4.196.2	Constructor & Destructor Documentation	1201
4.196.3	Member Function Documentation	1202
4.197	std::__detail::__Rehash_base< _Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _↵ RehashPolicy, _Traits, typename > Struct Template Reference	1203
4.197.1	Detailed Description	1203
4.198	std::__detail::__Rehash_base< _Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _↵ RehashPolicy, _Traits, false_type > Struct Template Reference	1204
4.198.1	Detailed Description	1204
4.199	std::__detail::__Rehash_base< _Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _↵ RehashPolicy, _Traits, true_type > Struct Template Reference	1204
4.199.1	Detailed Description	1204
4.200	__gnu_cxx::__Relative_pointer_impl< _Tp > Class Template Reference	1205
4.200.1	Detailed Description	1205
4.201	__gnu_cxx::__Relative_pointer_impl< const _Tp > Class Template Reference	1205
4.201.1	Detailed Description	1206
4.202	__gnu_parallel::__RestrictedBoundedConcurrentQueue< _Tp > Class Template Reference	1206
4.202.1	Detailed Description	1206
4.202.2	Constructor & Destructor Documentation	1206
4.202.3	Member Function Documentation	1207
4.203	std::__future_base::__Result< _Res > Struct Template Reference	1208
4.203.1	Detailed Description	1209
4.204	std::__future_base::__Result< _Res & > Struct Template Reference	1209
4.204.1	Detailed Description	1210
4.205	std::__future_base::__Result< void > Struct Template Reference	1210
4.205.1	Detailed Description	1211
4.206	std::__future_base::__Result_alloc< _Res, _Alloc > Struct Template Reference	1211
4.206.1	Detailed Description	1212
4.207	std::__future_base::__Result_base Struct Reference	1212
4.207.1	Detailed Description	1213
4.208	__gnu_debug::__Safe_container< _SafeContainer, _Alloc, _SafeBase, _IsCxx11AllocatorAware > Class Template Reference	1213

4.208.1 Detailed Description	1213
4.209 __gnu_debug::_Safe_forward_list<_SafeSequence> Class Template Reference	1214
4.209.1 Detailed Description	1215
4.209.2 Member Function Documentation	1215
4.209.3 Member Data Documentation	1216
4.210 __gnu_debug::_Safe_iterator<_Iterator, _Sequence, _Category> Class Template Reference	1217
4.210.1 Detailed Description	1219
4.210.2 Constructor & Destructor Documentation	1220
4.210.3 Member Function Documentation	1221
4.210.4 Member Data Documentation	1228
4.211 __gnu_debug::_Safe_iterator_base Class Reference	1230
4.211.1 Detailed Description	1231
4.211.2 Constructor & Destructor Documentation	1231
4.211.3 Member Function Documentation	1232
4.211.4 Member Data Documentation	1234
4.212 __gnu_debug::_Safe_local_iterator<_Iterator, _Sequence> Class Template Reference	1235
4.212.1 Detailed Description	1237
4.212.2 Constructor & Destructor Documentation	1237
4.212.3 Member Function Documentation	1239
4.212.4 Member Data Documentation	1246
4.213 __gnu_debug::_Safe_local_iterator_base Class Reference	1247
4.213.1 Detailed Description	1248
4.213.2 Constructor & Destructor Documentation	1248
4.213.3 Member Function Documentation	1249
4.213.4 Member Data Documentation	1251
4.214 __gnu_debug::_Safe_node_sequence<_Sequence> Class Template Reference	1253
4.214.1 Detailed Description	1254
4.214.2 Member Function Documentation	1254
4.214.3 Member Data Documentation	1256
4.215 __gnu_debug::_Safe_sequence<_Sequence> Class Template Reference	1257
4.215.1 Detailed Description	1258
4.215.2 Member Function Documentation	1258
4.215.3 Member Data Documentation	1260
4.216 __gnu_debug::_Safe_sequence_base Class Reference	1261
4.216.1 Detailed Description	1262
4.216.2 Constructor & Destructor Documentation	1262
4.216.3 Member Function Documentation	1262
4.216.4 Member Data Documentation	1264
4.217 __gnu_debug::_Safe_unordered_container<_Container> Class Template Reference	1265

4.217.1 Detailed Description	1266
4.217.2 Member Function Documentation	1266
4.217.3 Member Data Documentation	1268
4.218 <code>__gnu_debug::_Safe_unordered_container_base</code> Class Reference	1269
4.218.1 Detailed Description	1270
4.218.2 Constructor & Destructor Documentation	1270
4.218.3 Member Function Documentation	1270
4.218.4 Member Data Documentation	1272
4.219 <code>__gnu_debug::_Safe_vector<_SafeSequence, _BaseSequence ></code> Class Template Reference	1273
4.219.1 Detailed Description	1273
4.220 <code>__gnu_parallel::SamplingSorter<__stable, _RAIter, _StrictWeakOrdering ></code> Struct Template Reference	1274
4.220.1 Detailed Description	1274
4.221 <code>__gnu_parallel::SamplingSorter<false, _RAIter, _StrictWeakOrdering ></code> Struct Template Reference	1274
4.221.1 Detailed Description	1274
4.222 <code>std::__detail::_Scanner<_CharT ></code> Class Template Reference	1274
4.222.1 Detailed Description	1276
4.222.2 Member Enumeration Documentation	1276
4.223 <code>__gnu_debug::Sequence_traits<_Sequence ></code> Struct Template Reference	1276
4.223.1 Detailed Description	1277

Class `__gnu_cxx::slist<_Tp, _Alloc>`

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html

Module `mathsf`

Provide accuracy comparisons on a per-function basis for a small number of targets.

Class `std::basic_string<_CharT, _Traits, _Alloc>`

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html

Member `std::regex_traits<_Ch_type>::transform_primary(_Fwd_iter __first, _Fwd_iter __last) const`

Implement this function correctly.

2 Module Documentation

2.1 Adaptors for pointers to functions

Collaboration diagram for Adaptors for pointers to functions:

Classes

- class `std::pointer_to_binary_function<_Arg1, _Arg2, _Result>`
- class `std::pointer_to_unary_function<_Arg, _Result>`

Functions

- `template<typename _Arg, typename _Result>`
`pointer_to_unary_function<_Arg, _Result> std::ptr_fun(_Result(*__x)(_Arg))`
- `template<typename _Arg1, typename _Arg2, typename _Result>`
`pointer_to_binary_function<_Arg1, _Arg2, _Result> std::ptr_fun(_Result(*__x)(_Arg1, _Arg2))`

2.1.1 Detailed Description

The advantage of function objects over pointers to functions is that the objects in the standard library declare nested typedefs describing their argument and result types with uniform names (e.g., `result_type` from the base classes `unary_function` and `binary_function`). Sometimes those typedefs are required, not just optional.

Adaptors are provided to turn pointers to unary (single-argument) and binary (double-argument) functions into function objects. The long-winded functor `pointer_to_unary_function` is constructed with a function pointer `f`, and its `operator()` called with argument `x` returns `f(x)`. The functor `pointer_to_binary_function` does the same thing, but with a double-argument `f` and `operator()`.

The function `ptr_fun` takes a pointer-to-function `f` and constructs an instance of the appropriate functor.

2.1.2 Function Documentation

2.1.2.1 `ptr_fun()` [1/2]

```
template<typename _Arg , typename _Result >
pointer_to_unary_function<_Arg, _Result> std::ptr_fun (
    _Result(*) (_Arg) __x ) [inline]
```

One of the [adaptors for function pointers](#).

Definition at line 1100 of file `stl_function.h`.

2.1.2.2 `ptr_fun()` [2/2]

```
template<typename _Arg1 , typename _Arg2 , typename _Result >
pointer_to_binary_function<_Arg1, _Arg2, _Result> std::ptr_fun (
    _Result(*) (_Arg1, _Arg2) __x ) [inline]
```

One of the [adaptors for function pointers](#).

Definition at line 1126 of file `stl_function.h`.

2.2 Adaptors for pointers to members

Collaboration diagram for Adaptors for pointers to members:

Classes

- class `std::const_mem_fun1_ref_t<_Ret, _Tp, _Arg>`
- class `std::const_mem_fun1_t<_Ret, _Tp, _Arg>`
- class `std::const_mem_fun_ref_t<_Ret, _Tp>`
- class `std::const_mem_fun_t<_Ret, _Tp>`
- class `std::mem_fun1_ref_t<_Ret, _Tp, _Arg>`
- class `std::mem_fun1_t<_Ret, _Tp, _Arg>`
- class `std::mem_fun_ref_t<_Ret, _Tp>`
- class `std::mem_fun_t<_Ret, _Tp>`

Functions

- `template<typename _Ret, typename _Tp>`
`mem_fun_t<_Ret, _Tp> std::mem_fun (_Ret(_Tp::*__f)())`
- `template<typename _Ret, typename _Tp, typename _Arg>`
`mem_fun1_t<_Ret, _Tp, _Arg> std::mem_fun (_Ret(_Tp::*__f)(_Arg))`
- `template<typename _Ret, typename _Tp>`
`mem_fun_ref_t<_Ret, _Tp> std::mem_fun_ref (_Ret(_Tp::*__f)())`
- `template<typename _Ret, typename _Tp, typename _Arg>`
`mem_fun1_ref_t<_Ret, _Tp, _Arg> std::mem_fun_ref (_Ret(_Tp::*__f)(_Arg))`

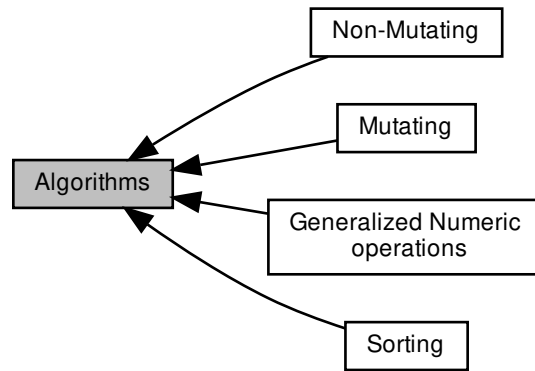

2.2.1 Detailed Description

There are a total of $8 = 2^3$ function objects in this family. (1) Member functions taking no arguments vs member functions taking one argument. (2) Call through pointer vs call through reference. (3) Const vs non-const member function.

All of this complexity is in the function objects themselves. You can ignore it by using the helper function `mem_fun` and `mem_fun_ref`, which create whichever type of adaptor is appropriate.

2.3 Algorithms

Collaboration diagram for Algorithms:

Modules

- [Generalized Numeric operations](#)
- [Mutating](#)
- [Non-Mutating](#)
- [Sorting](#)

2.3.1 Detailed Description

Components for performing algorithmic operations. Includes non-modifying sequence, modifying (mutating) sequence, sorting, searching, merge, partition, heap, set, minima, maxima, and permutation operations.

2.4 Allocators

Collaboration diagram for Allocators:

Files

- file [scoped_allocator](#)

Classes

- struct [__gnu_cxx::__alloc_traits](#)< [_Alloc](#), [typename](#) >
- class [__gnu_cxx::__mt_alloc](#)< [_Tp](#), [_Poolp](#) >
- class [__gnu_cxx::__pool_alloc](#)< [_Tp](#) >
- class [__gnu_cxx::__ExtPtr_allocator](#)< [_Tp](#) >
- class [std::allocator](#)< [_Tp](#) >
- class [std::allocator](#)< [void](#) >
- struct [std::allocator_traits](#)< [_Alloc](#) >

- class [std::scoped_allocator_adaptor](#)< [_OuterAlloc](#), [_InnerAllocs](#) >
- class [__gnu_cxx::throw_allocator_base](#)< [_Tp](#), [_Cond](#) >
- struct [std::uses_allocator](#)< [_Tp](#), [_Alloc](#) >

Typedefs

- [template](#)<[typename](#) [_Tp](#) >
using [std::__allocator_base](#) = [__gnu_cxx::new_allocator](#)< [_Tp](#) >

Functions

- [template](#)<[typename](#) [_T1](#), [typename](#) [_T2](#) >
constexpr bool **std::operator!=** (const [allocator](#)< [_T1](#) > &, const [allocator](#)< [_T2](#) > &) noexcept
- [template](#)<[typename](#) [_OutA1](#), [typename](#) [_OutA2](#), [typename](#)... [_InA](#)>
bool **operator!=** (const [scoped_allocator_adaptor](#)< [_OutA1](#), [_InA](#)... > &__a, const [scoped_allocator_adaptor](#)< [_OutA2](#), [_InA](#)... > &__b) noexcept
- [template](#)<[typename](#) [_T1](#), [typename](#) [_T2](#) >
constexpr bool **std::operator==** (const [allocator](#)< [_T1](#) > &, const [allocator](#)< [_T2](#) > &) noexcept
- [template](#)<[typename](#) [_OutA1](#), [typename](#) [_OutA2](#), [typename](#)... [_InA](#)>
bool **operator==** (const [scoped_allocator_adaptor](#)< [_OutA1](#), [_InA](#)... > &__a, const [scoped_allocator_adaptor](#)< [_OutA2](#), [_InA](#)... > &__b) noexcept

2.4.1 Detailed Description

Classes encapsulating memory operations.

2.4.2 Typedef Documentation

2.4.2.1 `__allocator_base`

```
template<typename _Tp >
using std::__allocator_base = typedef __gnu_cxx::new_allocator<_Tp>
```

An alias to the base class for `std::allocator`.

Used to set the `std::allocator` base class to `__gnu_cxx::new_allocator`.

Template Parameters

<code>_Tp</code>	Type of allocated object.
------------------	---------------------------

Definition at line 48 of file `c++allocator.h`.

2.4.3 Function Documentation

2.4.3.1 `operator!=()`

```
template<typename _OutA1 , typename _OutA2 , typename... _InA>
bool operator!=(
    const scoped_allocator_adaptor< _OutA1, _InA... > & __a,
    const scoped_allocator_adaptor< _OutA2, _InA... > & __b ) [related]
```

Definition at line 507 of file `scoped_allocator`.

2.4.3.2 `operator==()`

```
template<typename _OutA1 , typename _OutA2 , typename... _InA>
bool operator==(
    const scoped_allocator_adaptor< _OutA1, _InA... > & __a,
    const scoped_allocator_adaptor< _OutA2, _InA... > & __b ) [related]
```

Definition at line 496 of file `scoped_allocator`.

2.5 Arithmetic Classes

Collaboration diagram for Arithmetic Classes:

Classes

- struct `std::divides< _Tp >`
- struct `std::divides< void >`
- struct `std::minus< _Tp >`
- struct `std::minus< void >`
- struct `std::modulus< _Tp >`
- struct `std::modulus< void >`
- struct `std::multiplies< _Tp >`
- struct `std::multiplies< void >`
- struct `std::negate< _Tp >`
- struct `std::negate< void >`
- struct `std::plus< _Tp >`

Macros

- `#define __cpp_lib_transparent_operators`

2.5.1 Detailed Description

Because basic math often needs to be done during an algorithm, the library provides functors for those operations. See the documentation for [the base classes](#) for examples of their use.

2.6 Array creation functions

Collaboration diagram for Array creation functions:

Functions

- `template<typename _Tp, size_t _Nm, size_t... _Idx>`
`constexpr array< remove_cv_t< _Tp >, _Nm > std::experimental::fundamentals_v2::__to_array (_Tp(&__a)[_Nm], index_sequence< _Idx... >)`
- `template<typename _Dest = void, typename... _Types>`
`constexpr array< typename __make_array_elem< _Dest, _Types... >::type, sizeof...(_Types)> std::experimental::fundamentals_v2::make_array (_Types &&... __t)`
- `template<typename _Tp, size_t _Nm>`
`constexpr array< remove_cv_t< _Tp >, _Nm > std::experimental::fundamentals_v2::to_array (_Tp(&__a)[_Nm])`
`noexcept(is_nothrow_constructible< remove_cv_t< _Tp >, _Tp & >::value)`

2.6.1 Detailed Description

Array creation functions as described in N4529, Working Draft, C++ Extensions for Library Fundamentals, Version 2

2.6.2 Function Documentation

2.6.2.1 `make_array()`

```

template<typename _Dest = void, typename... _Types>
constexpr array< typename __make_array_elem< _Dest, _Types... >::type, sizeof...( _Types)> std::experimental::fundamentals\_v2::make\_array (
    _Types &&... __t )
  
```

Create a `std::array` from a variable-length list of arguments.

Definition at line 86 of file `experimental/array`.

2.6.2.2 `to_array()`

```

template<typename _Tp, size_t _Nm>
constexpr array< remove\_cv\_t< _Tp >, _Nm > std::experimental::fundamentals\_v2::to\_array (
    _Tp(& __a[_Nm] ) ) [noexcept]
  
```

Create a `std::array` from an array.

Definition at line 101 of file `experimental/array`.

2.7 Associative

Collaboration diagram for Associative:

Classes

- class `std::map<_Key, _Tp, _Compare, _Alloc >`
- class `std::multimap<_Key, _Tp, _Compare, _Alloc >`
- class `std::multiset<_Key, _Compare, _Alloc >`
- class `std::set<_Key, _Compare, _Alloc >`

2.7.1 Detailed Description

Associative containers allow fast retrieval of data based on keys.

Each container type is parameterized on a `Key` type, and an ordering relation used to sort the elements of the container.

All associative containers must meet certain requirements, summarized in [tables](#).

2.8 Atomics

Classes

- struct `std::__atomic_base<_ITp>`
- struct `std::__atomic_base<_PTp*>`
- struct `std::__atomic_flag_base`
- struct `std::atomic<_Tp>`
- struct `std::atomic<_Tp*>`
- struct `std::atomic<bool>`
- struct `std::atomic<char>`
- struct `std::atomic<char16_t>`
- struct `std::atomic<char32_t>`
- struct `std::atomic<int>`
- struct `std::atomic<long>`
- struct `std::atomic<long long>`
- struct `std::atomic<short>`
- struct `std::atomic<signed char>`
- struct `std::atomic<unsigned char>`
- struct `std::atomic<unsigned int>`
- struct `std::atomic<unsigned long>`
- struct `std::atomic<unsigned long long>`
- struct `std::atomic<unsigned short>`
- struct `std::atomic<wchar_t>`
- struct `std::atomic_flag`

Macros

- `#define _GLIBCXX20_INIT(l)`
- `#define _GLIBCXX20_INIT(l)`
- `#define ATOMIC_BOOL_LOCK_FREE`
- `#define ATOMIC_CHAR16_T_LOCK_FREE`

2.8.1 Detailed Description

Components for performing atomic operations.

2.8.2 Macro Definition Documentation

2.8.2.1 ATOMIC_BOOL_LOCK_FREE

```
#define ATOMIC_BOOL_LOCK_FREE
```

Lock-free property.

0 indicates that the types are never lock-free. 1 indicates that the types are sometimes lock-free. 2 indicates that the types are always lock-free.

Definition at line 49 of file `atomic_lockfree_defines.h`.

2.8.3 Typedef Documentation

2.8.3.1 atomic_bool

```
typedef atomic<bool> std::atomic_bool
```

atomic_bool

Definition at line 991 of file atomic.

2.8.3.2 atomic_char

```
typedef atomic<char> std::atomic_char
```

atomic_char

Definition at line 994 of file atomic.

2.8.3.3 atomic_char16_t

```
typedef atomic<char16_t> std::atomic_char16_t
```

atomic_char16_t

Definition at line 1035 of file atomic.

2.8.3.4 atomic_char32_t

```
typedef atomic<char32_t> std::atomic_char32_t
```

atomic_char32_t

Definition at line 1038 of file atomic.

2.8.3.5 atomic_int

```
typedef atomic<int> std::atomic_int
```

atomic_int

Definition at line 1009 of file atomic.

2.8.3.6 atomic_int16_t

```
typedef atomic<int16_t> std::atomic_int16_t
```

atomic_int16_t

Definition at line 1051 of file atomic.

2.8.3.7 atomic_int32_t

```
typedef atomic<int32_t> std::atomic_int32_t
```

atomic_int32_t

Definition at line 1057 of file atomic.

2.8.3.8 atomic_int64_t

```
typedef atomic<int64_t> std::atomic_int64_t
```

atomic_int64_t

Definition at line 1063 of file atomic.

2.8.3.9 atomic_int8_t

```
typedef atomic<int8_t> std::atomic_int8_t
```

atomic_int8_t

Definition at line 1045 of file atomic.

2.8.3.10 atomic_int_fast16_t

```
typedef atomic<int_fast16_t> std::atomic_int_fast16_t
```

atomic_int_fast16_t

Definition at line 1101 of file atomic.

2.8.3.11 `atomic_int_fast32_t`

```
typedef atomic<int_fast32_t> std::atomic_int_fast32_t
```

`atomic_int_fast32_t`

Definition at line 1107 of file `atomic`.

2.8.3.12 `atomic_int_fast64_t`

```
typedef atomic<int_fast64_t> std::atomic_int_fast64_t
```

`atomic_int_fast64_t`

Definition at line 1113 of file `atomic`.

2.8.3.13 `atomic_int_fast8_t`

```
typedef atomic<int_fast8_t> std::atomic_int_fast8_t
```

`atomic_int_fast8_t`

Definition at line 1095 of file `atomic`.

2.8.3.14 `atomic_int_least16_t`

```
typedef atomic<int_least16_t> std::atomic_int_least16_t
```

`atomic_int_least16_t`

Definition at line 1076 of file `atomic`.

2.8.3.15 `atomic_int_least32_t`

```
typedef atomic<int_least32_t> std::atomic_int_least32_t
```

`atomic_int_least32_t`

Definition at line 1082 of file `atomic`.

2.8.3.16 `atomic_int_least64_t`

```
typedef atomic<int_least64_t> std::atomic_int_least64_t
```

`atomic_int_least64_t`

Definition at line 1088 of file `atomic`.

2.8.3.17 `atomic_int_least8_t`

```
typedef atomic<int_least8_t> std::atomic_int_least8_t
```

`atomic_int_least8_t`

Definition at line 1070 of file `atomic`.

2.8.3.18 `atomic_intmax_t`

```
typedef atomic<intmax_t> std::atomic_intmax_t
```

`atomic_intmax_t`

Definition at line 1134 of file `atomic`.

2.8.3.19 `atomic_intptr_t`

```
typedef atomic<intptr_t> std::atomic_intptr_t
```

`atomic_intptr_t`

Definition at line 1121 of file `atomic`.

2.8.3.20 `atomic_llong`

```
typedef atomic<long long> std::atomic_llong
```

`atomic_llong`

Definition at line 1021 of file `atomic`.

2.8.3.21 atomic_long

```
typedef atomic<long> std::atomic_long
```

atomic_long

Definition at line 1015 of file atomic.

2.8.3.22 atomic_ptrdiff_t

```
typedef atomic<ptrdiff_t> std::atomic_ptrdiff_t
```

atomic_ptrdiff_t

Definition at line 1130 of file atomic.

2.8.3.23 atomic_schar

```
typedef atomic<signed char> std::atomic_schar
```

atomic_schar

Definition at line 997 of file atomic.

2.8.3.24 atomic_short

```
typedef atomic<short> std::atomic_short
```

atomic_short

Definition at line 1003 of file atomic.

2.8.3.25 atomic_size_t

```
typedef atomic<size_t> std::atomic_size_t
```

atomic_size_t

Definition at line 1127 of file atomic.

2.8.3.26 `atomic_uchar`

```
typedef atomic<unsigned char> std::atomic_uchar
```

`atomic_uchar`

Definition at line 1000 of file `atomic`.

2.8.3.27 `atomic_uint`

```
typedef atomic<unsigned int> std::atomic_uint
```

`atomic_uint`

Definition at line 1012 of file `atomic`.

2.8.3.28 `atomic_uint16_t`

```
typedef atomic<uint16_t> std::atomic_uint16_t
```

`atomic_uint16_t`

Definition at line 1054 of file `atomic`.

2.8.3.29 `atomic_uint32_t`

```
typedef atomic<uint32_t> std::atomic_uint32_t
```

`atomic_uint32_t`

Definition at line 1060 of file `atomic`.

2.8.3.30 `atomic_uint64_t`

```
typedef atomic<uint64_t> std::atomic_uint64_t
```

`atomic_uint64_t`

Definition at line 1066 of file `atomic`.

2.8.3.31 `atomic_uint8_t`

```
typedef atomic<uint8_t> std::atomic_uint8_t
```

`atomic_uint8_t`

Definition at line 1048 of file `atomic`.

2.8.3.32 `atomic_uint_fast16_t`

```
typedef atomic<uint_fast16_t> std::atomic_uint_fast16_t
```

`atomic_uint_fast16_t`

Definition at line 1104 of file `atomic`.

2.8.3.33 `atomic_uint_fast32_t`

```
typedef atomic<uint_fast32_t> std::atomic_uint_fast32_t
```

`atomic_uint_fast32_t`

Definition at line 1110 of file `atomic`.

2.8.3.34 `atomic_uint_fast64_t`

```
typedef atomic<uint_fast64_t> std::atomic_uint_fast64_t
```

`atomic_uint_fast64_t`

Definition at line 1116 of file `atomic`.

2.8.3.35 `atomic_uint_fast8_t`

```
typedef atomic<uint_fast8_t> std::atomic_uint_fast8_t
```

`atomic_uint_fast8_t`

Definition at line 1098 of file `atomic`.

2.8.3.36 atomic_uint_least16_t

```
typedef atomic<uint_least16_t> std::atomic\_uint\_least16\_t
```

[atomic_uint_least16_t](#)

Definition at line 1079 of file atomic.

2.8.3.37 atomic_uint_least32_t

```
typedef atomic<uint_least32_t> std::atomic\_uint\_least32\_t
```

[atomic_uint_least32_t](#)

Definition at line 1085 of file atomic.

2.8.3.38 atomic_uint_least64_t

```
typedef atomic<uint_least64_t> std::atomic\_uint\_least64\_t
```

[atomic_uint_least64_t](#)

Definition at line 1091 of file atomic.

2.8.3.39 atomic_uint_least8_t

```
typedef atomic<uint_least8_t> std::atomic\_uint\_least8\_t
```

[atomic_uint_least8_t](#)

Definition at line 1073 of file atomic.

2.8.3.40 atomic_uintmax_t

```
typedef atomic<uintmax_t> std::atomic\_uintmax\_t
```

[atomic_uintmax_t](#)

Definition at line 1137 of file atomic.

2.8.3.41 atomic_uintptr_t

```
typedef atomic<uintptr_t> std::atomic_uintptr_t
```

atomic_uintptr_t

Definition at line 1124 of file atomic.

2.8.3.42 atomic_ullong

```
typedef atomic<unsigned long long> std::atomic_ullong
```

atomic_ullong

Definition at line 1024 of file atomic.

2.8.3.43 atomic_ulong

```
typedef atomic<unsigned long> std::atomic_ulong
```

atomic_ulong

Definition at line 1018 of file atomic.

2.8.3.44 atomic_ushort

```
typedef atomic<unsigned short> std::atomic_ushort
```

atomic_ushort

Definition at line 1006 of file atomic.

2.8.3.45 atomic_wchar_t

```
typedef atomic<wchar_t> std::atomic_wchar_t
```

atomic_wchar_t

Definition at line 1027 of file atomic.

2.8.3.46 memory_order

```
typedef enum std::memory_order std::memory_order
```

Enumeration for memory_order.

2.8.4 Enumeration Type Documentation

2.8.4.1 memory_order

```
enum std::memory_order
```

Enumeration for memory_order.

Definition at line 74 of file atomic_base.h.

2.8.5 Function Documentation

2.8.5.1 kill_dependency()

```
template<typename _Tp >  
_Tp std::kill_dependency (   
    _Tp __y ) [inline], [noexcept]
```

kill_dependency

Definition at line 131 of file atomic_base.h.

2.9 Base and Implementation Classes

Collaboration diagram for Base and Implementation Classes:

Classes

- struct `std::__detail::Default_ranged_hash`

2.14.1 Detailed Description

2.14.2 Function Documentation

2.14.2.1 `operator!=()` [1/4]

```
bool std::operator!=(  
    const std::bernoulli\_distribution & __d1,  
    const std::bernoulli\_distribution & __d2 ) [inline]
```

Return true if two Bernoulli distributions have different parameters.

Definition at line 3690 of file random.h.

2.14.2.2 `operator!=()` [2/4]

```
template<typename _IntType >  
bool std::operator!=(  
    const std::binomial\_distribution< _IntType > & __d1,  
    const std::binomial\_distribution< _IntType > & __d2 ) [inline]
```

Return true if two binomial distributions are different.

Definition at line 3965 of file random.h.

2.14.2.3 `operator!=()` [3/4]

```
template<typename _IntType >  
bool std::operator!=(  
    const std::geometric\_distribution< _IntType > & __d1,  
    const std::geometric\_distribution< _IntType > & __d2 ) [inline]
```

Return true if two geometric distributions have different parameters.

Definition at line 4144 of file random.h.

2.14.2.4 `operator!=()` [4/4]

```
template<typename _IntType >  
bool std::operator!=(  
    const std::negative\_binomial\_distribution< _IntType > & __d1,  
    const std::negative\_binomial\_distribution< _IntType > & __d2 ) [inline]
```

Return true if two negative binomial distributions are different.

Definition at line 4398 of file random.h.

2.14.2.5 operator<<() [1/2]

```
template<typename _CharT , typename _Traits >
std::basic_ostream< _CharT, _Traits > & std::operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::bernoulli_distribution & __x )
```

Inserts a `bernoulli_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>bernoulli_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

Definition at line 986 of file `bits/random.tcc`.

References `std::basic_ios<_CharT, _Traits>::fill()`, `std::ios_base::flags()`, and `std::ios_base::precision()`.

2.14.2.6 `operator<<()` [2/2]

```
template<typename _IntType , typename _CharT , typename _Traits >
std::basic_ostream< _CharT, _Traits > & std::operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::geometric_distribution< _IntType > & __x )
```

Inserts a `geometric_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>geometric_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

Definition at line 1067 of file `bits/random.tcc`.

References `std::basic_ios<_CharT, _Traits>::fill()`, `std::ios_base::flags()`, and `std::ios_base::precision()`.

2.14.2.7 `operator>>()` [1/2]

```
template<typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& std::operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::bernoulli_distribution & __x ) [inline]
```

Extracts a `bernoulli_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

\leftrightarrow __is	An input stream.
\leftrightarrow __x	A bernoulli_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

Definition at line 3720 of file random.h.

References std::bernoulli_distribution::param().

2.14.2.8 operator>>() [2/2]

```
template<typename _IntType , typename _CharT , typename _Traits >
std::basic_istream< _CharT, _Traits > & std::operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::geometric_distribution< _IntType > & __x )
```

Extracts a geometric_distribution random number distribution __x from the input stream __is.

Parameters

\leftrightarrow __is	An input stream.
\leftrightarrow __x	A geometric_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

Definition at line 1090 of file bits/random.tcc.

References std::ios_base::flags(), std::geometric_distribution< _IntType >::param(), and std::skipws().

2.15 Binary Search

Collaboration diagram for Binary Search:

Functions

- `template<typename _ForwardIterator, typename _Tp >`
`constexpr bool std::binary_search (_ForwardIterator __first, _ForwardIterator __last, const _Tp &__val)`
- `template<typename _ForwardIterator, typename _Tp, typename _Compare >`

`constexpr _ForwardIterator std::lower_bound (_ForwardIterator __first, _ForwardIterator __last, const _Tp &__val, _Compare __comp)`
- `template<typename _ForwardIterator, typename _Tp >`
`constexpr _ForwardIterator std::upper_bound (_ForwardIterator __first, _ForwardIterator __last, const _Tp &__val)`
- `template<typename _ForwardIterator, typename _Tp, typename _Compare >`
`constexpr _ForwardIterator std::upper_bound (_ForwardIterator __first, _ForwardIterator __last, const _Tp &__val, _Compare __comp)`

2.15.1 Detailed Description

These algorithms are variations of a classic binary search, and all assume that the sequence being searched is already sorted.

The number of comparisons will be logarithmic (and as few as possible). The number of steps through the sequence will be logarithmic for random-access iterators (e.g., pointers), and linear otherwise.

The LWG has passed Defect Report 270, which notes: *The proposed resolution reinterprets binary search. Instead of thinking about searching for a value in a sorted range, we view that as an important special case of a more general algorithm: searching for the partition point in a partitioned range. We also add a guarantee that the old wording did not: we ensure that the upper bound is no earlier than the lower bound, that the pair returned by equal_range is a valid range, and that the first part of that pair is the lower bound.*

The actual effect of the first sentence is that a comparison functor passed by the user doesn't necessarily need to induce a strict weak ordering relation. Rather, it partitions the range.

2.15.2 Function Documentation

2.15.2.1 `binary_search()` [1/2]

```
template<typename _ForwardIterator , typename _Tp >
constexpr bool std::binary_search (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __val )
```

Determines whether an element exists in a range.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.

Returns

True if `__val` (or its equivalent) is in `[__first,__last]`.

Note that this does not actually return an iterator to `__val`. For that, use `std::find` or a container's specialized find member functions.

Definition at line 2267 of file `stl_algo.h`.

2.15.2.2 `binary_search()` [2/2]

```
template<typename _ForwardIterator , typename _Tp , typename _Compare >
constexpr bool std::binary_search (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __val,
    _Compare __comp )
```

Determines whether an element exists in a range.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.
<code>__comp</code>	A functor to use for comparisons.

Returns

True if `__val` (or its equivalent) is in `[__first,__last]`.

Note that this does not actually return an iterator to `__val`. For that, use `std::find` or a container's specialized find member functions.

The comparison function should have the same effects on ordering as the function used for the initial sort.

Definition at line 2301 of file `stl_algo.h`.

2.15.2.3 `equal_range()` [1/2]

```
template<typename _ForwardIterator , typename _Tp >
constexpr pair<_ForwardIterator, _ForwardIterator> std::equal_range (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __val ) [inline]
```

Finds the largest subrange in which `__val` could be inserted at any place in it without changing the ordering.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.

Returns

An pair of iterators defining the subrange.

This is equivalent to

```
std::make_pair(lower_bound(__first, __last, __val),
               upper_bound(__first, __last, __val))
```

but does not actually call those functions.

Definition at line 2196 of file `stl_algo.h`.

2.15.2.4 `equal_range()` [2/2]

```
template<typename _ForwardIterator , typename _Tp , typename _Compare >
constexpr pair<_ForwardIterator, _ForwardIterator> std::equal_range (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __val,
    _Compare __comp ) [inline]
```

Finds the largest subrange in which `__val` could be inserted at any place in it without changing the ordering.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.
<code>__comp</code>	A functor to use for comparisons.

Returns

An pair of iterators defining the subrange.

This is equivalent to

```
std::make_pair(lower_bound(__first, __last, __val, __comp),
               upper_bound(__first, __last, __val, __comp))
```

but does not actually call those functions.

Definition at line 2233 of file `stl_algo.h`.

2.15.2.5 `lower_bound()` [1/2]

```
template<typename _ForwardIterator, typename _Tp>
constexpr _ForwardIterator std::lower_bound (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __val ) [inline]
```

Finds the first position in which *val* could be inserted without changing the ordering.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.

Returns

An iterator pointing to the first element *not less than val*, or `end()` if every element is less than *val*.

Definition at line 1348 of file `stl_algo.h`.

2.15.2.6 `lower_bound()` [2/2]

```
template<typename _ForwardIterator, typename _Tp, typename _Compare>
constexpr _ForwardIterator std::lower_bound (
```

```

_FowardIterator __first,
_FowardIterator __last,
const _Tp & __val,
_Compare __comp ) [inline]

```

Finds the first position in which `__val` could be inserted without changing the ordering.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.
<code>__comp</code>	A functor to use for comparisons.

Returns

An iterator pointing to the first element *not less than* `__val`, or `end()` if every element is less than `__val`.

The comparison function should have the same effects on ordering as the function used for the initial sort.

Definition at line 2036 of file `stl_algo.h`.

2.15.2.7 `upper_bound()` [1/2]

```

template<typename _ForwardIterator , typename _Tp >
constexpr _ForwardIterator std::upper_bound (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __val ) [inline]

```

Finds the last position in which `__val` could be inserted without changing the ordering.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.

Returns

An iterator pointing to the first element greater than `__val`, or `end()` if no elements are greater than `__val`.

Definition at line 2092 of file `stl_algo.h`.

2.15.2.8 `upper_bound()` [2/2]

```
template<typename _ForwardIterator, typename _Tp, typename _Compare >
constexpr _ForwardIterator std::upper_bound (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __val,
    _Compare __comp ) [inline]
```

Finds the last position in which `__val` could be inserted without changing the ordering.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.
<code>__comp</code>	A functor to use for comparisons.

Returns

An iterator pointing to the first element greater than `__val`, or `end()` if no elements are greater than `__val`.

The comparison function should have the same effects on ordering as the function used for the initial sort.

Definition at line 2123 of file `stl_algo.h`.

2.16.1 Detailed Description

Binders turn functions/functors with two arguments into functors with a single argument, storing an argument to be applied later. For example, a variable `B` of type `binder1st` is constructed from a functor `f` and an argument `x`. Later, `B's operator()` is called with a single argument `y`. The return value is the value of `f(x, y)`. `B` can be *called* with various arguments (`y1, y2, ...`) and will in turn call `f(x, y1), f(x, y2), ...`

The function `bind1st` is provided to save some typing. It takes the function and an argument as parameters, and returns an instance of `binder1st`.

The type `binder2nd` and its creator function `bind2nd` do the same thing, but the stored argument is passed as the second parameter instead of the first, e.g., `bind2nd(std::minus<float>(), 1.3)` will create a functor whose `operator()` accepts a floating-point number, subtracts 1.3 from it, and returns the result. (If `bind1st` had been used, the functor would perform `1.3 - x` instead.

Creator-wrapper functions like `bind1st` are intended to be used in calling algorithms. Their return values will be temporary objects. (The goal is to not require you to type names like `std::binder1st<std::plus<int>>` for declaring a variable to hold the return value from `bind1st(std::plus<int>(), 5)`.

These become more useful when combined with the composition functions.

These functions are deprecated in C++11 and can be replaced by `std::bind` (or `std::tr1::bind`) which is more powerful and flexible, supporting functions with any number of arguments. Uses of `bind1st` can be replaced by `std::bind(f, x, std::placeholders::_1)` and `bind2nd` by `std::bind(f, std::placeholders::_1, x)`.

2.16.2 Function Documentation

2.16.2.1 `bind()` [1/2]

```
template<typename _Func , typename... _BoundArgs>
constexpr _Bind_helper<__is_socketlike<_Func>::value, _Func, _BoundArgs...>::type std::bind (
    _Func && __f,
    _BoundArgs &&... __args ) [inline]
```

Function template for `std::bind`.

Definition at line 785 of file `functional`.

2.16.2.2 `bind()` [2/2]

```
template<typename _Result , typename _Func , typename... _BoundArgs>
constexpr _Bindres_helper<_Result, _Func, _BoundArgs...>::type std::bind (
    _Func && __f,
    _BoundArgs &&... __args ) [inline]
```

Function template for `std::bind<R>`.

Definition at line 809 of file `functional`.

2.16.2.3 bind1st()

```
template<typename _Operation , typename _Tp >  
binder1st<_Operation> std::bind1st (   
    const _Operation & __fn,  
    const _Tp & __x ) [inline]
```

One of the [binder functors](#).

Definition at line 135 of file binders.h.

2.16.2.4 bind2nd()

```
template<typename _Operation , typename _Tp >  
binder2nd<_Operation> std::bind2nd (   
    const _Operation & __fn,  
    const _Tp & __x ) [inline]
```

One of the [binder functors](#).

Definition at line 170 of file binders.h.

2.17 Bit manipulation

2.21.1 Detailed Description

Classes and functions for complex numbers.

2.21.2 Function Documentation

2.21.2.1 `abs()`

```
template<typename _Tp >
_Tp std::abs (
    const complex< _Tp > & __z ) [inline]
```

Return magnitude of `z`.

Definition at line 629 of file `complex`.

Referenced by `std::binomial_distribution< _IntType >::operator()()`, and `std::poisson_distribution< _IntType >::operator()()`.

2.21.2.2 `arg()`

```
template<typename _Tp >
_Tp std::arg (
    const complex< _Tp > & __z ) [inline]
```

Return phase angle of z .

Definition at line 656 of file `complex`.

2.21.2.3 `conj()`

```
template<typename _Tp >
constexpr complex< _Tp > std::conj (
    const complex< _Tp > & __z ) [inline]
```

Return complex conjugate of z .

Definition at line 708 of file `complex`.

2.21.2.4 `cos()`

```
template<typename _Tp >
complex< _Tp > std::cos (
    const complex< _Tp > & __z ) [inline]
```

Return complex cosine of z .

Definition at line 740 of file `complex`.

2.21.2.5 `cosh()`

```
template<typename _Tp >
complex< _Tp > std::cosh (
    const complex< _Tp > & __z ) [inline]
```

Return complex hyperbolic cosine of z .

Definition at line 770 of file `complex`.

2.21.2.6 exp()

```
template<typename _Tp >
complex< _Tp > std::exp (
    const complex< _Tp > & __z ) [inline]
```

Return complex base e exponential of z.

Definition at line 796 of file complex.

2.21.2.7 fabs()

```
template<typename _Tp >
std::complex< _Tp > std::tr1::fabs (
    const std::complex< _Tp > & __z ) [inline]
```

fabs(__z) [8.1.8].

Definition at line 309 of file tr1/complex.

2.21.2.8 log()

```
template<typename _Tp >
complex< _Tp > std::log (
    const complex< _Tp > & __z ) [inline]
```

Return complex natural logarithm of z.

Definition at line 823 of file complex.

Referenced by `std::generate_canonical()`, `std::normal_distribution< result_type >::operator()()`, `std::gamma_distribution< result_type >::operator()()`, `std::binomial_distribution< _IntType >::operator()()`, and `std::poisson_distribution< _IntType >::operator()()`.

2.21.2.9 log10()

```
template<typename _Tp >
complex< _Tp > std::log10 (
    const complex< _Tp > & __z ) [inline]
```

Return complex base 10 logarithm of z.

Definition at line 828 of file complex.

2.21.2.10 norm()

```
template<typename _Tp >
_Tp constexpr std::norm (
    const complex< _Tp > & ) [inline]
```

Return z magnitude squared.

Definition at line 692 of file complex.

2.21.2.11 operator!=() [1/3]

```
template<typename _Tp >
constexpr bool std::operator!= (
    const complex< _Tp > & __x,
    const complex< _Tp > & __y ) [inline]
```

Return false if x is equal to y .

Definition at line 482 of file complex.

2.21.2.12 operator!=() [2/3]

```
template<typename _Tp >
constexpr bool std::operator!= (
    const complex< _Tp > & __x,
    const _Tp & __y ) [inline]
```

Return false if x is equal to y .

Definition at line 487 of file complex.

2.21.2.13 operator!=() [3/3]

```
template<typename _Tp >
constexpr bool std::operator!= (
    const _Tp & __x,
    const complex< _Tp > & __y ) [inline]
```

Return false if x is equal to y .

Definition at line 492 of file complex.

2.21.2.14 operator*() [1/3]

```
template<typename _Tp >
constexpr complex<_Tp> std::operator* (
    const complex< _Tp > & __x,
    const complex< _Tp > & __y ) [inline]
```

Return new complex value x times y .

Definition at line 391 of file complex.

2.21.2.15 operator*() [2/3]

```
template<typename _Tp >
constexpr complex<_Tp> std::operator* (
    const complex< _Tp > & __x,
    const _Tp & __y ) [inline]
```

Return new complex value x times y .

Definition at line 400 of file complex.

2.21.2.16 operator*() [3/3]

```
template<typename _Tp >
constexpr complex<_Tp> std::operator* (
    const _Tp & __x,
    const complex< _Tp > & __y ) [inline]
```

Return new complex value x times y .

Definition at line 409 of file complex.

2.21.2.17 operator*=() [1/2]

```
template<typename _Tp >
constexpr complex< _Tp > & std::complex< _Tp >::operator*= (
    const _Tp & __t )
```

Multiply this complex number by a scalar.

Definition at line 250 of file complex.

2.21.2.18 operator*=() [2/2]

```
template<typename _Tp >
template<typename _Up >
constexpr complex< _Tp > & std::complex< _Tp >::operator*= (
    const complex< _Up > & __z )
```

Multiply this complex number by another.

Definition at line 304 of file complex.

2.21.2.19 operator+() [1/4]

```
template<typename _Tp >
constexpr complex<_Tp> std::operator+ (
    const complex< _Tp > & __x,
    const complex< _Tp > & __y ) [inline]
```

Return new complex value x plus y.

Definition at line 331 of file complex.

2.21.2.20 operator+() [2/4]

```
template<typename _Tp >
constexpr complex<_Tp> std::operator+ (
    const complex< _Tp > & __x,
    const _Tp & __y ) [inline]
```

Return new complex value x plus y.

Definition at line 340 of file complex.

2.21.2.21 operator+() [3/4]

```
template<typename _Tp >
constexpr complex<_Tp> std::operator+ (
    const _Tp & __x,
    const complex< _Tp > & __y ) [inline]
```

Return new complex value x plus y.

Definition at line 349 of file complex.

2.21.2.22 operator+() [4 / 4]

```
template<typename _Tp >
constexpr complex<_Tp> std::operator+ (
    const complex<_Tp > & __x ) [inline]
```

Return x.

Definition at line 450 of file complex.

2.21.2.23 operator+=()

```
template<typename _Tp >
template<typename _Up >
constexpr complex<_Tp > & std::complex<_Tp >::operator+= (
    const complex<_Up > & __z )
```

Add another complex number to this one.

Definition at line 281 of file complex.

2.21.2.24 operator-() [1 / 4]

```
template<typename _Tp >
constexpr complex<_Tp> std::operator- (
    const complex<_Tp > & __x,
    const complex<_Tp > & __y ) [inline]
```

Return new complex value x minus y.

Definition at line 361 of file complex.

2.21.2.25 operator-() [2 / 4]

```
template<typename _Tp >
constexpr complex<_Tp> std::operator- (
    const complex<_Tp > & __x,
    const _Tp & __y ) [inline]
```

Return new complex value x minus y.

Definition at line 370 of file complex.

2.21.2.26 operator-() [3/4]

```
template<typename _Tp >
constexpr complex<_Tp> std::operator- (
    const _Tp & __x,
    const complex< _Tp > & __y ) [inline]
```

Return new complex value x minus y .

Definition at line 379 of file complex.

2.21.2.27 operator-() [4/4]

```
template<typename _Tp >
constexpr complex<_Tp> std::operator- (
    const complex< _Tp > & __x ) [inline]
```

Return complex negation of x .

Definition at line 456 of file complex.

2.21.2.28 operator-=()

```
template<typename _Tp >
template<typename _Up >
constexpr complex< _Tp > & std::complex< _Tp >::operator-= (
    const complex< _Up > & __z )
```

Subtract another complex number from this one.

Definition at line 292 of file complex.

2.21.2.29 operator/() [1/3]

```
template<typename _Tp >
constexpr complex<_Tp> std::operator/ (
    const complex< _Tp > & __x,
    const complex< _Tp > & __y ) [inline]
```

Return new complex value x divided by y .

Definition at line 421 of file complex.

2.21.2.30 operator/() [2/3]

```
template<typename _Tp >
constexpr complex<_Tp> std::operator/ (
    const complex<_Tp > & __x,
    const _Tp & __y ) [inline]
```

Return new complex value x divided by y.

Definition at line 430 of file complex.

2.21.2.31 operator/() [3/3]

```
template<typename _Tp >
constexpr complex<_Tp> std::operator/ (
    const _Tp & __x,
    const complex<_Tp > & __y ) [inline]
```

Return new complex value x divided by y.

Definition at line 439 of file complex.

2.21.2.32 operator/=() [1/2]

```
template<typename _Tp >
constexpr complex<_Tp > & std::complex<_Tp >::operator/= (
    const _Tp & __t )
```

Divide this complex number by a scalar.

Definition at line 260 of file complex.

2.21.2.33 operator/=() [2/2]

```
template<typename _Tp >
template<typename _Up >
constexpr complex<_Tp > & std::complex<_Tp >::operator/= (
    const complex<_Up > & __z )
```

Divide this complex number by another.

Definition at line 317 of file complex.

2.21.2.34 operator<<()

```
template<typename _Tp , typename _CharT , class _Traits >
basic_ostream<_CharT, _Traits>& std::operator<< (
    basic_ostream< _CharT, _Traits > & __os,
    const complex< _Tp > & __x )
```

Insertion operator for complex values.

Definition at line 554 of file complex.

2.21.2.35 operator=() [1/2]

```
template<typename _Tp >
constexpr complex< _Tp > & std::complex< _Tp >::operator= (
    const _Tp & __t )
```

Assign a scalar to this complex number.

Definition at line 240 of file complex.

2.21.2.36 operator=() [2/2]

```
template<typename _Tp >
template<typename _Up >
constexpr complex< _Tp > & std::complex< _Tp >::operator= (
    const complex< _Up > & __z )
```

Assign another complex number to this one.

Definition at line 270 of file complex.

2.21.2.37 operator==() [1/3]

```
template<typename _Tp >
constexpr bool std::operator==(
    const complex< _Tp > & __x,
    const complex< _Tp > & __y ) [inline]
```

Return true if x is equal to y.

Definition at line 463 of file complex.

2.21.2.38 operator==() [2/3]

```
template<typename _Tp >
constexpr bool std::operator==(
    const complex< _Tp > & __x,
    const _Tp & __y ) [inline]
```

Return true if *x* is equal to *y*.

Definition at line 468 of file `complex`.

2.21.2.39 operator==() [3/3]

```
template<typename _Tp >
constexpr bool std::operator==(
    const _Tp & __x,
    const complex< _Tp > & __y ) [inline]
```

Return true if *x* is equal to *y*.

Definition at line 474 of file `complex`.

2.21.2.40 operator>>()

```
template<typename _Tp , typename _CharT , class _Traits >
basic_istream<_CharT, _Traits>& std::operator>> (
    basic_istream< _CharT, _Traits > & __is,
    complex< _Tp > & __x )
```

Extraction operator for complex values.

Definition at line 500 of file `complex`.

