result, \_\_  
_BinaryOperation __bin_op)`
- `template<typename _Iter, typename _OutputIterator, typename _BinaryOperation >`  
`_OutputIterator \_\_gnu\_parallel::\_\_parallel\_partial\_sum\_basecase (_Iter __begin, _Iter __end, _OutputIterator`  
`__result, _BinaryOperation __bin_op, typename std::iterator\_traits< _Iter >::value_type __value)`
- `template<typename _Iter, typename _OutputIterator, typename _BinaryOperation >`  
`_OutputIterator \_\_gnu\_parallel::\_\_parallel\_partial\_sum\_linear (_Iter __begin, _Iter __end, _OutputIterator \_\_  
__result, _BinaryOperation __bin_op, typename std::iterator\_traits< _Iter >::difference_type __n)`

#### 5.419.1 Detailed Description

Parallel implementation of `std::partial_sum()`, i.e. prefix sums. This file is a GNU parallel extension to the Standard C++ Library.

### 5.420 partition.h File Reference

#### Namespaces

- [\\_\\_gnu\\_parallel](#)

#### Macros

- `#define _GLIBCXX_VOLATILE`

#### Functions

- `template<typename _RAIter, typename _Compare >`  
`void \_\_gnu\_parallel::\_\_parallel\_nth\_element (_RAIter __begin, _RAIter __nth, _RAIter __end, _Compare __comp)`
- `template<typename _RAIter, typename _Compare >`  
`void \_\_gnu\_parallel::\_\_parallel\_partial\_sort (_RAIter __begin, _RAIter __middle, _RAIter __end, _Compare __comp)`
- `template<typename _RAIter, typename _Predicate >`  
`std::iterator\_traits< _RAIter >::difference_type \_\_gnu\_parallel::\_\_parallel\_partition (_RAIter __begin, _RAIter __end, _Predicate __pred, _ThreadIndex __num_threads)`

#### 5.420.1 Detailed Description

Parallel implementation of `std::partition()`, `std::nth_element()`, and `std::partial_sort()`. This file is a GNU parallel extension to the Standard C++ Library.

#### 5.420.2 Macro Definition Documentation

##### 5.420.2.1 \_GLIBCXX\_VOLATILE

```
#define _GLIBCXX_VOLATILE
```

Decide whether to declare certain variables volatile.

Definition at line 43 of file `partition.h`.

## 5.421 pat\_trie\_.hpp File Reference

## Classes

#### 5.429.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

##### Author

Bob Walters

Provides reusable `_Pointer_adapter` for assisting in the development of custom pointer types that can be used with the standard containers via the `allocator::pointer` and `allocator::const_pointer` typedefs.

#### 5.430 `policy_access_fn_imps.hpp` File Reference

##### 5.430.1 Detailed Description

Contains an implementation class for a `binary_heap`.

### 5.530.1 Detailed Description

Parallel implementations of set operations for random-access iterators. This file is a GNU parallel extension to the Standard C++ Library.

## 5.531 `settings.h` File Reference

### Classes

- `struct \_\_gnu\_parallel::Settings`

### Namespaces

- [\\_\\_gnu\\_parallel](#)

## Macros

- `#define _GLIBCXX_PARALLEL_CONDITION(__c)`

### 5.531.1 Detailed Description

Runtime settings and tuning parameters, heuristics to decide whether to use parallelized algorithms.

This file is a GNU parallel extension to the Standard C++ Library.

### 5.531.2 Deciding whether to run an algorithm in parallel.

There are several ways the user can switch on and off the parallel execution of an algorithm, both at compile- and run-time.

Only sequential execution can be forced at compile-time. This reduces code size and protects code parts that have non-thread-safe side effects.

Ultimately, forcing parallel execution at compile-time makes sense. Often, the sequential algorithm implementation is used as a subroutine, so no reduction in code size can be achieved. Also, the machine the program is run on might have only one processor core, so to avoid overhead, the algorithm is executed sequentially.