2.21.2.41 polar()

```
template<typename _Tp >
complex< _Tp > std::polar (
    const _Tp & __rho,
    const _Tp & __theta = 0 ) [inline]
```

Return complex with magnitude *rho* and angle *theta*.

Definition at line 700 of file `complex`.

2.21.2.42 pow() [1/5]

```
template<typename _Tp >
complex< _Tp > std::pow (
    const complex< _Tp > & __z,
    int __n ) [inline]
```

Return x to the y 'th power.

Definition at line 1018 of file complex.

Referenced by `std::gamma_distribution< result_type >::operator()()`.

2.21.2.43 pow() [2/5]

```
template<typename _Tp >
complex< _Tp > std::pow (
    const complex< _Tp > & __x,
    const _Tp & __y )
```

Return x to the y 'th power.

Definition at line 1027 of file complex.

2.21.2.44 pow() [3/5]

```
template<typename _Tp >
complex< _Tp > std::pow (
    const complex< _Tp > & __x,
    const complex< _Tp > & __y ) [inline]
```

Return x to the y 'th power.

Definition at line 1066 of file complex.

2.21.2.45 pow() [4/5]

```
template<typename _Tp >
complex< _Tp > std::pow (
    const _Tp & __x,
    const complex< _Tp > & __y ) [inline]
```

Return x to the y 'th power.

Definition at line 1072 of file complex.

2.21.2.46 pow() [5/5]

```
template<typename _Tp , typename _Up >
std::complex<typename __gnu_cxx::__promote_2<_Tp, _Up>::__type> std::tr1::pow (
    const std::complex< _Tp > & __x,
    const _Up & __y ) [inline]
```

Additional overloads [8.1.9].

Definition at line 350 of file tr1/complex.

2.21.2.47 sin()

```
template<typename _Tp >
complex< _Tp > std::sin (
    const complex< _Tp > & __z ) [inline]
```

Return complex sine of z.

Definition at line 858 of file complex.

2.21.2.48 sinh()

```
template<typename _Tp >
complex< _Tp > std::sinh (
    const complex< _Tp > & __z ) [inline]
```

Return complex hyperbolic sine of z.

Definition at line 888 of file complex.

2.21.2.49 sqrt()

```
template<typename _Tp >
complex< _Tp > std::sqrt (
    const complex< _Tp > & __z ) [inline]
```

Return complex square root of z.

Definition at line 932 of file complex.

Referenced by `std::normal_distribution< result_type >::operator()()`, and `std::student_t_distribution< _RealType >::operator()()`.

2.21.2.50 tan()

```
template<typename _Tp >  
complex< _Tp > std::tan (  
    const complex< _Tp > & __z ) [inline]
```

Return complex tangent of z.

Definition at line 959 of file complex.

2.21.2.51 tanh()

```
template<typename _Tp >  
complex< _Tp > std::tanh (  
    const complex< _Tp > & __z ) [inline]
```

Return complex hyperbolic tangent of z.

Definition at line 987 of file complex.

2.22 Concurrency

Collaboration diagram for Concurrency:

Modules

- [Condition Variables](#)
- [Futures](#)
- [Mutexes](#)
- [Threads](#)

2.22.1 Detailed Description

Components for concurrent operations, including threads, mutexes, and condition variables.

2.23 Condition Variables

Collaboration diagram for Condition Variables:

Classes

- class `std::condition_variable`
- class `std::_V2::condition_variable_any`

Enumerations

- enum `std::cv_status` { `no_timeout`, `timeout` }

Functions

- void `std::notify_all_at_thread_exit` (`condition_variable` &, `unique_lock`< `mutex` >)

2.23.1 Detailed Description

Classes for `condition_variable` support.

2.23.2 Enumeration Type Documentation

2.23.2.1 `cv_status`

```
enum std::cv_status [strong]
```

`cv_status`

Definition at line 68 of file `condition_variable`.

2.24 Const-propagating wrapper

Collaboration diagram for Const-propagating wrapper:

Classes

- class `std::experimental::fundamentals_v2::propagate_const< _Tp >`

Functions

- `template<typename _Tp >`
`constexpr const _Tp & std::experimental::fundamentals_v2::get_underlying (const propagate_const< _Tp > &__pt) noexcept`
- `template<typename _Tp >`
`constexpr _Tp & std::experimental::fundamentals_v2::get_underlying (propagate_const< _Tp > &__pt) noexcept`
- `template<typename _Tp >`
`constexpr bool std::experimental::fundamentals_v2::operator!= (const propagate_const< _Tp > &__pt, nullptr_t)`
- `template<typename _Tp >`
`constexpr bool std::experimental::fundamentals_v2::operator!= (nullptr_t, const propagate_const< _Tp > &__pu)`
- `template<typename _Tp, typename _Up >`
`constexpr bool std::experimental::fundamentals_v2::operator!= (const propagate_const< _Tp > &__pt, const propagate_const< _Up > &__pu)`
- `template<typename _Tp, typename _Up >`
`constexpr bool std::experimental::fundamentals_v2::operator!= (const propagate_const< _Tp > &__pt, const _Up &__u)`
- `template<typename _Tp, typename _Up >`
`constexpr bool std::experimental::fundamentals_v2::operator!= (const _Tp &__t, const propagate_const< _Up > &__pu)`
- `template<typename _Tp, typename _Up >`
`constexpr bool std::experimental::fundamentals_v2::operator< (const propagate_const< _Tp > &__pt, const propagate_const< _Up > &__pu)`
- `template<typename _Tp, typename _Up >`
`constexpr bool std::experimental::fundamentals_v2::operator< (const propagate_const< _Tp > &__pt, const _Up &__u)`
- `template<typename _Tp, typename _Up >`
`constexpr bool std::experimental::fundamentals_v2::operator< (const _Tp &__t, const propagate_const< _Up > &__pu)`

- `template<typename _Tp, typename _Up >`
`constexpr bool std::experimental::fundamentals_v2::operator<= (const propagate_const< _Tp > &__pt,`
`const propagate_const< _Up > &__pu)`
- `template<typename _Tp, typename _Up >`
`constexpr bool std::experimental::fundamentals_v2::operator<= (const propagate_const< _Tp > &__pt,`
`const _Up &__u)`
- `template<typename _Tp, typename _Up >`
`constexpr bool std::experimental::fundamentals_v2::operator<= (const _Tp &__t, const propagate_const<`
`_Up > &__pu)`
- `template<typename _Tp >`
`constexpr bool std::experimental::fundamentals_v2::operator== (const propagate_const< _Tp > &__pt,`
`nullptr_t)`
- `template<typename _Tp >`
`constexpr bool std::experimental::fundamentals_v2::operator== (nullptr_t, const propagate_const< _Tp >`
`&__pu)`
- `template<typename _Tp, typename _Up >`
`constexpr bool std::experimental::fundamentals_v2::operator== (const propagate_const< _Tp > &__pt,`
`const propagate_const< _Up > &__pu)`
- `template<typename _Tp, typename _Up >`
`constexpr bool std::experimental::fundamentals_v2::operator== (const propagate_const< _Tp > &__pt,`
`const _Up &__u)`
- `template<typename _Tp, typename _Up >`
`constexpr bool std::experimental::fundamentals_v2::operator== (const _Tp &__t, const propagate_const<`
`_Up > &__pu)`
- `template<typename _Tp, typename _Up >`
`constexpr bool std::experimental::fundamentals_v2::operator> (const propagate_const< _Tp > &__pt, const`
`propagate_const< _Up > &__pu)`
- `template<typename _Tp, typename _Up >`
`constexpr bool std::experimental::fundamentals_v2::operator> (const propagate_const< _Tp > &__pt, const`
`_Up &__u)`
- `template<typename _Tp, typename _Up >`
`constexpr bool std::experimental::fundamentals_v2::operator> (const _Tp &__t, const propagate_const< ↵`
`_Up > &__pu)`
- `template<typename _Tp, typename _Up >`
`constexpr bool std::experimental::fundamentals_v2::operator>= (const propagate_const< _Tp > &__pt,`
`const propagate_const< _Up > &__pu)`
- `template<typename _Tp, typename _Up >`
`constexpr bool std::experimental::fundamentals_v2::operator>= (const propagate_const< _Tp > &__pt,`
`const _Up &__u)`
- `template<typename _Tp, typename _Up >`
`constexpr bool std::experimental::fundamentals_v2::operator>= (const _Tp &__t, const propagate_const<`
`_Up > &__pu)`
- `template<typename _Tp >`
`constexpr void std::experimental::fundamentals_v2::swap (propagate_const< _Tp > &__pt, propagate_const<`
`_Tp > &__pt2) noexcept(__is_nothrow_swappable< _Tp >::value)`

2.24.1 Detailed Description

A const-propagating wrapper that propagates const to pointer-like members, as described in n4388 "A Proposal to Add a Const-Propagating Wrapper to the Standard Library".

2.25 Containers

Collaboration diagram for Containers:

Modules

- [Associative](#)
- [Sequences](#)
- [Unordered Associative](#)

2.25.1 Detailed Description

Containers are collections of objects.

A container may hold any type which meets certain requirements, but the type of contained object is chosen at compile time, and all objects in a given container must be of the same type. (Polymorphism is possible by declaring a container of pointers to a base class and then populating it with pointers to instances of derived classes. Variant value types such as the `any` class from `Boost` can also be used.

All contained types must be `Assignable` and `CopyConstructible`. Specific containers may place additional requirements on the types of their contained objects.

Containers manage memory allocation and deallocation themselves when storing your objects. The objects are destroyed when the container is itself destroyed. Note that if you are storing pointers in a container, `delete` is *not* automatically called on the pointers before destroying them.

All containers must meet certain requirements, summarized in `tables`.

The standard containers are further refined into [Sequences](#) and [Associative Containers](#). [Unordered Associative Containers](#).

2.26 Containers

2.29.1 Detailed Description

Components for error handling, reporting, and diagnostic operations.

2.29.2 Function Documentation

2.29.2.1 `generic_category()`

```
const error\_category& std::_V2::generic_category ( ) [noexcept]
```

Error category for `errno` error codes.

2.29.2.2 `make_error_code()`

```
error\_code make_error_code (
    errc __e ) [related]
```

Definition at line 239 of file `system_error`.

2.29.2.3 `make_error_condition()`

```
error\_condition make_error_condition (
    errc __e ) [related]
```

Create an `error_condition` representing a standard `errc` condition.

Definition at line 335 of file `system_error`.

2.29.2.4 `operator!=()` [1/2]

```
bool operator!= (
    const error\_code & __lhs,
    const error\_code & __rhs ) [related]
```

Definition at line 398 of file `system_error`.

2.29.2.5 operator!=() [2/2]

```
bool operator!=(  
    const error_condition & __lhs,  
    const error_condition & __rhs ) [related]
```

Definition at line 415 of file system_error.

2.29.2.6 operator<()

```
bool operator<(  
    const error_condition & __lhs,  
    const error_condition & __rhs ) [related]
```

Define an ordering for error_condition objects.

Definition at line 379 of file system_error.

2.29.2.7 operator==() [1/2]

```
bool operator==(  
    const error_code & __lhs,  
    const error_code & __rhs ) [related]
```

Definition at line 342 of file system_error.

2.29.2.8 operator==() [2/2]

```
bool operator==(  
    const error_condition & __lhs,  
    const error_condition & __rhs ) [related]
```

Definition at line 357 of file system_error.

2.29.2.9 system_category()

```
const error_category& std::_V2::system_category ( ) [noexcept]
```

Error category for other error codes defined by the OS.

2.30 Dynamic Bitset.

Collaboration diagram for Dynamic Bitset.:

Classes

- struct `std::tr2::__dynamic_bitset_base< _WordT, _Alloc >`
- class `std::tr2::dynamic_bitset< _WordT, _Alloc >`
- class `std::tr2::dynamic_bitset< _WordT, _Alloc >::reference`

Functions

- `template<typename _CharT, typename _Traits, typename _Alloc1 >`
`void std::tr2::dynamic_bitset< _WordT, _Alloc >::M_copy_to_string (std::basic_string< _CharT, _Traits, ↵`
`_Alloc1 > &__str, _CharT __zero=_CharT('0'), _CharT __one=_CharT('1')) const`
- `template<typename _CharT, typename _Traits, typename _WordT, typename _Alloc >`
`std::basic_ostream< _CharT, _Traits > & std::tr2::operator<< (std::basic_ostream< _CharT, _Traits > &__os,`
`const dynamic_bitset< _WordT, _Alloc > &__x)`
- `template<typename _CharT, typename _Traits, typename _WordT, typename _Alloc >`
`std::basic_istream< _CharT, _Traits > & std::tr2::operator>> (std::basic_istream< _CharT, _Traits > &__is,`
`dynamic_bitset< _WordT, _Alloc > &__x)`
- `template<typename _WordT, typename _Alloc >`
`bool std::tr2::operator!= (const dynamic_bitset< _WordT, _Alloc > &__lhs, const dynamic_bitset< _WordT, _Alloc`
`> &__rhs)`
- `template<typename _WordT, typename _Alloc >`
`bool std::tr2::operator<= (const dynamic_bitset< _WordT, _Alloc > &__lhs, const dynamic_bitset< _WordT, ↵`
`_Alloc > &__rhs)`
- `template<typename _WordT, typename _Alloc >`
`bool std::tr2::operator> (const dynamic_bitset< _WordT, _Alloc > &__lhs, const dynamic_bitset< _WordT, _Alloc`
`> &__rhs)`
- `template<typename _WordT, typename _Alloc >`
`bool std::tr2::operator>= (const dynamic_bitset< _WordT, _Alloc > &__lhs, const dynamic_bitset< _WordT, ↵`
`_Alloc > &__rhs)`
- `template<typename _WordT, typename _Alloc >`
`dynamic_bitset< _WordT, _Alloc > std::tr2::operator& (const dynamic_bitset< _WordT, _Alloc > &__x, const`
`dynamic_bitset< _WordT, _Alloc > &__y)`

- `template<typename _WordT, typename _Alloc >`
`dynamic_bitset< _WordT, _Alloc > std::tr2::operator|` (const `dynamic_bitset< _WordT, _Alloc > &__x`, const `dynamic_bitset< _WordT, _Alloc > &__y`)
- `template<typename _WordT, typename _Alloc >`
`dynamic_bitset< _WordT, _Alloc > std::tr2::operator^` (const `dynamic_bitset< _WordT, _Alloc > &__x`, const `dynamic_bitset< _WordT, _Alloc > &__y`)
- `template<typename _WordT, typename _Alloc >`
`dynamic_bitset< _WordT, _Alloc > std::tr2::operator-` (const `dynamic_bitset< _WordT, _Alloc > &__x`, const `dynamic_bitset< _WordT, _Alloc > &__y`)

2.30.1 Detailed Description

2.30.2 Function Documentation

2.30.2.1 `operator!=()`

```
template<typename _WordT, typename _Alloc >
bool std::tr2::operator!= (
    const dynamic_bitset< _WordT, _Alloc > & __lhs,
    const dynamic_bitset< _WordT, _Alloc > & __rhs ) [inline]
```

These comparisons for equality/inequality are, well, *bitwise*.

Definition at line 1123 of file `dynamic_bitset`.

2.30.2.2 `operator&()`

```
template<typename _WordT, typename _Alloc >
dynamic_bitset<_WordT, _Alloc> std::tr2::operator& (
    const dynamic_bitset< _WordT, _Alloc > & __x,
    const dynamic_bitset< _WordT, _Alloc > & __y ) [inline]
```

Global bitwise operations on bitsets.

Parameters

<code>__x</code>	A bitset.
<code>__y</code>	A bitset of the same size as <code>__x</code> .

Returns

A new bitset.

These should be self-explanatory.

Definition at line 1158 of file `dynamic_bitset`.

2.30.2.3 `operator-()`

```
template<typename _WordT , typename _Alloc >
dynamic_bitset<_WordT, _Alloc> std::tr2::operator- (
    const dynamic_bitset< _WordT, _Alloc > & __x,
    const dynamic_bitset< _WordT, _Alloc > & __y ) [inline]
```

Global bitwise operations on bitsets.

Parameters

<code>__x</code>	A bitset.
<code>__y</code>	A bitset of the same size as <code>__x</code> .

Returns

A new bitset.

These should be self-explanatory.

Definition at line 1188 of file `dynamic_bitset`.

2.30.2.4 `operator<<()`

```
template<typename _CharT , typename _Traits , typename _WordT , typename _Alloc >
std::basic_ostream<_CharT, _Traits>& std::tr2::operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const dynamic_bitset< _WordT, _Alloc > & __x ) [inline]
```

Stream output operator for `dynamic_bitset`.

Definition at line 1201 of file `dynamic_bitset`.

2.30.2.5 `operator<=()`

```
template<typename _WordT , typename _Alloc >
bool std::tr2::operator<= (
    const dynamic_bitset< _WordT, _Alloc > & __lhs,
    const dynamic_bitset< _WordT, _Alloc > & __rhs ) [inline]
```

These comparisons for equality/inequality are, well, *bitwise*.

Definition at line 1129 of file `dynamic_bitset`.

2.30.2.6 operator>()

```
template<typename _WordT , typename _Alloc >
bool std::tr2::operator> (
    const dynamic_bitset< _WordT, _Alloc > & __lhs,
    const dynamic_bitset< _WordT, _Alloc > & __rhs ) [inline]
```

These comparisons for equality/inequality are, well, *bitwise*.

Definition at line 1135 of file dynamic_bitset.

2.30.2.7 operator>=()

```
template<typename _WordT , typename _Alloc >
bool std::tr2::operator>= (
    const dynamic_bitset< _WordT, _Alloc > & __lhs,
    const dynamic_bitset< _WordT, _Alloc > & __rhs ) [inline]
```

These comparisons for equality/inequality are, well, *bitwise*.

Definition at line 1141 of file dynamic_bitset.

2.30.2.8 operator>>()

```
template<typename _CharT , typename _Traits , typename _WordT , typename _Alloc >
std::basic_istream<_CharT, _Traits>& std::tr2::operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    dynamic_bitset< _WordT, _Alloc > & __x )
```

Stream input operator for dynamic_bitset.

Input will skip whitespace and only accept '0' and '1' characters. The dynamic_bitset will grow as necessary to hold the string of bits.

Definition at line 207 of file dynamic_bitset.tcc.

References std::basic_string< _CharT, _Traits, _Alloc >::reserve(), std::tr2::dynamic_bitset< _WordT, _Alloc >::size(), and std::basic_ios< _CharT, _Traits >::widen().

2.30.2.9 operator^()

```
template<typename _WordT , typename _Alloc >
dynamic_bitset<_WordT, _Alloc> std::tr2::operator^ (
    const dynamic_bitset< _WordT, _Alloc > & __x,
    const dynamic_bitset< _WordT, _Alloc > & __y ) [inline]
```

Global bitwise operations on bitsets.

Parameters

$_x$	A bitset.
$_y$	A bitset of the same size as $_x$.

Returns

A new bitset.

These should be self-explanatory.

Definition at line 1178 of file dynamic_bitset.

2.30.2.10 operator" | ()

```
template<typename _WordT , typename _Alloc >
dynamic_bitset<_WordT, _Alloc> std::tr2::operator| (
    const dynamic_bitset< _WordT, _Alloc > & __x,
    const dynamic_bitset< _WordT, _Alloc > & __y ) [inline]
```

Global bitwise operations on bitsets.

Parameters

$_x$	A bitset.
$_y$	A bitset of the same size as $_x$.

Returns

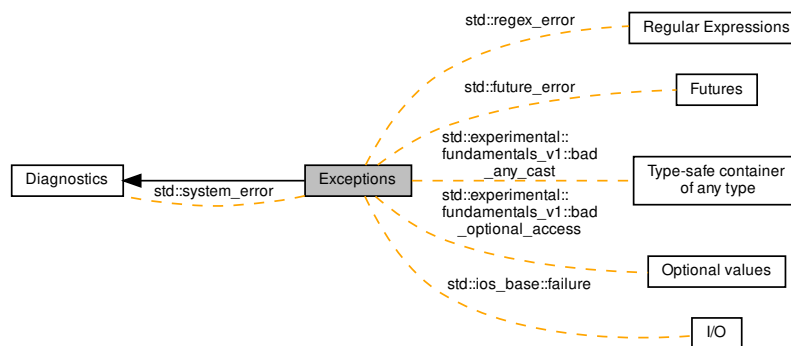

A new bitset.

These should be self-explanatory.

Definition at line 1168 of file dynamic_bitset.

2.31 Exceptions

Collaboration diagram for Exceptions:

Classes

- class `__cxxabiv1::__forced_unwind`
- class `std::bad_alloc`
- class `std::experimental::fundamentals_v1::bad_any_cast`
- class `std::bad_cast`
- class `std::bad_exception`
- class `std::bad_function_call`
- class `std::experimental::fundamentals_v1::bad_optional_access`
- class `std::bad_typeid`
- class `std::bad_weak_ptr`
- class `std::domain_error`
- class `std::exception`

- class `std::system_error`
- class `std::underflow_error`

Macros

- `#define __cpp_lib_uncaught_exceptions`

Typedefs

- `typedef void(* std::terminate_handler) ()`
- `typedef void(* std::unexpected_handler) ()`

Functions

- `std::exception::exception (const exception &)=default`
- `std::exception::exception (exception &&)=default`
- `void __gnu_cxx::__verbose_terminate_handler ()`
- `exception_ptr std::current_exception () noexcept`
- `terminate_handler std::get_terminate () noexcept`
- `unexpected_handler std::get_unexpected () noexcept`
- `template<typename _Ex >`
`exception_ptr std::make_exception_ptr (_Ex __ex) noexcept`
- `exception & std::exception::operator= (const exception &)=default`
- `exception & std::exception::operator= (exception &&)=default`
- `void std::rethrow_exception (exception_ptr)`
- `template<typename _Ex >`
`void std::rethrow_if_nested (const _Ex &__ex)`
- `terminate_handler std::set_terminate (terminate_handler) noexcept`
- `unexpected_handler std::set_unexpected (unexpected_handler) noexcept`
- `void std::terminate () noexcept`
- `template<typename _Tp >`
`void std::throw_with_nested (_Tp &&__t)`
- `bool std::uncaught_exception () noexcept`
- `int std::uncaught_exceptions () noexcept`
- `void std::unexpected ()`
- `virtual const char * std::exception::what () const noexcept`

2.31.1 Detailed Description

Classes and functions for reporting errors via exception classes.

2.31.2 Typedef Documentation

2.31.2.1 terminate_handler

```
typedef void(* std::terminate_handler) ()
```

If you write a replacement terminate handler, it must be of this type.

Definition at line 65 of file exception.

2.31.2.2 unexpected_handler

```
typedef void(* std::unexpected_handler) ()
```

If you write a replacement unexpected handler, it must be of this type.

Definition at line 68 of file exception.

2.31.3 Function Documentation

2.31.3.1 __verbose_terminate_handler()

```
void __gnu_cxx::__verbose_terminate_handler ( )
```

A replacement for the standard terminate_handler which prints more information about the terminating exception (if any) on stderr.

Call

```
std::set_terminate(__gnu_cxx::__verbose_terminate_handler)
```

to use. For more info, see <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt02ch06s02.html>.

In 3.4 and later, this is on by default.

2.31.3.2 current_exception()

```
exception_ptr std::current_exception ( ) [noexcept]
```

Obtain an exception_ptr to the currently handled exception. If there is none, or the currently handled exception is foreign, return the null value.

2.31.3.3 get_terminate()

```
terminate_handler std::get_terminate ( ) [noexcept]
```

Return the current terminate handler.

2.31.3.4 get_unexpected()

```
unexpected_handler std::get_unexpected ( ) [noexcept]
```

Return the current unexpected handler.

2.31.3.5 make_exception_ptr()

```
template<typename _Ex >  
exception_ptr std::make_exception_ptr (   
    _Ex __ex ) [noexcept]
```

Obtain an exception_ptr pointing to a copy of the supplied object.

Definition at line 186 of file exception_ptr.h.

2.31.3.6 rethrow_exception()

```
void std::rethrow_exception (   
    exception_ptr )
```

Throw the object pointed to by the exception_ptr.

2.31.3.7 rethrow_if_nested()

```
template<typename _Ex >  
void std::rethrow_if_nested (   
    const _Ex & __ex ) [inline]
```

If __ex is derived from nested_exception, __ex.rethrow_nested().

Definition at line 159 of file nested_exception.h.

References std::__addressof().

2.31.3.8 set_terminate()

```
terminate_handler std::set_terminate (   
    terminate_handler ) [noexcept]
```

Takes a new handler function as an argument, returns the old function.

2.31.3.9 set_unexpected()

```
unexpected_handler std::set_unexpected (
    unexpected_handler ) [noexcept]
```

Takes a new handler function as an argument, returns the old function.

2.31.3.10 terminate()

```
void std::terminate ( ) [noexcept]
```

The runtime will call this function if exception handling must be abandoned for any reason. It can also be called by the user.

2.31.3.11 throw_with_nested()

```
template<typename _Tp >
void std::throw_with_nested (
    _Tp && __t ) [inline]
```

If `__t` is derived from `nested_exception`, throws `__t`. Else, throws an implementation-defined object derived from both.

Definition at line 118 of file `nested_exception.h`.

2.31.3.12 uncaught_exception()

```
bool std::uncaught_exception ( ) [noexcept]
```

[18.6.4]/1: 'Returns true after completing evaluation of a throw-expression until either completing initialization of the exception-declaration in the matching handler or entering `unexpected()` due to the throw; or after entering `terminate()` for any reason other than an explicit call to `terminate()`. [Note: This includes stack unwinding [15.2]. end note]'

2: 'When `uncaught_exception()` is true, throwing an exception can result in a call of `terminate()` (15.5.1).'

2.31.3.13 uncaught_exceptions()

```
int std::uncaught_exceptions ( ) [noexcept]
```

The number of uncaught exceptions.

2.31.3.14 unexpected()

```
void std::unexpected ( )
```

The runtime will call this function if an exception is thrown which violates the function's exception specification.

2.31.3.15 what()

```
virtual const char* std::exception::what ( ) const [virtual], [noexcept]
```

Returns a C-style character string describing the general cause of the current error.

Reimplemented in `std::experimental::filesystem::v1::filesystem_error`, `std::ios_base::failure`, `std::runtime_error`, `std::bad_typeid`, `std::bad_cast`, `std::logic_error`, `std::future_error`, `std::bad_weak_ptr`, `std::bad_alloc`, `std::experimental::fundamentals_v1::bad_exception`, and `std::bad_function_call`.

2.34.1 Detailed Description

Utilities for performing operations on file systems and their components, such as paths, regular files, and directories.

ISO/IEC TS 18822:2015 C++ File System Technical Specification

2.34.2 Enumeration Type Documentation

2.34.2.1 copy_options

```
enum std::experimental::filesystem::v1::copy_options : unsigned short [strong]
```

Bitmask type.

Definition at line 88 of file experimental/bits/fs_fwd.h.

2.34.2.2 perms

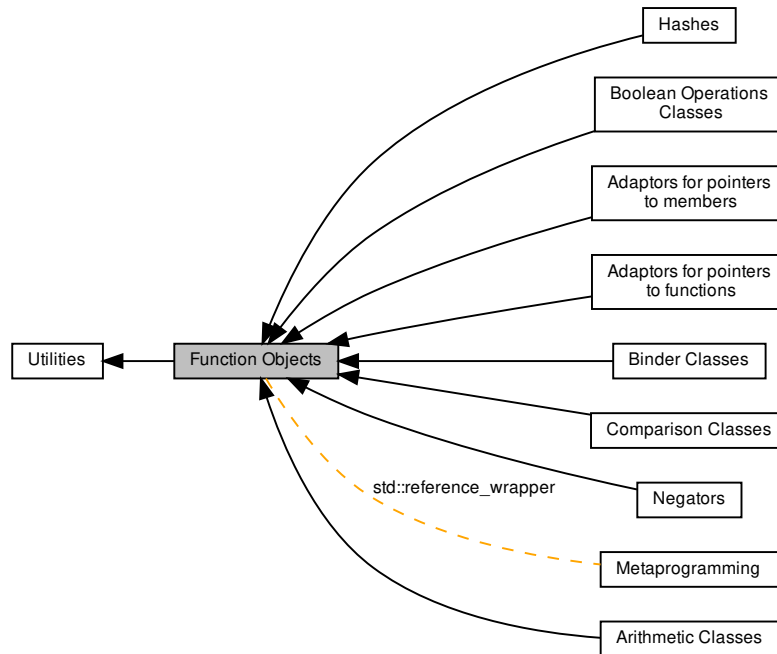

```
enum std::experimental::filesystem::v1::perms : unsigned [strong]
```

Bitmask type.

Definition at line 141 of file experimental/bits/fs_fwd.h.

2.35 Function Objects

Collaboration diagram for Function Objects:

Modules

- [Adaptors for pointers to functions](#)
- [Adaptors for pointers to members](#)
- [Arithmetic Classes](#)
- [Binder Classes](#)
- [Boolean Operations Classes](#)
- [Comparison Classes](#)
- [Hashes](#)
- [Negators](#)

Classes

- `struct std::binary_function< _Arg1, _Arg2, _Result >`
- `class std::function< _Res(_ArgTypes...)>`
- `class std::reference_wrapper< _Tp >`
- `struct std::unary_function< _Arg, _Result >`

Functions

- `template<typename _Tp, typename _Class >`
`constexpr _Mem_fn<_Tp _Class::*> std::mem_fn (_Tp _Class::* __pm) noexcept`

2.35.1 Detailed Description

Function objects, or *functors*, are objects with an `operator()` defined and accessible. They can be passed as arguments to algorithm templates and used in place of a function pointer. Not only is the resulting expressiveness of the library increased, but the generated code can be more efficient than what you might write by hand. When we refer to *functors*, then, generally we include function pointers in the description as well.

Often, functors are only created as temporaries passed to algorithm calls, rather than being created as named variables.

Two examples taken from the standard itself follow. To perform a by-element addition of two vectors `a` and `b` containing `double`, and put the result in `a`, use

```
transform(a.begin(), a.end(), b.begin(), a.begin(), plus<double>());
```

To negate every element in `a`, use

```
transform(a.begin(), a.end(), a.begin(), negate<double>());
```

The addition and negation functions will be inlined directly.

The standard functors are derived from structs named `unary_function` and `binary_function`. These two classes contain nothing but typedefs, to aid in generic (template) programming. If you write your own functors, you might consider doing the same.

2.35.2 Function Documentation

2.35.2.1 `mem_fn()`

```
template<typename _Tp, typename _Class >
constexpr _Mem_fn<_Tp _Class::*> std::mem_fn (
    _Tp _Class::* __pm ) [inline], [noexcept]
```

Returns a function object that forwards to the member pointer `pm`.

Definition at line 170 of file `functional`.

2.36 Futures

Collaboration diagram for Futures:

Classes

- class `std::__basic_future< _Res >`
- struct `std::__future_base`

enum std::future_status [strong]
```

Status code for futures.

Definition at line 174 of file future.

2.36.2.3 launch

```
enum std::launch [strong]
```

Launch code for futures.

Definition at line 137 of file future.

2.36.3 Function Documentation

2.36.3.1 async() [1/2]

```
template<typename _Fn , typename... _Args>
future< __async_result_of< _Fn, _Args...  > > std::async (
    launch __policy,
    _Fn && __fn,
    _Args &&... __args )
```

async

Definition at line 1727 of file future.

2.36.3.2 async() [2/2]

```
template<typename _Fn , typename... _Args>
future< __async_result_of< _Fn, _Args...  > > std::async (
    _Fn && __fn,
    _Args &&... __args ) [inline]
```

async, potential overload

Definition at line 1760 of file future.

2.36.3.3 future_category()

```
const error_category& std::future_category ( ) [noexcept]
```

Points to a statically-allocated object derived from `error_category`.

2.36.3.4 make_error_code()

```
error_code std::make_error_code (
    future_errc __errc ) [inline], [noexcept]
```

Overload for `make_error_code`.

Definition at line 84 of file `future`.

2.36.3.5 make_error_condition()

```
error_condition std::make_error_condition (
    future_errc __errc ) [inline], [noexcept]
```

Overload for `make_error_condition`.

Definition at line 89 of file `future`.

2.36.3.6 swap()

```
template<typename _Res , typename... _ArgTypes>
void std::swap (
    packaged_task< _Res(_ArgTypes...)> & __x,
    packaged_task< _Res(_ArgTypes...)> & __y ) [inline], [noexcept]
```

`swap`

Definition at line 1591 of file `future`.

_BinaryOperation __binary_op)`

2.37.1 Detailed Description

2.37.2 Function Documentation

2.37.2.1 accumulate() [1/2]

```
template<typename _InputIterator , typename _Tp >
constexpr _Tp std::accumulate (
    _InputIterator __first,
    _InputIterator __last,
    _Tp __init ) [inline]
```

Accumulate values in a range.

Accumulates the values in the range `[first,last)` using `operator+()`. The initial value is *init*. The values are processed in order.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__init</code>	Starting value to add other values to.

Returns

The final sum.

Definition at line 134 of file `stl_numeric.h`.

Referenced by `__gnu_parallel::__parallel_partial_sum_linear()`.

2.37.2.2 accumulate() [2/2]

```
template<typename _InputIterator , typename _Tp , typename _BinaryOperation >
constexpr _Tp std::accumulate (
    _InputIterator __first,
    _InputIterator __last,
    _Tp __init,
    _BinaryOperation __binary_op ) [inline]
```

Accumulate values in a range with operation.

Accumulates the values in the range `[first,last)` using the function object `__binary_op`. The initial value is `__init`. The values are processed in order.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__init</code>	Starting value to add other values to.
<code>__binary_op</code>	Function object to accumulate with.

Returns

The final sum.

Definition at line 161 of file `stl_numeric.h`.

2.37.2.3 adjacent_difference() [1/2]

```
template<typename _InputIterator , typename _OutputIterator >
constexpr _OutputIterator std::adjacent_difference (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result )
```

Return differences between adjacent values.

Computes the difference between adjacent values in the range `[first,last)` using `operator-()` and writes the result to `__result`.

Parameters

<code>__first</code>	Start of input range.
<code>__last</code>	End of input range.
<code>__result</code>	Output sums.

Returns

Iterator pointing just beyond the values written to result.

`_GLIBCXX_RESOLVE_LIB_DEFECTS` DR 539. `partial_sum` and `adjacent_difference` should mention requirements

Definition at line 338 of file `stl_numeric.h`.

2.37.2.4 adjacent_difference() [2/2]

```
template<typename _InputIterator , typename _OutputIterator , typename _BinaryOperation >
constexpr _OutputIterator std::adjacent_difference (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    _BinaryOperation __binary_op )
```

Return differences between adjacent values.

Computes the difference between adjacent values in the range `[__first,__last)` using the function object `__binary_op` and writes the result to `__result`.

Parameters

<code>__first</code>	Start of input range.
<code>__last</code>	End of input range.
<code>__result</code>	Output sum.
<code>__binary_op</code>	Function object.

Returns

Iterator pointing just beyond the values written to result.

`_GLIBCXX_RESOLVE_LIB_DEFECTS` DR 539. `partial_sum` and `adjacent_difference` should mention requirements

Definition at line 382 of file `stl_numeric.h`.

2.37.2.5 `inner_product()` [1/2]

```
template<typename _InputIterator1 , typename _InputIterator2 , typename _Tp >
constexpr _Tp std::inner_product (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _Tp __init ) [inline]
```

Compute inner product of two ranges.

Starting with an initial value of `__init`, multiplies successive elements from the two ranges and adds each product into the accumulated value using `operator+()`. The values in the ranges are processed in order.

Parameters

<code>__first1</code>	Start of range 1.
<code>__last1</code>	End of range 1.
<code>__first2</code>	Start of range 2.
<code>__init</code>	Starting value to add other values to.

Returns

The final inner product.

Definition at line 190 of file `stl_numeric.h`.

2.37.2.6 inner_product() [2/2]

```
template<typename _InputIterator1 , typename _InputIterator2 , typename _Tp , typename _Binary↵
Operation1 , typename _BinaryOperation2 >
constexpr _Tp std::inner_product (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _Tp __init,
    _BinaryOperation1 __binary_op1,
    _BinaryOperation2 __binary_op2 ) [inline]
```

Compute inner product of two ranges.

Starting with an initial value of `__init`, applies `__binary_op2` to successive elements from the two ranges and accumulates each result into the accumulated value using `__binary_op1`. The values in the ranges are processed in order.

Parameters

<code>__first1</code>	Start of range 1.
<code>__last1</code>	End of range 1.
<code>__first2</code>	Start of range 2.
<code>__init</code>	Starting value to add other values to.
<code>__binary_op1</code>	Function object to accumulate with.
<code>__binary_op2</code>	Function object to apply to pairs of input values.

Returns

The final inner product.

Definition at line 223 of file `stl_numeric.h`.

2.37.2.7 iota()

```
template<typename _ForwardIterator , typename _Tp >
constexpr void std::iota (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Tp __value )
```

Create a range of sequentially increasing values.

For each element in the range `[first,last)` assigns `value` and increments `value` as if by `++value`.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__value</code>	Starting value.

Returns

Nothing.

Definition at line 88 of file `stl_numeric.h`.

2.37.2.8 `partial_sum()` [1/2]

```
template<typename _InputIterator , typename _OutputIterator >
constexpr _OutputIterator std::partial_sum (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result )
```

Return list of partial sums.

Accumulates the values in the range `[first,last)` using the `+` operator. As each successive input value is added into the total, that partial sum is written to `__result`. Therefore, the first value in `__result` is the first value of the input, the second value in `__result` is the sum of the first and second input values, and so on.

Parameters

<code>__first</code>	Start of input range.
<code>__last</code>	End of input range.
<code>__result</code>	Output sum.

Returns

Iterator pointing just beyond the values written to `__result`.

Definition at line 256 of file `stl_numeric.h`.

Referenced by `__gnu_parallel::__parallel_random_shuffle_drs_pu()`, and `__gnu_parallel::__sequential_random_shuffle()`.

2.37.2.9 `partial_sum()` [2/2]

```
template<typename _InputIterator , typename _OutputIterator , typename _BinaryOperation >
constexpr _OutputIterator std::partial_sum (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    _BinaryOperation __binary_op )
```

Return list of partial sums.

Accumulates the values in the range `[first,last)` using `__binary_op`. As each successive input value is added into the total, that partial sum is written to `__result`. Therefore, the first value in `__result` is the first value of the input, the second value in `__result` is the sum of the first and second input values, and so on.

Parameters

<code>__first</code>	Start of input range.
<code>__last</code>	End of input range.
<code>__result</code>	Output sum.
<code>__binary_op</code>	Function object.

Returns

Iterator pointing just beyond the values written to `__result`.

Definition at line 298 of file `stl_numeric.h`.

2.40.1 Detailed Description

2.40.2 Function Documentation

2.40.2.1 is_heap() [1/2]

```
template<typename _RandomAccessIterator >
constexpr bool std::is_heap (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last ) [inline]
```

Determines whether a range is a heap.

Parameters

<i>__first</i>	Start of range.
<i>__last</i>	End of range.

Returns

True if range is a heap, false otherwise.

Definition at line 550 of file `stl_heap.h`.

References `std::is_heap_until()`.

2.40.2.2 is_heap() [2/2]

```
template<typename _RandomAccessIterator , typename _Compare >
constexpr bool std::is_heap (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    _Compare __comp ) [inline]
```

Determines whether a range is a heap using comparison functor.

Parameters

<i>__first</i>	Start of range.
<i>__last</i>	End of range.
<i>__comp</i>	Comparison functor to use.

Returns

True if range is a heap, false otherwise.

Definition at line 564 of file `stl_heap.h`.

2.40.2.3 `is_heap_until()` [1/2]

```
template<typename _RandomAccessIterator >
constexpr _RandomAccessIterator std::is_heap_until (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last ) [inline]
```

Search the end of a heap.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.

Returns

An iterator pointing to the first element not in the heap.

This operation returns the last iterator `i` in `[__first, __last)` for which the range `[__first, i)` is a heap.

Definition at line 496 of file `stl_heap.h`.

2.40.2.4 `is_heap_until()` [2/2]

```
template<typename _RandomAccessIterator , typename _Compare >
constexpr _RandomAccessIterator std::is_heap_until (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    _Compare __comp ) [inline]
```

Search the end of a heap using comparison functor.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__comp</code>	Comparison functor to use.

Returns

An iterator pointing to the first element not in the heap.

This operation returns the last iterator `i` in `[__first, __last)` for which the range `[__first, i)` is a heap. Comparisons are made using `__comp`.

Definition at line 525 of file `stl_heap.h`.

Referenced by `std::is_heap()`.

2.40.2.5 make_heap() [1/2]

```
template<typename _RandomAccessIterator >
constexpr void std::make_heap (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last ) [inline]
```

Construct a heap over a range.

Parameters

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap.

This operation makes the elements in [`__first`,`__last`) into a heap.

Definition at line 374 of file `stl_heap.h`.

2.40.2.6 make_heap() [2/2]

```
template<typename _RandomAccessIterator , typename _Compare >
constexpr void std::make_heap (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    _Compare __comp ) [inline]
```

Construct a heap over a range using comparison functor.

Parameters

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap.
<code>__comp</code>	Comparison functor to use.

This operation makes the elements in [`__first`,`__last`) into a heap. Comparisons are made using `__comp`.

Definition at line 401 of file `stl_heap.h`.

2.40.2.7 pop_heap() [1/2]

```
template<typename _RandomAccessIterator >
constexpr void std::pop_heap (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last ) [inline]
```

Pop an element off a heap.

Parameters

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap.

Precondition

`[__first, __last)` is a valid, non-empty range.

This operation pops the top of the heap. The elements `__first` and `__last-1` are swapped and `[__first, __last-1)` is made into a heap.

Definition at line 282 of file `stl_heap.h`.

2.40.2.8 `pop_heap()` [2/2]

```
template<typename _RandomAccessIterator, typename _Compare>
constexpr void std::pop_heap (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    _Compare __comp ) [inline]
```

Pop an element off a heap using comparison functor.

Parameters

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap.
<code>__comp</code>	Comparison functor to use.

This operation pops the top of the heap. The elements `__first` and `__last-1` are swapped and `[__first, __last-1)` is made into a heap. Comparisons are made using `comp`.

Definition at line 316 of file `stl_heap.h`.

2.40.2.9 `push_heap()` [1/2]

```
template<typename _RandomAccessIterator>
constexpr void std::push_heap (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last ) [inline]
```

Push an element onto a heap.

Parameters

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap + element.

This operation pushes the element at `last-1` onto the valid heap over the range `[__first,__last-1)`. After completion, `[__first,__last)` is a valid heap.

Definition at line 161 of file `stl_heap.h`.

2.40.2.10 `push_heap()` [2/2]

```
template<typename _RandomAccessIterator , typename _Compare >
constexpr void std::push_heap (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    _Compare __comp ) [inline]
```

Push an element onto a heap using comparison functor.

Parameters

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap + element.
<code>__comp</code>	Comparison functor.

This operation pushes the element at `__last-1` onto the valid heap over the range `[__first,__last-1)`. After completion, `[__first,__last)` is a valid heap. Compare operations are performed using `comp`.

Definition at line 197 of file `stl_heap.h`.

Referenced by `std::priority_queue<_Tp, _Sequence, _Compare >::push()`.

2.40.2.11 `sort_heap()` [1/2]

```
template<typename _RandomAccessIterator >
constexpr void std::sort_heap (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last ) [inline]
```

Sort a heap.

Parameters

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap.

This operation sorts the valid heap in the range [`__first`,`__last`).

Definition at line 439 of file `stl_heap.h`.

2.40.2.12 `sort_heap()` [2/2]

```
template<typename _RandomAccessIterator , typename _Compare >
constexpr void std::sort_heap (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    _Compare __comp ) [inline]
```

Sort a heap using comparison functor.

Parameters

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap.
<code>__comp</code>	Comparison functor to use.

This operation sorts the valid heap in the range [`__first`,`__last`). Comparisons are made using `__comp`.

Definition at line 467 of file `stl_heap.h`.

2.41.1 Detailed Description

2.41.2 Function Documentation

2.41.2.1 `priority_queue()` [1/3]

```
template<typename _Tv , typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename
_Alloc = std::allocator<char>>
__gnu_pbds::priority_queue<_Tv, Cmp_Fn, Tag, _Alloc>::priority_queue (
    const cmp_fn & r_cmp_fn ) [inline]
```

Constructor taking some policy objects. `r_cmp_fn` will be copied by the `Cmp_Fn` object of the container object.

Definition at line 115 of file `priority_queue.hpp`.

2.41.2.2 `priority_queue()` [2/3]

```
template<typename _Tv , typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename
_Alloc = std::allocator<char>>
template<typename It >
__gnu_pbds::priority_queue<_Tv, Cmp_Fn, Tag, _Alloc>::priority_queue (
    It first_it,
    It last_it ) [inline]
```

Constructor taking `__iterators` to a range of `value_types`. The `value_types` between `first_it` and `last_it` will be inserted into the container object.

Definition at line 121 of file `priority_queue.hpp`.

2.41.2.3 priority_queue() [3/3]

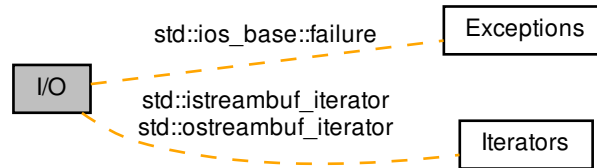

```
template<typename _Tv , typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename
_Alloc = std::allocator<char>>>
template<typename It >
__gnu_pbds::priority_queue< _Tv, Cmp_Fn, Tag, _Alloc >::priority_queue (
    It first_it,
    It last_it,
    const cmp_fn & r_cmp_fn ) [inline]
```

Constructor taking __iterators to a range of value_types and some policy objects The value_types between first_it and last_it will be inserted into the container object. r_cmp_fn will be copied by the cmp_fn object of the container object.

Definition at line 129 of file priority_queue.hpp.

2.42 I/O

Collaboration diagram for I/O:

Classes

- class `std::basic_filebuf< _CharT, _Traits >`
- class `std::basic_fstream< _CharT, _Traits >`
- class `std::basic_ifstream< _CharT, _Traits >`
- class `std::basic_ios< _CharT, _Traits >`
- class `std::basic_iostream< _CharT, _Traits >`
- class `std::basic_istream< _CharT, _Traits >`
- class `std::basic_istreamstream< _CharT, _Traits, _Alloc >`
- class `std::basic_ofstream< _CharT, _Traits >`
- class `std::basic_ostream< _CharT, _Traits >`
- class `std::basic_ostreamstream< _CharT, _Traits, _Alloc >`
- class `std::basic_streambuf< _CharT, _Traits >`
- class `std::basic_stringbuf< _CharT, _Traits, _Alloc >`
- class `std::basic_stringstream< _CharT, _Traits, _Alloc >`
- class `std::ios_base::failure`
- class `std::ios_base`
- class `std::istreambuf_iterator< _CharT, _Traits >`
- class `std::ostreambuf_iterator< _CharT, _Traits >`
- class `__gnu_cxx::stdio_filebuf< _CharT, _Traits >`
- class `__gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >`

Typedefs

- typedef `basic_filebuf< char >` `std::filebuf`
- typedef `basic_fstream< char >` `std::fstream`
- typedef `basic_ifstream< char >` `std::ifstream`
- typedef `basic_ios< char >` `std::ios`
- typedef `basic_iostream< char >` `std::iostream`
- typedef `basic_istream< char >` `std::istream`
- typedef `basic_istreamstream< char >` `std::istreamstream`
- typedef `basic_ofstream< char >` `std::ofstream`

- typedef `basic_ostream`< char > `std::ostream`
- typedef `basic_ostringstream`< char > `std::ostringstream`
- typedef `basic_streambuf`< char > `std::streambuf`
- typedef `basic_stringbuf`< char > `std::stringbuf`
- typedef `basic_stringstream`< char > `std::stringstream`
- typedef `basic_filebuf`< wchar_t > `std::wfilebuf`
- typedef `basic_fstream`< wchar_t > `std::wfstream`
- typedef `basic_ifstream`< wchar_t > `std::wifstream`
- typedef `basic_ios`< wchar_t > `std::wios`
- typedef `basic_iostream`< wchar_t > `std::wiostream`
- typedef `basic_istream`< wchar_t > `std::wistream`
- typedef `basic_istreamstream`< wchar_t > `std::wistreamstream`
- typedef `basic_ofstream`< wchar_t > `std::wofstream`
- typedef `basic_ostream`< wchar_t > `std::wostream`
- typedef `basic_ostringstream`< wchar_t > `std::wostringstream`
- typedef `basic_streambuf`< wchar_t > `std::wstreambuf`
- typedef `basic_stringbuf`< wchar_t > `std::wstringbuf`
- typedef `basic_stringstream`< wchar_t > `std::wstringstream`

2.42.1 Detailed Description

Nearly all of the I/O classes are parameterized on the type of characters they read and write. (The major exception is `ios_base` at the top of the hierarchy.) This is a change from pre-Standard streams, which were not templates.

For ease of use and compatibility, all of the `basic_*` I/O-related classes are given typedef names for both of the builtin character widths (wide and narrow). The typedefs are the same as the pre-Standard names, for example:

```
typedef basic_ifstream<char> ifstream;
```

Because properly forward-declaring these classes can be difficult, you should not do it yourself. Instead, include the `<iosfwd>` header, which contains only declarations of all the I/O classes as well as the typedefs. Trying to forward-declare the typedefs themselves (e.g., `class ostream;`) is not valid ISO C++.

For more specific declarations, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/io.↵html#std.io.objects>

2.42.2 Typedef Documentation

2.42.2.1 filebuf

```
typedef basic_filebuf<char> std::filebuf
```

Class for `char` file buffers.

Definition at line 159 of file `iosfwd`.

2.42.2.2 fstream

```
typedef basic_fstream<char> std::fstream
```

Class for `char` mixed input and output file streams.

Definition at line 168 of file `iosfwd`.

2.42.2.3 ifstream

```
typedef basic_ifstream<char> std::ifstream
```

Class for `char` input file streams.

Definition at line 162 of file `iosfwd`.

2.42.2.4 ios

```
typedef basic_ios<char> std::ios
```

Base class for `char` streams.

Definition at line 128 of file `iosfwd`.

2.42.2.5 ostream

```
typedef basic_ostream<char> std::ostream
```

Base class for `char` mixed input and output streams.

Definition at line 144 of file `iosfwd`.

2.42.2.6 istream

```
typedef basic_istream<char> std::istream
```

Base class for `char` input streams.

Definition at line 138 of file `iosfwd`.

2.42.2.7 `istringstream`

```
typedef basic_istringstream<char> std::istringstream
```

Class for `char` input memory streams.

Definition at line 150 of file `iosfwd`.

2.42.2.8 `ofstream`

```
typedef basic_ofstream<char> std::ofstream
```

Class for `char` output file streams.

Definition at line 165 of file `iosfwd`.

2.42.2.9 `ostream`

```
typedef basic_ostream<char> std::ostream
```

Base class for `char` output streams.

Definition at line 141 of file `iosfwd`.

2.42.2.10 `ostringstream`

```
typedef basic_ostringstream<char> std::ostringstream
```

Class for `char` output memory streams.

Definition at line 153 of file `iosfwd`.

2.42.2.11 `streambuf`

```
typedef basic_streambuf<char> std::streambuf
```

Base class for `char` buffers.

Definition at line 135 of file `iosfwd`.

2.42.2.12 `stringbuf`

```
typedef basic_stringbuf<char> std::stringbuf
```

Class for `char` memory buffers.

Definition at line 147 of file `iosfwd`.

2.42.2.13 `stringstream`

```
typedef basic_stringstream<char> std::stringstream
```

Class for `char` mixed input and output memory streams.

Definition at line 156 of file `iosfwd`.

2.42.2.14 `wfilebuf`

```
typedef basic_filebuf<wchar_t> std::wfilebuf
```

Class for `wchar_t` file buffers.

Definition at line 199 of file `iosfwd`.

2.42.2.15 `wfstream`

```
typedef basic_fstream<wchar_t> std::wfstream
```

Class for `wchar_t` mixed input and output file streams.

Definition at line 208 of file `iosfwd`.

2.42.2.16 `wifstream`

```
typedef basic_ifstream<wchar_t> std::wifstream
```

Class for `wchar_t` input file streams.

Definition at line 202 of file `iosfwd`.

2.42.2.17 wios

```
typedef basic_ios<wchar_t> std::wios
```

Base class for `wchar_t` streams.

Definition at line 172 of file `iosfwd`.

2.42.2.18 wiostream

```
typedef basic_iostream<wchar_t> std::wiostream
```

Base class for `wchar_t` mixed input and output streams.

Definition at line 184 of file `iosfwd`.

2.42.2.19 wistream

```
typedef basic_istream<wchar_t> std::wistream
```

Base class for `wchar_t` input streams.

Definition at line 178 of file `iosfwd`.

2.42.2.20 wstringstream

```
typedef basic_istringstream<wchar_t> std::wstringstream
```

Class for `wchar_t` input memory streams.

Definition at line 190 of file `iosfwd`.

2.42.2.21 wofstream

```
typedef basic_ofstream<wchar_t> std::wofstream
```

Class for `wchar_t` output file streams.

Definition at line 205 of file `iosfwd`.

2.42.2.22 wostream

```
typedef basic_ostream<wchar_t> std::wostream
```

Base class for `wchar_t` output streams.

Definition at line 181 of file `iosfwd`.

2.42.2.23 wostringstream

```
typedef basic_ostringstream<wchar_t> std::wostringstream
```

Class for `wchar_t` output memory streams.

Definition at line 193 of file `iosfwd`.

2.42.2.24 wstreambuf

```
typedef basic_streambuf<wchar_t> std::wstreambuf
```

Base class for `wchar_t` buffers.

Definition at line 175 of file `iosfwd`.

2.42.2.25 wstringbuf

```
typedef basic_stringbuf<wchar_t> std::wstringbuf
```

Class for `wchar_t` memory buffers.

Definition at line 187 of file `iosfwd`.

2.42.2.26 wstringstream

```
typedef basic_stringstream<wchar_t> std::wstringstream
```

Class for `wchar_t` mixed input and output memory streams.

Definition at line 196 of file `iosfwd`.

2.43 Invalidation Guarantees

Collaboration diagram for Invalidation Guarantees:

- struct [__gnu_pbds::basic_invalidation_guarantee](#)
- struct [__gnu_pbds::point_invalidation_guarantee](#)
- struct [__gnu_pbds::range_invalidation_guarantee](#)

2.43.1 Detailed Description

2.44 Iterator Tags

Collaboration diagram for Iterator Tags:

Classes

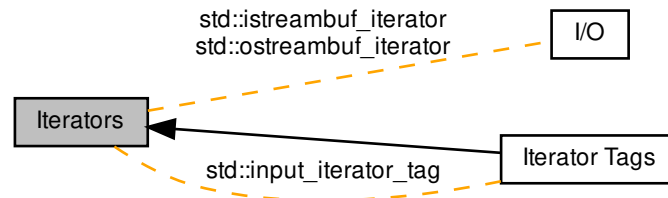

- struct [std::bidirectional_iterator_tag](#)
- struct [std::forward_iterator_tag](#)
- struct [std::input_iterator_tag](#)
- struct [std::output_iterator_tag](#)
- struct [std::random_access_iterator_tag](#)

2.44.1 Detailed Description

These are empty types, used to distinguish different iterators. The distinction is not made by what they contain, but simply by what they are. Different underlying algorithms can then be used based on the different operations supported by different iterator types.

2.45 Iterators

Collaboration diagram for Iterators:

Modules

2.45.1 Detailed Description

Abstractions for uniform iterating through various underlying types.

2.45.2 Function Documentation

2.45.2.1 `__iterator_category()`

```
template<typename _Iter >
constexpr iterator\_traits<_Iter>::iterator_category std::__iterator_category (
    const _Iter & ) [inline]
```

This function is not a part of the C++ standard but is syntactic sugar for internal library use only.

Definition at line 238 of file `stl_iterator_base_types.h`.

Referenced by `__gnu_debug::__valid_range_aux()`, `std::advance()`, `std::deque< _StateSeqT >::assign()`, `std::deque< _StateSeqT >::deque()`, `std::distance()`, `std::deque< _StateSeqT >::insert()`, and `std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::vector()`.

2.45.2.2 back_inserter()

```
template<typename _Container >
constexpr back_insert_iterator<_Container> std::back_inserter (
    _Container & __x ) [inline]
```

Parameters

<code>__x</code>	A container of arbitrary type.
------------------	--------------------------------

Returns

An instance of `back_insert_iterator` working on `__x`.

This wrapper function helps in creating `back_insert_iterator` instances. Typing the name of the iterator requires knowing the precise full type of the container, which can be tedious and impedes generic programming. Using this function lets you take advantage of automatic template parameter deduction, making the compiler match the correct types for you.

Definition at line 685 of file `bits/stl_iterator.h`.

Referenced by `std::match_results<_Bi_iter>::format()`, and `std::regex_replace()`.

2.45.2.3 front_inserter()

```
template<typename _Container >
constexpr front_insert_iterator<_Container> std::front_inserter (
    _Container & __x ) [inline]
```

Parameters

<code>__x</code>	A container of arbitrary type.
------------------	--------------------------------

Returns

An instance of `front_insert_iterator` working on `x`.

This wrapper function helps in creating `front_insert_iterator` instances. Typing the name of the iterator requires knowing the precise full type of the container, which can be tedious and impedes generic programming. Using this function lets you take advantage of automatic template parameter deduction, making the compiler match the correct types for you.

Definition at line 788 of file `bits/stl_iterator.h`.

2.45.2.4 inserter()

```
template<typename _Container >
insert_iterator<_Container> std::inserter (
    _Container & __x,
    typename _Container::iterator __i ) [inline]
```

Parameters

\leftarrow __x	A container of arbitrary type.
\leftarrow __i	An iterator into the container.

Returns

An instance of insert_iterator working on __x.

This wrapper function helps in creating insert_iterator instances. Typing the name of the iterator requires knowing the precise full type of the container, which can be tedious and impedes generic programming. Using this function lets you take advantage of automatic template parameter deduction, making the compiler match the correct types for you.

Definition at line 931 of file bits/stl_iterator.h.

2.45.2.5 make_reverse_iterator()

```
template<typename _Iterator >
constexpr reverse_iterator<_Iterator> std::make_reverse_iterator (
    _Iterator __i ) [inline]
```

Generator function for reverse_iterator.

Definition at line 552 of file bits/stl_iterator.h.

2.45.2.6 operator==()

```
template<typename _Iterator >
constexpr bool std::operator== (
    const reverse_iterator<_Iterator > & __x,
    const reverse_iterator<_Iterator > & __y ) [inline]
```

Parameters

\leftarrow __x	A reverse_iterator.
\leftarrow __y	A reverse_iterator.

Returns

A simple bool.

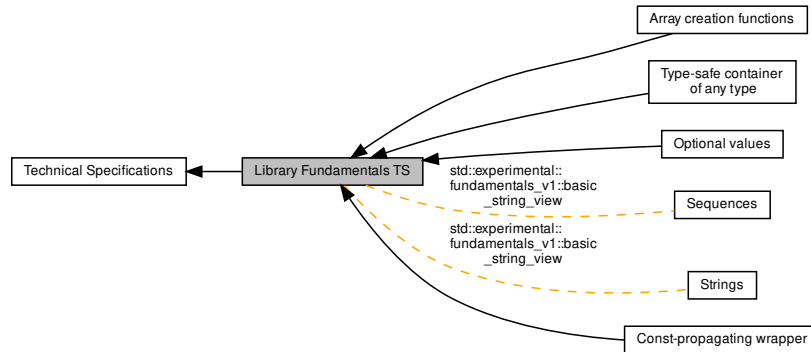

Reverse iterators forward comparisons to their underlying `base()` iterators.

Definition at line 385 of file `bits/stl_iterator.h`.

References `std::reverse_iterator<_Iterator>::base()`.

2.48.1 Detailed Description

Classes and functions for internationalization and localization.

2.48.2 Function Documentation

2.48.2.1 `has_facet()`

```
template<typename _Facet >
bool std::has_facet (
    const locale & __loc ) throw ( )
```

Test for the presence of a facet.

`has_facet` tests the locale argument for the presence of the facet type provided as the template parameter. Facets derived from the facet parameter will also return true.

Template Parameters

<code>_Facet</code>	The facet type to test the presence of.
---------------------	---

Parameters

<code>__loc</code>	The locale to test.
--------------------	---------------------

Returns

true if `__loc` contains a facet of type `_Facet`, else false.

Definition at line 104 of file `locale_classes.tcc`.

2.48.2.2 `use_facet()`

```
template<typename _Facet >
const _Facet & std::use_facet (
    const locale & __loc )
```

Return a facet.

`use_facet` looks for and returns a reference to a facet of type `Facet` where `Facet` is the template parameter. If `has_facet(locale)` is true, there is a suitable facet to return. It throws `std::bad_cast` if the locale doesn't contain a facet of type `Facet`.

Template Parameters

<code>_Facet</code>	The facet type to access.
---------------------	---------------------------

Parameters

<code>__loc</code>	The locale to use.
--------------------	--------------------

Returns

Reference to facet of type `Facet`.

Exceptions

<code>std::bad_cast</code>	if <code>__loc</code> doesn't contain a facet of type <code>_Facet</code> .
----------------------------	---

Definition at line 132 of file `locale_classes.tcc`.

2.49.1 Detailed Description

2.49.2 Mathematical Special Functions

A collection of advanced mathematical special functions, defined by ISO/IEC IS 29124 and then added to ISO C++ 2017.

2.49.2.1 Introduction and History

The first significant library upgrade on the road to C++2011, [TR1](#), included a set of 23 mathematical functions that significantly extended the standard transcendental functions inherited from C and declared in `<cmath>`.

Although most components from TR1 were eventually adopted for C++11 these math functions were left behind out of concern for implementability. The math functions were published as a separate international standard [IS 29124 - Extensions to the C++ Library to Support Mathematical Special Functions](#).

For C++17 these functions were incorporated into the main standard.

2.49.2.2 Contents

The following functions are implemented in namespace `std`:

- `assoc_laguerre` - Associated Laguerre functions
- `assoc_legendre` - Associated Legendre functions
- `beta` - Beta functions
- `comp_ellint_1` - Complete elliptic functions of the first kind
- `comp_ellint_2` - Complete elliptic functions of the second kind
- `comp_ellint_3` - Complete elliptic functions of the third kind

- `cyl_bessel_i` - Regular modified cylindrical Bessel functions
- `cyl_bessel_j` - Cylindrical Bessel functions of the first kind
- `cyl_bessel_k` - Irregular modified cylindrical Bessel functions
- `cyl_neumann` - Cylindrical Neumann functions or Cylindrical Bessel functions of the second kind
- `ellint_1` - Incomplete elliptic functions of the first kind
- `ellint_2` - Incomplete elliptic functions of the second kind
- `ellint_3` - Incomplete elliptic functions of the third kind
- `expint` - The exponential integral
- `hermite` - Hermite polynomials
- `laguerre` - Laguerre functions
- `legendre` - Legendre polynomials
- `riemann_zeta` - The Riemann zeta function
- `sph_bessel` - Spherical Bessel functions
- `sph_legendre` - Spherical Legendre functions
- `sph_neumann` - Spherical Neumann functions

The hypergeometric functions were stricken from the TR29124 and C++17 versions of this math library because of implementation concerns. However, since they were in the TR1 version and since they are popular we kept them as an extension in namespace `__gnu_cxx`:

- [conf_hyperg](#) - Confluent hypergeometric functions
- [hyperg](#) - Hypergeometric functions

2.49.2.3 Argument Promotion

The arguments supplied to the non-suffixed functions will be promoted according to the following rules:

1. If any argument intended to be floating point is given an integral value That integral value is promoted to double.
2. All floating point arguments are promoted up to the largest floating point precision among them.

2.49.2.4 NaN Arguments

If any of the floating point arguments supplied to these functions is invalid or NaN (`std::numeric_limits<Tp>::quiet_↔NaN`), the value NaN is returned.

2.49.2.5 Implementation

We strive to implement the underlying math with type generic algorithms to the greatest extent possible. In practice, the functions are thin wrappers that dispatch to function templates. Type dependence is controlled with `std::numeric_limits` and functions thereof.

We don't promote `float` to `double` or `double` to `long double` reflexively. The goal is for `float` functions to operate more quickly, at the cost of `float` accuracy and possibly a smaller domain of validity. Similarly, `long double` should give you more dynamic range and slightly more precision than `double` on many systems.

2.49.2.6 Testing

These functions have been tested against equivalent implementations from the [Gnu Scientific Library](#), [GSL](#) and [Boost](#) and the ratio

$$\frac{|f - f_{test}|}{|f_{test}|}$$

is generally found to be within 10^{-15} for 64-bit double on linux-x86_64 systems over most of the ranges of validity.

Todo Provide accuracy comparisons on a per-function basis for a small number of targets.

2.49.2.7 General Bibliography

2.49.3 Function Documentation

2.49.3.1 `airy_ai()`

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type __gnu_cxx::airy_ai (
    _Tp __x ) [inline]
```

Return the Airy function $Ai(x)$ of real argument x .

Definition at line 1242 of file `specfun.h`.

2.49.3.2 airy_aif()

```
float __gnu_cxx::airy_aif (
    float __x ) [inline]
```

Return the Airy function $Ai(x)$ of float argument x.

Definition at line 1219 of file specfun.h.

2.49.3.3 airy_ail()

```
long double __gnu_cxx::airy_ail (
    long double __x ) [inline]
```

Return the Airy function $Ai(x)$ of long double argument x.

Definition at line 1230 of file specfun.h.

2.49.3.4 airy_bi()

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type __gnu_cxx::airy_bi (
    _Tp __x ) [inline]
```

Return the Airy function $Bi(x)$ of real argument x.

Definition at line 1277 of file specfun.h.

2.49.3.5 airy_bif()

```
float __gnu_cxx::airy_bif (
    float __x ) [inline]
```

Return the Airy function $Bi(x)$ of float argument x.

Definition at line 1254 of file specfun.h.

2.49.3.6 airy_bil()

```
long double __gnu_cxx::airy_bil (
    long double __x ) [inline]
```

Return the Airy function $Bi(x)$ of long double argument x.

Definition at line 1265 of file specfun.h.

2.49.3.7 `assoc_laguerre()`

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::assoc_laguerre (
    unsigned int __n,
    unsigned int __m,
    _Tp __x ) [inline]
```

Return the associated Laguerre polynomial of nonnegative order n , nonnegative degree m and real argument $x \leftarrow$: $L_n^m(x)$.

The associated Laguerre function of real degree α , $L_n^\alpha(x)$, is defined by

$$L_n^\alpha(x) = \frac{(\alpha+1)_n}{n!} {}_1F_1(-n; \alpha+1; x)$$

where $(\alpha)_n$ is the Pochhammer symbol and ${}_1F_1(a; c; x)$ is the confluent hypergeometric function.

The associated Laguerre polynomial is defined for integral degree $\alpha = m$ by:

$$L_n^m(x) = (-1)^m \frac{d^m}{dx^m} L_{n+m}(x)$$

where the Laguerre polynomial is defined by:

$$L_n(x) = \frac{e^x}{n!} \frac{d^n}{dx^n} (x^n e^{-x})$$

and $x \geq 0$.

See also

`laguerre` for details of the Laguerre function of degree n

Template Parameters

<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .
------------------	--

Parameters

<code>__n</code>	The order of the Laguerre function, <code>__n</code> ≥ 0 .
<code>__m</code>	The degree of the Laguerre function, <code>__m</code> ≥ 0 .
<code>__x</code>	The argument of the Laguerre function, <code>__x</code> ≥ 0 .

Exceptions

<code>std::domain_error</code>	if <code>__x</code> < 0 .
--------------------------------	-----------------------------

Definition at line 252 of file specfun.h.

2.49.3.8 `assoc_laguerref()`

```
float std::assoc_laguerref (
    unsigned int __n,
    unsigned int __m,
    float __x ) [inline]
```

Return the associated Laguerre polynomial of order n , degree m : $L_n^m(x)$ for `float` argument.

See also

`assoc_laguerre` for more details.

Definition at line 206 of file specfun.h.

2.49.3.9 `assoc_laguerrel()`

```
long double std::assoc_laguerrel (
    unsigned int __n,
    unsigned int __m,
    long double __x ) [inline]
```

Return the associated Laguerre polynomial of order n , degree m : $L_n^m(x)$.

See also

`assoc_laguerre` for more details.

Definition at line 216 of file specfun.h.

2.49.3.10 `assoc_legendre()`

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::assoc_legendre (
    unsigned int __l,
    unsigned int __m,
    _Tp __x ) [inline]
```

Return the associated Legendre function of degree l and order m .

The associated Legendre function is derived from the Legendre function $P_l(x)$ by the Rodrigues formula:

$$P_l^m(x) = (1 - x^2)^{m/2} \frac{d^m}{dx^m} P_l(x)$$

See also

`legendre` for details of the Legendre function of degree l

Template Parameters

<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .
------------------	--

Parameters

<code>__l</code>	The degree <code>__l >= 0</code> .
<code>__m</code>	The order <code>__m <= 1</code> .
<code>__x</code>	The argument, <code>abs (__x) <= 1</code> .

Exceptions

<code>std::domain_error</code>	if <code>abs (__x) > 1</code> .
--------------------------------	------------------------------------

Definition at line 298 of file `specfun.h`.

2.49.3.11 `assoc_legendref()`

```
float std::assoc_legendref (
    unsigned int __l,
    unsigned int __m,
    float __x ) [inline]
```

Return the associated Legendre function of degree `l` and order `m` for `float` argument.

See also

`assoc_legendre` for more details.

Definition at line 267 of file `specfun.h`.

2.49.3.12 `assoc_legendrel()`

```
long double std::assoc_legendrel (
    unsigned int __l,
    unsigned int __m,
    long double __x ) [inline]
```

Return the associated Legendre function of degree `l` and order `m`.

See also

`assoc_legendre` for more details.

Definition at line 276 of file `specfun.h`.

2.49.3.13 beta()

```
template<typename _Tpa , typename _Tpb >
__gnu_cxx::__promote_2<_Tpa, _Tpb>::__type std::beta (
    _Tpa __a,
    _Tpb __b ) [inline]
```

Return the beta function, $B(a, b)$, for real parameters a, b .

The beta function is defined by

$$B(a, b) = \int_0^1 t^{a-1} (1-t)^{b-1} dt = \frac{\Gamma(a)\Gamma(b)}{\Gamma(a+b)}$$

where $a > 0$ and $b > 0$

Template Parameters

<code>_Tpa</code>	The floating-point type of the parameter <code>__a</code> .
<code>_Tpb</code>	The floating-point type of the parameter <code>__b</code> .

Parameters

<code>__a</code>	The first argument of the beta function, <code>__a > 0</code> .
<code>__b</code>	The second argument of the beta function, <code>__b > 0</code> .

Exceptions

<code>std::domain_error</code>	if <code>__a < 0</code> or <code>__b < 0</code> .
--------------------------------	---

Definition at line 343 of file `specfun.h`.

2.49.3.14 betaf()

```
float std::betaf (
    float __a,
    float __b ) [inline]
```

Return the beta function, $B(a, b)$, for `float` parameters a, b .

See also

`beta` for more details.

Definition at line 312 of file `specfun.h`.

2.49.3.15 `betal()`

```
long double std::betal (
    long double __a,
    long double __b ) [inline]
```

Return the beta function, $B(a, b)$, for long double parameters `a`, `b`.

See also

`beta` for more details.

Definition at line 322 of file `specfun.h`.

2.49.3.16 `comp_ellint_1()`

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::comp_ellint_1 (
    _Tp __k ) [inline]
```

Return the complete elliptic integral of the first kind $K(k)$ for real modulus `k`.

The complete elliptic integral of the first kind is defined as

$$K(k) = F(k, \pi/2) = \int_0^{\pi/2} \frac{d\theta}{\sqrt{1 - k^2 \sin^2 \theta}}$$

where $F(k, \phi)$ is the incomplete elliptic integral of the first kind and the modulus $|k| \leq 1$.

See also

`ellint_1` for details of the incomplete elliptic function of the first kind.

Template Parameters

<code>_Tp</code>	The floating-point type of the modulus <code>__k</code> .
------------------	---

Parameters

<code>__k</code>	The modulus, $\text{abs}(\text{__k}) \leq 1$
------------------	--

Exceptions

<code>std::domain_error</code>	if $\text{abs}(\text{__k}) > 1$.
--------------------------------	-----------------------------------

Definition at line 391 of file specfun.h.

2.49.3.17 `comp_ellint_1f()`

```
float std::comp_ellint_1f (
    float __k ) [inline]
```

Return the complete elliptic integral of the first kind $E(k)$ for `float` modulus `k`.

See also

`comp_ellint_1` for details.

Definition at line 358 of file specfun.h.

2.49.3.18 `comp_ellint_1l()`

```
long double std::comp_ellint_1l (
    long double __k ) [inline]
```

Return the complete elliptic integral of the first kind $E(k)$ for `long double` modulus `k`.

See also

`comp_ellint_1` for details.

Definition at line 368 of file specfun.h.

2.49.3.19 `comp_ellint_2()`

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::comp_ellint_2 (
    _Tp __k ) [inline]
```

Return the complete elliptic integral of the second kind $E(k)$ for real modulus `k`.

The complete elliptic integral of the second kind is defined as

$$E(k) = E(k, \pi/2) = \int_0^{\pi/2} \sqrt{1 - k^2 \sin^2 \theta}$$

where $E(k, \phi)$ is the incomplete elliptic integral of the second kind and the modulus $|k| \leq 1$.

See also

`ellint_2` for details of the incomplete elliptic function of the second kind.

Template Parameters

<code>__Tp</code>	The floating-point type of the modulus <code>__k</code> .
-------------------	---

Parameters

<code>__k</code>	The modulus, <code>abs (__k) <= 1</code>
------------------	---

Exceptions

<code>std::domain_error</code>	if <code>abs (__k) > 1</code> .
--------------------------------	------------------------------------

Definition at line 438 of file `specfun.h`.

2.49.3.20 `comp_ellint_2f()`

```
float std::comp_ellint_2f (
    float __k ) [inline]
```

Return the complete elliptic integral of the second kind $E(k)$ for `float` modulus `k`.

See also

`comp_ellint_2` for details.

Definition at line 406 of file `specfun.h`.

2.49.3.21 `comp_ellint_2l()`

```
long double std::comp_ellint_2l (
    long double __k ) [inline]
```

Return the complete elliptic integral of the second kind $E(k)$ for long double modulus `k`.

See also

`comp_ellint_2` for details.

Definition at line 416 of file `specfun.h`.

2.49.3.22 comp_ellint_3()

```
template<typename _Tp , typename _Tpn >
__gnu_cxx::__promote_2<_Tp, _Tpn>::__type std::comp_ellint_3 (
    _Tp __k,
    _Tpn __nu ) [inline]
```

Return the complete elliptic integral of the third kind $\Pi(k, \nu) = \Pi(k, \nu, \pi/2)$ for real modulus k .

The complete elliptic integral of the third kind is defined as

$$\Pi(k, \nu) = \Pi(k, \nu, \pi/2) = \int_0^{\pi/2} \frac{d\theta}{(1 - \nu \sin^2 \theta) \sqrt{1 - k^2 \sin^2 \theta}}$$

where $\Pi(k, \nu, \phi)$ is the incomplete elliptic integral of the second kind and the modulus $|k| \leq 1$.

See also

`ellint_3` for details of the incomplete elliptic function of the third kind.

Template Parameters

<code>_Tp</code>	The floating-point type of the modulus <code>__k</code> .
<code>_Tpn</code>	The floating-point type of the argument <code>__nu</code> .

Parameters

<code>__k</code>	The modulus, <code>abs (__k) <= 1</code>
<code>__nu</code>	The argument

Exceptions

<code>std::domain_error</code>	if <code>abs (__k) > 1</code> .
--------------------------------	------------------------------------

Definition at line 489 of file `specfun.h`.

2.49.3.23 comp_ellint_3f()

```
float std::comp_ellint_3f (
    float __k,
    float __nu ) [inline]
```

Return the complete elliptic integral of the third kind $\Pi(k, \nu)$ for `float` modulus k .

See also

`comp_ellint_3` for details.

Definition at line 453 of file `specfun.h`.

2.49.3.24 `comp_ellint_3l()`

```
long double std::comp_ellint_3l (
    long double __k,
    long double __nu ) [inline]
```

Return the complete elliptic integral of the third kind $\Pi(k, \nu)$ for `long double` modulus `k`.

See also

`comp_ellint_3` for details.

Definition at line 463 of file `specfun.h`.

2.49.3.25 `conf_hyperg()`

```
template<typename _Tpa , typename _Tpc , typename _Tp >
__gnu_cxx::__promote_3<_Tpa, _Tpc, _Tp>::__type __gnu_cxx::conf_hyperg (
    _Tpa __a,
    _Tpc __c,
    _Tp __x ) [inline]
```

Return the confluent hypergeometric function ${}_1F_1(a; c; x)$ of real numeratorial parameter `a`, denominatorial parameter `c`, and argument `x`.

The confluent hypergeometric function is defined by

$${}_1F_1(a; c; x) = \sum_{n=0}^{\infty} \frac{(a)_n x^n}{(c)_n n!}$$

where the Pochhammer symbol is $(x)_k = (x)(x+1)\dots(x+k-1)$, $(x)_0 = 1$

Parameters

<code>↔ _a</code>	The numeratorial parameter
<code>↔ _c</code>	The denominatorial parameter
<code>↔ _x</code>	The argument

Definition at line 1327 of file `specfun.h`.

2.49.3.26 `conf_hypergf()`

```
float __gnu_cxx::conf_hypergf (
    float __a,
```

```
float __c,
float __x ) [inline]
```

Return the confluent hypergeometric function ${}_1F_1(a; c; x)$ of `float` numeratorial parameter `a`, denominatorial parameter `c`, and argument `x`.

See also

`conf_hyperg` for details.

Definition at line 1295 of file `specfun.h`.

2.49.3.27 `conf_hypergl()`

```
long double __gnu_cxx::conf_hypergl (
    long double __a,
    long double __c,
    long double __x ) [inline]
```

Return the confluent hypergeometric function ${}_1F_1(a; c; x)$ of `long double` numeratorial parameter `a`, denominatorial parameter `c`, and argument `x`.

See also

`conf_hyperg` for details.

Definition at line 1306 of file `specfun.h`.

2.49.3.28 `cyl_bessel_i()`

```
template<typename _Tpnu , typename _Tp >
__gnu_cxx::__promote_2<_Tpnu, _Tp>::__type std::cyl_bessel_i (
    _Tpnu __nu,
    _Tp __x ) [inline]
```

Return the regular modified Bessel function $I_\nu(x)$ for real order ν and argument $x \geq 0$.

The regular modified cylindrical Bessel function is:

$$I_\nu(x) = i^{-\nu} J_\nu(ix) = \sum_{k=0}^{\infty} \frac{(x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}$$

Template Parameters

<code>_Tpnu</code>	The floating-point type of the order <code>__nu</code> .
<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .

Parameters

<code>__nu</code>	The order
<code>__x</code>	The argument, <code>__x >= 0</code>

Exceptions

<code>std::domain_error</code>	if <code>__x < 0</code> .
--------------------------------	------------------------------

Definition at line 535 of file `specfun.h`.

2.49.3.29 `cyl_bessel_if()`

```
float std::cyl_bessel_if (
    float __nu,
    float __x ) [inline]
```

Return the regular modified Bessel function $I_\nu(x)$ for `float` order ν and argument $x \geq 0$.

See also

`cyl_bessel_i` for details.

Definition at line 504 of file `specfun.h`.

2.49.3.30 `cyl_bessel_il()`

```
long double std::cyl_bessel_il (
    long double __nu,
    long double __x ) [inline]
```

Return the regular modified Bessel function $I_\nu(x)$ for `long double` order ν and argument $x \geq 0$.

See also

`cyl_bessel_i` for details.

Definition at line 514 of file `specfun.h`.

2.49.3.31 `cyl_bessel_j()`

```
template<typename _Tpnu , typename _Tp >
__gnu_cxx::__promote_2<_Tpnu, _Tp>::__type std::cyl_bessel_j (
    _Tpnu __nu,
    _Tp __x ) [inline]
```

Return the Bessel function $J_\nu(x)$ of real order ν and argument $x \geq 0$.

The cylindrical Bessel function is:

$$J_\nu(x) = \sum_{k=0}^{\infty} \frac{(-1)^k (x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}$$

Template Parameters

<code>__Tpnu</code>	The floating-point type of the order <code>__nu</code> .
<code>__Tp</code>	The floating-point type of the argument <code>__x</code> .

Parameters

<code>__nu</code>	The order
<code>__x</code>	The argument, <code>__x >= 0</code>

Exceptions

<code>std::domain_error</code>	if <code>__x < 0</code> .
--------------------------------	------------------------------

Definition at line 581 of file `specfun.h`.

2.49.3.32 `cyl_bessel_jf()`

```
float std::cyl_bessel_jf (  
    float __nu,  
    float __x ) [inline]
```

Return the Bessel function of the first kind $J_\nu(x)$ for `float` order ν and argument $x \geq 0$.

See also

`cyl_bessel_j` for setails.

Definition at line 550 of file `specfun.h`.

2.49.3.33 `cyl_bessel_jl()`

```
long double std::cyl_bessel_jl (  
    long double __nu,  
    long double __x ) [inline]
```

Return the Bessel function of the first kind $J_\nu(x)$ for `long double` order ν and argument $x \geq 0$.

See also

`cyl_bessel_j` for setails.

Definition at line 560 of file `specfun.h`.

2.49.3.34 `cyl_bessel_k()`

```
template<typename _Tpnu , typename _Tp >
__gnu_cxx::__promote_2<_Tpnu, _Tp>::__type std::cyl_bessel_k (
    _Tpnu __nu,
    _Tp __x ) [inline]
```

Return the irregular modified Bessel function $K_\nu(x)$ of real order ν and argument x .

The irregular modified Bessel function is defined by:

$$K_\nu(x) = \frac{\pi}{2} \frac{I_{-\nu}(x) - I_\nu(x)}{\sin \nu\pi}$$

where for integral $\nu = n$ a limit is taken: $\lim_{\nu \rightarrow n}$. For negative argument we have simply:

$$K_{-\nu}(x) = K_\nu(x)$$

Template Parameters

<code>_Tpnu</code>	The floating-point type of the order <code>__nu</code> .
<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .

Parameters

<code>__nu</code>	The order
<code>__x</code>	The argument, <code>__x >= 0</code>

Exceptions

<code>std::domain_error</code>	if <code>__x < 0</code> .
--------------------------------	------------------------------

Definition at line 633 of file `specfun.h`.

2.49.3.35 `cyl_bessel_kf()`

```
float std::cyl_bessel_kf (
    float __nu,
    float __x ) [inline]
```

Return the irregular modified Bessel function $K_\nu(x)$ for `float` order ν and argument $x \geq 0$.

See also

`cyl_bessel_k` for details.

Definition at line 596 of file `specfun.h`.

2.49.3.36 cyl_bessel_kl()

```
long double std::cyl_bessel_kl (
    long double __nu,
    long double __x ) [inline]
```

Return the irregular modified Bessel function $K_\nu(x)$ for long double order ν and argument $x \geq 0$.

See also

`cyl_bessel_k` for setails.

Definition at line 606 of file specfun.h.

2.49.3.37 cyl_neumann()

```
template<typename _Tpnu , typename _Tp >
__gnu_cxx::__promote_2<_Tpnu, _Tp>::__type std::cyl_neumann (
    _Tpnu __nu,
    _Tp __x ) [inline]
```

Return the Neumann function $N_\nu(x)$ of real order ν and argument $x \geq 0$.

The Neumann function is defined by:

$$N_\nu(x) = \frac{J_\nu(x) \cos \nu\pi - J_{-\nu}(x)}{\sin \nu\pi}$$

where $x \geq 0$ and for integral order $\nu = n$ a limit is taken: $\lim_{\nu \rightarrow n}$.

Template Parameters

<code>_Tpnu</code>	The floating-point type of the order <code>__nu</code> .
<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .

Parameters

<code>__nu</code>	The order
<code>__x</code>	The argument, <code>__x</code> ≥ 0

Exceptions

<code>std::domain_error</code>	if <code>__x</code> < 0 .
--------------------------------	-----------------------------

Definition at line 681 of file specfun.h.

2.49.3.38 cyl_neumannf()

```
float std::cyl_neumannf (
    float __nu,
    float __x ) [inline]
```

Return the Neumann function $N_\nu(x)$ of `float` order ν and argument x .

See also

`cyl_neumann` for setails.

Definition at line 648 of file `specfun.h`.

2.49.3.39 cyl_neumannl()

```
long double std::cyl_neumannl (
    long double __nu,
    long double __x ) [inline]
```

Return the Neumann function $N_\nu(x)$ of `long double` order ν and argument x .

See also

`cyl_neumann` for setails.

Definition at line 658 of file `specfun.h`.

2.49.3.40 ellint_1()

```
template<typename _Tp , typename _Tpp >
__gnu_cxx::__promote_2<_Tp, _Tpp>::__type std::ellint_1 (
    _Tp __k,
    _Tpp __phi ) [inline]
```

Return the incomplete elliptic integral of the first kind $F(k, \phi)$ for `real` modulus k and angle ϕ .

The incomplete elliptic integral of the first kind is defined as

$$F(k, \phi) = \int_0^\phi \frac{d\theta}{\sqrt{1 - k^2 \sin^2 \theta}}$$

For $\phi = \pi/2$ this becomes the complete elliptic integral of the first kind, $K(k)$.

See also

`comp_ellint_1`.

Template Parameters

<code>__Tp</code>	The floating-point type of the modulus <code>__k</code> .
<code>__Tpp</code>	The floating-point type of the angle <code>__phi</code> .

Parameters

<code>__k</code>	The modulus, <code>abs (__k) <= 1</code>
<code>__phi</code>	The integral limit argument in radians

Exceptions

<code>std::domain_error</code>	if <code>abs (__k) > 1</code> .
--------------------------------	------------------------------------

Definition at line 729 of file `specfun.h`.

2.49.3.41 `ellint_1f()`

```
float std::ellint_1f (  
    float __k,  
    float __phi ) [inline]
```

Return the incomplete elliptic integral of the first kind $E(k, \phi)$ for `float` modulus k and angle ϕ .

See also

`ellint_1` for details.

Definition at line 696 of file `specfun.h`.

2.49.3.42 `ellint_1l()`

```
long double std::ellint_1l (  
    long double __k,  
    long double __phi ) [inline]
```

Return the incomplete elliptic integral of the first kind $E(k, \phi)$ for `long double` modulus k and angle ϕ .

See also

`ellint_1` for details.

Definition at line 706 of file `specfun.h`.

2.49.3.43 `ellint_2()`

```
template<typename _Tp , typename _Tpp >
__gnu_cxx::__promote_2<_Tp, _Tpp>::__type std::ellint_2 (
    _Tp __k,
    _Tpp __phi ) [inline]
```

Return the incomplete elliptic integral of the second kind $E(k, \phi)$.

The incomplete elliptic integral of the second kind is defined as

$$E(k, \phi) = \int_0^\phi \sqrt{1 - k^2 \sin^2 \theta}$$

For $\phi = \pi/2$ this becomes the complete elliptic integral of the second kind, $E(k)$.

See also

`comp_ellint_2`.

Template Parameters

<code>_Tp</code>	The floating-point type of the modulus <code>__k</code> .
<code>_Tpp</code>	The floating-point type of the angle <code>__phi</code> .

Parameters

<code>__k</code>	The modulus, <code>abs (__k) <= 1</code>
<code>__phi</code>	The integral limit argument in radians

Returns

The elliptic function of the second kind.

Exceptions

<code>std::domain_error</code>	if <code>abs (__k) > 1</code> .
--------------------------------	------------------------------------

Definition at line 777 of file `specfun.h`.

2.49.3.44 `ellint_2f()`

```
float std::ellint_2f (
    float __k,
    float __phi ) [inline]
```

Return the incomplete elliptic integral of the second kind $E(k, \phi)$ for `float` argument.

See also

`ellint_2` for details.

Definition at line 744 of file `specfun.h`.

2.49.3.45 `ellint_2l()`

```
long double std::ellint_2l (
    long double __k,
    long double __phi ) [inline]
```

Return the incomplete elliptic integral of the second kind $E(k, \phi)$.

See also

`ellint_2` for details.

Definition at line 754 of file `specfun.h`.

2.49.3.46 `ellint_3()`

```
template<typename _Tp , typename _Tpn , typename _Tpp >
__gnu_cxx::__promote_3<_Tp, _Tpn, _Tpp>::__type std::ellint_3 (
    _Tp __k,
    _Tpn __nu,
    _Tpp __phi ) [inline]
```

Return the incomplete elliptic integral of the third kind $\Pi(k, \nu, \phi)$.

The incomplete elliptic integral of the third kind is defined by:

$$\Pi(k, \nu, \phi) = \int_0^\phi \frac{d\theta}{(1 - \nu \sin^2 \theta) \sqrt{1 - k^2 \sin^2 \theta}}$$

For $\phi = \pi/2$ this becomes the complete elliptic integral of the third kind, $\Pi(k, \nu)$.

See also

`comp_ellint_3`.

Template Parameters

<code>_Tp</code>	The floating-point type of the modulus <code>__k</code> .
<code>_Tpn</code>	The floating-point type of the argument <code>__nu</code> .
<code>_Tpp</code>	The floating-point type of the angle <code>__phi</code> .

Parameters

<code>__k</code>	The modulus, <code>abs (__k) <= 1</code>
<code>__nu</code>	The second argument
<code>__phi</code>	The integral limit argument in radians

Returns

The elliptic function of the third kind.

Exceptions

<code>std::domain_error</code>	if <code>abs (__k) > 1</code> .
--------------------------------	------------------------------------

Definition at line 830 of file `specfun.h`.

2.49.3.47 `ellint_3f()`

```
float std::ellint_3f (
    float __k,
    float __nu,
    float __phi ) [inline]
```

Return the incomplete elliptic integral of the third kind $\Pi(k, \nu, \phi)$ for `float` argument.

See also

`ellint_3` for details.

Definition at line 792 of file `specfun.h`.

2.49.3.48 `ellint_3l()`

```
long double std::ellint_3l (
    long double __k,
    long double __nu,
    long double __phi ) [inline]
```

Return the incomplete elliptic integral of the third kind $\Pi(k, \nu, \phi)$.

See also

`ellint_3` for details.

Definition at line 802 of file `specfun.h`.

2.49.3.49 expint()

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::expint (
    _Tp __x ) [inline]
```

Return the exponential integral $Ei(x)$ for real argument `x`.

The exponential integral is given by

$$Ei(x) = - \int_{-x}^{\infty} \frac{e^t}{t} dt$$

Template Parameters

<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .
------------------	--

Parameters

<code>__x</code>	The argument of the exponential integral function.
------------------	--

Definition at line 870 of file `specfun.h`.

2.49.3.50 expintf()

```
float std::expintf (
    float __x ) [inline]
```

Return the exponential integral $Ei(x)$ for `float` argument `x`.

See also

`expint` for details.

Definition at line 844 of file `specfun.h`.

2.49.3.51 expintl()

```
long double std::expintl (
    long double __x ) [inline]
```

Return the exponential integral $Ei(x)$ for `long double` argument `x`.

See also

`expint` for details.

Definition at line 854 of file `specfun.h`.

2.49.3.52 hermite()

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::hermite (
    unsigned int __n,
    _Tp __x ) [inline]
```

Return the Hermite polynomial $H_n(x)$ of order `n` and `real` argument `x`.

The Hermite polynomial is defined by:

$$H_n(x) = (-1)^n e^{x^2} \frac{d^n}{dx^n} e^{-x^2}$$

The Hermite polynomial obeys a reflection formula:

$$H_n(-x) = (-1)^n H_n(x)$$

Template Parameters

<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .
------------------	--

Parameters

<code>__n</code>	The order
<code>__x</code>	The argument

Definition at line 918 of file `specfun.h`.

2.49.3.53 hermitef()

```
float std::hermitef (
    unsigned int __n,
    float __x ) [inline]
```

Return the Hermite polynomial $H_n(x)$ of nonnegative order `n` and `float` argument `x`.

See also

`hermite` for details.

Definition at line 885 of file `specfun.h`.

2.49.3.54 hermitel()

```
long double std::hermitel (
    unsigned int __n,
    long double __x ) [inline]
```

Return the Hermite polynomial $H_n(x)$ of nonnegative order n and `long double` argument x .

See also

`hermite` for details.

Definition at line 895 of file `specfun.h`.

2.49.3.55 hyperg()

```
template<typename _Tpa , typename _Tpb , typename _Tpc , typename _Tp >
__gnu_cxx::__promote_4<_Tpa, _Tpb, _Tpc, _Tp>::__type __gnu_cxx::hyperg (
    _Tpa __a,
    _Tpb __b,
    _Tpc __c,
    _Tp __x ) [inline]
```

Return the hypergeometric function ${}_2F_1(a, b; c; x)$ of real numeratorial parameters a and b , denominatorial parameter c , and argument x .

The hypergeometric function is defined by

$${}_2F_1(a; c; x) = \sum_{n=0}^{\infty} \frac{(a)_n (b)_n x^n}{(c)_n n!}$$

where the Pochhammer symbol is $(x)_k = (x)(x+1)\dots(x+k-1)$, $(x)_0 = 1$

Parameters

\longleftrightarrow <code>_a</code>	The first numeratorial parameter
\longleftrightarrow <code>_b</code>	The second numeratorial parameter
\longleftrightarrow <code>_c</code>	The denominatorial parameter
\longleftrightarrow <code>_x</code>	The argument

Definition at line 1376 of file `specfun.h`.

2.49.3.56 hypergf()

```
float __gnu_cxx::hypergf (
    float __a,
    float __b,
    float __c,
    float __x ) [inline]
```

Return the hypergeometric function ${}_2F_1(a, b; c; x)$ of @ float numeratorial parameters a and b, denominatorial parameter c, and argument x.

See also

hyperg for details.

Definition at line 1343 of file specfun.h.

2.49.3.57 hypergl()

```
long double __gnu_cxx::hypergl (
    long double __a,
    long double __b,
    long double __c,
    long double __x ) [inline]
```

Return the hypergeometric function ${}_2F_1(a, b; c; x)$ of long double numeratorial parameters a and b, denominatorial parameter c, and argument x.

See also

hyperg for details.

Definition at line 1354 of file specfun.h.

2.49.3.58 laguerre()

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::laguerre (
    unsigned int __n,
    _Tp __x ) [inline]
```

Returns the Laguerre polynomial $L_n(x)$ of nonnegative degree n and real argument $x \geq 0$.

The Laguerre polynomial is defined by:

$$L_n(x) = \frac{e^x}{n!} \frac{d^n}{dx^n} (x^n e^{-x})$$

Template Parameters

<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .
------------------	--

Parameters

<code>__n</code>	The nonnegative order
<code>__x</code>	The argument <code>__x >= 0</code>

Exceptions

<code>std::domain_error</code>	if <code>__x < 0</code> .
--------------------------------	------------------------------

Definition at line 962 of file `specfun.h`.

2.49.3.59 `laguerref()`

```
float std::laguerref (
    unsigned int __n,
    float __x ) [inline]
```

Returns the Laguerre polynomial $L_n(x)$ of nonnegative degree `n` and `float` argument $x \geq 0$.

See also

`laguerre` for more details.

Definition at line 933 of file `specfun.h`.

2.49.3.60 `laguerrel()`

```
long double std::laguerrel (
    unsigned int __n,
    long double __x ) [inline]
```

Returns the Laguerre polynomial $L_n(x)$ of nonnegative degree `n` and `long double` argument $x \geq 0$.

See also

`laguerre` for more details.

Definition at line 943 of file `specfun.h`.

2.49.3.61 `legendre()`

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::legendre (
    unsigned int __l,
    _Tp __x ) [inline]
```

Return the Legendre polynomial $P_l(x)$ of nonnegative degree l and real argument $|x| \leq 0$.

The Legendre function of order l and argument x , $P_l(x)$, is defined by:

$$P_l(x) = \frac{1}{2^l l!} \frac{d^l}{dx^l} (x^2 - 1)^l$$

Template Parameters

<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .
------------------	--

Parameters

<code>__l</code>	The degree $l \geq 0$
<code>__x</code>	The argument $\text{abs}(\text{__x}) \leq 1$

Exceptions

<code>std::domain_error</code>	if $\text{abs}(\text{__x}) > 1$
--------------------------------	---------------------------------

Definition at line 1007 of file `specfun.h`.

2.49.3.62 `legendref()`

```
float std::legendref (
    unsigned int __l,
    float __x ) [inline]
```

Return the Legendre polynomial $P_l(x)$ of nonnegative degree l and `float` argument $|x| \leq 0$.

See also

`legendre` for more details.

Definition at line 977 of file `specfun.h`.

2.49.3.63 `legendrel()`

```
long double std::legendrel (
    unsigned int __l,
    long double __x ) [inline]
```

Return the Legendre polynomial $P_l(x)$ of nonnegative degree l and long double argument $|x| \leq 0$.

See also

`legendre` for more details.

Definition at line 987 of file `specfun.h`.

2.49.3.64 `riemann_zeta()`

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::riemann_zeta (
    _Tp __s ) [inline]
```

Return the Riemann zeta function $\zeta(s)$ for real argument s .

The Riemann zeta function is defined by:

$$\zeta(s) = \sum_{k=1}^{\infty} k^{-s} \text{ for } s > 1$$

and

$$\zeta(s) = \frac{1}{1-2^{1-s}} \sum_{k=1}^{\infty} (-1)^{k-1} k^{-s} \text{ for } 0 \leq s \leq 1$$

For $s < 1$ use the reflection formula:

$$\zeta(s) = 2^s \pi^{s-1} \sin\left(\frac{\pi s}{2}\right) \Gamma(1-s) \zeta(1-s)$$

Template Parameters

<code>_Tp</code>	The floating-point type of the argument <code>__s</code> .
------------------	--

Parameters

<code>__s</code>	The argument $s \neq 1$
------------------	-------------------------

Definition at line 1058 of file `specfun.h`.

2.49.3.65 riemann_zetaf()

```
float std::riemann_zetaf (
    float __s ) [inline]
```

Return the Riemann zeta function $\zeta(s)$ for `float` argument s .

See also

`riemann_zeta` for more details.

Definition at line 1022 of file `specfun.h`.

2.49.3.66 riemann_zetal()

```
long double std::riemann_zetal (
    long double __s ) [inline]
```

Return the Riemann zeta function $\zeta(s)$ for `long double` argument s .

See also

`riemann_zeta` for more details.

Definition at line 1032 of file `specfun.h`.

2.49.3.67 sph_bessel()

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::sph_bessel (
    unsigned int __n,
    _Tp __x ) [inline]
```

Return the spherical Bessel function $j_n(x)$ of nonnegative order n and real argument $x \geq 0$.

The spherical Bessel function is defined by:

$$j_n(x) = \left(\frac{\pi}{2x}\right)^{1/2} J_{n+1/2}(x)$$

Template Parameters

<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .
------------------	--

Parameters

\leftrightarrow __n	The integral order n ≥ 0
\leftrightarrow __x	The real argument x ≥ 0

Exceptions

<code>std::domain_error</code>	if __x < 0 .
--------------------------------	--------------

Definition at line 1102 of file specfun.h.

2.49.3.68 sph_besself()

```
float std::sph_besself (
    unsigned int __n,
    float __x ) [inline]
```

Return the spherical Bessel function $j_n(x)$ of nonnegative order n and float argument $x \geq 0$.

See also

sph_bessel for more details.

Definition at line 1073 of file specfun.h.

2.49.3.69 sph_bessell()

```
long double std::sph_bessell (
    unsigned int __n,
    long double __x ) [inline]
```

Return the spherical Bessel function $j_n(x)$ of nonnegative order n and long double argument $x \geq 0$.

See also

sph_bessel for more details.

Definition at line 1083 of file specfun.h.

2.49.3.70 sph_legendre()

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::sph_legendre (
    unsigned int __l,
    unsigned int __m,
    _Tp __theta ) [inline]
```

Return the spherical Legendre function of nonnegative integral degree l and order m and real angle θ in radians.