To force sequential execution of an algorithm ultimately at compile-time, the user must add the tag `gnu_parallel::sequential_tag()` to the end of the parameter list, e. g.

```
std::sort(__v.begin(), __v.end(), __gnu_parallel::sequential_tag());
```

This is compatible with all overloaded algorithm variants. No additional code will be instantiated, at all. The same holds for most algorithm calls with iterators not providing random access.

If the algorithm call is not forced to be executed sequentially at compile-time, the decision is made at run-time. The global variable `__gnu_parallel::_Settings::algorithm_strategy` is checked. It is a tristate variable corresponding to:

- a. `force_sequential`, meaning the sequential algorithm is executed.
- b. `force_parallel`, meaning the parallel algorithm is executed.
- c. `heuristic`

For heuristic, the parallel algorithm implementation is called only if the input size is sufficiently large. For most algorithms, the input size is the (combined) length of the input sequence(`__s`). The threshold can be set by the user, individually for each algorithm. The according variables are called `gnu_parallel::_Settings::[algorithm]_minimal_n`.

For some of the algorithms, there are even more tuning options, e. g. the ability to choose from multiple algorithm variants. See below for details.

### 5.531.3 Macro Definition Documentation

#### 5.531.3.1 \_GLIBCXX\_PARALLEL\_CONDITION

```
#define _GLIBCXX_PARALLEL_CONDITION(
 __c)
```

Determine at compile(?) -time if the parallel variant of an algorithm should be called.

#### Parameters

|                   |                                                                                                                           |
|-------------------|---------------------------------------------------------------------------------------------------------------------------|
| <a href="#">↩</a> | A condition that is convertible to bool that is overruled by <code>__gnu_parallel::_Settings::algorithm_strategy</code> . |
| <code>_c</code>   | Usually a decision based on the input size.                                                                               |

- `#define PB_DS_S_TREE_BASE`
- `#define PB_DS_S_TREE_BASE_NAME`
- `#define PB_DS_S_TREE_NAME`

#### 5.544.1 Detailed Description

Contains an implementation class for splay trees.

## 5.545 `split_fn_imps.hpp` File Reference

### 5.545.1 Detailed Description

Contains an implementation class for `pat_trie`.

## 5.546 `split_join_fn_imps.hpp` File Reference

### 5.546.1 Detailed Description

Contains an implementation class for a `binary_heap`.

## 5.547 `split_join_fn_imps.hpp` File Reference

### 5.547.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

## 5.548 `split_join_fn_imps.hpp` File Reference

### 5.548.1 Detailed Description

Contains an implementation class for `bin_search_tree_`.

## 5.549 `split_join_fn_imps.hpp` File Reference

### 5.549.1 Detailed Description

Contains an implementation class for `ov_tree_`.

## 5.550 `split_join_fn_imps.hpp` File Reference

### 5.550.1 Detailed Description

Contains an implementation class for a pairing heap.

## 5.551 split\_join\_fn\_imps.hpp File Reference

### 5.551.1 Detailed Description

Contains an implementation for rb\_tree\_.

## 5.552 split\_join\_fn\_imps.hpp File Reference

### 5.552.1 Detailed Description

Contains an implementation for rc\_binomial\_heap\_.

## 5.553 split\_join\_fn\_imps.hpp File Reference

### 5.553.1 Detailed Description

Contains an implementation class for splay\_tree\_.

## 5.554 split\_join\_fn\_imps.hpp File Reference

### 5.554.1 Detailed Description

Contains an implementation for thin\_heap\_.

## 5.555 sso\_string\_base.h File Reference

### Namespaces

### 5.569.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<algorithm>`.

### 5.569.2 Function Documentation

#### 5.569.2.1 `__rotate()` [1/3]

```
template<typename _ForwardIterator >
constexpr _ForwardIterator std::_V2::__rotate (
 _ForwardIterator __first,
 _ForwardIterator __middle,
 _ForwardIterator __last,
 forward_iterator_tag)
```

This is a helper function for the rotate algorithm.