The spherical Legendre function is defined by

$$Y_l^m(\theta, \phi) = (-1)^m \left[\frac{(2l+1)}{4\pi} \frac{(l-m)!}{(l+m)!} \right] P_l^m(\cos \theta) \exp^{im\phi}$$

Template Parameters

<code>_Tp</code>	The floating-point type of the angle <code>__theta</code> .
------------------	---

Parameters

<code>__l</code>	The order <code>__l</code> ≥ 0
<code>__m</code>	The degree <code>__m</code> ≥ 0 and <code>__m</code> \leq <code>__l</code>
<code>__theta</code>	The radian polar angle argument

Definition at line 1149 of file specfun.h.

2.49.3.71 sph_legendref()

```
float std::sph_legendref (
    unsigned int __l,
    unsigned int __m,
    float __theta ) [inline]
```

Return the spherical Legendre function of nonnegative integral degree l and order m and float angle θ in radians.

See also

`sph_legendre` for details.

Definition at line 1117 of file specfun.h.

2.49.3.72 sph_legendrel()

```
long double std::sph_legendrel (
    unsigned int __l,
    unsigned int __m,
    long double __theta ) [inline]
```

Return the spherical Legendre function of nonnegative integral degree l and order m and long double angle θ in radians.

See also

`sph_legendre` for details.

Definition at line 1128 of file `specfun.h`.

2.49.3.73 sph_neumann()

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::sph_neumann (
    unsigned int __n,
    _Tp __x ) [inline]
```

Return the spherical Neumann function of integral order $n \geq 0$ and real argument $x \geq 0$.

The spherical Neumann function is defined by

$$n_n(x) = \left(\frac{\pi}{2x}\right)^{1/2} N_{n+1/2}(x)$$

Template Parameters

<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .
------------------	--

Parameters

<code>__n</code>	The integral order $n \geq 0$
<code>__x</code>	The real argument $__x \geq 0$

Exceptions

<code>std::domain_error</code>	if <code>__x < 0</code> .
--------------------------------	------------------------------

Definition at line 1193 of file `specfun.h`.

2.49.3.74 sph_neumannf()

```
float std::sph_neumannf (
    unsigned int __n,
    float __x ) [inline]
```

Return the spherical Neumann function of integral order $n \geq 0$ and `float` argument $x \geq 0$.

See also

`sph_neumann` for details.

Definition at line 1164 of file `specfun.h`.

2.49.3.75 sph_neumannl()

```
long double std::sph_neumannl (
    unsigned int __n,
    long double __x ) [inline]
```

Return the spherical Neumann function of integral order $n \geq 0$ and `long double` $x \geq 0$.

See also

`sph_neumann` for details.

Definition at line 1174 of file `specfun.h`.

- template<typename _ForwardIterator, typename _Tp >
void [std::uninitialized_fill](#) (_ForwardIterator __first, _ForwardIterator __last, const _Tp &__x)
- template<typename _ForwardIterator, typename _Size, typename _Tp >
_ForwardIterator [std::uninitialized_fill_n](#) (_ForwardIterator __first, _Size __n, const _Tp &__x)

2.50.1 Detailed Description

Components for memory allocation, deallocation, and management.

2.50.2 Function Documentation

2.50.2.1 align()

```
void* std::align (
    size_t __align,
    size_t __size,
    void *& __ptr,
    size_t & __space ) [inline], [noexcept]
```

Fit aligned storage in buffer.

This function tries to fit `__size` bytes of storage with alignment `__align` into the buffer `__ptr` of size `__space` bytes. If such a buffer fits then `__ptr` is changed to point to the first byte of the aligned storage and `__space` is reduced by the bytes used for alignment.

C++11 20.6.5 [ptr.align]

Parameters

<code>__align</code>	A fundamental or extended alignment value.
<code>__size</code>	Size of the aligned storage required.
<code>__ptr</code>	Pointer to a buffer of <code>__space</code> bytes.
<code>__space</code>	Size of the buffer pointed to by <code>__ptr</code> .

Returns

the updated pointer if the aligned storage fits, otherwise `nullptr`.

Definition at line 123 of file `memory`.

2.50.2.2 uninitialized_copy()

```
template<typename _InputIterator , typename _ForwardIterator >
_FowardIterator std::uninitialized_copy (
    _InputIterator __first,
    _InputIterator __last,
    _ForwardIterator __result ) [inline]
```

Copies the range `[first,last)` into `result`.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.

Returns

`__result + (__first - __last)`

Like `copy()`, but does not require an initialized output range.

Definition at line 125 of file `stl_uninitialized.h`.

Referenced by `__gnu_parallel::parallel_sort_mwms_pu()`.

2.50.2.3 uninitialized_copy_n()

```
template<typename _InputIterator , typename _Size , typename _ForwardIterator >
_FForwardIterator std::uninitialized_copy_n (
    _InputIterator __first,
    _Size __n,
    _ForwardIterator __result ) [inline]
```

Copies the range `[first,first+n)` into `result`.

Parameters

<code>__first</code>	An input iterator.
<code>__n</code>	The number of elements to copy.
<code>__result</code>	An output iterator.

Returns

`__result + __n`

Like `copy_n()`, but does not require an initialized output range.

Definition at line 854 of file `stl_uninitialized.h`.

2.50.2.4 uninitialized_fill()

```
template<typename _ForwardIterator , typename _Tp >
void std::uninitialized_fill (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __x ) [inline]
```

Copies the value `x` into the range `[first,last)`.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__x</code>	The source value.

Returns

Nothing.

Like `fill()`, but does not require an initialized output range.

Definition at line 200 of file `stl_uninitialized.h`.

2.50.2.5 uninitialized_fill_n()

```
template<typename _ForwardIterator , typename _Size , typename _Tp >
_FowardIterator std::uninitialized_fill_n (
    _ForwardIterator __first,
    _Size __n,
    const _Tp & __x ) [inline]
```

Copies the value `x` into the range `[first,first+n)`.

Parameters

<code>__first</code>	An input iterator.
<code>__n</code>	The number of copies to make.
<code>__x</code>	The source value.

Returns

Nothing.

Like `fill_n()`, but does not require an initialized output range.

Definition at line 272 of file `stl_uninitialized.h`.

2.51.1 Detailed Description

Template utilities for compile-time introspection and modification, including type classification traits, type property inspection traits and type transformation traits.

2.51.2 Typedef Documentation

2.51.2.1 `add_const_t`

```
template<typename _Tp >
using std::add\_const\_t = typedef typename add\_const<_Tp>::type
```

Alias template for `add_const`.

Definition at line 1578 of file `type_traits`.

2.51.2.2 add_cv_t

```
template<typename _Tp >  
using std::add_cv_t = typedef typename add_cv<_Tp>::type
```

Alias template for add_cv.

Definition at line 1586 of file type_traits.

2.51.2.3 add_lvalue_reference_t

```
template<typename _Tp >  
using std::add_lvalue_reference_t = typedef typename add_lvalue_reference<_Tp>::type
```

Alias template for add_lvalue_reference.

Definition at line 1639 of file type_traits.

2.51.2.4 add_pointer_t

```
template<typename _Tp >  
using std::add_pointer_t = typedef typename add_pointer<_Tp>::type
```

Alias template for add_pointer.

Definition at line 2044 of file type_traits.

2.51.2.5 add_rvalue_reference_t

```
template<typename _Tp >  
using std::add_rvalue_reference_t = typedef typename add_rvalue_reference<_Tp>::type
```

Alias template for add_rvalue_reference.

Definition at line 1643 of file type_traits.

2.51.2.6 add_volatile_t

```
template<typename _Tp >  
using std::add_volatile_t = typedef typename add_volatile<_Tp>::type
```

Alias template for add_volatile.

Definition at line 1582 of file type_traits.

2.51.2.7 aligned_storage_t

```
template<size_t _Len, size_t _Align = __alignof__(typename __aligned_storage_msa<_Len>::__type)>
using std::aligned_storage_t = typedef typename aligned_storage<_Len, _Align>::type
```

Alias template for aligned_storage.

Definition at line 2543 of file type_traits.

2.51.2.8 common_type_t

```
template<typename... _Tp>
using std::common_type_t = typedef typename common_type<_Tp...>::type
```

Alias template for common_type.

Definition at line 2562 of file type_traits.

2.51.2.9 conditional_t

```
template<bool _Cond, typename _Iftrue , typename _Iffalse >
using std::conditional_t = typedef typename conditional<_Cond, _Iftrue, _Iffalse>::type
```

Alias template for conditional.

Definition at line 2558 of file type_traits.

2.51.2.10 decay_t

```
template<typename _Tp >
using std::decay_t = typedef typename decay<_Tp>::type
```

Alias template for decay.

Definition at line 2550 of file type_traits.

2.51.2.11 enable_if_t

```
template<bool _Cond, typename _Tp = void>
using std::enable_if_t = typedef typename enable_if<_Cond, _Tp>::type
```

Alias template for enable_if.

Definition at line 2554 of file type_traits.

2.51.2.12 false_type

```
typedef integral_constant<bool, false> std::false_type
```

The type used as a compile-time boolean with false value.

Definition at line 78 of file type_traits.

2.51.2.13 make_signed_t

```
template<typename _Tp >  
using std::make_signed_t = typedef typename make_signed<_Tp>::type
```

Alias template for make_signed.

Definition at line 1961 of file type_traits.

2.51.2.14 make_unsigned_t

```
template<typename _Tp >  
using std::make_unsigned_t = typedef typename make_unsigned<_Tp>::type
```

Alias template for make_unsigned.

Definition at line 1965 of file type_traits.

2.51.2.15 remove_all_extents_t

```
template<typename _Tp >  
using std::remove_all_extents_t = typedef typename remove_all_extents<_Tp>::type
```

Alias template for remove_all_extents.

Definition at line 2003 of file type_traits.

2.51.2.16 remove_const_t

```
template<typename _Tp >  
using std::remove_const_t = typedef typename remove_const<_Tp>::type
```

Alias template for remove_const.

Definition at line 1566 of file type_traits.

2.51.2.17 remove_cv_t

```
template<typename _Tp >
using std::remove_cv_t = typedef typename remove_cv<_Tp>::type
```

Alias template for remove_cv.

Definition at line 1574 of file type_traits.

2.51.2.18 remove_extent_t

```
template<typename _Tp >
using std::remove_extent_t = typedef typename remove_extent<_Tp>::type
```

Alias template for remove_extent.

Definition at line 1999 of file type_traits.

2.51.2.19 remove_pointer_t

```
template<typename _Tp >
using std::remove_pointer_t = typedef typename remove_pointer<_Tp>::type
```

Alias template for remove_pointer.

Definition at line 2040 of file type_traits.

2.51.2.20 remove_reference_t

```
template<typename _Tp >
using std::remove_reference_t = typedef typename remove_reference<_Tp>::type
```

Alias template for remove_reference.

Definition at line 1635 of file type_traits.

2.51.2.21 remove_volatile_t

```
template<typename _Tp >
using std::remove_volatile_t = typedef typename remove_volatile<_Tp>::type
```

Alias template for remove_volatile.

Definition at line 1570 of file type_traits.

2.51.2.22 result_of_t

```
template<typename _Tp >  
using std::result_of_t = typedef typename result_of<_Tp>::type
```

Alias template for result_of.

Definition at line 2570 of file type_traits.

2.51.2.23 true_type

```
typedef integral_constant<bool, true> std::true_type
```

The type used as a compile-time boolean with true value.

Definition at line 75 of file type_traits.

2.51.2.24 underlying_type_t

```
template<typename _Tp >  
using std::underlying_type_t = typedef typename underlying_type<_Tp>::type
```

Alias template for underlying_type.

Definition at line 2566 of file type_traits.

2.51.2.25 void_t

```
template<typename... >  
using std::void_t = typedef void
```

A metafunction that always yields void, used for detecting valid types.

Definition at line 2576 of file type_traits.

2.51.3 Variable Documentation

2.51.3.1 alignment_value

```
template<size_t _Len, typename... _Types>  
const size_t std::aligned_union< _Len, _Types >::alignment_value [static]
```

The value of the strictest alignment of _Types.

Definition at line 2117 of file type_traits.

2.52 Mutating

Collaboration diagram for Mutating:

Functions

- `template<typename _II, typename _OI >`
`constexpr _OI std::copy (_II __first, _II __last, _OI __result)`

2.52.1 Detailed Description

2.52.2 Function Documentation

2.52.2.1 `copy()`

```
template<typename _II , typename _OI >
constexpr _OI std::copy (
    _II __first,
    _II __last,
    _OI __result ) [inline]
```

Copies the range `[first,last)` into `result`.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.

Returns

`result + (last - first)`

This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling). Result may not be contained within `[first,last)`; the `copy_backward` function should be used instead.

Note that the end of the output range is permitted to be contained within `[first,last)`.

Definition at line 560 of file `stl_algobase.h`.

2.52.2.2 `copy_backward()`

```
template<typename _BI1 , typename _BI2 >
constexpr _BI2 std::copy_backward (
    _BI1 __first,
    _BI1 __last,
    _BI2 __result ) [inline]
```

Copies the range `[first,last)` into `result`.

Parameters

<code>__first</code>	A bidirectional iterator.
<code>__last</code>	A bidirectional iterator.
<code>__result</code>	A bidirectional iterator.

Returns

result - (last - first)

The function has the same effect as `copy`, but starts at the end of the range and works its way to the start, returning the start of the result. This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling).

Result may not be in the range `(first,last]`. Use `copy` instead. Note that the start of the output range may overlap `[first,last)`.

Definition at line 797 of file `stl_algobase.h`.

Referenced by `std::deque<_StateSeqT>::_M_reallocate_map()`.

2.52.2.3 copy_if()

```
template<typename _InputIterator , typename _OutputIterator , typename _Predicate >
constexpr _OutputIterator std::copy_if (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    _Predicate __pred )
```

Copy the elements of a sequence for which a predicate is true.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__pred</code>	A predicate.

Returns

An iterator designating the end of the resulting sequence.

Copies each element in the range `[__first,__last)` for which `__pred` returns true to the range beginning at `__result`.

`copy_if()` is stable, so the relative order of elements that are copied is unchanged.

Definition at line 688 of file `stl_algo.h`.

2.52.2.4 `copy_n()`

```
template<typename _InputIterator , typename _Size , typename _OutputIterator >
constexpr _OutputIterator std::copy_n (
    _InputIterator __first,
    _Size __n,
    _OutputIterator __result ) [inline]
```

Copies the range `[first,first+n)` into `[result,result+n)`.

Parameters

<code>__first</code>	An input iterator.
<code>__n</code>	The number of elements to copy.
<code>__result</code>	An output iterator.

Returns

`result+n`.

This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling).

Definition at line 768 of file `stl_algo.h`.

2.52.2.5 `fill()`

```
template<typename _ForwardIterator , typename _Tp >
constexpr void std::fill (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __value ) [inline]
```

Fills the range `[first,last)` with copies of `value`.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__value</code>	A reference-to-const of arbitrary type.

Returns

Nothing.

This function fills a range with copies of the same value. For char types filling contiguous areas of memory, this becomes an inline call to `memset` or `wmemset`.

Definition at line 937 of file `stl_algobase.h`.

2.52.2.6 `fill_n()`

```
template<typename _OI , typename _Size , typename _Tp >
constexpr _OI std::fill_n (
    _OI __first,
    _Size __n,
    const _Tp & __value ) [inline]
```

Fills the range `[first,first+n)` with copies of `value`.

Parameters

<code>__first</code>	An output iterator.
<code>__n</code>	The count of copies to perform.
<code>__value</code>	A reference-to-const of arbitrary type.

Returns

The iterator at `first+n`.

This function fills a range with copies of the same value. For char types filling contiguous areas of memory, this becomes an inline call to `memset` or `wmemset`.

If `__n` is negative, the function does nothing.

Definition at line 1089 of file `stl_algobase.h`.

2.52.2.7 `generate()`

```
template<typename _ForwardIterator , typename _Generator >
constexpr void std::generate (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Generator __gen )
```

Assign the result of a function object to each value in a sequence.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__gen</code>	A function object taking no arguments and returning <code>std::iterator_traits<_ForwardIterator>::value_type</code>

Returns

`generate()` returns no value.

Performs the assignment `*i = __gen()` for each `i` in the range `[__first,__last)`.

Definition at line 4446 of file `stl_algo.h`.

2.52.2.8 `generate_n()`

```
template<typename _OutputIterator , typename _Size , typename _Generator >
constexpr _OutputIterator std::generate_n (
    _OutputIterator __first,
    _Size __n,
    _Generator __gen )
```

Assign the result of a function object to each value in a sequence.

Parameters

<code>__first</code>	A forward iterator.
<code>__n</code>	The length of the sequence.
<code>__gen</code>	A function object taking no arguments and returning <code>std::iterator_traits<_ForwardIterator>::value_type</code>

Returns

The end of the sequence, `__first+__n`

Performs the assignment `*i = __gen()` for each `i` in the range `[__first,__first+__n)`.

If `__n` is negative, the function does nothing and returns `__first`.

Definition at line 4480 of file `stl_algo.h`.

2.52.2.9 `is_partitioned()`

```
template<typename _InputIterator , typename _Predicate >
constexpr bool std::is_partitioned (
    _InputIterator __first,
    _InputIterator __last,
    _Predicate __pred ) [inline]
```

Checks whether the sequence is partitioned.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__pred</code>	A predicate.

Returns

True if the range `[__first,__last)` is partitioned by `__pred`, i.e. if all elements that satisfy `__pred` appear before those that do not.

Definition at line 530 of file `stl_algo.h`.

References `std::find_if_not()`, and `std::none_of()`.

2.52.2.10 `iter_swap()`

```
template<typename _ForwardIterator1 , typename _ForwardIterator2 >
constexpr void std::iter_swap (
    _ForwardIterator1 __a,
    _ForwardIterator2 __b ) [inline]
```

Swaps the contents of two iterators.

Parameters

<code>↔ _a</code>	An iterator.
<code>↔ _b</code>	Another iterator.

Returns

Nothing.

This function swaps the values pointed to by two iterators, not the iterators themselves.

Definition at line 152 of file `stl_algobase.h`.

Referenced by `std::__merge_without_buffer()`, `std::__move_median_to_first()`, `std::__partition()`, `std::__reverse()`, `std::__V2::__rotate()`, and `std::__unguarded_partition()`.

2.52.2.11 move()

```
template<typename _II , typename _OI >
constexpr _OI std::move (
    _II __first,
    _II __last,
    _OI __result ) [inline]
```

Moves the range [first,last) into result.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.

Returns

result + (last - first)

This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling). Result may not be contained within [first,last); the `move_backward` function should be used instead.

Note that the end of the output range is permitted to be contained within [first,last).

Definition at line 593 of file `stl_algobase.h`.

2.52.2.12 move_backward()

```
template<typename _BI1 , typename _BI2 >
constexpr _BI2 std::move_backward (
    _BI1 __first,
    _BI1 __last,
    _BI2 __result ) [inline]
```

Moves the range [first,last) into result.

Parameters

<code>__first</code>	A bidirectional iterator.
<code>__last</code>	A bidirectional iterator.
<code>__result</code>	A bidirectional iterator.

Returns

result - (last - first)

The function has the same effect as `move`, but starts at the end of the range and works its way to the start, returning the start of the result. This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling).

Result may not be in the range `(first,last]`. Use `move` instead. Note that the start of the output range may overlap `[first,last)`.

Definition at line 833 of file `stl_algobase.h`.

2.52.2.13 partition()

```
template<typename _ForwardIterator , typename _Predicate >
constexpr _ForwardIterator std::partition (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Predicate __pred ) [inline]
```

Move elements for which a predicate is true to the beginning of a sequence.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__pred</code>	A predicate functor.

Returns

An iterator `middle` such that `__pred(i)` is true for each iterator `i` in the range `[__first,middle)` and false for each `i` in the range `[middle,__last)`.

`__pred` must not modify its operand. `partition()` does not preserve the relative ordering of elements in each group, use `stable_partition()` if this is needed.

Definition at line 4668 of file `stl_algo.h`.

2.52.2.14 partition_copy()

```
template<typename _InputIterator , typename _OutputIterator1 , typename _OutputIterator2 , typename
_Predicate >
constexpr pair<_OutputIterator1, _OutputIterator2> std::partition_copy (
    _InputIterator __first,
```

```

__InputIterator __last,
__OutputIterator1 __out_true,
__OutputIterator2 __out_false,
_Predicate __pred )

```

Copy the elements of a sequence to separate output sequences depending on the truth value of a predicate.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__out_true</code>	An output iterator.
<code>__out_false</code>	An output iterator.
<code>__pred</code>	A predicate.

Returns

A pair designating the ends of the resulting sequences.

Copies each element in the range `[__first, __last)` for which `__pred` returns true to the range beginning at `__out_true` and each element for which `__pred` returns false to `__out_false`.

Definition at line 805 of file `stl_algo.h`.

2.52.2.15 `partition_point()`

```

template<typename _ForwardIterator , typename _Predicate >
constexpr _ForwardIterator std::partition_point (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Predicate __pred )

```

Find the partition point of a partitioned range.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__pred</code>	A predicate.

Returns

An iterator `mid` such that `all_of(__first, mid, __pred)` and `none_of(mid, __last, __pred)` are both true.

Definition at line 552 of file `stl_algo.h`.

2.52.2.16 `random_shuffle()`

```
template<typename _RandomAccessIterator , typename _RandomNumberGenerator >
void std::random_shuffle (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    _RandomNumberGenerator && __rand )
```

Shuffle the elements of a sequence using a random number generator.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__rand</code>	The RNG functor or function.

Returns

Nothing.

Reorders the elements in the range `[__first,__last)` using `__rand` to provide a random distribution. Calling `__rand(N)` for a positive integer `N` should return a randomly chosen integer from the range `[0,N)`.

Definition at line 4627 of file `stl_algo.h`.

2.52.2.17 `remove()`

```
template<typename _ForwardIterator , typename _Tp >
constexpr _ForwardIterator std::remove (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __value ) [inline]
```

Remove elements from a sequence.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__value</code>	The value to be removed.

Returns

An iterator designating the end of the resulting sequence.

All elements equal to `__value` are removed from the range `[__first,__last)`.

`remove()` is stable, so the relative order of elements that are not removed is unchanged.

Elements between the end of the resulting sequence and `__last` are still present, but their value is unspecified.

Definition at line 875 of file `stl_algo.h`.

2.52.2.18 `remove_copy()`

```
template<typename _InputIterator , typename _OutputIterator , typename _Tp >
constexpr _OutputIterator std::remove_copy (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    const _Tp & __value ) [inline]
```

Copy a sequence, removing elements of a given value.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__value</code>	The value to be removed.

Returns

An iterator designating the end of the resulting sequence.

Copies each element in the range `[__first,__last)` not equal to `__value` to the range beginning at `__result`. `remove_copy()` is stable, so the relative order of elements that are copied is unchanged.

Definition at line 619 of file `stl_algo.h`.

2.52.2.19 `remove_copy_if()`

```
template<typename _InputIterator , typename _OutputIterator , typename _Predicate >
constexpr _OutputIterator std::remove_copy_if (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    _Predicate __pred ) [inline]
```

Copy a sequence, removing elements for which a predicate is true.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__pred</code>	A predicate.

Returns

An iterator designating the end of the resulting sequence.

Copies each element in the range `[__first,__last)` for which `__pred` returns false to the range beginning at `__result`.

`remove_copy_if()` is stable, so the relative order of elements that are copied is unchanged.

Definition at line 653 of file `stl_algo.h`.

2.52.2.20 `remove_if()`

```
template<typename _ForwardIterator , typename _Predicate >
constexpr _ForwardIterator std::remove_if (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Predicate __pred ) [inline]
```

Remove elements from a sequence using a predicate.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__pred</code>	A predicate.

Returns

An iterator designating the end of the resulting sequence.

All elements for which `__pred` returns true are removed from the range `[__first,__last)`.

`remove_if()` is stable, so the relative order of elements that are not removed is unchanged.

Elements between the end of the resulting sequence and `__last` are still present, but their value is unspecified.

Definition at line 909 of file `stl_algo.h`.

2.52.2.21 replace()

```
template<typename _ForwardIterator , typename _Tp >
constexpr void std::replace (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __old_value,
    const _Tp & __new_value )
```

Replace each occurrence of one value in a sequence with another value.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__old_value</code>	The value to be replaced.
<code>__new_value</code>	The replacement value.

Returns

`replace()` returns no value.

For each iterator `i` in the range `[__first,__last)` if `*i == __old_value` then the assignment `*i = __new_value` is performed.

Definition at line 4380 of file `stl_algo.h`.

2.52.2.22 replace_copy_if()

```
template<typename _InputIterator , typename _OutputIterator , typename _Predicate , typename _Tp
>
constexpr _OutputIterator std::replace_copy_if (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    _Predicate __pred,
    const _Tp & __new_value ) [inline]
```

Copy a sequence, replacing each value for which a predicate returns true with another value.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__pred</code>	A predicate.
<code>__new_value</code>	The replacement value.

Returns

The end of the output sequence, `__result+(__last-__first)`.

Copies each element in the range `[__first,__last)` to the range `[__result,__result+(__last-__first))` replacing elements for which `__pred` returns true with `__new_value`.

Definition at line 3200 of file `stl_algo.h`.

2.52.2.23 `replace_if()`

```
template<typename _ForwardIterator, typename _Predicate, typename _Tp >
constexpr void std::replace_if (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Predicate __pred,
    const _Tp & __new_value )
```

Replace each value in a sequence for which a predicate returns true with another value.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__pred</code>	A predicate.
<code>__new_value</code>	The replacement value.

Returns

`replace_if()` returns no value.

For each iterator `i` in the range `[__first,__last)` if `__pred(*i)` is true then the assignment `*i = __new_value` is performed.

Definition at line 4413 of file `stl_algo.h`.

2.52.2.24 `reverse()`

```
template<typename _BidirectionalIterator >
constexpr void std::reverse (
    _BidirectionalIterator __first,
    _BidirectionalIterator __last ) [inline]
```

Reverse a sequence.

Parameters

<code>__first</code>	A bidirectional iterator.
<code>__last</code>	A bidirectional iterator.

Returns

`reverse()` returns no value.

Reverses the order of the elements in the range `[__first,__last)`, so that the first element becomes the last etc. For every `i` such that $0 \leq i < (_\text{last} - _\text{first})/2$, `reverse()` swaps `*(__first+i)` and `*(__last-(i+1))`

Definition at line 1170 of file `stl_algo.h`.

2.52.2.25 reverse_copy()

```
template<typename _BidirectionalIterator , typename _OutputIterator >
constexpr _OutputIterator std::reverse_copy (
    _BidirectionalIterator __first,
    _BidirectionalIterator __last,
    _OutputIterator __result )
```

Copy a sequence, reversing its elements.

Parameters

<code>__first</code>	A bidirectional iterator.
<code>__last</code>	A bidirectional iterator.
<code>__result</code>	An output iterator.

Returns

An iterator designating the end of the resulting sequence.

Copies the elements in the range `[__first,__last)` to the range `[__result,__result+(__last-__first))` such that the order of the elements is reversed. For every `i` such that $0 \leq i < (_\text{last} - _\text{first})$, `reverse_copy()` performs the assignment `*(__result+(__last-__first)-1-i) = *(__first+i)`. The ranges `[__first,__last)` and `[__result,__result+(__last-__first))` must not overlap.

Definition at line 1198 of file `stl_algo.h`.

2.52.2.26 rotate()

```
template<typename _ForwardIterator >
constexpr _ForwardIterator std::_V2::rotate (
    _ForwardIterator __first,
    _ForwardIterator __middle,
    _ForwardIterator __last ) [inline]
```

Rotate the elements of a sequence.

Parameters

<code>__first</code>	A forward iterator.
<code>__middle</code>	A forward iterator.
<code>__last</code>	A forward iterator.

Returns

`first + (last - middle).`

Rotates the elements of the range `[__first,__last)` by `(__middle - __first)` positions so that the element at `__middle` is moved to `__first`, the element at `__middle+1` is moved to `__first+1` and so on for each element in the range `[__first,__last)`.

This effectively swaps the ranges `[__first,__middle)` and `[__middle,__last)`.

Performs `*(__first+(n+(__last-__middle))%(__last-__first))=*(__first+n)` for each `n` in the range `[0,__last-__first)`.

Definition at line 1430 of file `stl_algo.h`.

2.52.2.27 rotate_copy()

```
template<typename _ForwardIterator , typename _OutputIterator >
constexpr _OutputIterator std::rotate_copy (
    _ForwardIterator __first,
    _ForwardIterator __middle,
    _ForwardIterator __last,
    _OutputIterator __result ) [inline]
```

Copy a sequence, rotating its elements.

Parameters

<code>__first</code>	A forward iterator.
<code>__middle</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__result</code>	An output iterator.

Returns

An iterator designating the end of the resulting sequence.

Copies the elements of the range `[__first,__last)` to the range beginning at

Returns

, rotating the copied elements by `(__middle-__first)` positions so that the element at `__middle` is moved to `↵ __result`, the element at `__middle+1` is moved to `__result+1` and so on for each element in the range `[__first,__last)`.

Performs `*(__result+(n+(__last-__middle))%(__last-__first))=*(__first+n)` for each `n` in the range `[0,__last-__first)`.

Definition at line 1468 of file `stl_algo.h`.

2.52.2.28 shuffle()

```
template<typename _RandomAccessIterator , typename _UniformRandomNumberGenerator >
void std::shuffle (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    _UniformRandomNumberGenerator && __g )
```

Shuffle the elements of a sequence using a uniform random number generator.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__g</code>	A <code>UniformRandomNumberGenerator</code> (26.5.1.3).

Returns

Nothing.

Reorders the elements in the range `[__first,__last)` using `__g` to provide random numbers.

Definition at line 3753 of file `stl_algo.h`.

2.52.2.29 stable_partition()

```
template<typename _ForwardIterator , typename _Predicate >
_FowardIterator std::stable_partition (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Predicate __pred ) [inline]
```

Move elements for which a predicate is true to the beginning of a sequence, preserving relative ordering.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__pred</code>	A predicate functor.

Returns

An iterator `middle` such that `__pred(i)` is true for each iterator `i` in the range `[first,middle)` and false for each `i` in the range `[middle,last)`.

Performs the same function as `partition()` with the additional guarantee that the relative ordering of elements in each group is preserved, so any two elements `x` and `y` in the range `[__first,__last)` such that `__pred(x) == __pred(y)` will have the same relative ordering after calling `stable_partition()`.

Definition at line 1649 of file `stl_algo.h`.

2.52.2.30 `swap_ranges()`

```
template<typename _ForwardIterator1 , typename _ForwardIterator2 >
constexpr _ForwardIterator2 std::swap_ranges (
    _ForwardIterator1 __first1,
    _ForwardIterator1 __last1,
    _ForwardIterator2 __first2 )
```

Swap the elements of two sequences.

Parameters

<code>__first1</code>	A forward iterator.
<code>__last1</code>	A forward iterator.
<code>__first2</code>	A forward iterator.

Returns

An iterator equal to `first2+(last1-first1)`.

Swaps each element in the range `[first1,last1)` with the corresponding element in the range `[first2,(last1-first1))`. The ranges must not overlap.

Definition at line 201 of file `stl_algobase.h`.

2.52.2.31 transform() [1/2]

```
template<typename _InputIterator , typename _OutputIterator , typename _UnaryOperation >
constexpr _OutputIterator std::transform (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    _UnaryOperation __unary_op )
```

Perform an operation on a sequence.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__unary_op</code>	A unary operator.

Returns

An output iterator equal to `__result+(__last-__first)`.

Applies the operator to each element in the input range and assigns the results to successive elements of the output sequence. Evaluates `*(__result+N)=unary_op(*(__first+N))` for each `N` in the range `[0,__last-__first)`.

`unary_op` must not alter its argument.

Definition at line 4309 of file `stl_algo.h`.

2.52.2.32 transform() [2/2]

```
template<typename _InputIterator1 , typename _InputIterator2 , typename _OutputIterator , typename
_BinaryOperation >
constexpr _OutputIterator std::transform (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _OutputIterator __result,
    _BinaryOperation __binary_op )
```

Perform an operation on corresponding elements of two sequences.

Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__binary_op</code>	A binary operator.

Returns

An output iterator equal to `result+(last-first)`.

Applies the operator to the corresponding elements in the two input ranges and assigns the results to successive elements of the output sequence. Evaluates `*(__result+N)=__binary_op(*(__first1+N),*(__first2+N))` for each `N` in the range `[0,__last1-__first1)`.

`binary_op` must not alter either of its arguments.

Definition at line 4347 of file `stl_algo.h`.

2.52.2.33 unique() [1/2]

```
template<typename _ForwardIterator >
constexpr _ForwardIterator std::unique (
    _ForwardIterator __first,
    _ForwardIterator __last ) [inline]
```

Remove consecutive duplicate values from a sequence.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.

Returns

An iterator designating the end of the resulting sequence.

Removes all but the first element from each group of consecutive values that compare equal. `unique()` is stable, so the relative order of elements that are not removed is unchanged. Elements between the end of the resulting sequence and `__last` are still present, but their value is unspecified.

Definition at line 978 of file `stl_algo.h`.

2.52.2.34 unique() [2/2]

```
template<typename _ForwardIterator , typename _BinaryPredicate >
constexpr _ForwardIterator std::unique (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _BinaryPredicate __binary_pred ) [inline]
```

Remove consecutive values from a sequence using a predicate.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__binary_pred</code>	A binary predicate.

Returns

An iterator designating the end of the resulting sequence.

Removes all but the first element from each group of consecutive values for which `__binary_pred` returns true. `unique()` is stable, so the relative order of elements that are not removed is unchanged. Elements between the end of the resulting sequence and `__last` are still present, but their value is unspecified.

Definition at line 1009 of file `stl_algo.h`.

2.52.2.35 `unique_copy()` [1/2]

```
template<typename _InputIterator , typename _OutputIterator >
constexpr _OutputIterator std::unique_copy (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result ) [inline]
```

Copy a sequence, removing consecutive duplicate values.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.

Returns

An iterator designating the end of the resulting sequence.

Copies each element in the range `[__first,__last)` to the range beginning at `__result`, except that only the first element is copied from groups of consecutive elements that compare equal. `unique_copy()` is stable, so the relative order of elements that are copied is unchanged.

`_GLIBCXX_RESOLVE_LIB_DEFECTS` DR 241. Does `unique_copy()` require CopyConstructible and Assignable?

`_GLIBCXX_RESOLVE_LIB_DEFECTS` DR 538. 241 again: Does `unique_copy()` require CopyConstructible and Assignable?

Definition at line 4518 of file `stl_algo.h`.

2.52.2.36 `unique_copy()` [2/2]

```
template<typename _InputIterator , typename _OutputIterator , typename _BinaryPredicate >
constexpr _OutputIterator std::unique_copy (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    _BinaryPredicate __binary_pred ) [inline]
```

Copy a sequence, removing consecutive values using a predicate.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__binary_pred</code>	A binary predicate.

Returns

An iterator designating the end of the resulting sequence.

Copies each element in the range `[__first,__last)` to the range beginning at `__result`, except that only the first element is copied from groups of consecutive elements for which `__binary_pred` returns true. `unique_copy()` is stable, so the relative order of elements that are copied is unchanged.

`_GLIBCXX_RESOLVE_LIB_DEFECTS` DR 241. Does `unique_copy()` require CopyConstructible and Assignable?

Definition at line 4560 of file `stl_algo.h`.

2.53 Mutexes

Collaboration diagram for Mutexes:

Classes

- struct [std::adopt_lock_t](#)
- struct [std::defer_lock_t](#)
- class [std::lock_guard< _Mutex >](#)
- class [std::mutex](#)
- struct [std::once_flag](#)
- class [std::recursive_mutex](#)
- class [std::recursive_timed_mutex](#)
- class [std::shared_lock< _Mutex >](#)
- class [std::shared_timed_mutex](#)
- class [std::timed_mutex](#)
- struct [std::try_to_lock_t](#)
- class [std::unique_lock< _Mutex >](#)

Macros

- `#define __cpp_lib_shared_timed_mutex`

Functions

- `template<typename _Callable, typename... _Args>`
`void std::call_once (once_flag &__once, _Callable &&__f, _Args &&... __args)`
- `template<typename _L1, typename _L2, typename... _L3>`
`void std::lock (_L1 &__l1, _L2 &__l2, _L3 &... __l3)`
- `template<typename _Lock1, typename _Lock2, typename... _Lock3>`
`int std::try_lock (_Lock1 &__l1, _Lock2 &__l2, _Lock3 &... __l3)`

Variables

- `constexpr adopt_lock_t std::adopt_lock`
- `constexpr defer_lock_t std::defer_lock`
- `constexpr try_to_lock_t std::try_to_lock`

2.53.1 Detailed Description

Classes for mutex support.

2.53.2 Function Documentation

2.53.2.1 `call_once()`

```
template<typename _Callable , typename... _Args>
void std::call_once (
    once_flag & __once,
    _Callable && __f,
    _Args &&... __args )
```

Invoke a callable and synchronize with other calls using the same flag.

Definition at line 712 of file mutex.

2.53.2.2 `lock()`

```
template<typename _L1 , typename _L2 , typename... _L3>
void std::lock (
    _L1 & __l1,
    _L2 & __l2,
    _L3 &... __l3 )
```

Generic lock.

Parameters

\leftarrow _l1	Meets Lockable requirements (try_lock() may throw).
\leftarrow _l2	Meets Lockable requirements (try_lock() may throw).
\leftarrow _l3	Meets Lockable requirements (try_lock() may throw).

Exceptions

<i>An</i>	exception thrown by an argument's lock() or try_lock() member.
-----------	--

Postcondition

All arguments are locked.

All arguments are locked via a sequence of calls to `lock()`, `try_lock()` and `unlock()`. If the call exits via an exception any locks that were obtained will be released.

Definition at line 589 of file `mutex`.

2.53.2.3 try_lock()

```
template<typename _Lock1 , typename _Lock2 , typename... _Lock3>
int std::try_lock (
    _Lock1 & __l1,
    _Lock2 & __l2,
    _Lock3 &... __l3 )
```

Generic `try_lock`.

Parameters

 <i>__l1</i>	Meets Lockable requirements (<code>try_lock()</code> may throw).
 <i>__l2</i>	Meets Lockable requirements (<code>try_lock()</code> may throw).
 <i>__l3</i>	Meets Lockable requirements (<code>try_lock()</code> may throw).

Returns

Returns -1 if all `try_lock()` calls return true. Otherwise returns a 0-based index corresponding to the argument that returned false.

Postcondition

Either all arguments are locked, or none will be.

Sequentially calls `try_lock()` on each argument.

Definition at line 568 of file `mutex`.

2.53.3 Variable Documentation

2.53.3.1 adopt_lock

```
constexpr adopt_lock_t std::adopt_lock [inline]
```

Tag used to make a scoped lock take ownership of a locked mutex.

Definition at line 145 of file std_mutex.h.

2.53.3.2 defer_lock

```
constexpr defer_lock_t std::defer_lock [inline]
```

Tag used to prevent a scoped lock from acquiring ownership of a mutex.

Definition at line 139 of file std_mutex.h.

2.53.3.3 try_to_lock

```
constexpr try_to_lock_t std::try_to_lock [inline]
```

Tag used to prevent a scoped lock from blocking if a mutex is locked.

Definition at line 142 of file std_mutex.h.

2.54 Negators

Collaboration diagram for Negators:

Classes

- class `std::binary_negate<_Predicate>`
- class `std::unary_negate<_Predicate>`

Functions

- template<typename _Predicate>
constexpr `unary_negate<_Predicate>` `std::not1` (const _Predicate &__pred)
- template<typename _Predicate>
constexpr `binary_negate<_Predicate>` `std::not2` (const _Predicate &__pred)

2.54.1 Detailed Description

The functions `not1` and `not2` each take a predicate functor and return an instance of `unary_negate` or `binary_negate`, respectively. These classes are functors whose `operator()` performs the stored predicate function and then returns the negation of the result.

For example, given a vector of integers and a trivial predicate,

```

struct IntGreaterThanThree
: public std::unary_function<int, bool>
{
    bool operator() (int x) { return x > 3; }
};
std::find_if (v.begin(), v.end(), not1(IntGreaterThanThree()));
  
```

The call to `find_if` will locate the first index (*i*) of *v* for which `!(v[i] > 3)` is true.

The `not1/unary_negate` combination works on predicates taking a single argument. The `not2/binary_negate` combination works on predicates which take two arguments.

2.54.2 Function Documentation

2.54.2.1 not1()

```
template<typename _Predicate >  
constexpr unary_negate<_Predicate> std::not1 (  
    const _Predicate & __pred ) [inline]
```

One of the [negation functors](#).

Definition at line 1024 of file stl_function.h.

2.54.2.2 not2()

```
template<typename _Predicate >  
constexpr binary_negate<_Predicate> std::not2 (  
    const _Predicate & __pred ) [inline]
```

One of the [negation functors](#).

Definition at line 1052 of file stl_function.h.

2.56.1 Detailed Description

2.56.2 Function Documentation

2.56.2.1 `adjacent_find()` [1/2]

```
template<typename _ForwardIterator >
constexpr _ForwardIterator std::adjacent_find (
    _ForwardIterator __first,
    _ForwardIterator __last ) [inline]
```

Find two adjacent values in a sequence that are equal.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.

Returns

The first iterator `i` such that `i` and `i+1` are both valid iterators in `[__first,__last)` and such that `*i == *(i+1)`, or `__last` if no such iterator exists.

Definition at line 4031 of file `stl_algo.h`.

2.56.2.2 `adjacent_find()` [2/2]

```
template<typename _ForwardIterator , typename _BinaryPredicate >
constexpr _ForwardIterator std::adjacent_find (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _BinaryPredicate __binary_pred ) [inline]
```

Find two adjacent values in a sequence using a predicate.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__binary_pred</code>	A binary predicate.

Returns

The first iterator `i` such that `i` and `i+1` are both valid iterators in `[__first,__last)` and such that `__binary_pred(i,i+1)` is true, or `__last` if no such iterator exists.

Definition at line 4057 of file `stl_algo.h`.

2.56.2.3 all_of()

```
template<typename _InputIterator , typename _Predicate >
constexpr bool std::all_of (
    _InputIterator __first,
    _InputIterator __last,
    _Predicate __pred ) [inline]
```

Checks that a predicate is true for all the elements of a sequence.

Parameters

<i>__first</i>	An input iterator.
<i>__last</i>	An input iterator.
<i>__pred</i>	A predicate.

Returns

True if the check is true, false otherwise.

Returns true if *__pred* is true for each element in the range [*__first*,*__last*), and false otherwise.

Definition at line 452 of file `stl_algo.h`.

References `std::find_if_not()`.

2.56.2.4 any_of()

```
template<typename _InputIterator , typename _Predicate >
constexpr bool std::any_of (
    _InputIterator __first,
    _InputIterator __last,
    _Predicate __pred ) [inline]
```

Checks that a predicate is true for at least one element of a sequence.

Parameters

<i>__first</i>	An input iterator.
<i>__last</i>	An input iterator.
<i>__pred</i>	A predicate.

Returns

True if the check is true, false otherwise.

Returns true if an element exists in the range [*__first*,*__last*) such that *__pred* is true, and false otherwise.

Definition at line 489 of file `stl_algo.h`.

References `std::none_of()`.

2.56.2.5 `count()`

```
template<typename _InputIterator , typename _Tp >
constexpr iterator\_traits<_InputIterator>::difference_type std::count (
    _InputIterator __first,
    _InputIterator __last,
    const _Tp & __value ) [inline]
```

Count the number of copies of a value in a sequence.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__value</code>	The value to be counted.

Returns

The number of iterators `i` in the range `[__first,__last)` for which `*i == __value`

Definition at line 4083 of file `stl_algo.h`.

2.56.2.6 `count_if()`

```
template<typename _InputIterator , typename _Predicate >
constexpr iterator\_traits<_InputIterator>::difference_type std::count_if (
    _InputIterator __first,
    _InputIterator __last,
    _Predicate __pred ) [inline]
```

Count the elements of a sequence for which a predicate is true.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__pred</code>	A predicate.

Returns

The number of iterators `i` in the range `[__first,__last)` for which `__pred(*i)` is true.

Definition at line 4107 of file `stl_algo.h`.

2.56.2.7 equal() [1/4]

```
template<typename _IIter1 , typename _IIter2 , typename _BinaryPredicate >
constexpr bool std::equal (
    _IIter1 __first1,
    _IIter1 __last1,
    _IIter2 __first2,
    _BinaryPredicate __binary_pred ) [inline]
```

Tests a range for element-wise equality.

Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__binary_pred</code>	A binary predicate functor .

Returns

A boolean true or false.

This compares the elements of two ranges using the `binary_pred` parameter, and returns true or false depending on whether all of the corresponding elements of the ranges are equal.

Definition at line 1435 of file `stl_algobase.h`.

2.56.2.8 equal() [2/4]

```
template<typename _II1 , typename _II2 >
constexpr bool std::equal (
    _II1 __first1,
    _II1 __last1,
    _II2 __first2 ) [inline]
```

Tests a range for element-wise equality.

Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.

Returns

A boolean true or false.

This compares the elements of two ranges using `==` and returns true or false depending on whether all of the corresponding elements of the ranges are equal.

Definition at line 1404 of file `stl_algobase.h`.

2.56.2.9 `equal()` [3/4]

```
template<typename _II1 , typename _II2 >
constexpr bool std::equal (
    _II1 __first1,
    _II1 __last1,
    _II2 __first2,
    _II2 __last2 ) [inline]
```

Tests a range for element-wise equality.

Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__last2</code>	An input iterator.

Returns

A boolean true or false.

This compares the elements of two ranges using `==` and returns true or false depending on whether all of the corresponding elements of the ranges are equal.

Definition at line 1525 of file `stl_algobase.h`.

2.56.2.10 `equal()` [4/4]

```
template<typename _IIter1 , typename _IIter2 , typename _BinaryPredicate >
constexpr bool std::equal (
    _IIter1 __first1,
    _IIter1 __last1,
    _IIter2 __first2,
    _IIter2 __last2,
    _BinaryPredicate __binary_pred ) [inline]
```

Tests a range for element-wise equality.

Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__last2</code>	An input iterator.
<code>__binary_pred</code>	A binary predicate functor .

Returns

A boolean true or false.

This compares the elements of two ranges using the `binary_pred` parameter, and returns true or false depending on whether all of the corresponding elements of the ranges are equal.

Definition at line 1558 of file `stl_algobase.h`.

Referenced by `std::operator==()`.

2.56.2.11 find()

```
template<typename _InputIterator , typename _Tp >
constexpr _InputIterator std::find (
    _InputIterator __first,
    _InputIterator __last,
    const _Tp & __val ) [inline]
```

Find the first occurrence of a value in a sequence.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__val</code>	The value to find.

Returns

The first iterator `i` in the range `[__first,__last)` such that `*i == __val`, or `__last` if no such iterator exists.

Definition at line 3900 of file `stl_algo.h`.

2.56.2.12 `find_end()` [1/2]

```
template<typename _ForwardIterator1 , typename _ForwardIterator2 >
constexpr _ForwardIterator1 std::find_end (
    _ForwardIterator1 __first1,
    _ForwardIterator1 __last1,
    _ForwardIterator2 __first2,
    _ForwardIterator2 __last2 ) [inline]
```

Find last matching subsequence in a sequence.

Parameters

<code>__first1</code>	Start of range to search.
<code>__last1</code>	End of range to search.
<code>__first2</code>	Start of sequence to match.
<code>__last2</code>	End of sequence to match.

Returns

The last iterator `i` in the range `[__first1, __last1-(__last2-__first2))` such that `*(i+N) == *(__first2+N)` for each `N` in the range `[0, __last2-__first2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1, __last1)` for a sub-sequence that compares equal value-by-value with the sequence given by `[__first2, __last2)` and returns an iterator to the `__first` element of the sub-sequence, or `__last1` if the sub-sequence is not found. The sub-sequence will be the last such subsequence contained in `[__first1, __last1)`.

Because the sub-sequence must lie completely within the range `[__first1, __last1)` it must start at a position less than `__last1-(__last2-__first2)` where `__last2-__first2` is the length of the sub-sequence. This means that the returned iterator `i` will be in the range `[__first1, __last1-(__last2-__first2))`.

Definition at line 367 of file `stl_algo.h`.

2.56.2.13 `find_end()` [2/2]

```
template<typename _ForwardIterator1 , typename _ForwardIterator2 , typename _BinaryPredicate >
constexpr _ForwardIterator1 std::find_end (
    _ForwardIterator1 __first1,
    _ForwardIterator1 __last1,
    _ForwardIterator2 __first2,
    _ForwardIterator2 __last2,
    _BinaryPredicate __comp ) [inline]
```

Find last matching subsequence in a sequence using a predicate.

Parameters

<code>__first1</code>	Start of range to search.
<code>__last1</code>	End of range to search.
<code>__first2</code>	Start of sequence to match.
<code>__last2</code>	End of sequence to match.
<code>__comp</code>	The predicate to use.

Returns

The last iterator `i` in the range `[__first1, __last1 - (__last2 - __first2))` such that `predicate(*(i+N), (__first2+N))` is true for each `N` in the range `[0, __last2 - __first2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1, __last1)` for a sub-sequence that compares equal value-by-value with the sequence given by `[__first2, __last2)` using `comp` as a predicate and returns an iterator to the first element of the sub-sequence, or `__last1` if the sub-sequence is not found. The sub-sequence will be the last such subsequence contained in `[__first, __last1)`.

Because the sub-sequence must lie completely within the range `[__first1, __last1)` it must start at a position less than `__last1 - (__last2 - __first2)` where `__last2 - __first2` is the length of the sub-sequence. This means that the returned iterator `i` will be in the range `[__first1, __last1 - (__last2 - __first2))`

Definition at line 417 of file `stl_algo.h`.

2.56.2.14 find_first_of() [1/2]

```
template<typename _InputIterator, typename _ForwardIterator >
constexpr _InputIterator std::find_first_of (
    _InputIterator __first1,
    _InputIterator __last1,
    _ForwardIterator __first2,
    _ForwardIterator __last2 )
```

Find element from a set in a sequence.

Parameters

<code>__first1</code>	Start of range to search.
<code>__last1</code>	End of range to search.
<code>__first2</code>	Start of match candidates.
<code>__last2</code>	End of match candidates.

Returns

The first iterator `i` in the range `[__first1, __last1)` such that `*i == *(i2)` such that `i2` is an iterator in `[__first2, __last2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1, __last1)` for an element that is equal to some element in the range `[__first2, __last2)`. If found, returns an iterator in the range `[__first1, __last1)`, otherwise returns `__last1`.

Definition at line 3957 of file `stl_algo.h`.

2.56.2.15 `find_first_of()` [2/2]

```
template<typename _InputIterator , typename _ForwardIterator , typename _BinaryPredicate >
constexpr _InputIterator std::find_first_of (
    _InputIterator __first1,
    _InputIterator __last1,
    _ForwardIterator __first2,
    _ForwardIterator __last2,
    _BinaryPredicate __comp )
```

Find element from a set in a sequence using a predicate.

Parameters

<code>__first1</code>	Start of range to search.
<code>__last1</code>	End of range to search.
<code>__first2</code>	Start of match candidates.
<code>__last2</code>	End of match candidates.
<code>__comp</code>	Predicate to use.

Returns

The first iterator `i` in the range `[__first1, __last1)` such that `comp(*i, *(i2))` is true and `i2` is an iterator in `[__first2, __last2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1, __last1)` for an element that is equal to some element in the range `[__first2, __last2)`. If found, returns an iterator in the range `[__first1, __last1)`, otherwise returns `__last1`.

Definition at line 3999 of file `stl_algo.h`.

2.56.2.16 `find_if()`

```
template<typename _InputIterator , typename _Predicate >
constexpr _InputIterator std::find_if (
    _InputIterator __first,
    _InputIterator __last,
    _Predicate __pred ) [inline]
```

Find the first element in a sequence for which a predicate is true.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__pred</code>	A predicate.

Returns

The first iterator `i` in the range `[__first,__last)` such that `__pred(*i)` is true, or `__last` if no such iterator exists.

Definition at line 3925 of file `stl_algo.h`.

Referenced by `std::none_of()`.

2.56.2.17 find_if_not()

```
template<typename _InputIterator , typename _Predicate >
constexpr _InputIterator std::find_if_not (
    _InputIterator __first,
    _InputIterator __last,
    _Predicate __pred ) [inline]
```

Find the first element in a sequence for which a predicate is false.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__pred</code>	A predicate.

Returns

The first iterator `i` in the range `[__first,__last)` such that `__pred(*i)` is false, or `__last` if no such iterator exists.

Definition at line 505 of file `stl_algo.h`.

Referenced by `std::all_of()`, and `std::is_partitioned()`.

2.56.2.18 for_each()

```
template<typename _InputIterator , typename _Function >
constexpr _Function std::for_each (
    _InputIterator __first,
    _InputIterator __last,
    _Function __f )
```

Apply a function to every element of a sequence.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__f</code>	A unary function object.

Returns

`__f`

Applies the function object `__f` to each element in the range `[first,last)`. `__f` must not modify the order of the sequence. If `__f` has a return value it is ignored.

Definition at line 3838 of file `stl_algo.h`.

2.56.2.19 `is_permutation()` [1/4]

```
template<typename _ForwardIterator1 , typename _ForwardIterator2 >
constexpr bool std::is_permutation (
    _ForwardIterator1 __first1,
    _ForwardIterator1 __last1,
    _ForwardIterator2 __first2 ) [inline]
```

Checks whether a permutation of the second sequence is equal to the first sequence.

Parameters

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.

Returns

true if there exists a permutation of the elements in the range `[__first2, __first2 + (__last1 - __first1))`, beginning with `ForwardIterator2` begin, such that `equal(__first1, __last1, begin)` returns true; otherwise, returns false.

Definition at line 2044 of file `stl_algobase.h`.

2.56.2.20 `is_permutation()` [2/4]

```
template<typename _ForwardIterator1 , typename _ForwardIterator2 , typename _BinaryPredicate >
constexpr bool std::is_permutation (
    _ForwardIterator1 __first1,
```

```
_ForwardIterator1 __last1,  
_ForwardIterator2 __first2,  
_BinaryPredicate __pred ) [inline]
```

Checks whether a permutation of the second sequence is equal to the first sequence.

Parameters

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__pred</code>	A binary predicate.

Returns

true if there exists a permutation of the elements in the range `[__first2, __first2 + (__last1 - __first1))`, beginning with `ForwardIterator2` begin, such that `equal(__first1, __last1, __begin, __pred)` returns true; otherwise, returns false.

Definition at line 3532 of file `stl_algo.h`.

2.56.2.21 `is_permutation()` [3/4]

```
template<typename _ForwardIterator1 , typename _ForwardIterator2 >
constexpr bool std::is_permutation (
    _ForwardIterator1 __first1,
    _ForwardIterator1 __last1,
    _ForwardIterator2 __first2,
    _ForwardIterator2 __last2 ) [inline]
```

Checks whether a permutaion of the second sequence is equal to the first sequence.

Parameters

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__last2</code>	End of first range.

Returns

true if there exists a permutation of the elements in the range `[__first2, __last2)`, beginning with `ForwardIterator2` begin, such that `equal(__first1, __last1, begin)` returns true; otherwise, returns false.

Definition at line 3626 of file `stl_algo.h`.

2.56.2.22 `is_permutation()` [4/4]

```
template<typename _ForwardIterator1 , typename _ForwardIterator2 , typename _BinaryPredicate >
constexpr bool std::is_permutation (
```

```

    _ForwardIterator1 __first1,
    _ForwardIterator1 __last1,
    _ForwardIterator2 __first2,
    _ForwardIterator2 __last2,
    _BinaryPredicate __pred ) [inline]

```

Checks whether a permutation of the second sequence is equal to the first sequence.

Parameters

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__last2</code>	End of first range.
<code>__pred</code>	A binary predicate.

Returns

true if there exists a permutation of the elements in the range `[__first2, __last2)`, beginning with `ForwardIterator2` begin, such that `equal(__first1, __last1, __begin, __pred)` returns true; otherwise, returns false.

Definition at line 3655 of file `stl_algo.h`.

2.56.2.23 mismatch() [1/4]

```

template<typename _InputIterator1 , typename _InputIterator2 >
constexpr pair<_InputIterator1, _InputIterator2> std::mismatch (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2 ) [inline]

```

Finds the places in ranges which don't match.

Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.

Returns

A pair of iterators pointing to the first mismatch.

This compares the elements of two ranges using `==` and returns a pair of iterators. The first iterator points into the first range, the second iterator points into the second range, and the elements pointed to by the iterators are not equal.

Definition at line 1768 of file `stl_algobase.h`.

2.56.2.24 mismatch() [2/4]

```
template<typename _InputIterator1 , typename _InputIterator2 , typename _BinaryPredicate >
constexpr pair<_InputIterator1, _InputIterator2> std::mismatch (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _BinaryPredicate __binary_pred ) [inline]
```

Finds the places in ranges which don't match.

Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__binary_pred</code>	A binary predicate functor .

Returns

A pair of iterators pointing to the first mismatch.

This compares the elements of two ranges using the `binary_pred` parameter, and returns a pair of iterators. The first iterator points into the first range, the second iterator points into the second range, and the elements pointed to by the iterators are not equal.

Definition at line 1803 of file `stl_algobase.h`.

2.56.2.25 mismatch() [3/4]

```
template<typename _InputIterator1 , typename _InputIterator2 >
constexpr pair<_InputIterator1, _InputIterator2> std::mismatch (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2 ) [inline]
```

Finds the places in ranges which don't match.

Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__last2</code>	An input iterator.

Returns

A pair of iterators pointing to the first mismatch.

This compares the elements of two ranges using `==` and returns a pair of iterators. The first iterator points into the first range, the second iterator points into the second range, and the elements pointed to by the iterators are not equal.

Definition at line 1851 of file `stl_algobase.h`.

2.56.2.26 mismatch() [4/4]

```
template<typename _InputIterator1 , typename _InputIterator2 , typename _BinaryPredicate >
constexpr pair<_InputIterator1, _InputIterator2> std::mismatch (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _BinaryPredicate __binary_pred ) [inline]
```

Finds the places in ranges which don't match.

Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__last2</code>	An input iterator.
<code>__binary_pred</code>	A binary predicate functor .

Returns

A pair of iterators pointing to the first mismatch.

This compares the elements of two ranges using the `binary_pred` parameter, and returns a pair of iterators. The first iterator points into the first range, the second iterator points into the second range, and the elements pointed to by the iterators are not equal.

Definition at line 1888 of file `stl_algobase.h`.

2.56.2.27 none_of()

```
template<typename _InputIterator , typename _Predicate >
constexpr bool std::none_of (
    _InputIterator __first,
    _InputIterator __last,
    _Predicate __pred ) [inline]
```

Checks that a predicate is false for all the elements of a sequence.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__pred</code>	A predicate.

Returns

True if the check is true, false otherwise.

Returns true if `__pred` is false for each element in the range `[__first,__last)`, and false otherwise.

Definition at line 470 of file `stl_algo.h`.

References `std::find_if()`.

Referenced by `std::any_of()`, and `std::is_partitioned()`.

2.56.2.28 `search()` [1/2]

```
template<typename _ForwardIterator1 , typename _ForwardIterator2 >
constexpr _ForwardIterator1 std::search (
    _ForwardIterator1 __first1,
    _ForwardIterator1 __last1,
    _ForwardIterator2 __first2,
    _ForwardIterator2 __last2 ) [inline]
```

Search a sequence for a matching sub-sequence.

Parameters

<code>__first1</code>	A forward iterator.
<code>__last1</code>	A forward iterator.
<code>__first2</code>	A forward iterator.
<code>__last2</code>	A forward iterator.

Returns

The first iterator `i` in the range `[__first1,__last1-(__last2-__first2))` such that `*(i+N) == *(__first2+N)` for each `N` in the range `[0,__last2-__first2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1,__last1)` for a sub-sequence that compares equal value-by-value with the sequence given by `[__first2,__last2)` and returns an iterator to the first element of the sub-sequence, or `__last1` if the sub-sequence is not found.

Because the sub-sequence must lie completely within the range `[__first1,__last1)` it must start at a position less than `__last1-(__last2-__first2)` where `__last2-__first2` is the length of the sub-sequence.

This means that the returned iterator `i` will be in the range `[__first1, __last1 - (__last2 - __first2))`

Definition at line 4148 of file `stl_algo.h`.

2.56.2.29 `search()` [2/2]

```
template<typename _ForwardIterator1 , typename _ForwardIterator2 , typename _BinaryPredicate >
constexpr _ForwardIterator1 std::search (
    _ForwardIterator1 __first1,
    _ForwardIterator1 __last1,
    _ForwardIterator2 __first2,
    _ForwardIterator2 __last2,
    _BinaryPredicate __predicate ) [inline]
```

Search a sequence for a matching sub-sequence using a predicate.

Parameters

<code>__first1</code>	A forward iterator.
<code>__last1</code>	A forward iterator.
<code>__first2</code>	A forward iterator.
<code>__last2</code>	A forward iterator.
<code>__predicate</code>	A binary predicate.

Returns

The first iterator `i` in the range `[__first1, __last1 - (__last2 - __first2))` such that `__predicate(*(i+N),*(__first2+N))` is true for each `N` in the range `[0, __last2 - __first2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1, __last1)` for a sub-sequence that compares equal value-by-value with the sequence given by `[__first2, __last2)`, using `__predicate` to determine equality, and returns an iterator to the first element of the sub-sequence, or `__last1` if no such iterator exists.

See also

`search(_ForwardIter1, _ForwardIter1, _ForwardIter2, _ForwardIter2)`

Definition at line 4189 of file `stl_algo.h`.

2.56.2.30 `search_n()` [1/2]

```
template<typename _ForwardIterator , typename _Integer , typename _Tp >
constexpr _ForwardIterator std::search_n (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Integer __count,
    const _Tp & __val ) [inline]
```

Search a sequence for a number of consecutive values.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__count</code>	The number of consecutive values.
<code>__val</code>	The value to find.

Returns

The first iterator `i` in the range `[__first, __last - __count)` such that `*(i+N) == __val` for each `N` in the range `[0, __count)`, or `__last` if no such iterator exists.

Searches the range `[__first, __last)` for `count` consecutive elements equal to `__val`.

Definition at line 4224 of file `stl_algo.h`.

2.56.2.31 `search_n()` [2/2]

```
template<typename _ForwardIterator, typename _Integer, typename _Tp, typename _BinaryPredicate>
constexpr _ForwardIterator std::search_n (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Integer __count,
    const _Tp & __val,
    _BinaryPredicate __binary_pred ) [inline]
```

Search a sequence for a number of consecutive values using a predicate.

Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__count</code>	The number of consecutive values.
<code>__val</code>	The value to find.
<code>__binary_pred</code>	A binary predicate.

Returns

The first iterator `i` in the range `[__first, __last - __count)` such that `__binary_pred(*(i+N), __val)` is true for each `N` in the range `[0, __count)`, or `__last` if no such iterator exists.

Searches the range `[__first, __last)` for `__count` consecutive elements for which the predicate returns true.

Definition at line 4259 of file `stl_algo.h`.

2.57 Normal Distributions

Collaboration diagram for Normal Distributions:

Classes

- class `std::cauchy_distribution<_RealType>`
- class `std::chi_squared_distribution<_RealType>`
- class `std::fisher_f_distribution<_RealType>`
- class `std::gamma_distribution<_RealType>`
- class `std::lognormal_distribution<_RealType>`

2.57.1 Detailed Description

2.57.2 Function Documentation

2.57.2.1 `operator!=()` [1/7]

```
template<typename _RealType >
bool std::operator!= (
    const std::normal_distribution< _RealType > & __d1,
    const std::normal_distribution< _RealType > & __d2 ) [inline]
```

Return true if two normal distributions are different.

Definition at line 2176 of file random.h.

2.57.2.2 `operator!=()` [2/7]

```
template<typename _RealType >
bool std::operator!= (
    const std::lognormal_distribution< _RealType > & __d1,
    const std::lognormal_distribution< _RealType > & __d2 ) [inline]
```

Return true if two lognormal distributions are different.

Definition at line 2387 of file random.h.

2.57.2.3 operator!=() [3/7]

```
template<typename _RealType >
bool std::operator!= (
    const std::gamma_distribution< _RealType > & __d1,
    const std::gamma_distribution< _RealType > & __d2 ) [inline]
```

Return true if two gamma distributions are different.

Definition at line 2618 of file random.h.

2.57.2.4 operator!=() [4/7]

```
template<typename _RealType >
bool std::operator!= (
    const std::chi_squared_distribution< _RealType > & __d1,
    const std::chi_squared_distribution< _RealType > & __d2 ) [inline]
```

Return true if two Chi-squared distributions are different.

Definition at line 2842 of file random.h.

2.57.2.5 operator!=() [5/7]

```
template<typename _RealType >
bool std::operator!= (
    const std::cauchy_distribution< _RealType > & __d1,
    const std::cauchy_distribution< _RealType > & __d2 ) [inline]
```

Return true if two Cauchy distributions have different parameters.

Definition at line 3016 of file random.h.

2.57.2.6 operator!=() [6/7]

```
template<typename _RealType >
bool std::operator!= (
    const std::fisher_f_distribution< _RealType > & __d1,
    const std::fisher_f_distribution< _RealType > & __d2 ) [inline]
```

Return true if two Fisher f distributions are different.

Definition at line 3280 of file random.h.

2.57.2.7 operator!=() [7/7]

```
template<typename _RealType >
bool std::operator!=(
    const std::student_t_distribution< _RealType > & __d1,
    const std::student_t_distribution< _RealType > & __d2 ) [inline]
```

Return true if two Student t distributions are different.

Definition at line 3502 of file random.h.

2.57.2.8 operator<<()

```
template<typename _RealType , typename _CharT , typename _Traits >
std::basic_ostream< _CharT, _Traits > & std::operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::cauchy_distribution< _RealType > & __x )
```

Inserts a cauchy_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A cauchy_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

Definition at line 2110 of file bits/random.tcc.

References std::basic_ios< _CharT, _Traits >::fill(), std::ios_base::flags(), std::ios_base::precision(), and std::basic_istream< _CharT, _Traits >::widen().

2.57.2.9 operator>>()

```
template<typename _RealType , typename _CharT , typename _Traits >
std::basic_istream< _CharT, _Traits > & std::operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::cauchy_distribution< _RealType > & __x )
```

Extracts a cauchy_distribution random number distribution __x from the input stream __is.

Parameters

<code>_↔ _is</code>	An input stream.
<code>_↔ _x</code>	A <code>cauchy_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

Definition at line 2133 of file `bits/random.tcc`.

References `std::dec()`, `std::ios_base::flags()`, `std::cauchy_distribution<_RealType>::param()`, and `std::skipws()`.

2.58 Numeric Arrays

Collaboration diagram for Numeric Arrays:

Classes

- class `std::gslice`
- class `std::gslice_array< _Tp >`
- class `std::indirect_array< _Tp >`
- class `std::mask_array< _Tp >`
- class `std::slice`

2.58.1 Detailed Description

Classes and functions for representing and manipulating arrays of elements.

2.58.2 Function Documentation

2.58.2.1 `gslice()` [1/3]

```
std::gslice::gslice ( ) [inline]
```

Construct an empty slice.

Definition at line 149 of file `gslice.h`.

2.58.2.2 `gslice()` [2/3]

```
std::gslice::gslice (
    size_t __o,
    const valarray< size_t > & __l,
    const valarray< size_t > & __s ) [inline]
```

Construct a slice.

Constructs a slice with as many dimensions as the length of the `l` and `s` arrays.

Parameters

<code>_↔ _o</code>	Offset in array of first element.
<code>_↔ _l</code>	Array of dimension lengths.
<code>_↔ _s</code>	Array of dimension strides between array elements.

Definition at line 153 of file `gslice.h`.

2.58.2.3 `gslice()` [3/3]

```
std::gslice::gslice (
    const gslice & __g ) [inline]
```

Copy constructor.

Definition at line 158 of file `gslice.h`.

2.58.2.4 `gslice_array()`

```
template<typename _Tp >
std::gslice_array< _Tp >::gslice_array (
    const gslice_array< _Tp > & __a ) [inline]
```

Copy constructor. Both slices refer to the same underlying array.

Definition at line 148 of file `gslice_array.h`.

2.58.2.5 `indirect_array()`

```
template<typename _Tp >
std::indirect_array< _Tp >::indirect_array (
    const indirect_array< _Tp > & __a ) [inline]
```

Copy constructor. Both slices refer to the same underlying array.

Definition at line 143 of file `indirect_array.h`.

2.58.2.6 mask_array()

```
template<typename _Tp >
std::mask_array< _Tp >::mask_array (
    const mask_array< _Tp > & __a ) [inline]
```

Copy constructor. Both slices refer to the same underlying array.

Definition at line 144 of file mask_array.h.

2.58.2.7 slice() [1/2]

```
std::slice::slice ( ) [inline]
```

Construct an empty slice.

Definition at line 95 of file slice_array.h.

2.58.2.8 slice() [2/2]

```
std::slice::slice (
    size_t __o,
    size_t __d,
    size_t __s ) [inline]
```

Construct a slice.

Parameters

\leftrightarrow __o	Offset in array of first element.
\leftrightarrow __d	Number of elements in slice.
\leftrightarrow __s	Stride between array elements.

Definition at line 99 of file slice_array.h.

2.58.2.9 slice_array()

```
template<typename _Tp >
std::slice_array< _Tp >::slice_array (
    const slice_array< _Tp > & __a ) [inline]
```

Copy constructor. Both slices refer to the same underlying array.

Definition at line 217 of file slice_array.h.

2.58.2.10 valarray() [1/10]

```
template<typename _Tp >
std::valarray< _Tp >::valarray ( ) [inline]
```

Construct an empty array.

Definition at line 621 of file valarray.

2.58.2.11 valarray() [2/10]

```
template<typename _Tp >
std::valarray< _Tp >::valarray (
    size_t __n ) [inline], [explicit]
```

Construct an array with n elements.

Definition at line 625 of file valarray.

2.58.2.12 valarray() [3/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
    const _Tp & __t,
    size_t __n ) [inline]
```

Construct an array with n elements initialized to t .

Definition at line 631 of file valarray.

2.58.2.13 valarray() [4/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
    const valarray< _Tp > & __v ) [inline]
```

Copy constructor.

Definition at line 646 of file valarray.

2.58.2.14 `valarray()` [5/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
    valarray< _Tp > && __v ) [inline], [noexcept]
```

Move constructor.

Definition at line 654 of file `valarray`.

2.58.2.15 `valarray()` [6/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
    const slice_array< _Tp > & __sa ) [inline]
```

Construct an array with the same size and values in *sa*.

Definition at line 664 of file `valarray`.

2.58.2.16 `valarray()` [7/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
    const gslice_array< _Tp > & __ga ) [inline]
```

Construct an array with the same size and values in *ga*.

Definition at line 673 of file `valarray`.

2.58.2.17 `valarray()` [8/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
    const mask_array< _Tp > & __ma ) [inline]
```

Construct an array with the same size and values in *ma*.

Definition at line 684 of file `valarray`.

2.58.2.18 `valarray()` [9/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
    const indirect_array< _Tp > & __ia ) [inline]
```

Construct an array with the same size and values in *ia*.

Definition at line 693 of file `valarray`.

2.58.2.19 `valarray()` [10/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
    initializer_list< _Tp > __l ) [inline]
```

Construct an array with an `initializer_list` of values.

Definition at line 703 of file `valarray`.

2.58.2.20 `~gslice()`

```
std::gslice::~gslice ( ) [inline]
```

Destructor.

Definition at line 163 of file `gslice.h`.

2.58.2.21 `apply()` [1/2]

```
template<class _Tp>
_Expr< _ValFuncClos< _ValArray, _Tp >, _Tp > std::valarray< _Tp >::apply (
    _Tp func_Tp ) const [inline]
```

Apply a function to the array.

Returns a new `valarray` with elements assigned to the result of applying `func` to the corresponding element of this array. The new array has the same size as this one.

Parameters

<i>func</i>	Function of <code>Tp</code> returning <code>Tp</code> to apply.
-------------	---

Returns

New valarray with transformed elements.

Definition at line 1065 of file valarray.

2.58.2.22 apply() [2/2]

```
template<class _Tp>
_Expr< _RefFuncClos< _ValArray, _Tp >, _Tp > std::valarray< _Tp >::apply (
    _Tp funcconst _Tp & ) const [inline]
```

Apply a function to the array.

Returns a new valarray with elements assigned to the result of applying func to the corresponding element of this array. The new array has the same size as this one.

Parameters

<i>func</i>	Function of const Tp& returning Tp to apply.
-------------	--

Returns

New valarray with transformed elements.

Definition at line 1073 of file valarray.

2.58.2.23 begin() [1/2]

```
template<class _Tp >
_Tp * std::begin (
    valarray< _Tp > & __va ) [inline]
```

Return an iterator pointing to the first element of the valarray.

Parameters

<code>__va</code>	valarray.
-------------------	-----------

Definition at line 1214 of file valarray.

Referenced by std::cbegin(), std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::insert(), std::list< __inp, __rebind_inp >::merge(), std::list< __inp, __rebind_inp >::remove(), std::list< __inp, __rebind_inp >::remove_if(), and std::list< __inp, __rebind_inp >::unique().

2.58.2.24 begin() [2/2]

```
template<class _Tp >
const _Tp * std::begin (
    const valarray< _Tp > & __va ) [inline]
```

Return an iterator pointing to the first element of the const valarray.

Parameters

<code>__va</code>	valarray.
-------------------	-----------

Definition at line 1224 of file valarray.

2.58.2.25 cshift()

```
template<class _Tp >
valarray< _Tp > std::valarray< _Tp >::cshift (
    int __n ) const [inline]
```

Return a rotated array.

A new valarray is constructed as a copy of this array with elements in shifted positions. For an element with index *i*, the new position is $(i - n) \% \text{size}()$. The new valarray has the same size as the current one. Elements that are shifted beyond the array bounds are shifted into the other end of the array. No elements are lost.

Positive arguments shift toward index 0, wrapping around the top. Negative arguments shift towards the top, wrapping around to 0.

Parameters

<code>__n</code>	Number of element positions to rotate.
------------------	--

Returns

New valarray with elements in shifted positions.

Definition at line 991 of file valarray.

2.58.2.26 end() [1/2]

```
template<class _Tp >
_Tp * std::end (
    valarray< _Tp > & __va ) [inline]
```

Return an iterator pointing to one past the last element of the valarray.

Parameters

<code>__va</code>	<code>valarray.</code>
-------------------	------------------------

Definition at line 1234 of file `valarray`.

Referenced by `std::cend()`, `std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::insert()`, `std::list< __inp, __rebind_inp >::merge()`, `std::basic_filebuf< char_type, traits_type >::open()`, `std::list< __inp, __rebind_inp >::remove()`, `std::list< __inp, __rebind_inp >::remove_if()`, `std::list< __inp, __rebind_inp >::resize()`, and `std::list< __inp, __rebind_inp >::unique()`.

2.58.2.27 `end()` [2/2]

```
template<class _Tp >
const _Tp * std::end (
    const valarray< _Tp > & __va ) [inline]
```

Return an iterator pointing to one past the last element of the `const valarray`.

Parameters

<code>__va</code>	<code>valarray.</code>
-------------------	------------------------

Definition at line 1244 of file `valarray`.

2.58.2.28 `max()`

```
template<typename _Tp >
_Tp std::valarray< _Tp >::max ( ) const [inline]
```

Return the maximum element using `operator<()`.

Definition at line 1057 of file `valarray`.

2.58.2.29 `min()`

```
template<typename _Tp >
_Tp std::valarray< _Tp >::min ( ) const [inline]
```

Return the minimum element using `operator<()`.

Definition at line 1049 of file `valarray`.

2.58.2.30 `operator!()`

```
template<typename _Tp >
valarray< _Tp >::template _UnaryOp< __logical_not >::_Rt std::valarray< _Tp >::operator! ( )
const [inline]
```

Return a new valarray by applying unary ! to each element.

Definition at line 1092 of file valarray.

2.58.2.31 `operator%=()` [1/6]

```
template<typename _Tp >
void std::gslice_array< _Tp >::operator%= (
    const valarray< _Tp > & __v ) const [inline]
```

Modulo slice elements by corresponding elements of *v*.

Definition at line 207 of file gslice_array.h.

2.58.2.32 `operator%=()` [2/6]

```
template<typename _Tp >
void std::mask_array< _Tp >::operator%= (
    const valarray< _Tp > & __v ) const [inline]
```

Modulo slice elements by corresponding elements of *v*.

Definition at line 197 of file mask_array.h.

2.58.2.33 `operator%=()` [3/6]

```
template<typename _Tp >
void std::indirect_array< _Tp >::operator%= (
    const valarray< _Tp > & __v ) const [inline]
```

Modulo slice elements by corresponding elements of *v*.

Definition at line 196 of file indirect_array.h.

2.58.2.34 operator%=() [4/6]

```
template<typename _Tp >
void std::slice_array< _Tp >::operator%= (
    const valarray< _Tp > & __v ) const [inline]
```

Modulo slice elements by corresponding elements of *v*.

Definition at line 268 of file slice_array.h.

2.58.2.35 operator%=() [5/6]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator%= (
    const _Tp & __t ) [inline]
```

Set each element *e* of array to *e* % *t*.

Definition at line 1119 of file valarray.

2.58.2.36 operator%=() [6/6]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator%= (
    const valarray< _Tp > & __v ) [inline]
```

Modulo elements of array by corresponding elements of *v*.

Definition at line 1119 of file valarray.

2.58.2.37 operator&=() [1/6]

```
template<typename _Tp >
void std::gslice_array< _Tp >::operator&= (
    const valarray< _Tp > & __v ) const [inline]
```

Logical and slice elements with corresponding elements of *v*.

Definition at line 211 of file gslice_array.h.

2.58.2.38 operator&=() [2/6]

```
template<typename _Tp >
void std::mask_array< _Tp >::operator&= (
    const valarray< _Tp > & __v ) const [inline]
```

Logical and slice elements with corresponding elements of *v*.

Definition at line 201 of file mask_array.h.

2.58.2.39 operator&=() [3/6]

```
template<typename _Tp >
void std::indirect_array< _Tp >::operator&= (
    const valarray< _Tp > & __v ) const [inline]
```

Logical and slice elements with corresponding elements of *v*.

Definition at line 200 of file indirect_array.h.

2.58.2.40 operator&=() [4/6]

```
template<typename _Tp >
void std::slice_array< _Tp >::operator&= (
    const valarray< _Tp > & __v ) const [inline]
```

Logical and slice elements with corresponding elements of *v*.

Definition at line 272 of file slice_array.h.

2.58.2.41 operator&=() [5/6]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator&= (
    const _Tp & __t ) [inline]
```

Set each element *e* of array to *e* & *t*.

Definition at line 1121 of file valarray.

2.58.2.42 operator&=() [6/6]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator&= (
    const valarray< _Tp > & __v ) [inline]
```

Logical and corresponding elements of *v* with elements of array.

Definition at line 1121 of file valarray.

2.58.2.43 operator*=() [1/6]

```
template<typename _Tp >
void std::gslice_array< _Tp >::operator*= (
    const valarray< _Tp > & __v ) const [inline]
```

Multiply slice elements by corresponding elements of *v*.

Definition at line 205 of file gslice_array.h.

2.58.2.44 operator*=() [2/6]

```
template<typename _Tp >
void std::mask_array< _Tp >::operator*= (
    const valarray< _Tp > & __v ) const [inline]
```

Multiply slice elements by corresponding elements of *v*.

Definition at line 195 of file mask_array.h.

2.58.2.45 operator*=() [3/6]

```
template<typename _Tp >
void std::indirect_array< _Tp >::operator*= (
    const valarray< _Tp > & __v ) const [inline]
```

Multiply slice elements by corresponding elements of *v*.

Definition at line 194 of file indirect_array.h.

2.58.2.46 operator*=() [4/6]

```
template<typename _Tp >
void std::slice_array< _Tp >::operator*= (
    const valarray< _Tp > & __v ) const [inline]
```

Multiply slice elements by corresponding elements of *v*.

Definition at line 266 of file slice_array.h.

2.58.2.47 operator*=() [5/6]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator*= (
    const _Tp & __t ) [inline]
```

Multiply each element of array by *t*.

Definition at line 1117 of file valarray.

2.58.2.48 operator*=() [6/6]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator*= (
    const valarray< _Tp > & __v ) [inline]
```

Multiply elements of array by corresponding elements of *v*.

Definition at line 1117 of file valarray.

2.58.2.49 operator+()

```
template<typename _Tp >
valarray< _Tp >::template _UnaryOp< __unary_plus >::_Rt std::valarray< _Tp >::operator+ ( )
const [inline]
```

Return a new valarray by applying unary + to each element.

Definition at line 1089 of file valarray.

2.58.2.50 operator+=() [1/6]

```
template<typename _Tp >
void std::gslice_array< _Tp >::operator+= (
    const valarray< _Tp > & __v ) const [inline]
```

Add corresponding elements of *v* to slice elements.

Definition at line 208 of file gslice_array.h.

2.58.2.51 operator+=() [2/6]

```
template<typename _Tp >
void std::mask_array< _Tp >::operator+= (
    const valarray< _Tp > & __v ) const [inline]
```

Add corresponding elements of *v* to slice elements.

Definition at line 198 of file mask_array.h.

2.58.2.52 operator+=() [3/6]

```
template<typename _Tp >
void std::indirect_array< _Tp >::operator+= (
    const valarray< _Tp > & __v ) const [inline]
```

Add corresponding elements of *v* to slice elements.

Definition at line 197 of file indirect_array.h.

2.58.2.53 operator+=() [4/6]

```
template<typename _Tp >
void std::slice_array< _Tp >::operator+= (
    const valarray< _Tp > & __v ) const [inline]
```

Add corresponding elements of *v* to slice elements.

Definition at line 269 of file slice_array.h.

2.58.2.54 operator+=() [5/6]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator+= (
    const _Tp & __t ) [inline]
```

Add *t* to each element of array.

Definition at line 1115 of file valarray.

2.58.2.55 operator+=() [6/6]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator+= (
    const valarray< _Tp > & __v ) [inline]
```

Add corresponding elements of *v* to elements of array.

Definition at line 1115 of file valarray.

2.58.2.56 operator-()

```
template<typename _Tp >
valarray< _Tp >::template _UnaryOp< __negate >::_Rt std::valarray< _Tp >::operator- ( ) const
[inline]
```

Return a new valarray by applying unary - to each element.

Definition at line 1090 of file valarray.

2.58.2.57 operator-=() [1/6]

```
template<typename _Tp >
void std::gslice_array< _Tp >::operator-= (
    const valarray< _Tp > & __v ) const [inline]
```

Subtract corresponding elements of *v* from slice elements.

Definition at line 209 of file gslice_array.h.

2.58.2.58 operator-=() [2/6]

```
template<typename _Tp >
void std::mask_array< _Tp >::operator-= (
    const valarray< _Tp > & __v ) const [inline]
```

Subtract corresponding elements of *v* from slice elements.

Definition at line 199 of file mask_array.h.

2.58.2.59 operator-=() [3/6]

```
template<typename _Tp >
void std::indirect_array< _Tp >::operator-= (
    const valarray< _Tp > & __v ) const [inline]
```

Subtract corresponding elements of *v* from slice elements.

Definition at line 198 of file indirect_array.h.

2.58.2.60 operator-=() [4/6]

```
template<typename _Tp >
void std::slice_array< _Tp >::operator-= (
    const valarray< _Tp > & __v ) const [inline]
```

Subtract corresponding elements of *v* from slice elements.

Definition at line 270 of file slice_array.h.

2.58.2.61 operator-=() [5/6]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator-= (
    const _Tp & __t ) [inline]
```

Subtract *t* to each element of array.

Definition at line 1116 of file valarray.

2.58.2.62 `operator-=()` [6/6]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator-= (
    const valarray< _Tp > & __v ) [inline]
```

Subtract corresponding elements of *v* from elements of array.

Definition at line 1116 of file valarray.

2.58.2.63 `operator/=()` [1/6]

```
template<typename _Tp >
void std::gslice_array< _Tp >::operator/= (
    const valarray< _Tp > & __v ) const [inline]
```

Divide slice elements by corresponding elements of *v*.

Definition at line 206 of file gslice_array.h.

2.58.2.64 `operator/=()` [2/6]

```
template<typename _Tp >
void std::mask_array< _Tp >::operator/= (
    const valarray< _Tp > & __v ) const [inline]
```

Divide slice elements by corresponding elements of *v*.

Definition at line 196 of file mask_array.h.

2.58.2.65 `operator/=()` [3/6]

```
template<typename _Tp >
void std::indirect_array< _Tp >::operator/= (
    const valarray< _Tp > & __v ) const [inline]
```

Divide slice elements by corresponding elements of *v*.

Definition at line 195 of file indirect_array.h.

2.58.2.66 operator/=() [4/6]

```
template<typename _Tp >
void std::slice_array< _Tp >::operator/= (
    const valarray< _Tp > & __v ) const [inline]
```

Divide slice elements by corresponding elements of *v*.

Definition at line 267 of file slice_array.h.

2.58.2.67 operator/=() [5/6]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator/= (
    const _Tp & __t ) [inline]
```

Divide each element of array by *t*.

Definition at line 1118 of file valarray.

2.58.2.68 operator/=() [6/6]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator/= (
    const valarray< _Tp > & __v ) [inline]
```

Divide elements of array by corresponding elements of *v*.

Definition at line 1118 of file valarray.

2.58.2.69 operator<<=() [1/6]

```
template<typename _Tp >
void std::gslice_array< _Tp >::operator<<= (
    const valarray< _Tp > & __v ) const [inline]
```

Left shift slice elements by corresponding elements of *v*.

Definition at line 213 of file gslice_array.h.

2.58.2.70 `operator<<=()` [2/6]

```
template<typename _Tp >
void std::mask_array< _Tp >::operator<<= (
    const valarray< _Tp > & __v ) const [inline]
```

Left shift slice elements by corresponding elements of *v*.

Definition at line 203 of file `mask_array.h`.

2.58.2.71 `operator<<=()` [3/6]

```
template<typename _Tp >
void std::indirect_array< _Tp >::operator<<= (
    const valarray< _Tp > & __v ) const [inline]
```

Left shift slice elements by corresponding elements of *v*.

Definition at line 202 of file `indirect_array.h`.

2.58.2.72 `operator<<=()` [4/6]

```
template<typename _Tp >
void std::slice_array< _Tp >::operator<<= (
    const valarray< _Tp > & __v ) const [inline]
```

Left shift slice elements by corresponding elements of *v*.

Definition at line 274 of file `slice_array.h`.

2.58.2.73 `operator<<=()` [5/6]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator<<= (
    const _Tp & __t ) [inline]
```

Left shift each element *e* of array by *t* bits.

Definition at line 1123 of file `valarray`.

2.58.2.74 operator<<=() [6/6]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator<<= (
    const valarray< _Tp > & __v ) [inline]
```

Left shift elements of array by corresponding elements of *v*.

Definition at line 1123 of file valarray.

2.58.2.75 operator=() [1/20]

```
template<typename _Tp >
gslice_array< _Tp > & std::gslice_array< _Tp >::operator= (
    const gslice_array< _Tp > & __a ) [inline]
```

Assignment operator. Assigns slice elements to corresponding elements of *a*.

Definition at line 153 of file gslice_array.h.

2.58.2.76 operator=() [2/20]

```
template<typename _Tp >
indirect_array< _Tp > & std::indirect_array< _Tp >::operator= (
    const indirect_array< _Tp > & __a ) [inline]
```

Assignment operator. Assigns elements to corresponding elements of *a*.

Definition at line 154 of file indirect_array.h.

2.58.2.77 operator=() [3/20]

```
template<typename _Tp >
mask_array< _Tp > & std::mask_array< _Tp >::operator= (
    const mask_array< _Tp > & __a ) [inline]
```

Assignment operator. Assigns elements to corresponding elements of *a*.

Definition at line 154 of file mask_array.h.

2.58.2.78 operator=() [4/20]

```
template<typename _Tp >
void std::gslice_array< _Tp >::operator= (
    const valarray< _Tp > & __v ) const [inline]
```

Assign slice elements to corresponding elements of *v*.

Definition at line 171 of file gslice_array.h.

References `std::valarray< _Tp >::size()`.

2.58.2.79 operator=() [5/20]

```
template<typename _Tp >
void std::indirect_array< _Tp >::operator= (
    const valarray< _Tp > & __v ) const [inline]
```

Assign slice elements to corresponding elements of *v*.

Definition at line 168 of file indirect_array.h.

2.58.2.80 operator=() [6/20]

```
gslice & std::gslice::operator= (
    const gslice & __g ) [inline]
```

Assignment operator.

Definition at line 170 of file gslice.h.

2.58.2.81 operator=() [7/20]

```
template<typename _Tp >
void std::gslice_array< _Tp >::operator= (
    const _Tp & __t ) const [inline]
```

Assign all slice elements to *t*.

Definition at line 163 of file gslice_array.h.

2.58.2.82 operator=() [8/20]

```
template<typename _Tp >
void std::mask_array< _Tp >::operator= (
    const _Tp & __t ) const [inline]
```

Assign all slice elements to *t*.

Definition at line 163 of file mask_array.h.

2.58.2.83 operator=() [9/20]

```
template<typename _Tp >
void std::indirect_array< _Tp >::operator= (
    const _Tp & __t ) const [inline]
```

Assign all slice elements to *t*.

Definition at line 163 of file indirect_array.h.

2.58.2.84 operator=() [10/20]

```
template<typename _Tp >
slice_array< _Tp > & std::slice_array< _Tp >::operator= (
    const slice_array< _Tp > & __a ) [inline]
```

Assignment operator. Assigns slice elements to corresponding elements of *a*.

Definition at line 225 of file slice_array.h.

2.58.2.85 operator=() [11/20]

```
template<typename _Tp >
void std::slice_array< _Tp >::operator= (
    const valarray< _Tp > & __v ) const [inline]
```

Assign slice elements to corresponding elements of *v*.

Definition at line 239 of file slice_array.h.

2.58.2.86 operator=() [12/20]

```
template<typename _Tp >
void std::slice_array< _Tp >::operator= (
    const _Tp & __t ) const [inline]
```

Assign all slice elements to *t*.

Definition at line 234 of file slice_array.h.

2.58.2.87 operator=() [13/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
    const valarray< _Tp > & __v ) [inline]
```

Assign elements to an array.

Assign elements of array to values in *v*.

Parameters

<code>__v</code>	Valarray to get values from.
------------------	------------------------------

Definition at line 724 of file valarray.

2.58.2.88 operator=() [14/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
    valarray< _Tp > && __v ) [inline], [noexcept]
```

Move assign elements to an array.

Move assign elements of array to values in *v*.

Parameters

<code>__v</code>	Valarray to get values from.
------------------	------------------------------

Definition at line 748 of file valarray.

2.58.2.89 operator=() [15/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
    const _Tp & __t ) [inline]
```

Assign elements to a value.

Assign all elements of array to *t*.

Parameters

↔	Value for elements.
↔	
↔	
↔	
<i>t</i>	

Definition at line 788 of file valarray.

2.58.2.90 operator=() [16/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
    const slice_array< _Tp > & __sa ) [inline]
```

Assign elements to an array subset.

Assign elements of array to values in *sa*. Results are undefined if *sa* does not have the same size as this array.

Parameters

__sa	Array slice to get values from.
------	---------------------------------

Definition at line 796 of file valarray.

2.58.2.91 operator=() [17/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
    const gslice_array< _Tp > & __ga ) [inline]
```

Assign elements to an array subset.

Assign elements of array to values in *ga*. Results are undefined if *ga* does not have the same size as this array.

Parameters

<code>__ga</code>	Array slice to get values from.
-------------------	---------------------------------

Definition at line 806 of file `valarray`.

2.58.2.92 `operator=()` [18/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
    const mask_array< _Tp > & __ma ) [inline]
```

Assign elements to an array subset.

Assign elements of array to values in *ma*. Results are undefined if *ma* does not have the same size as this array.

Parameters

<code>__ma</code>	Array slice to get values from.
-------------------	---------------------------------

Definition at line 816 of file `valarray`.

2.58.2.93 `operator=()` [19/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
    const indirect_array< _Tp > & __ia ) [inline]
```

Assign elements to an array subset.

Assign elements of array to values in *ia*. Results are undefined if *ia* does not have the same size as this array.

Parameters

<code>__ia</code>	Array slice to get values from.
-------------------	---------------------------------

Definition at line 826 of file `valarray`.

2.58.2.94 `operator=()` [20/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
    initializer_list< _Tp > __l ) [inline]
```

Assign elements to an `initializer_list`.

Assign elements of array to values in `__l`. Results are undefined if `__l` does not have the same size as this array.

Parameters

<code>↔</code>	<code>initializer_list</code> to get values from.
<code>__↔</code>	
<code>↔</code>	
<code>__↔</code>	
<code>l</code>	

Definition at line 764 of file `valarray`.

2.58.2.95 `operator>>=()` [1/6]

```
template<typename _Tp >
void std::gslice_array< _Tp >::operator>>= (
    const valarray< _Tp > & __v ) const [inline]
```

Right shift slice elements by corresponding elements of `v`.

Definition at line 214 of file `gslice_array.h`.

2.58.2.96 `operator>>=()` [2/6]

```
template<typename _Tp >
void std::mask_array< _Tp >::operator>>= (
    const valarray< _Tp > & __v ) const [inline]
```

Right shift slice elements by corresponding elements of `v`.

Definition at line 204 of file `mask_array.h`.

2.58.2.97 `operator>>=()` [3/6]

```
template<typename _Tp >
void std::indirect_array< _Tp >::operator>>= (
    const valarray< _Tp > & __v ) const [inline]
```

Right shift slice elements by corresponding elements of `v`.

Definition at line 203 of file `indirect_array.h`.

2.58.2.98 `operator>>=()` [4/6]

```
template<typename _Tp >
void std::slice_array< _Tp >::operator>>= (
    const valarray< _Tp > & __v ) const [inline]
```

Right shift slice elements by corresponding elements of *v*.

Definition at line 275 of file `slice_array.h`.

2.58.2.99 `operator>>=()` [5/6]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator>>= (
    const _Tp & __t ) [inline]
```

Right shift each element *e* of array by *t* bits.

Definition at line 1124 of file `valarray`.

2.58.2.100 `operator>>=()` [6/6]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator>>= (
    const valarray< _Tp > & __v ) [inline]
```

Right shift elements of array by corresponding elements of *v*.

Definition at line 1124 of file `valarray`.

2.58.2.101 `operator[]()` [1/9]

```
template<typename _Tp >
_Tp & std::valarray< _Tp >::operator[] (
    size_t __i ) [inline]
```

Return a reference to the *i*'th array element.

Parameters

\leftarrow	Index of element to return.
$_ \leftarrow$	
\leftarrow	
$_ \leftarrow$	
<i>i</i>	

Returns

Reference to the i'th element.

Definition at line 592 of file valarray.

2.58.2.102 operator[]() [2/9]

```
template<typename _Tp >
_Expr< _SClos< _ValArray, _Tp >, _Tp > std::valarray< _Tp >::operator[] (
    slice __s ) const [inline]
```

Return an array subset.

Returns a new valarray containing the elements of the array indicated by the slice argument. The new valarray has the same size as the input slice.

See also

slice.

Parameters

 <code>__s</code>	The source slice.
--	-------------------

Returns

New valarray containing elements in `__s`.

Definition at line 858 of file valarray.

2.58.2.103 operator[]() [3/9]

```
template<typename _Tp >
slice_array< _Tp > std::valarray< _Tp >::operator[] (
    slice __s ) [inline]
```

Return a reference to an array subset.

Returns a new valarray containing the elements of the array indicated by the slice argument. The new valarray has the same size as the input slice.

See also

slice.

Parameters

<code>_↔</code>	The source slice.
<code>__s</code>	

Returns

New valarray containing elements in `__s`.

Definition at line 866 of file valarray.

2.58.2.104 `operator[]()` [4/9]

```
template<typename _Tp >
_Expr< _GClos< _ValArray, _Tp >, _Tp > std::valarray< _Tp >::operator[] (
    const gslice & __s ) const [inline]
```

Return an array subset.

Returns a `slice_array` referencing the elements of the array indicated by the slice argument.

See also

`gslice`.

Parameters

<code>_↔</code>	The source slice.
<code>__s</code>	

Returns

`Slice_array` referencing elements indicated by `__s`.

Definition at line 871 of file valarray.

2.58.2.105 `operator[]()` [5/9]

```
template<typename _Tp >
gslice_array< _Tp > std::valarray< _Tp >::operator[] (
    const gslice & __s ) [inline]
```

Return a reference to an array subset.

Returns a new valarray containing the elements of the array indicated by the `gslice` argument. The new valarray has the same size as the input `gslice`.

See also

gslice.

Parameters

 <u>_s</u>	The source gslice.
--	--------------------

Returns

New valarray containing elements in `__s`.

Definition at line 880 of file valarray.

2.58.2.106 operator[]() [6/9]

```
template<typename _Tp >
valarray< _Tp > std::valarray< _Tp >::operator[] (
    const valarray< bool > & __m ) const [inline]
```

Return an array subset.

Returns a new valarray containing the elements of the array indicated by the argument. The input is a valarray of bool which represents a bitmask indicating which elements should be copied into the new valarray. Each element of the array is added to the return valarray if the corresponding element of the argument is true.

Parameters

 <u>_m</u>	The valarray bitmask.
--	-----------------------

Returns

New valarray containing elements indicated by `__m`.

Definition at line 888 of file valarray.

2.58.2.107 operator[]() [7/9]

```
template<typename _Tp >
mask_array< _Tp > std::valarray< _Tp >::operator[] (
    const valarray< bool > & __m ) [inline]
```

Return a reference to an array subset.

Returns a new mask_array referencing the elements of the array indicated by the argument. The input is a valarray of bool which represents a bitmask indicating which elements are part of the subset. Elements of the array are part of the subset if the corresponding element of the argument is true.

Parameters

 <code>__m</code>	The valarray bitmask.
---	-----------------------

Returns

New valarray containing elements indicated by `__m`.

Definition at line 900 of file valarray.

2.58.2.108 `operator[]()` [8/9]

```
template<typename _Tp >
_Expr< _IClos< _ValArray, _Tp >, _Tp > std::valarray< _Tp >::operator[] (
    const valarray< size_t > & __i ) const [inline]
```

Return an array subset.

Returns a new valarray containing the elements of the array indicated by the argument. The elements in the argument are interpreted as the indices of elements of this valarray to copy to the return valarray.

Parameters

	The valarray element index list.
<code>__</code> 	
	
<code>__</code>  <code>i</code>	

Returns

New valarray containing elements in `__s`.

Definition at line 911 of file valarray.

2.58.2.109 `operator[]()` [9/9]

```
template<typename _Tp >
indirect_array< _Tp > std::valarray< _Tp >::operator[] (
    const valarray< size_t > & __i ) [inline]
```

Return a reference to an array subset.

Returns an indirect_array referencing the elements of the array indicated by the argument. The elements in the argument are interpreted as the indices of elements of this valarray to include in the subset. The returned indirect_array refers to these elements.

Parameters

	The valarray element index list.
	
	
	
	

Returns

Indirect_array referencing elements in `__i`.

Definition at line 919 of file valarray.

2.58.2.110 operator^=() [1/6]

```
template<typename _Tp >
void std::gslice_array< _Tp >::operator^= (
    const valarray< _Tp > & __v ) const [inline]
```

Logical xor slice elements with corresponding elements of `v`.

Definition at line 210 of file gslice_array.h.

2.58.2.111 operator^=() [2/6]

```
template<typename _Tp >
void std::mask_array< _Tp >::operator^= (
    const valarray< _Tp > & __v ) const [inline]
```

Logical xor slice elements with corresponding elements of `v`.

Definition at line 200 of file mask_array.h.

2.58.2.112 operator^=() [3/6]

```
template<typename _Tp >
void std::indirect_array< _Tp >::operator^= (
    const valarray< _Tp > & __v ) const [inline]
```

Logical xor slice elements with corresponding elements of `v`.

Definition at line 199 of file indirect_array.h.

2.58.2.113 `operator^=()` [4/6]

```
template<typename _Tp >
void std::slice_array< _Tp >::operator^= (
    const valarray< _Tp > & __v ) const [inline]
```

Logical xor slice elements with corresponding elements of *v*.

Definition at line 271 of file slice_array.h.

2.58.2.114 `operator^=()` [5/6]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator^= (
    const _Tp & __t ) [inline]
```

Set each element *e* of array to $e \wedge t$.