Definition at line 1242 of file `stl_algo.h`.

References `std::_V2::__rotate()`, and `std::iter_swap()`.

Referenced by `std::_V2::__rotate()`.

### 5.569.2.2 `__rotate()` [2/3]

```
template<typename _BidirectionalIterator >
constexpr _BidirectionalIterator std::_V2::__rotate (
 _BidirectionalIterator __first,
 _BidirectionalIterator __middle,
 _BidirectionalIterator __last,
 bidirectional_iterator_tag)
```

This is a helper function for the rotate algorithm.

Definition at line 1284 of file `stl_algo.h`.

References `std::_V2::__rotate()`.

### 5.569.2.3 `__rotate()` [3/3]

```
template<typename _RandomAccessIterator >
constexpr _RandomAccessIterator std::_V2::__rotate (
 _RandomAccessIterator __first,
 _RandomAccessIterator __middle,
 _RandomAccessIterator __last,
 random_access_iterator_tag)
```

This is a helper function for the rotate algorithm.

Definition at line 1323 of file `stl_algo.h`.

References `std::_V2::__rotate()`.

## 5.573.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<deque>`.

## 5.573.2 Macro Definition Documentation

## 5.573.2.1 \_GLIBCXX\_DEQUE\_BUF\_SIZE

```
#define _GLIBCXX_DEQUE_BUF_SIZE
```

This function controls the size of memory nodes.

#### Parameters

|                     |                         |
|---------------------|-------------------------|
| <code>__size</code> | The size of an element. |
|---------------------|-------------------------|

#### Returns

The number (not byte size) of elements per node.

This function started off as a compiler kludge from SGI, but seems to be a useful wrapper around a repeated constant expression. The **512** is tunable (and no other code needs to change), but no investigation has been done since inheriting the SGI code. Touch `_GLIBCXX_DEQUE_BUF_SIZE` only if you know what you are doing, however: changing it breaks the binary compatibility!!

Definition at line 92 of file `stl_deque.h`.

- `template<class _Tp >`  
`bool std::rel\_ops::operator>= (const _Tp &__x, const _Tp &__y)`

### 5.588.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<utility>`.

Inclusion of this file has been removed from all of the other STL headers for safety reasons, except `std_↵utility.h`. For more information, see the thread of about twenty messages starting with <http://gcc.gnu.↵org/ml/libstdc++/2001-01/msg00223.html>, or [http://gcc.gnu.org/onlinedocs/libstdc++/faq.↵html#faq.ambiguous\\_overloads](http://gcc.gnu.org/onlinedocs/libstdc++/faq.↵html#faq.ambiguous_overloads)

Short summary: the `rel_ops` operators should be avoided for the present.

## 5.617.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Contains two exception-generating types (throw\_value, throw\_allocator) intended to be used as value and allocator types while testing exception safety in templated containers and algorithms. The allocator has additional log and debug features. The exception generated is of type forced\_exception\_error.

#### 5.618.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<locale>`.

### 5.619 `trace_fn_imps.hpp` File Reference

#### 5.619.1 Detailed Description

Contains an implementation class for a `binary_heap`.

### 5.620 `trace_fn_imps.hpp` File Reference

#### 5.620.1 Detailed Description

Contains implementations of `cc_ht_map_`'s trace-mode functions.

### 5.621 `trace_fn_imps.hpp` File Reference

#### 5.621.1 Detailed Description

Contains implementations of `gp_ht_map_`'s trace-mode functions.

### 5.622 `trace_fn_imps.hpp` File Reference

#### 5.622.1 Detailed Description

Contains an implementation class for `left_child_next_sibling_heap_`.

### 5.623 `trace_fn_imps.hpp` File Reference

#### 5.623.1 Detailed Description

Contains implementations of `lu_map_`.