Definition at line 1120 of file valarray.

2.58.2.115 `operator^=()` [6/6]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator^= (
    const valarray< _Tp > & __v ) [inline]
```

Logical xor corresponding elements of *v* with elements of array.

Definition at line 1120 of file valarray.

2.58.2.116 `operator" |=()` [1/6]

```
template<typename _Tp >
void std::gslice_array< _Tp >::operator|= (
    const valarray< _Tp > & __v ) const [inline]
```

Logical or slice elements with corresponding elements of *v*.

Definition at line 212 of file gslice_array.h.

2.58.2.117 operator" |=() [2/6]

```
template<typename _Tp >
void std::mask_array< _Tp >::operator|= (
    const valarray< _Tp > & __v ) const [inline]
```

Logical or slice elements with corresponding elements of *v*.

Definition at line 202 of file mask_array.h.

2.58.2.118 operator" |=() [3/6]

```
template<typename _Tp >
void std::indirect_array< _Tp >::operator|= (
    const valarray< _Tp > & __v ) const [inline]
```

Logical or slice elements with corresponding elements of *v*.

Definition at line 201 of file indirect_array.h.

2.58.2.119 operator" |=() [4/6]

```
template<typename _Tp >
void std::slice_array< _Tp >::operator|= (
    const valarray< _Tp > & __v ) const [inline]
```

Logical or slice elements with corresponding elements of *v*.

Definition at line 273 of file slice_array.h.

2.58.2.120 operator" |=() [5/6]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator|= (
    const _Tp & __t ) [inline]
```

Set each element *e* of array to *e* | *t*.

Definition at line 1122 of file valarray.

2.58.2.121 `operator" |=()` [6/6]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator|= (
    const valarray< _Tp > & __v ) [inline]
```

Logical or corresponding elements of `v` with elements of array.

Definition at line 1122 of file `valarray`.

2.58.2.122 `operator~()`

```
template<typename _Tp >
valarray< _Tp >::template _UnaryOp< __bitwise_not >::_Rt std::valarray< _Tp >::operator~ ( )
const [inline]
```

Return a new valarray by applying unary `~` to each element.

Definition at line 1091 of file `valarray`.

2.58.2.123 `resize()`

```
template<class _Tp>
void std::valarray< _Tp >::resize (
    size_t __size,
    _Tp __c = _Tp() ) [inline]
```

Resize array.

Resize this array to `size` and set all elements to `c`. All references and iterators are invalidated.

Parameters

<code>__size</code>	New array size.
<code>__c</code>	New value for all elements.

Definition at line 1032 of file `valarray`.

2.58.2.124 `shift()`

```
template<class _Tp >
valarray< _Tp > std::valarray< _Tp >::shift (
    int __n ) const [inline]
```

Return a shifted array.

A new valarray is constructed as a copy of this array with elements in shifted positions. For an element with index i , the new position is $i - n$. The new valarray has the same size as the current one. New elements without a value are set to 0. Elements whose new position is outside the bounds of the array are discarded.

Positive arguments shift toward index 0, discarding elements $[0, n)$. Negative arguments discard elements from the top of the array.

Parameters

$_n$	Number of element positions to shift.
-------	---------------------------------------

Returns

New valarray with elements in shifted positions.

Definition at line 950 of file valarray.

2.58.2.125 size() [1/3]

```
size_t std::slice::size ( ) const [inline]
```

Return size of slice.

Definition at line 107 of file slice_array.h.

2.58.2.126 size() [2/3]

```
valarray< size_t > std::gslice::size ( ) const [inline]
```

Return array of sizes of slice dimensions.

Definition at line 139 of file gslice.h.

2.58.2.127 size() [3/3]

```
template<class _Tp >  
size_t std::valarray< _Tp >::size ( ) const [inline]
```

Return the number of elements in array.

Definition at line 937 of file valarray.

Referenced by std::gslice_array< _Tp >::operator=().

2.58.2.128 start() [1/2]

```
size_t std::slice::start ( ) const [inline]
```

Return array offset of first slice element.

Definition at line 103 of file slice_array.h.

2.58.2.129 start() [2/2]

```
size_t std::gslice::start ( ) const [inline]
```

Return array offset of first slice element.

Definition at line 135 of file gslice.h.

2.58.2.130 stride() [1/2]

```
size_t std::slice::stride ( ) const [inline]
```

Return array stride of slice.

Definition at line 111 of file slice_array.h.

2.58.2.131 stride() [2/2]

```
valarray< size_t > std::gslice::stride ( ) const [inline]
```

Return array of array strides for each dimension.

Definition at line 143 of file gslice.h.

2.58.2.132 sum()

```
template<class _Tp >  
_Tp std::valarray< _Tp >::sum ( ) const [inline]
```

Return the sum of all elements in the array.

Accumulates the sum of all elements into a Tp using +=. The order of adding the elements is unspecified.

Definition at line 942 of file valarray.

2.58.2.133 swap()

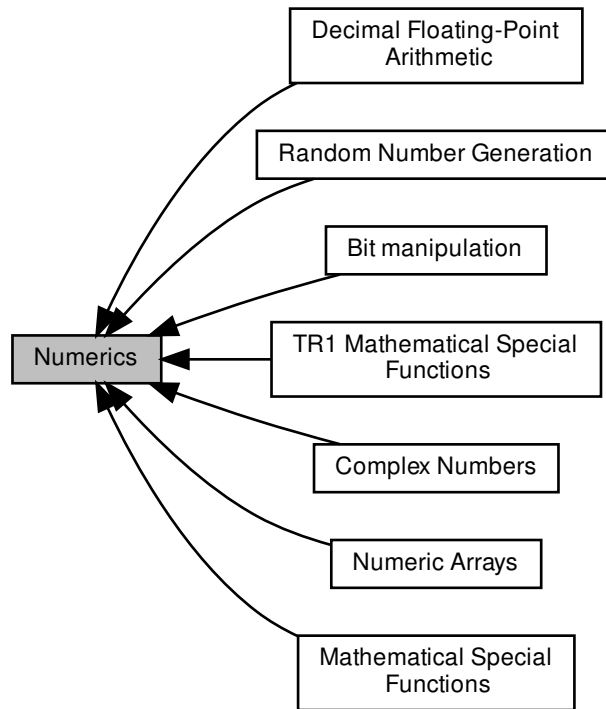

```
template<class _Tp>  
void std::valarray< _Tp >::swap (   
    valarray< _Tp > & __v ) [inline], [noexcept]
```

Swap.

Definition at line 928 of file valarray.

2.59 Numerics

Collaboration diagram for Numerics:

Modules

- [Bit manipulation](#)
- [Complex Numbers](#)
- [Decimal Floating-Point Arithmetic](#)
- [Mathematical Special Functions](#)
- [Numeric Arrays](#)
- [Random Number Generation](#)
- [TR1 Mathematical Special Functions](#)

2.59.1 Detailed Description

Components for performing numeric operations. Includes support for complex number types, random number generation, numeric (n-at-a-time) arrays, generalized numeric algorithms, and mathematical special functions.

2.60 Optional values

Collaboration diagram for Optional values:

Classes

- class `std::experimental::fundamentals_v1::bad_optional_access`
- struct `std::experimental::fundamentals_v1::in_place_t`
- struct `std::experimental::fundamentals_v1::nullopt_t`
- class `std::experimental::fundamentals_v1::optional< _Tp >`

Macros

- `#define __cpp_lib_experimental_optional`

Variables

- constexpr `in_place_t` `std::experimental::fundamentals_v1::in_place`
- constexpr `nullopt_t` `std::experimental::fundamentals_v1::nullopt`

2.60.1 Detailed Description

Class template for optional values and surrounding facilities, as described in n3793 "A proposal to add a utility class to represent optional objects (Revision 5)".

2.60.2 Variable Documentation

2.60.2.1 in_place

```
constexpr in_place_t std::experimental::fundamentals_v1::in_place
```

Tag for in-place construction.

Definition at line 77 of file experimental/optional.

2.60.2.2 nullopt

```
constexpr nullopt_t std::experimental::fundamentals_v1::nullopt
```

Tag to disengage optional objects.

Definition at line 96 of file experimental/optional.

2.61 Pointer Abstractions

Collaboration diagram for Pointer Abstractions:

Classes

- struct `std::default_delete<_Tp>`
- struct `std::default_delete<_Tp[]>`
- class `std::enable_shared_from_this<_Tp>`
- struct `std::hash<shared_ptr<_Tp>>`
- struct `std::hash<unique_ptr<_Tp,_Dp>>`
- struct `std::owner_less<_Tp>`
- struct `std::owner_less<shared_ptr<_Tp>>`
- struct `std::owner_less<void>`
- struct `std::owner_less<weak_ptr<_Tp>>`
- struct `std::pointer_traits<_Ptr>`
- struct `std::pointer_traits<_Tp*>`

2.61.1 Detailed Description

Smart pointers, etc.

2.61.2 Macro Definition Documentation

2.61.2.1 `__cpp_lib_make_unique`

```
#define __cpp_lib_make_unique
```

Definition at line 940 of file `unique_ptr.h`.

2.61.3 Function Documentation

2.61.3.1 `allocate_shared()`

```
template<typename _Tp, typename _Alloc, typename... _Args>
shared\_ptr< _Tp > allocate_shared (
    const _Alloc & __a,
    _Args &&... __args ) [related]
```

Create an object that is owned by a `shared_ptr`.

Parameters

<code>__a</code>	An allocator.
<code>__args</code>	Arguments for the <code>_Tp</code> object's constructor.

Returns

A `shared_ptr` that owns the newly created object.

Exceptions

<i>An</i>	exception thrown from <code>_Alloc::allocate</code> or from the constructor of <code>_Tp</code> .
-----------	---

A copy of `__a` will be used to allocate memory for the `shared_ptr` and the new object.

Definition at line 857 of file `bits/shared_ptr.h`.

2.61.3.2 `atomic_compare_exchange_strong_explicit()`

```
template<typename _Tp >
bool atomic_compare_exchange_strong_explicit (
    shared_ptr< _Tp > * __p,
    shared_ptr< _Tp > * __v,
    shared_ptr< _Tp > __w,
    memory_order ,
    memory_order ) [related]
```

Atomic compare-and-swap for `shared_ptr` objects.

Parameters

<code>__p</code>	A non-null pointer to a <code>shared_ptr</code> object.
<code>__v</code>	A non-null pointer to a <code>shared_ptr</code> object.
<code>__w</code>	A non-null pointer to a <code>shared_ptr</code> object.

Returns

True if `*__p` was equivalent to `*__v`, false otherwise.

The memory order for failure shall not be `memory_order_release` or `memory_order_acq_rel`, or stronger than the memory order for success.

Definition at line 225 of file `shared_ptr_atomic.h`.

2.61.3.3 `atomic_exchange_explicit()`

```
template<typename _Tp >
shared_ptr< _Tp > atomic_exchange_explicit (
    shared_ptr< _Tp > * __p,
    shared_ptr< _Tp > __r,
    memory_order ) [related]
```

Atomic exchange for `shared_ptr` objects.

Parameters

$_p$	A non-null pointer to a <code>shared_ptr</code> object.
$_r$	New value to store in <code>*__p</code> .

Returns

The original value of `*__p`

Definition at line 176 of file `shared_ptr_atomic.h`.

2.61.3.4 `atomic_is_lock_free()`

```
template<typename _Tp , _Lock_policy _Lp>
bool atomic_is_lock_free (
    const __shared_ptr< _Tp, _Lp > * __p ) [related]
```

Report whether `shared_ptr` atomic operations are lock-free.

Parameters

$_p$	A non-null pointer to a <code>shared_ptr</code> object.
-------	---

Returns

True if atomic access to `*__p` is lock-free, false otherwise.

Definition at line 76 of file `shared_ptr_atomic.h`.

2.61.3.5 `atomic_load_explicit()`

```
template<typename _Tp >
shared_ptr< _Tp > atomic_load_explicit (
    const shared_ptr< _Tp > * __p,
    memory_order ) [related]
```

Atomic load for `shared_ptr` objects.

Parameters

\leftarrow <code>_p</code>	A non-null <code>shared_ptr</code> object.
---------------------------------	--

Returns

`*__p`

The memory order shall not be `memory_order_release` or `memory_order_acq_rel`.

Definition at line 103 of file `shared_ptr_atomic.h`.

2.61.3.6 `atomic_store_explicit()`

```
template<typename _Tp >
void atomic_store_explicit (
    shared_ptr< _Tp > * __p,
    shared_ptr< _Tp > __r,
    memory_order ) [related]
```

Atomic store for `shared_ptr` objects.

Parameters

\leftarrow <code>_p</code>	A non-null pointer to a <code>shared_ptr</code> object.
\leftarrow <code>_r</code>	The value to store.

The memory order shall not be `memory_order_acquire` or `memory_order_acq_rel`.

Definition at line 139 of file `shared_ptr_atomic.h`.

2.61.3.7 `const_pointer_cast()`

```
template<typename _Tp , typename _Up >
shared_ptr< _Tp > const_pointer_cast (
    const shared_ptr< _Up > & __r ) [related]
```

Convert type of `shared_ptr`, via `const_cast`

Definition at line 590 of file `bits/shared_ptr.h`.

2.61.3.8 `dynamic_pointer_cast()`

```
template<typename _Tp , typename _Up >
shared_ptr< _Tp > dynamic_pointer_cast (
    const shared_ptr< _Up > & __r ) [related]
```

Convert type of `shared_ptr`, via `dynamic_cast`

Definition at line 599 of file `bits/shared_ptr.h`.

2.61.3.9 `get_deleter()`

```
template<typename _Del , typename _Tp >
_Del * get_deleter (
    const shared_ptr< _Tp > & __p ) [related]
```

20.7.2.2.10 `shared_ptr` `get_deleter`

If `__p` has a deleter of type `_Del`, return a pointer to it.

Definition at line 93 of file `bits/shared_ptr.h`.

2.61.3.10 `make_shared()`

```
template<typename _Tp , typename... _Args>
shared_ptr< _Tp > make_shared (
    _Args &&... __args ) [related]
```

Create an object that is owned by a `shared_ptr`.

Parameters

<code>__args</code>	Arguments for the <code>_Tp</code> object's constructor.
---------------------	--

Returns

A `shared_ptr` that owns the newly created object.

Exceptions

<code>std::bad_alloc</code> , or	an exception thrown from the constructor of <code>_Tp</code> .
----------------------------------	--

Definition at line 872 of file `bits/shared_ptr.h`.

2.61.3.11 make_unique() [1/3]

```
template<typename _Tp , typename... _Args>
_MakeUniq< _Tp >::__single_object make_unique (
    _Args &&... __args ) [related]
```

std::make_unique for single objects

Definition at line 961 of file unique_ptr.h.

2.61.3.12 make_unique() [2/3]

```
template<typename _Tp >
_MakeUniq< _Tp >::__array make_unique (
    size_t __num ) [related]
```

std::make_unique for arrays of unknown bound

Definition at line 967 of file unique_ptr.h.

2.61.3.13 make_unique() [3/3]

```
template<typename _Tp , typename... _Args>
_MakeUniq< _Tp >::__invalid_type make_unique (
    _Args && ... ) [related]
```

Disable std::make_unique for arrays of known bound.

2.61.3.14 operator!=(()) [1/6]

```
template<typename _Tp , typename _Up >
bool operator!= (
    const shared_ptr< _Tp > & __a,
    const shared_ptr< _Up > & __b ) [related]
```

Inequality operator for shared_ptr objects, compares the stored pointers.

Definition at line 469 of file bits/shared_ptr.h.

2.61.3.15 operator!=(()) [2/6]

```
template<typename _Tp >
bool operator!=(
    const shared_ptr< _Tp > & __a,
    nullptr_t ) [related]
```

shared_ptr comparison with nullptr

Definition at line 475 of file bits/shared_ptr.h.

2.61.3.16 operator!=(()) [3/6]

```
template<typename _Tp >
bool operator!=(
    nullptr_t ,
    const shared_ptr< _Tp > & __a ) [related]
```

shared_ptr comparison with nullptr

Definition at line 481 of file bits/shared_ptr.h.

2.61.3.17 operator!=(()) [4/6]

```
template<typename _Tp , typename _Dp , typename _Up , typename _Ep >
bool operator!=(
    const unique_ptr< _Tp, _Dp > & __x,
    const unique_ptr< _Up, _Ep > & __y ) [related]
```

Inequality operator for unique_ptr objects, compares the owned pointers.

Definition at line 774 of file unique_ptr.h.

2.61.3.18 operator!=(()) [5/6]

```
template<typename _Tp , typename _Dp >
bool operator!=(
    const unique_ptr< _Tp, _Dp > & __x,
    nullptr_t ) [related]
```

unique_ptr comparison with nullptr

Definition at line 781 of file unique_ptr.h.

2.61.3.19 operator!=(()) [6/6]

```
template<typename _Tp , typename _Dp >
bool operator!= (
    nullptr_t ,
    const unique_ptr< _Tp, _Dp > & __x ) [related]
```

unique_ptr comparison with nullptr

Definition at line 787 of file unique_ptr.h.

2.61.3.20 operator<() [1/6]

```
template<typename _Tp , typename _Up >
bool operator< (
    const shared_ptr< _Tp > & __a,
    const shared_ptr< _Up > & __b ) [related]
```

Relational operator for shared_ptr objects, compares the stored pointers.

Definition at line 487 of file bits/shared_ptr.h.

2.61.3.21 operator<() [2/6]

```
template<typename _Tp >
bool operator< (
    const shared_ptr< _Tp > & __a,
    nullptr_t ) [related]
```

shared_ptr comparison with nullptr

Definition at line 498 of file bits/shared_ptr.h.

2.61.3.22 operator<() [3/6]

```
template<typename _Tp >
bool operator< (
    nullptr_t ,
    const shared_ptr< _Tp > & __a ) [related]
```

shared_ptr comparison with nullptr

Definition at line 507 of file bits/shared_ptr.h.

2.61.3.23 operator<>() [4/6]

```
template<typename _Tp , typename _Dp , typename _Up , typename _Ep >
bool operator< (
    const unique_ptr< _Tp, _Dp > & __x,
    const unique_ptr< _Up, _Ep > & __y ) [related]
```

Relational operator for unique_ptr objects, compares the owned pointers.

Definition at line 795 of file unique_ptr.h.

2.61.3.24 operator<>() [5/6]

```
template<typename _Tp , typename _Dp >
bool operator< (
    const unique_ptr< _Tp, _Dp > & __x,
    nullptr_t ) [related]
```

unique_ptr comparison with nullptr

Definition at line 807 of file unique_ptr.h.

2.61.3.25 operator<>() [6/6]

```
template<typename _Tp , typename _Dp >
bool operator< (
    nullptr_t ,
    const unique_ptr< _Tp, _Dp > & __x ) [related]
```

unique_ptr comparison with nullptr

Definition at line 816 of file unique_ptr.h.

2.61.3.26 operator<<()

```
template<typename _Ch , typename _Tr , typename _Tp , _Lock_policy _Lp>
std::basic_ostream< _Ch, _Tr > & operator<< (
    std::basic_ostream< _Ch, _Tr > & __os,
    const __shared_ptr< _Tp, _Lp > & __p ) [related]
```

Write the stored pointer to an ostream.

Definition at line 69 of file bits/shared_ptr.h.

2.61.3.27 operator<=() [1/6]

```
template<typename _Tp , typename _Up >
bool operator<= (
    const shared_ptr< _Tp > & __a,
    const shared_ptr< _Up > & __b ) [related]
```

Relational operator for shared_ptr objects, compares the stored pointers.

Definition at line 516 of file bits/shared_ptr.h.

2.61.3.28 operator<=() [2/6]

```
template<typename _Tp >
bool operator<= (
    const shared_ptr< _Tp > & __a,
    nullptr_t ) [related]
```

shared_ptr comparison with nullptr

Definition at line 522 of file bits/shared_ptr.h.

2.61.3.29 operator<=() [3/6]

```
template<typename _Tp >
bool operator<= (
    nullptr_t ,
    const shared_ptr< _Tp > & __a ) [related]
```

shared_ptr comparison with nullptr

Definition at line 528 of file bits/shared_ptr.h.

2.61.3.30 operator<=() [4/6]

```
template<typename _Tp , typename _Dp , typename _Up , typename _Ep >
bool operator<= (
    const unique_ptr< _Tp, _Dp > & __x,
    const unique_ptr< _Up, _Ep > & __y ) [related]
```

Relational operator for unique_ptr objects, compares the owned pointers.

Definition at line 826 of file unique_ptr.h.

2.61.3.31 operator<=() [5/6]

```
template<typename _Tp , typename _Dp >
bool operator<= (
    const unique_ptr< _Tp, _Dp > & __x,
    nullptr_t ) [related]
```

unique_ptr comparison with nullptr

Definition at line 833 of file unique_ptr.h.

2.61.3.32 operator<=() [6/6]

```
template<typename _Tp , typename _Dp >
bool operator<= (
    nullptr_t ,
    const unique_ptr< _Tp, _Dp > & __x ) [related]
```

unique_ptr comparison with nullptr

Definition at line 839 of file unique_ptr.h.

2.61.3.33 operator==() [1/6]

```
template<typename _Tp , typename _Up >
bool operator== (
    const shared_ptr< _Tp > & __a,
    const shared_ptr< _Up > & __b ) [related]
```

Equality operator for shared_ptr objects, compares the stored pointers.

Definition at line 436 of file bits/shared_ptr.h.

2.61.3.34 operator==() [2/6]

```
template<typename _Tp >
bool operator== (
    const shared_ptr< _Tp > & __a,
    nullptr_t ) [related]
```

shared_ptr comparison with nullptr

Definition at line 442 of file bits/shared_ptr.h.

2.61.3.35 operator==() [3/6]

```
template<typename _Tp >
bool operator==(
    nullptr_t ,
    const shared_ptr< _Tp > & __a ) [related]
```

shared_ptr comparison with nullptr

Definition at line 463 of file bits/shared_ptr.h.

2.61.3.36 operator==() [4/6]

```
template<typename _Tp , typename _Dp , typename _Up , typename _Ep >
bool operator==(
    const unique_ptr< _Tp, _Dp > & __x,
    const unique_ptr< _Up, _Ep > & __y ) [related]
```

Equality operator for unique_ptr objects, compares the owned pointers.

Definition at line 753 of file unique_ptr.h.

2.61.3.37 operator==() [5/6]

```
template<typename _Tp , typename _Dp >
bool operator==(
    const unique_ptr< _Tp, _Dp > & __x,
    nullptr_t ) [related]
```

unique_ptr comparison with nullptr

Definition at line 760 of file unique_ptr.h.

2.61.3.38 operator==() [6/6]

```
template<typename _Tp , typename _Dp >
bool operator==(
    nullptr_t ,
    const unique_ptr< _Tp, _Dp > & __x ) [related]
```

unique_ptr comparison with nullptr

Definition at line 767 of file unique_ptr.h.

2.61.3.39 operator>() [1/6]

```

    const shared_ptr< _Tp > & __a ) [related]
```

shared_ptr comparison with nullptr

Definition at line 564 of file bits/shared_ptr.h.

2.61.3.48 operator>=() [4/6]

```
template<typename _Tp , typename _Dp , typename _Up , typename _Ep >
bool operator>= (
    const unique_ptr< _Tp, _Dp > & __x,
    const unique_ptr< _Up, _Ep > & __y ) [related]
```

Relational operator for unique_ptr objects, compares the owned pointers.

Definition at line 872 of file unique_ptr.h.

2.61.3.49 operator>=() [5/6]

```
template<typename _Tp , typename _Dp >
bool operator>= (
    const unique_ptr< _Tp, _Dp > & __x,
    nullptr_t ) [related]
```

unique_ptr comparison with nullptr

Definition at line 879 of file unique_ptr.h.

2.61.3.50 operator>=() [6/6]

```
template<typename _Tp , typename _Dp >
bool operator>= (
    nullptr_t ,
    const unique_ptr< _Tp, _Dp > & __x ) [related]
```

unique_ptr comparison with nullptr

Definition at line 885 of file unique_ptr.h.

2.61.3.51 static_pointer_cast()

```
template<typename _Tp , typename _Up >
shared_ptr< _Tp > static_pointer_cast (
    const shared_ptr< _Up > & __r ) [related]
```

Convert type of shared_ptr, via static_cast

Definition at line 581 of file bits/shared_ptr.h.

2.61.3.52 swap() [1/3]

```
template<typename _Tp >
void swap (
    shared_ptr< _Tp > & __a,
    shared_ptr< _Tp > & __b ) [related]
```

Swap overload for shared_ptr.

Definition at line 573 of file bits/shared_ptr.h.

Referenced by std::shared_ptr< _State >::atomic_exchange_explicit(), std::shared_ptr< _State >::atomic_store_explicit(), std::shared_ptr< _State >::swap(), and std::weak_ptr< _State_baseV2 >::swap().

2.61.3.53 swap() [2/3]

```
template<typename _Tp , typename _Dp >
enable_if< __is_swappable< _Dp >::value >::type swap (
    unique_ptr< _Tp, _Dp > & __x,
    unique_ptr< _Tp, _Dp > & __y ) [related]
```

Swap overload for unique_ptr.

Definition at line 738 of file unique_ptr.h.

2.61.3.54 swap() [3/3]

```
template<typename _Tp >
void swap (
    weak_ptr< _Tp > & __a,
    weak_ptr< _Tp > & __b ) [related]
```

Swap overload for weak_ptr.

Definition at line 762 of file bits/shared_ptr.h.

2.62 Pointer Safety and Garbage Collection

Collaboration diagram for Pointer Safety and Garbage Collection:

Enumerations

- enum `std::pointer_safety` { **relaxed**, **preferred**, **strict** }

Functions

- void `std::declare_no_pointers` (char *, size_t)
- void `std::declare_reachable` (void *)
- `pointer_safety` `std::get_pointer_safety` () noexcept
- void `std::undeclare_no_pointers` (char *, size_t)
- template<typename _Tp >
_Tp * `std::undeclare_reachable` (_Tp *__p)

2.62.1 Detailed Description

Utilities to assist with garbage collection in an implementation that supports *strict pointer safety*. This implementation only supports *relaxed pointer safety* and so these functions have no effect.

C++11 20.6.4 [util.dynamic.safety], Pointer safety

2.62.2 Enumeration Type Documentation

2.62.2.1 pointer_safety

```
enum std::pointer_safety [strong]
```

Constants representing the different types of pointer safety.

Definition at line 158 of file memory.

2.62.3 Function Documentation

2.62.3.1 `declare_no_pointers()`

```
void std::declare_no_pointers (
    char * ,
    size_t ) [inline]
```

Inform a garbage collector that a region of memory need not be traced.

Definition at line 171 of file memory.

2.62.3.2 `declare_reachable()`

```
void std::declare_reachable (
    void * ) [inline]
```

Inform a garbage collector that an object is still in use.

Definition at line 162 of file memory.

2.62.3.3 `get_pointer_safety()`

```
pointer_safety std::get_pointer_safety ( ) [inline], [noexcept]
```

The type of pointer safety supported by the implementation.

Definition at line 179 of file memory.

2.62.3.4 `undeclare_no_pointers()`

```
void std::undeclare_no_pointers (
    char * ,
    size_t ) [inline]
```

Unregister a range previously registered with `declare_no_pointers`.

Definition at line 175 of file memory.

2.62.3.5 `undeclare_reachable()`

```
template<typename _Tp >
_Tp* std::undeclare_reachable (
    _Tp * __p ) [inline]
```

Unregister an object previously registered with `declare_reachable`.

Definition at line 167 of file memory.

2.63 Poisson Distributions

Collaboration diagram for Poisson Distributions:

Classes

- class `std::discrete_distribution< _IntType >`
- class `std::exponential_distribution< _RealType >`
- class `std::extreme_value_distribution< _RealType >`
- struct `std::piecewise_linear_distribution< _RealType >::param_type`
- struct `std::piecewise_constant_distribution< _RealType >::param_type`
- struct `std::discrete_distribution< _IntType >::param_type`
- struct `std::extreme_value_distribution< _RealType >::param_type`
- struct `std::weibull_distribution< _RealType >::param_type`
- struct `std::exponential_distribution< _RealType >::param_type`
- struct `std::poisson_distribution< _IntType >::param_type`
- class `std::piecewise_constant_distribution< _RealType >`
- class `std::piecewise_linear_distribution< _RealType >`
- class `std::poisson_distribution< _IntType >`
- class `std::weibull_distribution< _RealType >`

Functions

- `template<typename _RealType, typename _CharT, typename _Traits >`
`std::basic_ostream< _CharT, _Traits > & std::operator<< (std::basic_ostream< _CharT, _Traits > &__os, const std::extreme_value_distribution< _RealType > &__x)`
- `template<typename _RealType, typename _CharT, typename _Traits >`
`std::basic_istream< _CharT, _Traits > & std::operator>> (std::basic_istream< _CharT, _Traits > &__is, std::exponential_distribution< _RealType > &__x)`
- `template<typename _RealType, typename _CharT, typename _Traits >`
`std::basic_istream< _CharT, _Traits > & std::operator>> (std::basic_istream< _CharT, _Traits > &__is, std::weibull_distribution< _RealType > &__x)`
- `template<typename _RealType, typename _CharT, typename _Traits >`
`std::basic_istream< _CharT, _Traits > & std::operator>> (std::basic_istream< _CharT, _Traits > &__is, std::extreme_value_distribution< _RealType > &__x)`

2.63.1 Detailed Description

2.63.2 Function Documentation

2.63.2.1 `operator!=()` [1/7]

```
template<typename _IntType >
bool std::operator!=(
    const std::poisson_distribution< _IntType > & __d1,
    const std::poisson_distribution< _IntType > & __d2 ) [inline]
```

Return true if two Poisson distributions are different.

Definition at line 4624 of file random.h.

2.63.2.2 `operator!=()` [2/7]

```
template<typename _RealType >
bool std::operator!=(
    const std::exponential_distribution< _RealType > & __d1,
    const std::exponential_distribution< _RealType > & __d2 ) [inline]
```

Return true if two exponential distributions have different parameters.

Definition at line 4815 of file random.h.

2.63.2.3 operator!=() [3/7]

```
template<typename _RealType >
bool std::operator!=(
    const std::weibull_distribution< _RealType > & __d1,
    const std::weibull_distribution< _RealType > & __d2 ) [inline]
```

Return true if two Weibull distributions have different parameters.

Definition at line 5025 of file random.h.

2.63.2.4 operator!=() [4/7]

```
template<typename _RealType >
bool std::operator!=(
    const std::extreme_value_distribution< _RealType > & __d1,
    const std::extreme_value_distribution< _RealType > & __d2 ) [inline]
```

Return true if two extreme value distributions have different parameters.

Definition at line 5235 of file random.h.

2.63.2.5 operator!=() [5/7]

```
template<typename _IntType >
bool std::operator!=(
    const std::discrete_distribution< _IntType > & __d1,
    const std::discrete_distribution< _IntType > & __d2 ) [inline]
```

Return true if two discrete distributions have different parameters.

Definition at line 5500 of file random.h.

2.63.2.6 operator!=() [6/7]

```
template<typename _RealType >
bool std::operator!=(
    const std::piecewise_constant_distribution< _RealType > & __d1,
    const std::piecewise_constant_distribution< _RealType > & __d2 ) [inline]
```

Return true if two piecewise constant distributions have different parameters.

Definition at line 5771 of file random.h.

2.63.2.7 operator!=() [7/7]

```
template<typename _RealType >
bool std::operator!=(
    const std::piecewise_linear_distribution< _RealType > & __d1,
    const std::piecewise_linear_distribution< _RealType > & __d2 ) [inline]
```

Return true if two piecewise linear distributions have different parameters.

Definition at line 6044 of file random.h.

2.63.2.8 operator<<() [1/3]

```
template<typename _RealType , typename _CharT , typename _Traits >
std::basic_ostream< _CharT, _Traits > & std::operator<<(
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::exponential_distribution< _RealType > & __x )
```

Inserts a exponential_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A exponential_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

Definition at line 1719 of file bits/random.tcc.

References std::basic_ios< _CharT, _Traits >::fill(), std::ios_base::flags(), and std::ios_base::precision().

2.63.2.9 operator<<() [2/3]

```
template<typename _RealType , typename _CharT , typename _Traits >
std::basic_ostream< _CharT, _Traits > & std::operator<<(
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::weibull_distribution< _RealType > & __x )
```

Inserts a weibull_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A weibull_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

Definition at line 2504 of file `bits/random.tcc`.

References `std::basic_ios<_CharT, _Traits>::fill()`, `std::ios_base::flags()`, `std::ios_base::precision()`, and `std::basic_istream<_CharT, _Traits>::widen()`.

2.63.2.10 operator<<() [3/3]

```
template<typename _RealType , typename _CharT , typename _Traits >
std::basic_ostream< _CharT, _Traits > & std::operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::extreme_value_distribution< _RealType > & __x )
```

Inserts a `extreme_value_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>extreme_value_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

Definition at line 2578 of file `bits/random.tcc`.

References `std::basic_ios<_CharT, _Traits>::fill()`, `std::ios_base::flags()`, `std::ios_base::precision()`, and `std::basic_istream<_CharT, _Traits>::widen()`.

2.63.2.11 operator>>() [1/3]

```
template<typename _RealType , typename _CharT , typename _Traits >
std::basic_istream< _CharT, _Traits > & std::operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::exponential_distribution< _RealType > & __x )
```

Extracts a `exponential_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>exponential_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

Definition at line 1741 of file `bits/random.tcc`.

References `std::dec()`, `std::ios_base::flags()`, `std::exponential_distribution<_RealType>::param()`, and `std::skipws()`.

2.63.2.12 operator>>() [2/3]

```
template<typename _RealType , typename _CharT , typename _Traits >
std::basic_istream< _CharT, _Traits > & std::operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::weibull_distribution< _RealType > & __x )
```

Extracts a `weibull_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>weibull_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

Definition at line 2527 of file `bits/random.tcc`.

References `std::dec()`, `std::ios_base::flags()`, `std::weibull_distribution<_RealType>::param()`, and `std::skipws()`.

2.63.2.13 operator>>() [3/3]

```
template<typename _RealType , typename _CharT , typename _Traits >
std::basic_istream< _CharT, _Traits > & std::operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::extreme_value_distribution< _RealType > & __x )
```

Extracts a `extreme_value_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>extreme_value_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

Definition at line 2601 of file `bits/random.tcc`.

References `std::dec()`, `std::ios_base::flags()`, `std::extreme_value_distribution<_RealType>::param()`, and `std::skipws()`.

2.64 Policy-Based Data Structures

Collaboration diagram for Policy-Based Data Structures:

Modules

- [Containers](#)
- [Exceptions](#)
- [Tags](#)
- [Traits](#)

2.64.1 Detailed Description

This is a library of policy-based elementary data structures: associative containers and priority queues. It is designed for high-performance, flexibility, semantic safety, and conformance to the corresponding containers in std (except for some points where it differs by design).

For details, see: http://gcc.gnu.org/onlinedocs/libstdc++/ext/pb_ds/index.html

Functions

- `template<typename _RealType , size_t __bits, typename _UniformRandomNumberGenerator > _RealType std::generate_canonical (_UniformRandomNumberGenerator & __g)`

2.66.1 Detailed Description

A facility for generating random numbers on selected distributions.

2.66.2 Function Documentation

2.66.2.1 `generate_canonical()`

```

template<typename _RealType , size_t __bits, typename _UniformRandomNumberGenerator >
_RealType std::generate_canonical (
    _UniformRandomNumberGenerator & __g )
  
```

A function template for converting the output of a (integral) uniform random number generator to a floating point result in the range [0-1).

Definition at line 3282 of file `bits/random.tcc`.

References `std::numeric_limits< _Tp >::epsilon()`, `std::log()`, and `std::min()`.

2.67.1 Detailed Description

These classes define objects which provide random or pseudorandom numbers, either from a discrete or a continuous interval. The random number generator supplied as a part of this library are all uniform random number generators which provide a sequence of random number uniformly distributed over their range.

A number generator is a function object with an `operator()` that takes zero arguments and returns a number.

A compliant random number generator must satisfy the following requirements.

Table 229 Random Number Generator Requirements

To be documented.

2.67.2 Typedef Documentation

2.67.2.1 minstd_rand

```
typedef linear_congruential_engine<uint_fast32_t, 48271UL, 0UL, 2147483647UL> std::minstd_rand
```

An alternative LCR (Lehmer Generator function).

Definition at line 1560 of file `random.h`.

2.67.2.2 minstd_rand0

```
typedef linear_congruential_engine<uint_fast32_t, 16807UL, 0UL, 2147483647UL> std::minstd_rand0
```

The classic Minimum Standard `rand0` of Lewis, Goodman, and Miller.

Definition at line 1554 of file `random.h`.

2.67.2.3 mt19937

```
typedef mersenne_twister_engine< uint_fast32_t, 32, 624, 397, 31, 0x9908b0dfUL, 11, 0xffffffffUL,
7, 0x9d2c5680UL, 15, 0xefc60000UL, 18, 1812433253UL> std::mt19937
```

The classic Mersenne Twister.

Reference: M. Matsumoto and T. Nishimura, Mersenne Twister: A 623-Dimensionally Equidistributed Uniform Pseudo-Random Number Generator, ACM Transactions on Modeling and Computer Simulation, Vol. 8, No. 1, January 1998, pp 3-30.

Definition at line 1576 of file random.h.

2.67.2.4 mt19937_64

```
typedef mersenne_twister_engine< uint_fast64_t, 64, 312, 156, 31, 0xb5026f5aa96619e9ULL, 29,
0x5555555555555555ULL, 17, 0x71d67fffed60000ULL, 37, 0xffff7eee00000000ULL, 43, 6364136223846793005ULL> std::mt19937_64
```

An alternative Mersenne Twister.

Definition at line 1588 of file random.h.

2.67.3 Function Documentation

2.67.3.1 operator!=() [1/6]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
bool std::operator!=(
    const std::linear_congruential_engine< _UIntType, __a, __c, __m > & __lhs,
    const std::linear_congruential_engine< _UIntType, __a, __c, __m > & __rhs ) [inline]
```

Compares two linear congruential random number generator objects of the same type for inequality.

Parameters

<code>__lhs</code>	A linear congruential random number generator object.
<code>__rhs</code>	Another linear congruential random number generator object.

Returns

true if the infinite sequences of generated values would be different, false otherwise.

Definition at line 432 of file random.h.

2.67.3.2 operator!=() [2/6]

```
template<typename _UIntType , size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a,
size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _U
UIntType __f>
bool std::operator!=( (
    const std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __
__s, __b, __t, __c, __l, __f > & __lhs,
    const std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __
__s, __b, __t, __c, __l, __f > & __rhs ) [inline]
```

Compares two % mersenne_twister_engine random number generator objects of the same type for inequality.

Parameters

<code>__lhs</code>	A % mersenne_twister_engine random number generator object.
<code>__rhs</code>	Another % mersenne_twister_engine random number generator object.

Returns

true if the infinite sequences of generated values would be different, false otherwise.

Definition at line 669 of file random.h.

2.67.3.3 operator!=() [3/6]

```
template<typename _UIntType , size_t __w, size_t __s, size_t __r>
bool std::operator!=( (
    const std::subtract_with_carry_engine< _UIntType, __w, __s, __r > & __lhs,
    const std::subtract_with_carry_engine< _UIntType, __w, __s, __r > & __rhs ) [inline]
```

Compares two % subtract_with_carry_engine random number generator objects of the same type for inequality.

Parameters

<code>__lhs</code>	A % subtract_with_carry_engine random number generator object.
<code>__rhs</code>	Another % subtract_with_carry_engine random number generator object.

Returns

true if the infinite sequences of generated values would be different, false otherwise.

Definition at line 870 of file random.h.

2.67.3.4 `operator!=()` [4/6]

```
template<typename _RandomNumberEngine , size_t __p, size_t __r>
bool std::operator!= (
    const std::discard_block_engine< _RandomNumberEngine, __p, __r > & __lhs,
    const std::discard_block_engine< _RandomNumberEngine, __p, __r > & __rhs ) [inline]
```

Compares two `discard_block_engine` random number generator objects of the same type for inequality.

Parameters

<code>__lhs</code>	A <code>discard_block_engine</code> random number generator object.
<code>__rhs</code>	Another <code>discard_block_engine</code> random number generator object.

Returns

true if the infinite sequences of generated values would be different, false otherwise.

Definition at line 1093 of file `random.h`.

2.67.3.5 `operator!=()` [5/6]

```
template<typename _RandomNumberEngine , size_t __w, typename _UIntType >
bool std::operator!= (
    const std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & __lhs,
    const std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & __rhs )
[inline]
```

Compares two `independent_bits_engine` random number generator objects of the same type for inequality.

Parameters

<code>__lhs</code>	A <code>independent_bits_engine</code> random number generator object.
<code>__rhs</code>	Another <code>independent_bits_engine</code> random number generator object.

Returns

true if the infinite sequences of generated values would be different, false otherwise.

Definition at line 1290 of file `random.h`.

2.67.3.6 operator!=() [6 / 6]

```
template<typename _RandomNumberEngine , size_t __k>
bool std::operator!=(
    const std::shuffle_order_engine< _RandomNumberEngine, __k > & __lhs,
    const std::shuffle_order_engine< _RandomNumberEngine, __k > & __rhs ) [inline]
```

Compares two shuffle_order_engine random number generator objects of the same type for inequality.

Parameters

<code>__lhs</code>	A shuffle_order_engine random number generator object.
<code>__rhs</code>	Another shuffle_order_engine random number generator object.

Returns

true if the infinite sequences of generated values would be different, false otherwise.

Definition at line 1543 of file random.h.

2.67.3.7 operator<<()

```
template<typename _RandomNumberEngine , size_t __w, typename _UIntType , typename _CharT , typename
 Traits >
std::basic_ostream<_CharT, Traits>& std::operator<< (
    std::basic_ostream< _CharT, Traits > & __os,
    const std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & __x )
```

Inserts the current state of a independent_bits_engine random number generator engine `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A independent_bits_engine random number generator engine.

Returns

The output stream with the state of `__x` inserted or in an error state.

Definition at line 1309 of file random.h.

2.70.1 Detailed Description

A facility for performing regular expression pattern matching.

2.70.2 Typedef Documentation

2.70.2.1 `cregex_token_iterator`

```
typedef regex_token_iterator<const char*> std::cregex_token_iterator
```

Token iterator for C-style NULL-terminated strings.

Definition at line 2963 of file `regex.h`.

2.70.2.2 `sub_match`

```
typedef sub_match<const char*> std::sub_match
```

Standard regex submatch over a C-style null-terminated string.

Definition at line 1010 of file `regex.h`.

2.70.2.3 `regex`

```
typedef basic_regex<char> std::regex
```

Standard regular expressions.

Definition at line 832 of file `regex.h`.

2.70.2.4 `sregex_token_iterator`

```
typedef regex_token_iterator<string::const_iterator> std::sregex_token_iterator
```

Token iterator for standard strings.

Definition at line 2966 of file `regex.h`.

2.70.2.5 `ssub_match`

```
typedef sub_match<string::const_iterator> std::ssub_match
```

Standard regex submatch over a standard string.

Definition at line 1013 of file `regex.h`.

2.70.2.6 `wcregex_token_iterator`

```
typedef regex_token_iterator<const wchar_t*> std::wcregex_token_iterator
```

Token iterator for C-style NULL-terminated wide strings.

Definition at line 2970 of file `regex.h`.

2.70.2.7 `wcsub_match`

```
typedef sub_match<const wchar_t*> std::wcsub_match
```

Regex submatch over a C-style null-terminated wide string.

Definition at line 1017 of file `regex.h`.

2.70.2.8 `wregex`

```
typedef basic_regex<wchar_t> std::wregex
```

Standard wide-character regular expressions.

Definition at line 836 of file `regex.h`.

2.70.2.9 wsregex_token_iterator

```
typedef regex_token_iterator<wstring::const_iterator> std::wsregex_token_iterator
```

Token iterator for standard wide-character strings.

Definition at line 2973 of file regex.h.

2.70.2.10 wssub_match

```
typedef sub_match<wstring::const_iterator> std::wssub_match
```

Regex submatch over a standard wide string.

Definition at line 1020 of file regex.h.

2.70.3 Function Documentation

2.70.3.1 operator!=() [1/8]

```
template<typename _BiIter >  
bool operator!=(  
    const sub_match< _BiIter > & __lhs,  
    const sub_match< _BiIter > & __rhs ) [related]
```

Tests the inequivalence of two regular expression submatches.

Parameters

<code>__lhs</code>	First regular expression submatch.
<code>__rhs</code>	Second regular expression submatch.

Returns

true if `__lhs` is not equivalent to `__rhs`, false otherwise.

Definition at line 1064 of file regex.h.

2.70.3.2 `operator!=()` [2/8]

```
template<typename _Bi_iter , typename _Ch_traits , typename _Ch_alloc >
bool operator!= (
    const __sub_match_string< _Bi_iter, _Ch_traits, _Ch_alloc > & __lhs,
    const sub\_match< _Bi_iter > & __rhs ) [related]
```

Tests the inequivalence of a string and a regular expression submatch.

Parameters

<code>__lhs</code>	A string.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` is not equivalent to `__rhs`, false otherwise.

Definition at line 1144 of file `regex.h`.

2.70.3.3 `operator!=()` [3/8]

```
template<typename _Bi_iter , typename _Ch_traits , typename _Ch_alloc >
bool operator!= (
    const sub\_match< _Bi_iter > & __lhs,
    const __sub_match_string< _Bi_iter, _Ch_traits, _Ch_alloc > & __rhs ) [related]
```

Tests the inequivalence of a regular expression submatch and a string.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A string.

Returns

true if `__lhs` is not equivalent to `__rhs`, false otherwise.

Definition at line 1237 of file `regex.h`.

2.70.3.4 `operator!=()` [4/8]

```
template<typename _Bi_iter >
bool operator!= (
```

```
typename iterator_traits<_Bi_iter>::value_type const * __lhs,  
const sub_match<_Bi_iter> & __rhs ) [related]
```

Tests the inequivalence of a C string and a regular expression submatch.

Parameters

<code>__lhs</code>	A null-terminated string.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` is not equivalent to `__rhs`, false otherwise.

Definition at line 1311 of file `regex.h`.

2.70.3.5 `operator!=()` [5/8]

```
template<typename _Bi_iter >
bool operator!= (
    const sub_match< _Bi_iter > & __lhs,
    typename iterator_traits< _Bi_iter >::value_type const * __rhs ) [related]
```

Tests the inequivalence of a regular expression submatch and a string.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A null-terminated string.

Returns

true if `__lhs` is not equivalent to `__rhs`, false otherwise.

Definition at line 1405 of file `regex.h`.

2.70.3.6 `operator!=()` [6/8]

```
template<typename _Bi_iter >
bool operator!= (
    typename iterator_traits< _Bi_iter >::value_type const & __lhs,
    const sub_match< _Bi_iter > & __rhs ) [related]
```

Tests the inequivalence of a character and a regular expression submatch.

Parameters

<code>__lhs</code>	A character.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` is not equivalent to `__rhs`, false otherwise.

Definition at line 1479 of file `regex.h`.

2.70.3.7 operator!=(()) [7/8]

```
template<typename _Bi_iter >
bool operator!= (
    const sub_match< _Bi_iter > & __lhs,
    typename iterator_traits< _Bi_iter >::value_type const & __rhs ) [related]
```

Tests the inequivalence of a regular expression submatch and a character.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A character.

Returns

true if `__lhs` is not equivalent to `__rhs`, false otherwise.

Definition at line 1579 of file `regex.h`.

2.70.3.8 operator!=(()) [8/8]

```
template<typename _Bi_iter , class _Alloc >
bool std::operator!= (
    const match_results< _Bi_iter, _Alloc > & __m1,
    const match_results< _Bi_iter, _Alloc > & __m2 ) [inline]
```

Compares two `match_results` for inequality.

Returns

true if the two objects do not refer to the same match, false otherwise.

Definition at line 2126 of file `regex.h`.

2.70.3.9 operator<() [1/7]

```
template<typename _BiIter >
bool operator< (
    const sub_match< _BiIter > & __lhs,
    const sub_match< _BiIter > & __rhs ) [related]
```

Tests the ordering of two regular expression submatches.

Parameters

<code>__lhs</code>	First regular expression submatch.
<code>__rhs</code>	Second regular expression submatch.

Returns

true if `__lhs` precedes `__rhs`, false otherwise.

Definition at line 1075 of file `regex.h`.

2.70.3.10 `operator<()` [2/7]

```
template<typename _Bi_iter , typename _Ch_traits , typename _Ch_alloc >
bool operator< (
    const __sub_match_string< _Bi_iter, _Ch_traits, _Ch_alloc > & __lhs,
    const sub\_match< _Bi_iter > & __rhs ) [related]
```

Tests the ordering of a string and a regular expression submatch.

Parameters

<code>__lhs</code>	A string.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` precedes `__rhs`, false otherwise.

Definition at line 1156 of file `regex.h`.

2.70.3.11 `operator<()` [3/7]

```
template<typename _Bi_iter , typename _Ch_traits , typename _Ch_alloc >
bool operator< (
    const sub\_match< _Bi_iter > & __lhs,
    const __sub_match_string< _Bi_iter, _Ch_traits, _Ch_alloc > & __rhs ) [related]
```

Tests the ordering of a regular expression submatch and a string.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A string.

Returns

true if `__lhs` precedes `__rhs`, false otherwise.

Definition at line 1249 of file `regex.h`.

2.70.3.12 operator<>() [4/7]

```
template<typename _Bi_iter >
bool operator< (
    typename iterator_traits< _Bi_iter >::value_type const * __lhs,
    const sub_match< _Bi_iter > & __rhs ) [related]
```

Tests the ordering of a C string and a regular expression submatch.

Parameters

<code>__lhs</code>	A null-terminated string.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` precedes `__rhs`, false otherwise.

Definition at line 1323 of file `regex.h`.

2.70.3.13 operator<>() [5/7]

```
template<typename _Bi_iter >
bool operator< (
    const sub_match< _Bi_iter > & __lhs,
    typename iterator_traits< _Bi_iter >::value_type const * __rhs ) [related]
```

Tests the ordering of a regular expression submatch and a C string.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A null-terminated string.

Returns

true if `__lhs` precedes `__rhs`, false otherwise.

Definition at line 1417 of file regex.h.

2.70.3.14 `operator<()` [6/7]

```
template<typename _Bi_iter >
bool operator< (
    typename iterator\_traits< _Bi_iter >::value_type const & __lhs,
    const sub\_match< _Bi_iter > & __rhs ) [related]
```

Tests the ordering of a character and a regular expression submatch.

Parameters

<code>__lhs</code>	A character.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` precedes `__rhs`, false otherwise.

Definition at line 1492 of file regex.h.

2.70.3.15 `operator<()` [7/7]

```
template<typename _Bi_iter >
bool operator< (
    const sub\_match< _Bi_iter > & __lhs,
    typename iterator\_traits< _Bi_iter >::value_type const & __rhs ) [related]
```

Tests the ordering of a regular expression submatch and a character.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A character.

Returns

true if `__lhs` precedes `__rhs`, false otherwise.

Definition at line 1592 of file regex.h.

2.70.3.16 `operator<<()`

```
template<typename _Ch_type , typename _Ch_traits , typename _Bi_iter >
basic_ostream< _Ch_type, _Ch_traits > & operator<< (
    basic_ostream< _Ch_type, _Ch_traits > & __os,
    const sub_match< _Bi_iter > & __m ) [related]
```

Inserts a matched string into an output stream.

Parameters

<code>__os</code>	The output stream.
<code>__m</code>	A submatch string.

Returns

the output stream with the submatch string inserted.

Definition at line 1647 of file regex.h.

2.70.3.17 `operator<=()` [1/7]

```
template<typename _BiIter >
bool operator<= (
    const sub_match< _BiIter > & __lhs,
    const sub_match< _BiIter > & __rhs ) [related]
```

Tests the ordering of two regular expression submatches.

Parameters

<code>__lhs</code>	First regular expression submatch.
<code>__rhs</code>	Second regular expression submatch.

Returns

true if `__lhs` does not succeed `__rhs`, false otherwise.

Definition at line 1086 of file regex.h.

2.70.3.18 `operator<=()` [2/7]

```
template<typename _Bi_iter , typename _Ch_traits , typename _Ch_alloc >
bool operator<= (
```

```
const __sub_match_string< _Bi_iter, _Ch_traits, _Ch_alloc > & __lhs,  
const sub_match< _Bi_iter > & __rhs ) [related]
```

Tests the ordering of a string and a regular expression submatch.

Parameters

<code>__lhs</code>	A string.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` does not succeed `__rhs`, false otherwise.

Definition at line 1192 of file `regex.h`.

2.70.3.19 `operator<=()` [3/7]

```
template<typename _Bi_iter , typename _Ch_traits , typename _Ch_alloc >
bool operator<= (
    const sub_match< _Bi_iter > & __lhs,
    const __sub_match_string< _Bi_iter, _Ch_traits, _Ch_alloc > & __rhs ) [related]
```

Tests the ordering of a regular expression submatch and a string.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A string.

Returns

true if `__lhs` does not succeed `__rhs`, false otherwise.

Definition at line 1285 of file `regex.h`.

2.70.3.20 `operator<=()` [4/7]

```
template<typename _Bi_iter >
bool operator<= (
    typename iterator_traits< _Bi_iter >::value_type const * __lhs,
    const sub_match< _Bi_iter > & __rhs ) [related]
```

Tests the ordering of a C string and a regular expression submatch.

Parameters

<code>__lhs</code>	A null-terminated string.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` does not succeed `__rhs`, false otherwise.

Definition at line 1359 of file `regex.h`.

2.70.3.21 operator<=() [5/7]

```
template<typename _Bi_iter >
bool operator<= (
    const sub_match< _Bi_iter > & __lhs,
    typename iterator_traits< _Bi_iter >::value_type const * __rhs ) [related]
```

Tests the ordering of a regular expression submatch and a C string.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A null-terminated string.

Returns

true if `__lhs` does not succeed `__rhs`, false otherwise.

Definition at line 1453 of file `regex.h`.

2.70.3.22 operator<=() [6/7]

```
template<typename _Bi_iter >
bool operator<= (
    typename iterator_traits< _Bi_iter >::value_type const & __lhs,
    const sub_match< _Bi_iter > & __rhs ) [related]
```

Tests the ordering of a character and a regular expression submatch.

Parameters

<code>__lhs</code>	A character.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` does not succeed `__rhs`, false otherwise.

Definition at line 1531 of file `regex.h`.

2.70.3.23 operator<=() [7/7]

```
template<typename _Bi_iter >
bool operator<= (
    const sub_match< _Bi_iter > & __lhs,
    typename iterator_traits< _Bi_iter >::value_type const & __rhs ) [related]
```

Tests the ordering of a regular expression submatch and a character.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A character.

Returns

true if `__lhs` does not succeed `__rhs`, false otherwise.

Definition at line 1631 of file regex.h.

2.70.3.24 operator==() [1/8]

```
template<typename _BiIter >
bool operator== (
    const sub_match< _BiIter > & __lhs,
    const sub_match< _BiIter > & __rhs ) [related]
```

Tests the equivalence of two regular expression submatches.

Parameters

<code>__lhs</code>	First regular expression submatch.
<code>__rhs</code>	Second regular expression submatch.

Returns

true if `__lhs` is equivalent to `__rhs`, false otherwise.

Definition at line 1035 of file regex.h.

2.70.3.25 operator==() [2/8]

```
template<typename _Bi_iter , typename _Ch_traits , typename _Ch_alloc >
bool operator== (
    const __sub_match_string< _Bi_iter, _Ch_traits, _Ch_alloc > & __lhs,
    const sub_match< _Bi_iter > & __rhs ) [related]
```

Tests the equivalence of a string and a regular expression submatch.

Parameters

<code>__lhs</code>	A string.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` is equivalent to `__rhs`, false otherwise.

Definition at line 1131 of file regex.h.

2.70.3.26 operator==() [3/8]

```
template<typename _Bi_iter , typename _Ch_traits , typename _Ch_alloc >
bool operator== (
    const sub_match< _Bi_iter > & __lhs,
    const __sub_match_string< _Bi_iter, _Ch_traits, _Ch_alloc > & __rhs ) [related]
```

Tests the equivalence of a regular expression submatch and a string.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A string.

Returns

true if `__lhs` is equivalent to `__rhs`, false otherwise.

Definition at line 1206 of file regex.h.

2.70.3.27 operator==() [4/8]

```
template<typename _Bi_iter >
bool operator== (
```

```
typename iterator_traits<_Bi_iter>::value_type const * __lhs,  
const sub_match<_Bi_iter> & __rhs ) [related]
```

Tests the equivalence of a C string and a regular expression submatch.

Parameters

<code>__lhs</code>	A null-terminated string.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` is equivalent to `__rhs`, false otherwise.

Definition at line 1298 of file `regex.h`.

2.70.3.28 `operator==()` [5/8]

```
template<typename _Bi_iter >
bool operator== (
    const sub_match< _Bi_iter > & __lhs,
    typename iterator_traits< _Bi_iter >::value_type const * __rhs ) [related]
```

Tests the equivalence of a regular expression submatch and a C string.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A null-terminated string.

Returns

true if `__lhs` is equivalent to `__rhs`, false otherwise.

Definition at line 1373 of file `regex.h`.

2.70.3.29 `operator==()` [6/8]

```
template<typename _Bi_iter >
bool operator== (
    typename iterator_traits< _Bi_iter >::value_type const & __lhs,
    const sub_match< _Bi_iter > & __rhs ) [related]
```

Tests the equivalence of a character and a regular expression submatch.

Parameters

<code>__lhs</code>	A character.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` is equivalent to `__rhs`, false otherwise.

Definition at line 1466 of file `regex.h`.

2.70.3.30 operator==() [7/8]

```
template<typename _Bi_iter >
bool operator== (
    const sub_match< _Bi_iter > & __lhs,
    typename iterator_traits< _Bi_iter >::value_type const & __rhs ) [related]
```

Tests the equivalence of a regular expression submatch and a character.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A character.

Returns

true if `__lhs` is equivalent to `__rhs`, false otherwise.

Definition at line 1545 of file `regex.h`.

2.70.3.31 operator==() [8/8]

```
template<typename _Bi_iter , typename _Alloc >
bool std::operator== (
    const match_results< _Bi_iter, _Alloc > & __m1,
    const match_results< _Bi_iter, _Alloc > & __m2 ) [inline]
```

Compares two `match_results` for equality.

Returns

true if the two objects refer to the same match, false otherwise.

Definition at line 2101 of file `regex.h`.

References `std::match_results< _Bi_iter, _Alloc >::begin()`, `std::match_results< _Bi_iter, _Alloc >::empty()`, `std::match_results< _Bi_iter, _Alloc >::end()`, `std::equal()`, `std::match_results< _Bi_iter, _Alloc >::prefix()`, `std::match_results< _Bi_iter, _Alloc >::ready()`, `std::match_results< _Bi_iter, _Alloc >::size()`, and `std::match_results< _Bi_iter, _Alloc >::suffix()`.

2.70.3.32 `operator>()` [1/7]

```
template<typename _BiIter >
bool operator> (
    const sub_match< _BiIter > & __lhs,
    const sub_match< _BiIter > & __rhs ) [related]
```

Tests the ordering of two regular expression submatches.

Parameters

<code>__lhs</code>	First regular expression submatch.
<code>__rhs</code>	Second regular expression submatch.

Returns

true if `__lhs` succeeds `__rhs`, false otherwise.

Definition at line 1108 of file `regex.h`.

2.70.3.33 `operator>()` [2/7]

```
template<typename _Bi_iter , typename _Ch_traits , typename _Ch_alloc >
bool operator> (
    const __sub_match_string< _Bi_iter, _Ch_traits, _Ch_alloc > & __lhs,
    const sub_match< _Bi_iter > & __rhs ) [related]
```

Tests the ordering of a string and a regular expression submatch.

Parameters

<code>__lhs</code>	A string.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` succeeds `__rhs`, false otherwise.

Definition at line 1168 of file `regex.h`.

2.70.3.34 `operator>()` [3/7]

```
template<typename _Bi_iter , typename _Ch_traits , typename _Ch_alloc >
bool operator> (
```

```
const sub_match< _Bi_iter > & __lhs,  
const __sub_match_string< _Bi_iter, _Ch_traits, _Ch_alloc > & __rhs ) [related]
```

Tests the ordering of a regular expression submatch and a string.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A string.

Returns

true if `__lhs` succeeds `__rhs`, false otherwise.

Definition at line 1261 of file `regex.h`.

2.70.3.35 `operator>()` [4/7]

```
template<typename _Bi_iter >
bool operator> (
    typename iterator_traits< _Bi_iter >::value_type const * __lhs,
    const sub_match< _Bi_iter > & __rhs ) [related]
```

Tests the ordering of a C string and a regular expression submatch.

Parameters

<code>__lhs</code>	A null-terminated string.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` succeeds `__rhs`, false otherwise.

Definition at line 1335 of file `regex.h`.

2.70.3.36 `operator>()` [5/7]

```
template<typename _Bi_iter >
bool operator> (
    const sub_match< _Bi_iter > & __lhs,
    typename iterator_traits< _Bi_iter >::value_type const * __rhs ) [related]
```

Tests the ordering of a regular expression submatch and a C string.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A null-terminated string.

Returns

true if `__lhs` succeeds `__rhs`, false otherwise.

Definition at line 1429 of file `regex.h`.

2.70.3.37 operator>() [6/7]

```
template<typename _Bi_iter >
bool operator> (
    typename iterator_traits< _Bi_iter >::value_type const & __lhs,
    const sub_match< _Bi_iter > & __rhs ) [related]
```

Tests the ordering of a character and a regular expression submatch.

Parameters

<code>__lhs</code>	A character.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` succeeds `__rhs`, false otherwise.

Definition at line 1505 of file `regex.h`.

2.70.3.38 operator>() [7/7]

```
template<typename _Bi_iter >
bool operator> (
    const sub_match< _Bi_iter > & __lhs,
    typename iterator_traits< _Bi_iter >::value_type const & __rhs ) [related]
```

Tests the ordering of a regular expression submatch and a character.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A character.

Returns

true if `__lhs` succeeds `__rhs`, false otherwise.

Definition at line 1605 of file `regex.h`.

2.70.3.39 operator>=() [1/7]

```
template<typename _BiIter >
bool operator>= (
    const sub_match< _BiIter > & __lhs,
    const sub_match< _BiIter > & __rhs ) [related]
```

Tests the ordering of two regular expression submatches.

Parameters

<code>__lhs</code>	First regular expression submatch.
<code>__rhs</code>	Second regular expression submatch.

Returns

true if `__lhs` does not precede `__rhs`, false otherwise.

Definition at line 1097 of file regex.h.

2.70.3.40 operator>=() [2/7]

```
template<typename _Bi_iter , typename _Ch_traits , typename _Ch_alloc >
bool operator>= (
    const __sub_match_string< _Bi_iter, _Ch_traits, _Ch_alloc > & __lhs,
    const sub_match< _Bi_iter > & __rhs ) [related]
```

Tests the ordering of a string and a regular expression submatch.

Parameters

<code>__lhs</code>	A string.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` does not precede `__rhs`, false otherwise.

Definition at line 1180 of file regex.h.

2.70.3.41 `operator>=()` [3/7]

```
template<typename _Bi_iter , typename _Ch_traits , typename _Ch_alloc >
bool operator>= (
    const sub_match< _Bi_iter > & __lhs,
    const __sub_match_string< _Bi_iter, _Ch_traits, _Ch_alloc > & __rhs ) [related]
```

Tests the ordering of a regular expression submatch and a string.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A string.

Returns

true if `__lhs` does not precede `__rhs`, false otherwise.

Definition at line 1273 of file `regex.h`.

2.70.3.42 `operator>=()` [4/7]

```
template<typename _Bi_iter >
bool operator>= (
    typename iterator_traits< _Bi_iter >::value_type const * __lhs,
    const sub_match< _Bi_iter > & __rhs ) [related]
```

Tests the ordering of a C string and a regular expression submatch.

Parameters

<code>__lhs</code>	A null-terminated string.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` does not precede `__rhs`, false otherwise.

Definition at line 1347 of file `regex.h`.

2.70.3.43 `operator>=()` [5/7]

```
template<typename _Bi_iter >
bool operator>= (
```

```
const sub_match< _Bi_iter > & __lhs,  
typename iterator_traits< _Bi_iter >::value_type const * __rhs ) [related]
```

Tests the ordering of a regular expression submatch and a C string.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A null-terminated string.

Returns

true if `__lhs` does not precede `__rhs`, false otherwise.

Definition at line 1441 of file `regex.h`.

2.70.3.44 `operator>=()` [6/7]

```
template<typename _Bi_iter >
bool operator>= (
    typename iterator_traits< _Bi_iter >::value_type const & __lhs,
    const sub_match< _Bi_iter > & __rhs ) [related]
```

Tests the ordering of a character and a regular expression submatch.

Parameters

<code>__lhs</code>	A character.
<code>__rhs</code>	A regular expression submatch.

Returns

true if `__lhs` does not precede `__rhs`, false otherwise.

Definition at line 1518 of file `regex.h`.

2.70.3.45 `operator>=()` [7/7]

```
template<typename _Bi_iter >
bool operator>= (
    const sub_match< _Bi_iter > & __lhs,
    typename iterator_traits< _Bi_iter >::value_type const & __rhs ) [related]
```

Tests the ordering of a regular expression submatch and a character.

Parameters

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A character.

Returns

true if `__lhs` does not precede `__rhs`, false otherwise.

Definition at line 1618 of file `regex.h`.

2.70.3.46 `regex_match()` [1/7]

```
template<typename _Bi_iter , typename _Alloc , typename _Ch_type , typename _Rx_traits >
bool std::regex_match (
    _Bi_iter __s,
    _Bi_iter __e,
    match_results< _Bi_iter, _Alloc > & __m,
    const basic_regex< _Ch_type, _Rx_traits > & __re,
    regex_constants::match_flag_type __flags = regex_constants::match_default ) [inline]
```

Determines if there is a match between the regular expression `e` and all of the character sequence `[first, last)`.

Parameters

<code>__s</code>	Start of the character sequence to match.
<code>__e</code>	One-past-the-end of the character sequence to match.
<code>__m</code>	The match results.
<code>__re</code>	The regular expression.
<code>__flags</code>	Controls how the regular expression is matched.

Return values

<code>true</code>	A match exists.
<code>false</code>	Otherwise.

Exceptions

<code>an</code>	exception of type <code>regex_error</code> .
-----------------	--

Definition at line 2171 of file `regex.h`.

Referenced by `std::regex_match()`.

2.70.3.47 `regex_match()` [2/7]

```
template<typename _Bi_iter , typename _Ch_type , typename _Rx_traits >
bool std::regex_match (
    _Bi_iter __first,
```

```

    __Bi_iter __last,
    const basic_regex< _Ch_type, _Rx_traits > & __re,
    regex_constants::match_flag_type __flags = regex_constants::match_default ) [inline]

```

Indicates if there is a match between the regular expression `e` and all of the character sequence `[first, last)`.

Parameters

<code>__first</code>	Beginning of the character sequence to match.
<code>__last</code>	One-past-the-end of the character sequence to match.
<code>__re</code>	The regular expression.
<code>__flags</code>	Controls how the regular expression is matched.

Return values

<code>true</code>	A match exists.
<code>false</code>	Otherwise.

Exceptions

<code>an</code>	exception of type <code>regex_error</code> .
-----------------	--

Definition at line 2199 of file `regex.h`.

References `std::regex_match()`.

2.70.3.48 `regex_match()` [3/7]

```

template<typename _Ch_type , typename _Alloc , typename _Rx_traits >
bool std::regex_match (
    const _Ch_type * __s,
    match_results< const _Ch_type *, _Alloc > & __m,
    const basic_regex< _Ch_type, _Rx_traits > & __re,
    regex_constants::match_flag_type __f = regex_constants::match_default ) [inline]

```

Determines if there is a match between the regular expression `e` and a C-style null-terminated string.

Parameters

<code>__s</code>	The C-style null-terminated string to match.
<code>__m</code>	The match results.
<code>__re</code>	The regular expression.
<code>__f</code>	Controls how the regular expression is matched.

Return values

<i>true</i>	A match exists.
<i>false</i>	Otherwise.

Exceptions

<i>an</i>	exception of type <code>regex_error</code> .
-----------	--

Definition at line 2224 of file `regex.h`.

References `std::regex_match()`.

2.70.3.49 `regex_match()` [4/7]

```
template<typename _Ch_traits , typename _Ch_alloc , typename _Alloc , typename _Ch_type , typename
_Rx_traits >
bool std::regex_match (
    const basic_string< _Ch_type, _Ch_traits, _Ch_alloc > & __s,
    match_results< typename basic_string< _Ch_type, _Ch_traits, _Ch_alloc >::const_iterator,
    _Alloc > & __m,
    const basic_regex< _Ch_type, _Rx_traits > & __re,
    regex_constants::match_flag_type __flags = regex_constants::match_default ) [inline]
```

Determines if there is a match between the regular expression `e` and a string.

Parameters

<code>__s</code>	The string to match.
<code>__m</code>	The match results.
<code>__re</code>	The regular expression.
<code>__flags</code>	Controls how the regular expression is matched.

Return values

<i>true</i>	A match exists.
<i>false</i>	Otherwise.

2.70.3.50 `regex_match()` [5/7]

```
template<typename _Ch_traits , typename _Ch_alloc , typename _Alloc , typename _Ch_type , typename
_Rx_traits >
bool std::regex_match (
    const basic_string< _Ch_type, _Ch_traits, _Ch_alloc > && ,
    match_results< typename basic_string< _Ch_type, _Ch_traits, _Ch_alloc >::const_iterator, _Alloc > & ,
    const basic_regex< _Ch_type, _Rx_traits > & ,
    regex_constants::match_flag_type = regex_constants::match_default ) [delete]
```

Prevent unsafe attempts to get `match_results` from a temporary string.

2.70.3.51 `regex_match()` [6/7]

```
template<typename _Ch_type , class _Rx_traits >
bool std::regex_match (
    const _Ch_type * __s,
    const basic_regex< _Ch_type, _Rx_traits > & __re,
    regex_constants::match_flag_type __f = regex_constants::match_default ) [inline]
```

Indicates if there is a match between the regular expression `e` and a C-style null-terminated string.

Parameters

<code>__s</code>	The C-style null-terminated string to match.
<code>__re</code>	The regular expression.
<code>__f</code>	Controls how the regular expression is matched.

Return values

<code>true</code>	A match exists.
<code>false</code>	Otherwise.

Exceptions

<code>an</code>	exception of type <code>regex_error</code> .
-----------------	--

2.70.3.52 `regex_match()` [7/7]

```
template<typename _Ch_traits , typename _Str_allocator , typename _Ch_type , typename _Rx_traits
>
bool std::regex_match (
    const basic_string< _Ch_type, _Ch_traits, _Str_allocator > & __s,
    const basic_regex< _Ch_type, _Rx_traits > & __re,
    regex_constants::match_flag_type __flags = regex_constants::match_default ) [inline]
```

Indicates if there is a match between the regular expression `e` and a string.

Parameters

<code>__s</code>	[IN] The string to match.
<code>__re</code>	[IN] The regular expression.
<code>__flags</code>	[IN] Controls how the regular expression is matched.

Return values

<code>true</code>	A match exists.
<code>false</code>	Otherwise.

Exceptions

2.70.3.53 `regex_replace()` [1/6]

```
template<typename _Out_iter , typename _Bi_iter , typename _Rx_traits , typename _Ch_type , typename
_St , typename _Sa >
_Out_iter std::regex_replace (
    _Out_iter __out,
    _Bi_iter __first,
    _Bi_iter __last,
    const basic_regex< _Ch_type, _Rx_traits > & __e,
    const basic_string< _Ch_type, _St, _Sa > & __fmt,
    regex_constants::match_flag_type __flags = regex_constants::match_default ) [inline]
```

Search for a regular expression within a range for multiple times, and replace the matched parts through filling a format string.

Parameters

<code>__out</code>	[OUT] The output iterator.
<code>__first</code>	[IN] The start of the string to search.
<code>__last</code>	[IN] One-past-the-end of the string to search.
<code>__e</code>	[IN] The regular expression to search for.
<code>__fmt</code>	[IN] The format string.
<code>__flags</code>	[IN] Search and replace policy flags.

Returns

`__out`

Exceptions

<i>an</i>	exception of type <code>regex_error</code> .

2.70.3.54 `regex_replace()` [2/6]

```
template<typename _Out_iter , typename _Bi_iter , typename _Rx_traits , typename _Ch_type >
_Out_iter std::regex_replace (
    _Out_iter __out,
    _Bi_iter __first,
    _Bi_iter __last,
    const basic_regex<_Ch_type, _Rx_traits > & __e,
    const _Ch_type * __fmt,
    regex_constants::match_flag_type __flags = regex_constants::match_default )
```

Search for a regular expression within a range for multiple times, and replace the matched parts through filling a format C-string.

Parameters

<code>__out</code>	[OUT] The output iterator.
<code>__first</code>	[IN] The start of the string to search.
<code>__last</code>	[IN] One-past-the-end of the string to search.
<code>__e</code>	[IN] The regular expression to search for.
<code>__fmt</code>	[IN] The format C-string.
<code>__flags</code>	[IN] Search and replace policy flags.

Returns`__out`**Exceptions**

<i>an</i>	exception of type <code>regex_error</code> .
-----------	--

2.70.3.55 `regex_replace()` [3/6]

```
template<typename _Rx_traits , typename _Ch_type , typename _St , typename _Sa , typename _Fst ,
typename _Fsa >
basic_string<_Ch_type, _St, _Sa> std::regex_replace (
    const basic_string< _Ch_type, _St, _Sa > & __s,
    const basic_regex< _Ch_type, _Rx_traits > & __e,
    const basic_string< _Ch_type, _Fst, _Fsa > & __fmt,
    regex_constants::match_flag_type __flags = regex_constants::match_default ) [inline]
```

Search for a regular expression within a string for multiple times, and replace the matched parts through filling a format string.

Parameters

<code>__s</code>	[IN] The string to search and replace.
<code>__e</code>	[IN] The regular expression to search for.
<code>__fmt</code>	[IN] The format string.
<code>__flags</code>	[IN] Search and replace policy flags.

Returns

The string after replacing.

Exceptions

<i>an</i>	exception of type <code>regex_error</code> .
-----------	--

Definition at line 2522 of file `regex.h`.

2.70.3.57 `regex_replace()` [5/6]

```
template<typename _Rx_traits , typename _Ch_type , typename _St , typename _Sa >
basic_string<_Ch_type> std::regex_replace (
    const _Ch_type * __s,
    const basic_regex< _Ch_type, _Rx_traits > & __e,
    const basic_string< _Ch_type, _St, _Sa > & __fmt,
    regex_constants::match_flag_type __flags = regex_constants::match_default ) [inline]
```

Search for a regular expression within a C-string for multiple times, and replace the matched parts through filling a format string.

Parameters

<code>__s</code>	[IN] The C-string to search and replace.
<code>__e</code>	[IN] The regular expression to search for.
<code>__fmt</code>	[IN] The format string.
<code>__flags</code>	[IN] Search and replace policy flags.

Returns

The string after replacing.

Exceptions

<i>an</i>	exception of type <code>regex_error</code> .

Definition at line 2574 of file `regex.h`.

References `std::back_inserter()`, and `std::regex_replace()`.

2.70.3.58 `regex_replace()` [6/6]

```
template<typename _Rx_traits , typename _Ch_type >
basic_string<_Ch_type> std::regex_replace (
    const _Ch_type * __s,
    const basic_regex< _Ch_type, _Rx_traits > & __e,
    const _Ch_type * __fmt,
    regex_constants::match_flag_type __flags = regex_constants::match_default ) [inline]
```

Search for a regular expression within a C-string for multiple times, and replace the matched parts through filling a format C-string.

Parameters

<code>__s</code>	[IN] The C-string to search and replace.
<code>__e</code>	[IN] The regular expression to search for.
<code>__fmt</code>	[IN] The format C-string.
<code>__flags</code>	[IN] Search and replace policy flags.

Returns

The string after replacing.

Exceptions

<i>an</i>	exception of type <code>regex_error</code> .

2.70.3.59 `regex_search()` [1/7]

```
template<typename _Bi_iter , typename _Alloc , typename _Ch_type , typename _Rx_traits >
bool std::regex_search (
    _Bi_iter __s,
    _Bi_iter __e,
    match_results< _Bi_iter, _Alloc > & __m,
    const basic_regex< _Ch_type, _Rx_traits > & __re,
    regex_constants::match_flag_type __flags = regex_constants::match_default ) [inline]
```

Searches for a regular expression within a range.

Parameters

<code>__s</code>	[IN] The start of the string to search.
<code>__e</code>	[IN] One-past-the-end of the string to search.
<code>__m</code>	[OUT] The match results.
<code>__re</code>	[IN] The regular expression to search for.
<code>__flags</code>	[IN] Search policy flags.

Return values

<code>true</code>	A match was found within the string.
<code>false</code>	No match was found within the string, the content of <code>m</code> is undefined.

Exceptions

<code>an</code>	exception of type <code>regex_error</code> .

2.70.3.60 `regex_search()` [2/7]

```
template<typename _Bi_iter , typename _Ch_type , typename _Rx_traits >
bool std::regex_search (
    _Bi_iter __first,
    _Bi_iter __last,
    const basic_regex< _Ch_type, _Rx_traits > & __re,
    regex_constants::match_flag_type __flags = regex_constants::match_default ) [inline]
```

Searches for a regular expression within a range.

Parameters

<code>__first</code>	[IN] The start of the string to search.
<code>__last</code>	[IN] One-past-the-end of the string to search.
<code>__re</code>	[IN] The regular expression to search for.
<code>__flags</code>	[IN] Search policy flags.

Return values

<code>true</code>	A match was found within the string.
<code>false</code>	No match was found within the string.

Exceptions

2.70.3.65 `regex_search()` [7/7]

```
template<typename _Ch_traits , typename _Ch_alloc , typename _Alloc , typename _Ch_type , typename
_Rx_traits >
bool std::regex_search (
    const basic_string<_Ch_type, _Ch_traits, _Ch_alloc > && ,
    match_results< typename basic_string<_Ch_type, _Ch_traits, _Ch_alloc >::const_↵
iterator, _Alloc > & ,
    const basic_regex<_Ch_type, _Rx_traits > & ,
    regex_constants::match_flag_type = regex_constants::match_default ) [delete]
```

Prevent unsafe attempts to get `match_results` from a temporary string.

2.70.3.66 `swap()` [1/2]

```
template<typename _Ch_type , typename _Rx_traits >
void swap (
    basic_regex<_Ch_type, _Rx_traits > & __lhs,
    basic_regex<_Ch_type, _Rx_traits > & __rhs ) [related]
```

Swaps the contents of two regular expression objects.

Parameters

<code>__lhs</code>	First regular expression.
<code>__rhs</code>	Second regular expression.

Definition at line 849 of file regex.h.

2.70.3.67 swap() [2/2]

```
template<typename _Bi_iter , typename _Alloc >
void std::swap (
    match_results< _Bi_iter, _Alloc > & __lhs,
    match_results< _Bi_iter, _Alloc > & __rhs ) [inline], [noexcept]
```

Swaps two match results.

Parameters

<code>__lhs</code>	A match result.
<code>__rhs</code>	A match result.

The contents of the two `match_results` objects are swapped.

Definition at line 2141 of file regex.h.

2.71.1 Detailed Description

Because libstdc++ based its implementation of the STL subsections of the library on the SGI 3.3 implementation, we inherited their extensions as well.

They are additionally documented in the [online documentation](#), a copy of which is also shipped with the library source code (in `.../docs/html/documentation.html`). You can also read the documentation [on SGI's site](#), which is still running even though the code is not maintained.

NB that the following notes are pulled from various comments all over the place, so they may seem stilted.

The `identity_element` functions are not part of the C++ standard; SGI provided them as an extension. Its argument is an operation, and its return value is the identity element for that operation. It is overloaded for addition and multiplication, and you can overload it for your own nefarious operations.

As an extension to the binders, SGI provided composition functors and wrapper functions to aid in their creation. The `unary_compose` functor is constructed from two functions/functors, `f` and `g`. Calling `operator()` with a single argument `x` returns `f(g(x))`. The function `compose1` takes the two functions and constructs a `unary_compose` variable for you.

`binary_compose` is constructed from three functors, `f`, `g1`, and `g2`. Its `operator()` returns `f(g1(x),g2(x))`. The function `compose2` takes `f`, `g1`, and `g2`, and constructs the `binary_compose` instance for you. For example, if `f` returns an `int`, then

```
int answer = (compose2(f,g1,g2))(x);
```

is equivalent to

```
int temp1 = g1(x);
int temp2 = g2(x);
int answer = f(temp1,temp2);
```

But the first form is more compact, and can be passed around as a functor to other algorithms.

As an extension, SGI provided a functor called `identity`. When a functor is required but no operations are desired, this can be used as a pass-through. Its `operator()` returns its argument unchanged.

`select1st` and `select2nd` are extensions provided by SGI. Their `operator()`s take a `std::pair` as an argument, and return either the first member or the second member, respectively. They can be used (especially with the composition functors) to *strip* data from a sequence before performing the remainder of an algorithm.

The `operator()` of the `project1st` functor takes two arbitrary arguments and returns the first one, while `project2nd` returns the second one. They are extensions provided by SGI.

These three functors are each constructed from a single arbitrary variable/value. Later, their `operator()`s completely ignore any arguments passed, and return the stored value.

- `constant_void_fun`'s `operator()` takes no arguments
- `constant_unary_fun`'s `operator()` takes one argument (ignored)
- `constant_binary_fun`'s `operator()` takes two arguments (ignored)

The helper creator functions `constant0`, `constant1`, and `constant2` each take a *result* argument and construct variables of the appropriate functor type.

2.71.2 Function Documentation

2.71.2.1 `__median()` [1/2]

```
template<typename _Tp >
const _Tp& __gnu_cxx::__median (
    const _Tp & __a,
    const _Tp & __b,
    const _Tp & __c )
```

Find the median of three values.

Parameters

\leftrightarrow _a	A value.
\leftrightarrow _b	A value.
\leftrightarrow _c	A value.

Returns

One of a, b or c.

If $\{1, m, n\}$ is some convolution of $\{a, b, c\}$ such that $1 \leq m \leq n$ then the value returned will be m. This is an SGI extension.

Definition at line 539 of file ext/algorithm.

2.71.2.2 __median() [2/2]

```
template<typename _Tp, typename _Compare>
const _Tp& __gnu_cxx::__median (
    const _Tp & __a,
    const _Tp & __b,
    const _Tp & __c,
    _Compare __comp )
```

Find the median of three values using a predicate for comparison.

Parameters

__a	A value.
__b	A value.
__c	A value.
__comp	A binary predicate.

Returns

One of a, b or c.

If $\{1, m, n\}$ is some convolution of $\{a, b, c\}$ such that $\text{comp}(1, m)$ and $\text{comp}(m, n)$ are both true then the value returned will be m. This is an SGI extension.

Definition at line 573 of file ext/algorithm.

2.71.2.3 `_Find_first()`

```
template<size_t _Nb>
size_t std::bitset<_Nb>::_Find_first ( ) const [inline], [noexcept]
```

Finds the index of the first "on" bit.

Returns

The index of the first bit set, or `size()` if not found.

See also

`_Find_next`

Definition at line 1373 of file `bitset`.

2.71.2.4 `_Find_next()`

```
template<size_t _Nb>
size_t std::bitset<_Nb>::_Find_next (
    size_t __prev ) const [inline], [noexcept]
```

Finds the index of the next "on" bit after `prev`.

Returns

The index of the next bit set, or `size()` if not found.

Parameters

<code>__prev</code>	Where to start searching.
---------------------	---------------------------

See also

`_Find_first`

Definition at line 1384 of file `bitset`.

2.71.2.5 `_Unchecked_flip()`

```
template<size_t _Nb>
bitset<_Nb>& std::bitset<_Nb>::_Unchecked_flip (
    size_t __pos ) [inline], [noexcept]
```

These versions of single-bit set, reset, flip, and test are extensions from the SGI version. They do no range checking.

Definition at line 1058 of file `bitset`.

2.71.2.6 `_Unchecked_reset()`

```
template<size_t _Nb>
bitset<_Nb>& std::bitset<_Nb>::_Unchecked_reset (
    size_t __pos ) [inline], [noexcept]
```

These versions of single-bit set, reset, flip, and test are extensions from the SGI version. They do no range checking.

Definition at line 1051 of file `bitset`.

2.71.2.7 `_Unchecked_set()` [1/2]

```
template<size_t _Nb>
bitset<_Nb>& std::bitset<_Nb>::_Unchecked_set (
    size_t __pos ) [inline], [noexcept]
```

These versions of single-bit set, reset, flip, and test are extensions from the SGI version. They do no range checking.

Definition at line 1034 of file `bitset`.

2.71.2.8 `_Unchecked_set()` [2/2]

```
template<size_t _Nb>
bitset<_Nb>& std::bitset<_Nb>::_Unchecked_set (
    size_t __pos,
    int __val ) [inline], [noexcept]
```

These versions of single-bit set, reset, flip, and test are extensions from the SGI version. They do no range checking.

Definition at line 1041 of file `bitset`.

2.71.2.9 `_Unchecked_test()`

```
template<size_t _Nb>
constexpr bool std::bitset<_Nb>::_Unchecked_test (
    size_t __pos ) const [inline], [noexcept]
```

These versions of single-bit set, reset, flip, and test are extensions from the SGI version. They do no range checking.

Definition at line 1065 of file `bitset`.

2.71.2.10 compose1()

```
template<class _Operation1 , class _Operation2 >
binary_compose<_Operation1, _Operation2> __gnu_cxx::compose1 (
    const _Operation1 & __fn1,
    const _Operation2 & __fn2 ) [inline]
```

An [SGI extension](#) .

Definition at line 137 of file ext/functional.

2.71.2.11 compose2()

```
template<class _Operation1 , class _Operation2 , class _Operation3 >
binary_compose<_Operation1, _Operation2, _Operation3> __gnu_cxx::compose2 (
    const _Operation1 & __fn1,
    const _Operation2 & __fn2,
    const _Operation3 & __fn3 ) [inline]
```

An [SGI extension](#) .

Definition at line 164 of file ext/functional.

2.71.2.12 constant0()

```
template<class _Result >
constant_void_fun<_Result> __gnu_cxx::constant0 (
    const _Result & __val ) [inline]
```

An [SGI extension](#) .

Definition at line 322 of file ext/functional.

2.71.2.13 constant1()

```
template<class _Result >
constant_unary_fun<_Result, _Result> __gnu_cxx::constant1 (
    const _Result & __val ) [inline]
```

An [SGI extension](#) .

Definition at line 328 of file ext/functional.

2.71.2.14 `constant2()`

```
template<class _Result >
constant_binary_fun<_Result,_Result,_Result> __gnu_cxx::constant2 (
    const _Result & __val ) [inline]
```

An SGI extension .

Definition at line 334 of file ext/functional.

2.71.2.15 `copy_n()`

```
template<typename _InputIterator , typename _Size , typename _OutputIterator >
std::pair<_InputIterator, _OutputIterator> __gnu_cxx::copy_n (
    _InputIterator __first,
    _Size __count,
    _OutputIterator __result ) [inline]
```

Copies the range [first,first+count) into [result,result+count).

Parameters

<code>__first</code>	An input iterator.
<code>__count</code>	The number of elements to copy.
<code>__result</code>	An output iterator.

Returns

A `std::pair` composed of `first+count` and `result+count`.

This is an SGI extension. This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling).

Definition at line 113 of file ext/algorithm.

2.71.2.16 `distance()`

```
template<typename _InputIterator , typename _Distance >
void __gnu_cxx::distance (
    _InputIterator __first,
    _InputIterator __last,
    _Distance & __n ) [inline]
```

This is an SGI extension.

Todo Needs documentation! See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation+style.html>

Definition at line 105 of file ext/iterator.

2.71.2.17 identity_element() [1/2]

```
template<class _Tp >
_Tp __gnu_cxx::identity_element (
    std::plus< _Tp > ) [inline]
```

An [SGI extension](#) .

Definition at line 79 of file ext/functional.

2.71.2.18 identity_element() [2/2]

```
template<class _Tp >
_Tp __gnu_cxx::identity_element (
    std::multiplies< _Tp > ) [inline]
```

An [SGI extension](#) .

Definition at line 85 of file ext/functional.

2.71.2.19 lexicographical_compare_3way()

```
template<typename _InputIterator1 , typename _InputIterator2 >
int __gnu_cxx::lexicographical_compare_3way (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2 )
```

memcmp on steroids.

Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__last2</code>	An input iterator.

Returns

An int, as with memcmp.

The return value will be less than zero if the first range is *lexigraphically less than* the second, greater than zero if the second range is *lexigraphically less than* the first, and zero otherwise. This is an SGI extension.

Definition at line 194 of file ext/algorithm.

2.71.2.20 power() [1/2]

```
template<typename _Tp , typename _Integer , typename _MonoidOperation >
_Tp __gnu_cxx::power (
    _Tp __x,
    _Integer __n,
    _MonoidOperation __monoid_op ) [inline]
```

This is an SGI extension.

Todo Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html

Definition at line 113 of file ext/numeric.

2.71.2.21 power() [2/2]

```
template<typename _Tp , typename _Integer >
_Tp __gnu_cxx::power (
    _Tp __x,
    _Integer __n ) [inline]
```

This is an SGI extension.

Todo Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html

Definition at line 123 of file ext/numeric.

2.71.2.22 random_sample() [1/2]

```
template<typename _InputIterator , typename _RandomAccessIterator >
_RandomAccessIterator __gnu_cxx::random_sample (
    _InputIterator __first,
    _InputIterator __last,
    _RandomAccessIterator __out_first,
    _RandomAccessIterator __out_last ) [inline]
```

This is an SGI extension.

Todo Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html

Definition at line 381 of file ext/algorithm.

2.71.2.23 `random_sample()` [2/2]

```
template<typename _InputIterator , typename _RandomAccessIterator , typename _RandomNumberGenerator >
_RandomAccessIterator __gnu_cxx::random_sample (
    _InputIterator __first,
    _InputIterator __last,
    _RandomAccessIterator __out_first,
    _RandomAccessIterator __out_last,
    _RandomNumberGenerator & __rand ) [inline]
```

This is an SGI extension.

Todo Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_↵_style.html

Definition at line 404 of file ext/algorithm.

2.71.2.24 `random_sample_n()` [1/2]

```
template<typename _ForwardIterator , typename _OutputIterator , typename _Distance >
_OutputIterator __gnu_cxx::random_sample_n (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _OutputIterator __out,
    const _Distance __n )
```

This is an SGI extension.

Todo Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_↵_style.html

Definition at line 260 of file ext/algorithm.

2.71.2.25 `random_sample_n()` [2/2]

```
template<typename _ForwardIterator , typename _OutputIterator , typename _Distance , typename _RandomNumberGenerator >
_OutputIterator __gnu_cxx::random_sample_n (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _OutputIterator __out,
    const _Distance __n,
    _RandomNumberGenerator & __rand )
```

This is an SGI extension.

Todo Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_↵_style.html

Definition at line 294 of file ext/algorithm.

2.71.2.26 uninitialized_copy_n()

```
template<typename _InputIter , typename _Size , typename _ForwardIter >
std::pair<_InputIter, _ForwardIter> __gnu_cxx::uninitialized_copy_n (
    _InputIter __first,
    _Size __count,
    _ForwardIter __result ) [inline]
```

Copies the range [first,last) into result.

Parameters

<code>__first</code>	An input iterator.
<code>__count</code>	Length
<code>__result</code>	An output iterator.

Returns

`__result + (__first + __count)`

Like `copy()`, but does not require an initialized output range.

Definition at line 121 of file `ext/memory`.

2.72 Sequences

Collaboration diagram for Sequences:

Classes

- struct `std::array<_Tp, _Nm>`
- class `std::basic_string<_CharT, _Traits, _Alloc>`
- class `std::experimental::fundamentals_v1::basic_string_view<_CharT, _Traits>`
- class `std::deque<_Tp, _Alloc>`
- class `std::forward_list<_Tp, _Alloc>`
- class `std::list<_Tp, _Alloc>`
- class `std::priority_queue<_Tp, _Sequence, _Compare>`
- class `std::queue<_Tp, _Sequence>`
- class `std::stack<_Tp, _Sequence>`
- class `std::vector<_Tp, _Alloc>`
- class `std::vector<bool, _Alloc>`

2.72.1 Detailed Description

Sequences arrange a collection of objects into a strictly linear order.

The differences between sequences are usually due to one or both of the following:

- memory management
- algorithmic complexity

As an example of the first case, `vector` is required to use a contiguous memory layout, while other sequences such as `deque` are not.

The prime reason for choosing one sequence over another should be based on the second category of differences, algorithmic complexity. For example, if you need to perform many inserts and removals from the middle of a sequence, `list` would be ideal. But if you need to perform constant-time access to random elements of the sequence, then `list` should not be used.

All sequences must meet certain requirements, summarized in [tables](#).

2.73 Set Operations

Collaboration diagram for Set Operations:

Functions

- `template<typename _InputIterator1, typename _InputIterator2 >`
`constexpr bool std::includes (_InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2, _InputIterator2 __last2)`
- `template<typename _InputIterator1, typename _InputIterator2, typename _Compare >`
`constexpr bool std::includes (_InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2, _InputIterator2 __last2, _Compare __comp)`
- `template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator >`
`constexpr _OutputIterator std::set_difference (_InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2, _InputIterator2 __last2, _OutputIterator __result)`
- `template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename _Compare >`
`constexpr _OutputIterator std::set_difference (_InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2, _InputIterator2 __last2, _OutputIterator __result, _Compare __comp)`
- `template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator >`
`constexpr _OutputIterator std::set_intersection (_InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2, _InputIterator2 __last2, _OutputIterator __result)`
- `template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename _Compare >`
`constexpr _OutputIterator std::set_intersection (_InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2, _InputIterator2 __last2, _OutputIterator __result, _Compare __comp)`
- `template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator >`
`constexpr _OutputIterator std::set_symmetric_difference (_InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2, _InputIterator2 __last2, _OutputIterator __result)`
- `template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename _Compare >`
`constexpr _OutputIterator std::set_symmetric_difference (_InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2, _InputIterator2 __last2, _OutputIterator __result, _Compare __comp)`
- `template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator >`
`constexpr _OutputIterator std::set_union (_InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2, _InputIterator2 __last2, _OutputIterator __result)`
- `template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename _Compare >`
`constexpr _OutputIterator std::set_union (_InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2, _InputIterator2 __last2, _OutputIterator __result, _Compare __comp)`

2.73.1 Detailed Description

These algorithms are common set operations performed on sequences that are already sorted. The number of comparisons will be linear.

2.73.2 Function Documentation

2.73.2.1 `includes()` [1/2]

```
template<typename _InputIterator1 , typename _InputIterator2 >
constexpr bool std::includes (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2 ) [inline]
```

Determines whether all elements of a sequence exists in a range.

Parameters

<code>__first1</code>	Start of search range.
<code>__last1</code>	End of search range.
<code>__first2</code>	Start of sequence
<code>__last2</code>	End of sequence.

Returns

True if each element in `[__first2,__last2)` is contained in order within `[__first1,__last1)`. False otherwise.

This operation expects both `[__first1,__last1)` and `[__first2,__last2)` to be sorted. Searches for the presence of each element in `[__first2,__last2)` within `[__first1,__last1)`. The iterators over each range only move forward, so this is a linear algorithm. If an element in `[__first2,__last2)` is not found before the search iterator reaches `__last2`, false is returned.

Definition at line 2845 of file `stl_algo.h`.

2.73.2.2 `includes()` [2/2]

```
template<typename _InputIterator1 , typename _InputIterator2 , typename _Compare >
constexpr bool std::includes (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _Compare __comp ) [inline]
```

Determines whether all elements of a sequence exists in a range using comparison.

Parameters

<code>__first1</code>	Start of search range.
<code>__last1</code>	End of search range.
<code>__first2</code>	Start of sequence
<code>__last2</code>	End of sequence.
<code>__comp</code>	Comparison function to use.

Returns

True if each element in [`__first2`,`__last2`) is contained in order within [`__first1`,`__last1`) according to `comp`. False otherwise.

This operation expects both [`__first1`,`__last1`) and [`__first2`,`__last2`) to be sorted. Searches for the presence of each element in [`__first2`,`__last2`) within [`__first1`,`__last1`), using `comp` to decide. The iterators over each range only move forward, so this is a linear algorithm. If an element in [`__first2`,`__last2`) is not found before the search iterator reaches `__last2`, false is returned.

Definition at line 2891 of file `stl_algo.h`.

2.73.2.3 set_difference() [1/2]

```
template<typename _InputIterator1 , typename _InputIterator2 , typename _OutputIterator >
constexpr _OutputIterator std::set_difference (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _OutputIterator __result ) [inline]
```

Return the difference of two sorted ranges.

Parameters

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__last2</code>	End of second range.
<code>__result</code>	Start of output range.

Returns

End of the output range.

This operation iterates over both ranges, copying elements present in the first range but not the second in order to the output range. Iterators increment for each range. When the current element of the first range is less than the second, that element is copied and the iterator advances. If the current element of the second range is less, the iterator advances, but no element is copied. If an element is contained in both ranges, no elements are copied and both ranges advance. The output range may not overlap either input range.

Definition at line 5420 of file `stl_algo.h`.

2.73.2.4 set_difference() [2/2]

```
template<typename _InputIterator1 , typename _InputIterator2 , typename _OutputIterator , typename
_Compare >
constexpr _OutputIterator std::set_difference (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _OutputIterator __result,
    _Compare __comp ) [inline]
```

Return the difference of two sorted ranges using comparison functor.

Parameters

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__last2</code>	End of second range.
<code>__result</code>	Start of output range.
<code>__comp</code>	The comparison functor.

Returns

End of the output range.

This operation iterates over both ranges, copying elements present in the first range but not the second in order to the output range. Iterators increment for each range. When the current element of the first range is less than the second according to `__comp`, that element is copied and the iterator advances. If the current element of the second range is less, no element is copied and the iterator advances. If an element is contained in both ranges according to `__comp`, no elements are copied and both ranges advance. The output range may not overlap either input range.

Definition at line 5472 of file `stl_algo.h`.

2.73.2.5 set_intersection() [1/2]

```
template<typename _InputIterator1 , typename _InputIterator2 , typename _OutputIterator >
constexpr _OutputIterator std::set_intersection (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _OutputIterator __result ) [inline]
```

Return the intersection of two sorted ranges.

Parameters

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__last2</code>	End of second range.
<code>__result</code>	Start of output range.

Returns

End of the output range.