### 5.624 `trace_fn_imps.hpp` File Reference

#### 5.624.1 Detailed Description

Contains an implementation class for `pat_trie_`.

## 5.625 `trace_fn_imps.hpp` File Reference

### 5.625.1 Detailed Description

Contains an implementation for `rc_binomial_heap_`.

## 5.626 `trace_fn_imps.hpp` File Reference

### 5.626.1 Detailed Description

Contains an implementation class for `left_child_next_sibling_heap_`.

## 5.627 `traits.hpp` File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::bin\\_search\\_tree\\_traits< Key, Mapped, Cmp\\_Fn, Node\\_Update, Node, \\_Alloc >](#)

#### 5.640.1 Detailed Description

This is a Standard C++ Library header.

#### 5.640.2 Macro Definition Documentation

##### 5.640.2.1 `_GLIBCXX_HAS_NESTED_TYPE`

```
#define _GLIBCXX_HAS_NESTED_TYPE(
 _NTYPE)
```

Use SFINAE to determine if the type `_Tp` has a publicly-accessible member type `_NTYPE`.

Definition at line 2614 of file `type_traits`.

### 5.649.1 Detailed Description

Contains a traits class of types used by containers.

## 5.650 `uniform_int_dist.h` File Reference

### Classes

- struct [std::uniform\\_int\\_distribution<\\_IntType>::param\\_type](#)
- class [std::uniform\\_int\\_distribution<\\_IntType>](#)

### Namespaces

- [std](#)
- [std::\\_\\_detail](#)

### Functions

- `template<typename _Tp>  
bool std::\_\_detail::\_Power\_of\_2 (_Tp __x)`

### 5.650.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<random>`.

## 5.651 `unique_copy.h` File Reference

### Namespaces

- [\\_\\_gnu\\_parallel](#)

### Functions

- `template<typename _Iter, class _OutputIterator, class _BinaryPredicate>  
_OutputIterator \_\_gnu\_parallel::\_\_parallel\_unique\_copy (_Iter __first, _Iter __last, _OutputIterator __result, ↩  
_BinaryPredicate __binary_pred)`
- `template<typename _Iter, class _OutputIterator>  
_OutputIterator \_\_gnu\_parallel::\_\_parallel\_unique\_copy (_Iter __first, _Iter __last, _OutputIterator __result)`

### 5.651.1 Detailed Description

Parallel implementations of `std::unique_copy()`. This file is a GNU parallel extension to the Standard C++ Library.

## 5.652 `unique_lock.h` File Reference

### Classes

- class `std::unique_lock<_Mutex>`

### Namespaces

- `std`

### 5.652.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<mutex>`.

## 5.653 `unique_ptr.h` File Reference

### Classes

- struct `std::default_delete<_Tp>`
- struct `std::default_delete<_Tp[]>`
- struct `std::hash<unique_ptr<_Tp, _Dp>>`
- class `std::unique_ptr<_Tp, _Dp>`
- class `std::unique_ptr<_Tp[], _Dp>`

### Namespaces

- `std`

### Macros

- `#define __cpp_lib_make_unique`

### 5.653.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<memory>`.

## 5.654 unordered\_map File Reference

### Macros

- `#define _GLIBCXX_UNORDERED_MAP`

### 5.654.1 Detailed Description

This is a Standard C++ Library header.

### 5.667.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<valarray>`.

## 5.668 valarray\_array.tcc File Reference

### Namespaces

- [std](#)

### Macros

- `#define _VALARRAY_ARRAY_TCC`

### 5.679.1 Detailed Description

Parallelization of embarrassingly parallel execution by means of work-stealing.

Work stealing is described in

R. D. Blumofe and C. E. Leiserson. Scheduling multithreaded computations by work stealing. *Journal of the ACM*, 46(5):720-748, 1999.

This file is a GNU parallel extension to the Standard C++ Library.