This operation iterates over both ranges, copying elements present in both ranges in order to the output range. Iterators increment for each range. When the current element of one range is less than the other, that iterator advances. If an element is contained in both ranges, the element from the first range is copied and both ranges advance. The output range may not overlap either input range.

Definition at line 5295 of file `stl_algo.h`.

2.73.2.6 set_intersection() [2/2]

```
template<typename _InputIterator1 , typename _InputIterator2 , typename _OutputIterator , typename
_Compare >
constexpr _OutputIterator std::set_intersection (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _OutputIterator __result,
    _Compare __comp ) [inline]
```

Return the intersection of two sorted ranges using comparison functor.

Parameters

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__last2</code>	End of second range.
<code>__result</code>	Start of output range.
<code>__comp</code>	The comparison functor.

Returns

End of the output range.

This operation iterates over both ranges, copying elements present in both ranges in order to the output range. Iterators increment for each range. When the current element of one range is less than the other according to `__comp`, that iterator advances. If an element is contained in both ranges according to `__comp`, the element from the first range is copied and both ranges advance. The output range may not overlap either input range.

Definition at line 5345 of file `stl_algo.h`.

2.73.2.7 `set_symmetric_difference()` [1/2]

```
template<typename _InputIterator1 , typename _InputIterator2 , typename _OutputIterator >
constexpr _OutputIterator std::set_symmetric_difference (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _OutputIterator __result ) [inline]
```

Return the symmetric difference of two sorted ranges.

Parameters

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__last2</code>	End of second range.
<code>__result</code>	Start of output range.

Returns

End of the output range.

This operation iterates over both ranges, copying elements present in one range but not the other in order to the output range. Iterators increment for each range. When the current element of one range is less than the other, that element is copied and the iterator advances. If an element is contained in both ranges, no elements are copied and both ranges advance. The output range may not overlap either input range.

Definition at line 5553 of file `stl_algo.h`.

2.73.2.8 `set_symmetric_difference()` [2/2]

```
template<typename _InputIterator1 , typename _InputIterator2 , typename _OutputIterator , typename
_Compare >
constexpr _OutputIterator std::set_symmetric_difference (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
```

```
_InputIterator2 __last2,  
_OutputIterator __result,  
_Compare __comp ) [inline]
```

Return the symmetric difference of two sorted ranges using comparison functor.

Parameters

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__last2</code>	End of second range.
<code>__result</code>	Start of output range.
<code>__comp</code>	The comparison functor.

Returns

End of the output range.

This operation iterates over both ranges, copying elements present in one range but not the other in order to the output range. Iterators increment for each range. When the current element of one range is less than the other according to `comp`, that element is copied and the iterator advances. If an element is contained in both ranges according to `__comp`, no elements are copied and both ranges advance. The output range may not overlap either input range.

Definition at line 5605 of file `stl_algo.h`.

2.73.2.9 `set_union()` [1/2]

```
template<typename _InputIterator1 , typename _InputIterator2 , typename _OutputIterator >
constexpr _OutputIterator std::set_union (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _OutputIterator __result ) [inline]
```

Return the union of two sorted ranges.

Parameters

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__last2</code>	End of second range.
<code>__result</code>	Start of output range.

Returns

End of the output range.

This operation iterates over both ranges, copying elements present in each range in order to the output range. Iterators increment for each range. When the current element of one range is less than the other, that element is copied and the

iterator advanced. If an element is contained in both ranges, the element from the first range is copied and both ranges advance. The output range may not overlap either input range.

Definition at line 5171 of file `stl_algo.h`.

2.73.2.10 `set_union()` [2/2]

```
template<typename _InputIterator1 , typename _InputIterator2 , typename _OutputIterator , typename
_Compare >
constexpr _OutputIterator std::set_union (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _OutputIterator __result,
    _Compare __comp ) [inline]
```

Return the union of two sorted ranges using a comparison functor.

Parameters

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__last2</code>	End of second range.
<code>__result</code>	Start of output range.
<code>__comp</code>	The comparison functor.

Returns

End of the output range.

This operation iterates over both ranges, copying elements present in each range in order to the output range. Iterators increment for each range. When the current element of one range is less than the other according to `__comp`, that element is copied and the iterator advanced. If an equivalent element according to `__comp` is contained in both ranges, the element from the first range is copied and both ranges advance. The output range may not overlap either input range.

Definition at line 5222 of file `stl_algo.h`.

2.74.1 Detailed Description

2.74.2 Function Documentation

2.74.2.1 `inplace_merge()` [1/2]

```
template<typename _BidirectionalIterator >
void std::inplace_merge (
    _BidirectionalIterator __first,
    _BidirectionalIterator __middle,
    _BidirectionalIterator __last ) [inline]
```

Merges two sorted ranges in place.

Parameters

<code>__first</code>	An iterator.
<code>__middle</code>	Another iterator.
<code>__last</code>	Another iterator.

Returns

Nothing.

Merges two sorted and consecutive ranges, [`__first`,`__middle`) and [`__middle`,`__last`), and puts the result in [`__first`,`__last`). The output will be sorted. The sort is *stable*, that is, for equivalent elements in the two ranges, elements from the first range will always come before elements from the second.

If enough additional memory is available, this takes $(\text{__last} - \text{__first}) - 1$ comparisons. Otherwise an $N \log N$ algorithm is used, where N is `distance(__first, __last)`.

Definition at line 2590 of file `stl_algo.h`.

2.74.2.2 `inplace_merge()` [2/2]

```
template<typename _BidirectionalIterator, typename _Compare >
void std::inplace_merge (
    _BidirectionalIterator __first,
    _BidirectionalIterator __middle,
    _BidirectionalIterator __last,
    _Compare __comp ) [inline]
```

Merges two sorted ranges in place.

Parameters

<code>__first</code>	An iterator.
<code>__middle</code>	Another iterator.
<code>__last</code>	Another iterator.
<code>__comp</code>	A functor to use for comparisons.

Returns

Nothing.

Merges two sorted and consecutive ranges, `[__first,__middle)` and `[middle,last)`, and puts the result in `[__first,__last)`. The output will be sorted. The sort is *stable*, that is, for equivalent elements in the two ranges, elements from the first range will always come before elements from the second.

If enough additional memory is available, this takes $(\text{__last} - \text{__first}) - 1$ comparisons. Otherwise an $N \log N$ algorithm is used, where N is `distance(__first,__last)`.

The comparison function should have the same effects on ordering as the function used for the initial sort.

Definition at line 2631 of file `stl_algo.h`.

2.74.2.3 `is_sorted()` [1/2]

```
template<typename _ForwardIterator >
constexpr bool std::is_sorted (
    _ForwardIterator __first,
    _ForwardIterator __last ) [inline]
```

Determines whether the elements of a sequence are sorted.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.

Returns

True if the elements are sorted, false otherwise.

Definition at line 3228 of file `stl_algo.h`.

References `std::is_sorted_until()`.

2.74.2.4 `is_sorted()` [2/2]

```
template<typename _ForwardIterator, typename _Compare>
constexpr bool std::is_sorted (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Compare __comp ) [inline]
```

Determines whether the elements of a sequence are sorted according to a comparison functor.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__comp</code>	A comparison functor.

Returns

True if the elements are sorted, false otherwise.

Definition at line 3243 of file `stl_algo.h`.

References `std::is_sorted_until()`.

2.74.2.5 `is_sorted_until()` [1/2]

```
template<typename _ForwardIterator>
constexpr _ForwardIterator std::is_sorted_until (
    _ForwardIterator __first,
    _ForwardIterator __last ) [inline]
```

Determines the end of a sorted sequence.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.

Returns

An iterator pointing to the last iterator `i` in `[__first, __last)` for which the range `[__first, i)` is sorted.

Definition at line 3274 of file `stl_algo.h`.

2.74.2.6 `is_sorted_until()` [2/2]

```
template<typename _ForwardIterator, typename _Compare >
constexpr _ForwardIterator std::is_sorted_until (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Compare __comp ) [inline]
```

Determines the end of a sorted sequence using comparison functor.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__comp</code>	A comparison functor.

Returns

An iterator pointing to the last iterator `i` in `[__first, __last)` for which the range `[__first, i)` is sorted.

Definition at line 3299 of file `stl_algo.h`.

Referenced by `std::is_sorted()`.

2.74.2.7 `lexicographical_compare()` [1/2]

```
template<typename _II1, typename _II2 >
constexpr bool std::lexicographical_compare (
    _II1 __first1,
    _II1 __last1,
    _II2 __first2,
    _II2 __last2 ) [inline]
```

Performs **dictionary** comparison on ranges.

Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__last2</code>	An input iterator.

Returns

A boolean true or false.

Returns true if the sequence of elements defined by the range `[first1,last1)` is lexicographically less than the sequence of elements defined by the range `[first2,last2)`. Returns false otherwise. (Quoted from [25.3.8]/1.) If the iterators are all character pointers, then this is an inline call to `memcmp`.

Definition at line 1590 of file `stl_algobase.h`.

2.74.2.8 `lexicographical_compare()` [2/2]

```
template<typename _II1 , typename _II2 , typename _Compare >
constexpr bool std::lexicographical_compare (
    _II1 __first1,
    _II1 __last1,
    _II2 __first2,
    _II2 __last2,
    _Compare __comp ) [inline]
```

Performs **dictionary** comparison on ranges.

Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__last2</code>	An input iterator.
<code>__comp</code>	A comparison functor .

Returns

A boolean true or false.

The same as the four-parameter `lexicographical_compare`, but uses the `comp` parameter instead of `<`.

Definition at line 1627 of file `stl_algobase.h`.

Referenced by `std::operator<()`.

2.74.2.9 `max()` [1/2]

```
template<typename _Tp >
constexpr const _Tp & std::max (
    const _Tp & __a,
    const _Tp & __b ) [inline]
```

This does what you think it does.

Parameters

<code>__a</code>	A thing of arbitrary type.
<code>__b</code>	Another thing of arbitrary type.

Returns

The greater of the parameters.

This is the simple classic generic implementation. It will work on temporary expressions, since they are only evaluated once, unlike a preprocessor macro.

Definition at line 254 of file `stl_algobase.h`.

Referenced by `__gnu_parallel::__parallel_nth_element()`, `std::_Deque_base<_StateSeqT, std::allocator<_StateSeqT> >::_M_initialize_map()`, `std::deque<_StateSeqT>::_M_reallocate_map()`, `std::discard_block_engine<__RandomNumberEngine, __p, __r>::max()`, `std::shuffle_order_engine<_RandomNumberEngine, __k>::max()`, `__gnu_parallel::multiseq_selection()`, and `std::basic_stringbuf<_CharT, _Traits, _Alloc>::overflow()`.

2.74.2.10 `max()` [2/2]

```
template<typename _Tp , typename _Compare >
constexpr const _Tp & std::max (
    const _Tp & __a,
    const _Tp & __b,
    _Compare __comp ) [inline]
```

This does what you think it does.

Parameters

<code>__a</code>	A thing of arbitrary type.
<code>__b</code>	Another thing of arbitrary type.
<code>__comp</code>	A comparison functor .

Returns

The greater of the parameters.

This will work on temporary expressions, since they are only evaluated once, unlike a preprocessor macro.

Definition at line 300 of file `stl_algobase.h`.

2.74.2.11 `max_element()` [1/2]

```
template<typename _ForwardIterator >
constexpr _ForwardIterator std::max_element (
    _ForwardIterator __first,
    _ForwardIterator __last ) [inline]
```

Return the maximum element in a range.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.

Returns

Iterator referencing the first instance of the largest value.

Definition at line 5722 of file `stl_algo.h`.

2.74.2.12 `max_element()` [2/2]

```
template<typename _ForwardIterator , typename _Compare >
constexpr _ForwardIterator std::max_element (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Compare __comp ) [inline]
```

Return the maximum element in a range using comparison functor.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__comp</code>	Comparison functor.

Returns

Iterator referencing the first instance of the largest value according to `__comp`.

Definition at line 5747 of file `stl_algo.h`.

2.74.2.13 merge() [1/2]

```
template<typename _InputIterator1 , typename _InputIterator2 , typename _OutputIterator >
constexpr _OutputIterator std::merge (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _OutputIterator __result ) [inline]
```

Merges two sorted ranges.

Parameters

<code>__first1</code>	An iterator.
<code>__first2</code>	Another iterator.
<code>__last1</code>	Another iterator.
<code>__last2</code>	Another iterator.
<code>__result</code>	An iterator pointing to the end of the merged range.

Returns

An output iterator equal to `__result + (__last1 - __first1)`
 • `(__last2 - __first2)`.

Merges the ranges `[__first1, __last1)` and `[__first2, __last2)` into the sorted range `[__result, __result + (__last1 - __first1) + (__last2 - __first2))`. Both input ranges must be sorted, and the output range must not overlap with either of the input ranges. The sort is *stable*, that is, for equivalent elements in the two ranges, elements from the first range will always come before elements from the second.

Definition at line 4951 of file `stl_algo.h`.

2.74.2.14 merge() [2/2]

```
template<typename _InputIterator1 , typename _InputIterator2 , typename _OutputIterator , typename
_Compare >
constexpr _OutputIterator std::merge (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
```

```
_InputIterator2 __first2,  
_InputIterator2 __last2,  
_OutputIterator __result,  
_Compare __comp ) [inline]
```

Merges two sorted ranges.

Parameters

<code>__first1</code>	An iterator.
<code>__first2</code>	Another iterator.
<code>__last1</code>	Another iterator.
<code>__last2</code>	Another iterator.
<code>__result</code>	An iterator pointing to the end of the merged range.
<code>__comp</code>	A functor to use for comparisons.

Returns

An output iterator equal to `__result + (__last1 - __first1)`
 • `(__last2 - __first2)`.

Merges the ranges `[__first1, __last1)` and `[__first2, __last2)` into the sorted range `[__result, __result + (__last1 - __first1) + (__last2 - __first2))`. Both input ranges must be sorted, and the output range must not overlap with either of the input ranges. The sort is *stable*, that is, for equivalent elements in the two ranges, elements from the first range will always come before elements from the second.

The comparison function should have the same effects on ordering as the function used for the initial sort.

Definition at line 5002 of file `stl_algo.h`.

2.74.2.15 `min()` [1/2]

```
template<typename _Tp >
constexpr const _Tp & std::min (
    const _Tp & __a,
    const _Tp & __b ) [inline]
```

This does what you think it does.

Parameters

<code>__a</code>	A thing of arbitrary type.
<code>__b</code>	Another thing of arbitrary type.

Returns

The lesser of the parameters.

This is the simple classic generic implementation. It will work on temporary expressions, since they are only evaluated once, unlike a preprocessor macro.

Definition at line 230 of file `stl_algobase.h`.

Referenced by `__gnu_parallel::__parallel_random_shuffle_drs()`, `__gnu_parallel::__parallel_sort_qs_divide()`, `std::__sample()`, `__gnu_parallel::__search_template()`, `__gnu_parallel::__sequential_random_shuffle()`, `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base>::compare()`, `std::basic_string<char>::compare()`, `std::generate_canonical()`, `std::discard_block_engine<_RandomNumberEngine, __p, __r>::min()`, `std::shuffle_order_engine<_RandomNumberEngine, __k>::min()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::overflow()`, `std::basic_streambuf<_Elem, _Tr>::xsgetn()`, and `std::basic_streambuf<_Elem, _Tr>::xsputn()`.

2.74.2.16 `min()` [2/2]

```
template<typename _Tp, typename _Compare>
constexpr const _Tp & std::min (
    const _Tp & __a,
    const _Tp & __b,
    _Compare __comp ) [inline]
```

This does what you think it does.

Parameters

<code>__a</code>	A thing of arbitrary type.
<code>__b</code>	Another thing of arbitrary type.
<code>__comp</code>	A comparison functor .

Returns

The lesser of the parameters.

This will work on temporary expressions, since they are only evaluated once, unlike a preprocessor macro.

Definition at line 278 of file `stl_algobase.h`.

2.74.2.17 `min_element()` [1/2]

```
template<typename _ForwardIterator>
constexpr _ForwardIterator std::min_element (
    _ForwardIterator __first,
    _ForwardIterator __last ) [inline]
```

Return the minimum element in a range.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.

Returns

Iterator referencing the first instance of the smallest value.

Definition at line 5658 of file `stl_algo.h`.

2.74.2.18 min_element() [2/2]

```
template<typename _ForwardIterator, typename _Compare>
constexpr _ForwardIterator std::min_element (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Compare __comp ) [inline]
```

Return the minimum element in a range using comparison functor.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__comp</code>	Comparison functor.

Returns

Iterator referencing the first instance of the smallest value according to `__comp`.

Definition at line 5683 of file `stl_algo.h`.

2.74.2.19 minmax() [1/2]

```
template<typename _Tp>
constexpr pair< const _Tp &, const _Tp & > std::minmax (
    const _Tp & __a,
    const _Tp & __b ) [inline]
```

Determines min and max at once as an ordered pair.

Parameters

<code>__a</code>	A thing of arbitrary type.
<code>__b</code>	Another thing of arbitrary type.

Returns

A pair(__b, __a) if __b is smaller than __a, pair(__a, __b) otherwise.

Definition at line 3325 of file stl_algo.h.

2.74.2.20 minmax() [2/2]

```
template<typename _Tp , typename _Compare >
constexpr pair< const _Tp &, const _Tp & > std::minmax (
    const _Tp & __a,
    const _Tp & __b,
    _Compare __comp ) [inline]
```

Determines min and max at once as an ordered pair.

Parameters

<code>__a</code>	A thing of arbitrary type.
<code>__b</code>	Another thing of arbitrary type.
<code>__comp</code>	A comparison functor .

Returns

A pair(__b, __a) if __b is smaller than __a, pair(__a, __b) otherwise.

Definition at line 3346 of file stl_algo.h.

2.74.2.21 minmax_element() [1/2]

```
template<typename _ForwardIterator >
constexpr pair<_ForwardIterator, _ForwardIterator> std::minmax_element (
    _ForwardIterator __first,
    _ForwardIterator __last ) [inline]
```

Return a pair of iterators pointing to the minimum and maximum elements in a range.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.

Returns

make_pair(m, M), where m is the first iterator i in [__first, __last) such that no other element in the range is smaller, and where M is the last iterator i in [__first, __last) such that no other element in the range is larger.

Definition at line 3426 of file stl_algo.h.

2.74.2.22 minmax_element() [2/2]

```
template<typename _ForwardIterator, typename _Compare >
constexpr pair<_ForwardIterator, _ForwardIterator> std::minmax_element (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Compare __comp ) [inline]
```

Return a pair of iterators pointing to the minimum and maximum elements in a range.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__comp</code>	Comparison functor.

Returns

make_pair(m, M), where m is the first iterator i in [__first, __last) such that no other element in the range is smaller, and where M is the last iterator i in [__first, __last) such that no other element in the range is larger.

Definition at line 3454 of file stl_algo.h.

2.74.2.23 next_permutation() [1/2]

```
template<typename _BidirectionalIterator >
constexpr bool std::next_permutation (
    _BidirectionalIterator __first,
    _BidirectionalIterator __last ) [inline]
```

Permute range into the next *dictionary* ordering.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.

Returns

False if wrapped to first permutation, true otherwise.

Treats all permutations of the range as a set of *dictionary* sorted sequences. Permutes the current sequence into the next one of this set. Returns true if there are more sequences to generate. If the sequence is the largest of the set, the smallest is generated and false returned.

Definition at line 2976 of file `stl_algo.h`.

2.74.2.24 next_permutation() [2/2]

```
template<typename _BidirectionalIterator , typename _Compare >
constexpr bool std::next_permutation (
    _BidirectionalIterator __first,
    _BidirectionalIterator __last,
    _Compare __comp ) [inline]
```

Permute range into the next *dictionary* ordering using comparison functor.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__comp</code>	A comparison functor.

Returns

False if wrapped to first permutation, true otherwise.

Treats all permutations of the range [`__first`,`__last`) as a set of *dictionary* sorted sequences ordered by `__comp`. Permutes the current sequence into the next one of this set. Returns true if there are more sequences to generate. If the sequence is the largest of the set, the smallest is generated and false returned.

Definition at line 3009 of file `stl_algo.h`.

2.74.2.25 nth_element() [1/2]

```
template<typename _RandomAccessIterator >
constexpr void std::nth_element (
    _RandomAccessIterator __first,
    _RandomAccessIterator __nth,
    _RandomAccessIterator __last ) [inline]
```

Sort a sequence just enough to find a particular position.

Parameters

<code>__first</code>	An iterator.
<code>__nth</code>	Another iterator.
<code>__last</code>	Another iterator.

Returns

Nothing.

Rearranges the elements in the range `[__first,__last)` so that `*__nth` is the same element that would have been in that position had the whole sequence been sorted. The elements either side of `*__nth` are not completely sorted, but for any iterator *i* in the range `[__first,__nth)` and any iterator *j* in the range `[__nth,__last)` it holds that `*j < *i` is false.

Definition at line 4778 of file `stl_algo.h`.

2.74.2.26 nth_element() [2/2]

```
template<typename _RandomAccessIterator , typename _Compare >
constexpr void std::nth_element (
    _RandomAccessIterator __first,
    _RandomAccessIterator __nth,
    _RandomAccessIterator __last,
    _Compare __comp ) [inline]
```

Sort a sequence just enough to find a particular position using a predicate for comparison.

Parameters

<code>__first</code>	An iterator.
<code>__nth</code>	Another iterator.
<code>__last</code>	Another iterator.
<code>__comp</code>	A comparison functor.

Returns

Nothing.

Rearranges the elements in the range `[__first,__last)` so that `*__nth` is the same element that would have been in that position had the whole sequence been sorted. The elements either side of `*__nth` are not completely sorted, but for any iterator *i* in the range `[__first,__nth)` and any iterator *j* in the range `[__nth,__last)` it holds that `__comp(*j,*i)` is false.

Definition at line 4818 of file `stl_algo.h`.

2.74.2.27 `partial_sort()` [1/2]

```
template<typename _RandomAccessIterator >
constexpr void std::partial_sort (
    _RandomAccessIterator __first,
    _RandomAccessIterator __middle,
    _RandomAccessIterator __last ) [inline]
```

Sort the smallest elements of a sequence.

Parameters

<code>__first</code>	An iterator.
<code>__middle</code>	Another iterator.
<code>__last</code>	Another iterator.

Returns

Nothing.

Sorts the smallest (`__middle-__first`) elements in the range `[first,last)` and moves them to the range `[__first,__middle)`. The order of the remaining elements in the range `[__middle,__last)` is undefined. After the sort if *i* and *j* are iterators in the range `[__first,__middle)` such that *i* precedes *j* and *k* is an iterator in the range `[__middle,__last)` then `*j < *i` and `*k < *i` are both false.

Definition at line 4702 of file `stl_algo.h`.

2.74.2.28 `partial_sort()` [2/2]

```
template<typename _RandomAccessIterator , typename _Compare >
constexpr void std::partial_sort (
    _RandomAccessIterator __first,
    _RandomAccessIterator __middle,
    _RandomAccessIterator __last,
    _Compare __comp ) [inline]
```

Sort the smallest elements of a sequence using a predicate for comparison.

Parameters

<code>__first</code>	An iterator.
<code>__middle</code>	Another iterator.
<code>__last</code>	Another iterator.
<code>__comp</code>	A comparison functor.

Returns

Nothing.

Sorts the smallest (`__middle-__first`) elements in the range `[__first,__last)` and moves them to the range `[__first,__middle)`. The order of the remaining elements in the range `[__middle,__last)` is undefined. After the sort if *i* and *j* are iterators in the range `[__first,__middle)` such that *i* precedes *j* and *k* is an iterator in the range `[__middle,__last)` then `*__comp(j,*i)` and `__comp(*k,*i)` are both false.

Definition at line 4741 of file `stl_algo.h`.

2.74.2.29 `partial_sort_copy()` [1/2]

```
template<typename _InputIterator , typename _RandomAccessIterator >
constexpr _RandomAccessIterator std::partial_sort_copy (
    _InputIterator __first,
    _InputIterator __last,
    _RandomAccessIterator __result_first,
    _RandomAccessIterator __result_last ) [inline]
```

Copy the smallest elements of a sequence.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__result_first</code>	A random-access iterator.
<code>__result_last</code>	Another random-access iterator.

Returns

An iterator indicating the end of the resulting sequence.

Copies and sorts the smallest *N* values from the range `[__first,__last)` to the range beginning at `__result_first`, where the number of elements to be copied, *N*, is the smaller of `(__last-__first)` and `(__result_last-__result_first)`. After the sort if *i* and *j* are iterators in the range `[__result_first,__result_first+N)` such that *i* precedes *j* then `*j<*i` is false. The value returned is `__result_first+N`.

Definition at line 1738 of file `stl_algo.h`.

2.74.2.30 `partial_sort_copy()` [2/2]

```
template<typename _InputIterator , typename _RandomAccessIterator , typename _Compare >
constexpr _RandomAccessIterator std::partial_sort_copy (
    _InputIterator __first,
    _InputIterator __last,
```

```
_RandomAccessIterator __result_first,  
_RandomAccessIterator __result_last,  
_Compare __comp ) [inline]
```

Copy the smallest elements of a sequence using a predicate for comparison.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	Another input iterator.
<code>__result_first</code>	A random-access iterator.
<code>__result_last</code>	Another random-access iterator.
<code>__comp</code>	A comparison functor.

Returns

An iterator indicating the end of the resulting sequence.

Copies and sorts the smallest N values from the range $[\text{__first}, \text{__last})$ to the range beginning at `result_first`, where the number of elements to be copied, N , is the smaller of $(\text{__last} - \text{__first})$ and $(\text{__result_last} - \text{__result_first})$. After the sort if i and j are iterators in the range $[\text{__result_first}, \text{__result_first} + N)$ such that i precedes j then `__comp(*j, *i)` is false. The value returned is `__result_first + N`.

Definition at line 1789 of file `stl_algo.h`.

2.74.2.31 prev_permutation() [1/2]

```
template<typename _BidirectionalIterator >
constexpr bool std::prev_permutation (
    _BidirectionalIterator __first,
    _BidirectionalIterator __last ) [inline]
```

Permute range into the previous *dictionary* ordering.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.

Returns

False if wrapped to last permutation, true otherwise.

Treats all permutations of the range as a set of *dictionary* sorted sequences. Permutes the current sequence into the previous one of this set. Returns true if there are more sequences to generate. If the sequence is the smallest of the set, the largest is generated and false returned.

Definition at line 3079 of file `stl_algo.h`.

2.74.2.32 prev_permutation() [2/2]

```
template<typename _BidirectionalIterator , typename _Compare >
constexpr bool std::prev_permutation (
    _BidirectionalIterator __first,
    _BidirectionalIterator __last,
    _Compare __comp ) [inline]
```

Permute range into the previous *dictionary* ordering using comparison functor.

Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__comp</code>	A comparison functor.

Returns

False if wrapped to last permutation, true otherwise.

Treats all permutations of the range [`__first`,`__last`) as a set of *dictionary* sorted sequences ordered by `__comp`. Permutes the current sequence into the previous one of this set. Returns true if there are more sequences to generate. If the sequence is the smallest of the set, the largest is generated and false returned.

Definition at line 3112 of file stl_algo.h.

2.74.2.33 `sort()` [1/2]

```
template<typename _RandomAccessIterator >
constexpr void std::sort (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last ) [inline]
```

Sort the elements of a sequence.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.

Returns

Nothing.

Sorts the elements in the range `[__first,__last)` in ascending order, such that for each iterator *i* in the range `[__first,__last-1)`,

$*(i+1) < *i$ is false.

The relative ordering of equivalent elements is not preserved, use `stable_sort()` if this is needed.

Definition at line 4856 of file `stl_algo.h`.

2.74.2.34 `sort()` [2/2]

```
template<typename _RandomAccessIterator, typename _Compare >
constexpr void std::sort (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    _Compare __comp ) [inline]
```

Sort the elements of a sequence using a predicate for comparison.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__comp</code>	A comparison functor.

Returns

Nothing.

Sorts the elements in the range `[__first, __last)` in ascending order, such that `__comp(*(i+1), *i)` is false for every iterator `i` in the range `[__first, __last-1)`.

The relative ordering of equivalent elements is not preserved, use `stable_sort()` if this is needed.

Definition at line 4887 of file `stl_algo.h`.

2.74.2.35 `stable_sort()` [1/2]

```
template<typename _RandomAccessIterator >
void std::stable_sort (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last ) [inline]
```

Sort the elements of a sequence, preserving the relative order of equivalent elements.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.

Returns

Nothing.

Sorts the elements in the range `[__first,__last)` in ascending order, such that for each iterator `i` in the range `[__first,__last-1)`, `*(i+1)<*(i)` is false.

The relative ordering of equivalent elements is preserved, so any two elements `x` and `y` in the range `[__first,__last)` such that `x<y` is false and `y<x` is false will have the same relative ordering after calling `stable_sort()`.

Definition at line 5065 of file `stl_algo.h`.

2.74.2.36 `stable_sort()` [2/2]

```
template<typename _RandomAccessIterator, typename _Compare>
void std::stable_sort (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    _Compare __comp ) [inline]
```

Sort the elements of a sequence using a predicate for comparison, preserving the relative order of equivalent elements.

Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__comp</code>	A comparison functor.

Returns

Nothing.

Sorts the elements in the range `[__first,__last)` in ascending order, such that for each iterator `i` in the range `[__first,__last-1)`, `__comp(*(i+1),*(i))` is false.

The relative ordering of equivalent elements is preserved, so any two elements `x` and `y` in the range `[__first,__last)` such that `__comp(x,y)` is false and `__comp(y,x)` is false will have the same relative ordering after calling `stable_sort()`.

Definition at line 5099 of file `stl_algo.h`.

2.75 Strings

Collaboration diagram for Strings:

Classes

- class `std::basic_string< _CharT, _Traits, _Alloc >`
- class `std::experimental::fundamentals_v1::basic_string_view< _CharT, _Traits >`
- struct `std::char_traits< _CharT >`

Typedefs

- typedef `basic_string< char >` `std::string`
- typedef `basic_string< char16_t >` `std::u16string`
- typedef `basic_string< char32_t >` `std::u32string`
- typedef `basic_string< wchar_t >` `std::wstring`

2.75.1 Detailed Description

2.75.2 Typedef Documentation

2.75.2.1 string

```
typedef basic_string<char> std::string
```

A string of `char`.

Definition at line 74 of file `stringfwd.h`.

2.75.2.2 u16string

```
typedef basic_string<char16_t> std::u16string
```

A string of `char16_t`.

Definition at line 93 of file `stringfwd.h`.

2.75.2.3 u32string

```
typedef basic_string<char32_t> std::u32string
```

A string of `char32_t`.

Definition at line 96 of file `stringfwd.h`.

2.75.2.4 wstring

```
typedef basic_string<wchar_t> std::wstring
```

A string of `wchar_t`.

Definition at line 83 of file `stringfwd.h`.

2.76.1 Detailed Description

A collection of advanced mathematical special functions.

2.76.2 Function Documentation

2.76.2.1 `assoc_laguerre()`

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::tr1::assoc_laguerre (
    unsigned int __n,
    unsigned int __m,
    _Tp __x ) [inline]
```

5.2.1.1 Associated Laguerre polynomials.

Definition at line 1275 of file tr1/cmath.

2.76.2.2 `assoc_legendre()`

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::tr1::assoc_legendre (
    unsigned int __l,
    unsigned int __m,
    _Tp __x ) [inline]
```

5.2.1.2 Associated Legendre functions.

Definition at line 1292 of file tr1/cmath.

2.76.2.3 beta()

```
template<typename _Tpx , typename _Tpy >
__gnu_cxx::__promote_2<_Tpx, _Tpy>::__type std::tr1::beta (
    _Tpx __x,
    _Tpy __y ) [inline]
```

5.2.1.3 Beta functions.

Definition at line 1309 of file tr1/cmath.

2.76.2.4 comp_ellint_1()

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::tr1::comp_ellint_1 (
    _Tp __k ) [inline]
```

5.2.1.4 Complete elliptic integrals of the first kind.

Definition at line 1326 of file tr1/cmath.

2.76.2.5 comp_ellint_2()

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::tr1::comp_ellint_2 (
    _Tp __k ) [inline]
```

5.2.1.5 Complete elliptic integrals of the second kind.

Definition at line 1343 of file tr1/cmath.

2.76.2.6 comp_ellint_3()

```
template<typename _Tp , typename _Tpn >
__gnu_cxx::__promote_2<_Tp, _Tpn>::__type std::tr1::comp_ellint_3 (
    _Tp __k,
    _Tpn __nu ) [inline]
```

5.2.1.6 Complete elliptic integrals of the third kind.

Definition at line 1360 of file tr1/cmath.

2.76.2.7 `conf_hyperg()`

```
template<typename _Tpa , typename _Tpc , typename _Tp >
__gnu_cxx::__promote_3<_Tpa, _Tpc, _Tp>::__type std::tr1::conf_hyperg (
    _Tpa __a,
    _Tpc __c,
    _Tp __x ) [inline]
```

5.2.1.7 Confluent hypergeometric functions.

Definition at line 1678 of file tr1/cmath.

2.76.2.8 `cyl_bessel_i()`

```
template<typename _Tpnu , typename _Tp >
__gnu_cxx::__promote_2<_Tpnu, _Tp>::__type std::tr1::cyl_bessel_i (
    _Tpnu __nu,
    _Tp __x ) [inline]
```

5.2.1.8 Regular modified cylindrical Bessel functions.

Definition at line 1377 of file tr1/cmath.

2.76.2.9 `cyl_bessel_j()`

```
template<typename _Tpnu , typename _Tp >
__gnu_cxx::__promote_2<_Tpnu, _Tp>::__type std::tr1::cyl_bessel_j (
    _Tpnu __nu,
    _Tp __x ) [inline]
```

5.2.1.9 Cylindrical Bessel functions (of the first kind).

Definition at line 1394 of file tr1/cmath.

2.76.2.10 `cyl_bessel_k()`

```
template<typename _Tpnu , typename _Tp >
__gnu_cxx::__promote_2<_Tpnu, _Tp>::__type std::tr1::cyl_bessel_k (
    _Tpnu __nu,
    _Tp __x ) [inline]
```

5.2.1.10 Irregular modified cylindrical Bessel functions.

Definition at line 1411 of file tr1/cmath.

2.76.2.11 cyl_neumann()

```
template<typename _Tpnu , typename _Tp >
__gnu_cxx::__promote_2<_Tpnu, _Tp>::__type std::tr1::cyl_neumann (
    _Tpnu __nu,
    _Tp __x ) [inline]
```

5.2.1.11 Cylindrical Neumann functions.

Definition at line 1428 of file tr1/cmath.

2.76.2.12 ellint_1()

```
template<typename _Tp , typename _Tpp >
__gnu_cxx::__promote_2<_Tp, _Tpp>::__type std::tr1::ellint_1 (
    _Tp __k,
    _Tpp __phi ) [inline]
```

5.2.1.12 Incomplete elliptic integrals of the first kind.

Definition at line 1445 of file tr1/cmath.

2.76.2.13 ellint_2()

```
template<typename _Tp , typename _Tpp >
__gnu_cxx::__promote_2<_Tp, _Tpp>::__type std::tr1::ellint_2 (
    _Tp __k,
    _Tpp __phi ) [inline]
```

5.2.1.13 Incomplete elliptic integrals of the second kind.

Definition at line 1462 of file tr1/cmath.

2.76.2.14 ellint_3()

```
template<typename _Tp , typename _Tpn , typename _Tpp >
__gnu_cxx::__promote_3<_Tp, _Tpn, _Tpp>::__type std::tr1::ellint_3 (
    _Tp __k,
    _Tpn __nu,
    _Tpp __phi ) [inline]
```

5.2.1.14 Incomplete elliptic integrals of the third kind.

Definition at line 1479 of file tr1/cmath.

2.76.2.15 expint()

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::tr1::expint (
    _Tp __x ) [inline]
```

5.2.1.15 Exponential integrals.

Definition at line 1496 of file tr1/cmath.

2.76.2.16 hermite()

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::tr1::hermite (
    unsigned int __n,
    _Tp __x ) [inline]
```

5.2.1.16 Hermite polynomials.

Definition at line 1513 of file tr1/cmath.

2.76.2.17 hyperg()

```
template<typename _Tpa , typename _Tpb , typename _Tpc , typename _Tp >
__gnu_cxx::__promote_4<_Tpa, _Tpb, _Tpc, _Tp>::__type std::tr1::hyperg (
    _Tpa __a,
    _Tpb __b,
    _Tpc __c,
    _Tp __x ) [inline]
```

5.2.1.17 Hypergeometric functions.

Definition at line 1695 of file tr1/cmath.

2.76.2.18 laguerre()

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::tr1::laguerre (
    unsigned int __n,
    _Tp __x ) [inline]
```

5.2.1.18 Laguerre polynomials.

Definition at line 1530 of file tr1/cmath.

2.76.2.19 legendre()

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::tr1::legendre (
    unsigned int __n,
    _Tp __x ) [inline]
```

5.2.1.19 Legendre polynomials.

Definition at line 1547 of file tr1/cmath.

2.76.2.20 riemann_zeta()

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::tr1::riemann_zeta (
    _Tp __x ) [inline]
```

5.2.1.20 Riemann zeta function.

Definition at line 1564 of file tr1/cmath.

2.76.2.21 sph_bessel()

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::tr1::sph_bessel (
    unsigned int __n,
    _Tp __x ) [inline]
```

5.2.1.21 Spherical Bessel functions.

Definition at line 1581 of file tr1/cmath.

2.76.2.22 sph_legendre()

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::tr1::sph_legendre (
    unsigned int __l,
    unsigned int __m,
    _Tp __theta ) [inline]
```

5.2.1.22 Spherical associated Legendre functions.

Definition at line 1598 of file tr1/cmath.

2.76.2.23 sph_neumann()

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::tr1::sph_neumann (
    unsigned int __n,
    _Tp __x ) [inline]
```

5.2.1.23 Spherical Neumann functions.

Definition at line 1615 of file tr1/cmath.

2.77 Tags

Typedefs

- [typedef void `__gnu_pbds::trivial_iterator_difference_type`](#)

2.77.1 Detailed Description

2.77.2 Typedef Documentation

2.77.2.1 `trivial_iterator_difference_type`

```
typedef void \_\_gnu\_pbds::trivial\_iterator\_difference\_type
```

Prohibit moving trivial iterators.

Definition at line 79 of file `tag_and_trait.hpp`.

2.78 Technical Specifications

Collaboration diagram for Technical Specifications:

Modules

- [Filesystem TS](#)
- [Library Fundamentals TS](#)

2.78.1 Detailed Description

Components specified by various Technical Specifications.

As indicated by the `std::experimental` namespace and the header paths, the contents of these Technical Specifications are experimental and not part of the C++ standard. As such the interfaces and implementations may change in the future, and there is **no guarantee of compatibility between different GCC releases** for these features.

2.79 Threads

Collaboration diagram for Threads:

- `template<typename _Clock, typename _Dur1, typename _Dur2 >`
`constexpr common_type< _Dur1, _Dur2 >::type operator- (const time_point< _Clock, _Dur1 > &__lhs, const time_point< _Clock, _Dur2 > &__rhs)`

2.80.1 Detailed Description

Classes and functions for time.

2.80.2 Typedef Documentation

2.80.2.1 high_resolution_clock

```
using std::chrono::_V2::high_resolution_clock = typedef system_clock
```

Highest-resolution clock.

This is the clock "with the shortest tick period." Alias to `std::system_clock` until higher-than-nanosecond definitions become feasible.

Definition at line 1100 of file `chrono`.

2.80.2.2 hours

```
using std::chrono::hours = typedef duration< int64_t , ratio<3600> >
```

hours

Definition at line 792 of file `chrono`.

2.80.2.3 microseconds

```
using std::chrono::microseconds = typedef duration< int64_t , micro>
```

microseconds

Definition at line 780 of file `chrono`.

2.80.2.4 milliseconds

```
using std::chrono::milliseconds = typedef duration< int64_t , milli>
```

milliseconds

Definition at line 783 of file `chrono`.

2.80.2.5 minutes

```
using std::chrono::minutes = typedef duration< int64_t , ratio< 60> >
```

minutes

Definition at line 789 of file chrono.

2.80.2.6 nanoseconds

```
using std::chrono::nanoseconds = typedef duration< int64_t , nano>
```

nanoseconds

Definition at line 777 of file chrono.

2.80.2.7 seconds

```
using std::chrono::seconds = typedef duration< int64_t >
```

seconds

Definition at line 786 of file chrono.

2.80.3 Function Documentation

2.80.3.1 duration_cast()

```
template<typename _ToDur , typename _Rep , typename _Period >  
constexpr __enable_if_is_duration<_ToDur> std::chrono::duration_cast (   
    const duration< _Rep, _Period > & __d )
```

duration_cast

Definition at line 254 of file chrono.

2.80.3.2 operator*() [1/2]

```
template<typename _Rep1 , typename _Period , typename _Rep2 >
constexpr duration< __common_rep_t< _Rep1, _Rep2 >, _Period > operator* (
    const duration< _Rep1, _Period > & __d,
    const _Rep2 & __s ) [related]
```

Multiply a duration by a scalar value.

Definition at line 637 of file chrono.

2.80.3.3 operator*() [2/2]

```
template<typename _Rep1 , typename _Rep2 , typename _Period >
constexpr duration< __common_rep_t< _Rep2, _Rep1 >, _Period > operator* (
    const _Rep1 & __s,
    const duration< _Rep2, _Period > & __d ) [related]
```

Multiply a duration by a scalar value.

Definition at line 647 of file chrono.

2.80.3.4 operator+() [1/3]

```
template<typename _Rep1 , typename _Period1 , typename _Rep2 , typename _Period2 >
constexpr common_type< duration< _Rep1, _Period1 >, duration< _Rep2, _Period2 > >::type operator+
(
    const duration< _Rep1, _Period1 > & __lhs,
    const duration< _Rep2, _Period2 > & __rhs ) [related]
```

The sum of two durations.

Definition at line 594 of file chrono.

2.80.3.5 operator+() [2/3]

```
template<typename _Clock , typename _Dur1 , typename _Rep2 , typename _Period2 >
constexpr time_point< _Clock, typename common_type< _Dur1, duration< _Rep2, _Period2 > >::type >
operator+ (
    const time_point< _Clock, _Dur1 > & __lhs,
    const duration< _Rep2, _Period2 > & __rhs ) [related]
```

Adjust a time point forwards by the given duration.

Definition at line 917 of file chrono.

2.80.3.6 operator+() [3/3]

```
template<typename _Rep1 , typename _Period1 , typename _Clock , typename _Dur2 >
constexpr time_point< _Clock, typename common_type< duration< _Rep1, _Period1 >, _Dur2 >::type >
operator+ (
    const duration< _Rep1, _Period1 > & __lhs,
    const time_point< _Clock, _Dur2 > & __rhs ) [related]
```

Adjust a time point forwards by the given duration.

Definition at line 931 of file chrono.

2.80.3.7 operator-() [1/3]

```
template<typename _Rep1 , typename _Period1 , typename _Rep2 , typename _Period2 >
constexpr common_type< duration< _Rep1, _Period1 >, duration< _Rep2, _Period2 > >::type operator-
(
    const duration< _Rep1, _Period1 > & __lhs,
    const duration< _Rep2, _Period2 > & __rhs ) [related]
```

The difference between two durations.

Definition at line 608 of file chrono.

2.80.3.8 operator-() [2/3]

```
template<typename _Clock , typename _Dur1 , typename _Rep2 , typename _Period2 >
constexpr time_point< _Clock, typename common_type< _Dur1, duration< _Rep2, _Period2 > >::type >
operator- (
    const time_point< _Clock, _Dur1 > & __lhs,
    const duration< _Rep2, _Period2 > & __rhs ) [related]
```

Adjust a time point backwards by the given duration.

Definition at line 945 of file chrono.

2.80.3.9 operator-() [3/3]

```
template<typename _Clock , typename _Dur1 , typename _Dur2 >
constexpr common_type< _Dur1, _Dur2 >::type operator- (
    const time_point< _Clock, _Dur1 > & __lhs,
    const time_point< _Clock, _Dur2 > & __rhs ) [related]
```

The difference between two time points (as a duration)

Definition at line 961 of file chrono.

2.80.3.10 time_point_cast()

```
template<typename _ToDur , typename _Clock , typename _Dur >
constexpr enable_if<__is_duration<_ToDur>::value, time_point<_Clock, _ToDur> >::type std::chrono<
::time_point_cast (
    const time_point< _Clock, _Dur > & __t )
```

time_point_cast

Definition at line 873 of file chrono.

2.81 Traits

Collaboration diagram for Traits:

Classes

- struct `__gnu_pbds::detail::bin_search_tree_traits< Key, Mapped, Cmp_Fn, Node_Update, Node, _Alloc >`
- struct `__gnu_pbds::detail::bin_search_tree_traits< Key, null_type, Cmp_Fn, Node_Update, Node, _Alloc >`
- struct `__gnu_pbds::container_traits< Cntr >`
- struct `__gnu_pbds::container_traits_base< _Tag >`

Variables

- static `null_type __gnu_pbds::detail::maybe_null_type< Key, null_type, _Alloc, Store_Hash >::s_null_type`

2.81.1 Detailed Description

2.82 Type-safe container of any type

Collaboration diagram for Type-safe container of any type:

Classes

- class `std::experimental::fundamentals_v1::any`
- class `std::experimental::fundamentals_v1::bad_any_cast`

Macros

- `#define __cpp_lib_experimental_any`

Functions

- static void `std::experimental::fundamentals_v1::any::Manager_internal<_Tp>::_S_manage` (`_Op __op` which, const `any *__anyp`, `_Arg *__arg`)
- static void `std::experimental::fundamentals_v1::any::Manager_external<_Tp>::_S_manage` (`_Op __op` which, const `any *__anyp`, `_Arg *__arg`)
- template<typename `_ValueType`>
`_ValueType std::experimental::fundamentals_v1::any_cast` (const `any &__any`)
- void `std::experimental::fundamentals_v1::swap` (`any &__x`, `any &__y`) noexcept
- template<typename `_ValueType`>
`_ValueType std::experimental::fundamentals_v1::any_cast` (`any &__any`)
- template<typename `_ValueType` , typename enable_if<is_move_constructible< `_ValueType` >::value||is_lvalue_reference< `_ValueType` >::value, bool >::type = true>
`_ValueType std::experimental::fundamentals_v1::any_cast` (`any &&__any`)
- template<typename `_ValueType`>
const `_ValueType *` `std::experimental::fundamentals_v1::any_cast` (const `any *__any`) noexcept
- template<typename `_ValueType`>
`_ValueType *` `std::experimental::fundamentals_v1::any_cast` (`any *__any`) noexcept

2.82.1 Detailed Description

A type-safe container for single values of value types, as described in n3804 "Any Library Proposal (Revision 3)".

2.82.2 Function Documentation

2.82.2.1 `any_cast()` [1/5]

```
template<typename _ValueType >
_ValueType std::experimental::fundamentals_v1::any_cast (
    const any & __any ) [inline]
```

Access the contained object.

Template Parameters

<code>_ValueType</code>	A const-reference or CopyConstructible type.
-------------------------	--

Parameters

<code>__any</code>	The object to access.
--------------------	-----------------------

Returns

The contained object.

Exceptions

<code>bad_any_cast</code>	If <code>__any.type() != typeid(remove_reference_t<_ValueType>)</code>
---------------------------	--

Definition at line 355 of file `experimental/any`.

2.82.2.2 `any_cast()` [2/5]

```
template<typename _ValueType >
_ValueType std::experimental::fundamentals_v1::any_cast (
    any & __any ) [inline]
```

Access the contained object.

Template Parameters

<code>_ValueType</code>	A reference or CopyConstructible type.
-------------------------	--

Parameters

<code>__any</code>	The object to access.
--------------------	-----------------------

Returns

The contained object.

Exceptions

<i>bad_any_cast</i>	If <code>__any.type() != typeid(remove_reference_t<_ValueType>)</code>
---------------------	--

Definition at line 378 of file experimental/any.

2.82.2.3 `any_cast()` [3/5]

```
template<typename _ValueType , typename enable_if<!is_move_constructible< _ValueType >::value||is_lvalue_reference< _ValueType >::value, bool >::type = true>
_ValueType std::experimental::fundamentals_v1::any_cast (
    any && __any ) [inline]
```

Access the contained object.

Template Parameters

<code>_ValueType</code>	A reference or CopyConstructible type.
-------------------------	--

Parameters

<code>__any</code>	The object to access.
--------------------	-----------------------

Returns

The contained object.

Exceptions

<i>bad_any_cast</i>	If <code>__any.type() != typeid(remove_reference_t<_ValueType>)</code>
---------------------	--

Definition at line 392 of file experimental/any.

2.82.2.4 `any_cast()` [4/5]

```
template<typename _ValueType >
const _ValueType* std::experimental::fundamentals_v1::any_cast (
    const any * __any ) [inline], [noexcept]
```

Access the contained object.

Template Parameters

<code>_ValueType</code>	The type of the contained object.
-------------------------	-----------------------------------

Parameters

<code>__any</code>	A pointer to the object to access.
--------------------	------------------------------------

Returns

The address of the contained object if `__any != nullptr && __any.type() == typeid(_ValueType)` , otherwise a null pointer.

Definition at line 468 of file `experimental/any`.

2.82.2.5 `any_cast()` [5/5]

```
template<typename _ValueType >
_ValueType* std::experimental::fundamentals_v1::any_cast (
    any * __any ) [inline], [noexcept]
```

Access the contained object.

Template Parameters

<code>_ValueType</code>	The type of the contained object.
-------------------------	-----------------------------------

Parameters

<code>__any</code>	A pointer to the object to access.
--------------------	------------------------------------

Returns

The address of the contained object if `__any != nullptr && __any.type() == typeid(_ValueType)` , otherwise a null pointer.

Definition at line 476 of file `experimental/any`.

2.82.2.6 swap()

```
void std::experimental::fundamentals_v1::swap (
    any & __x,
    any & __y ) [inline], [noexcept]
```

Exchange the states of two `any` objects.

Definition at line 342 of file `experimental/any`.

2.83 Uniform Distributions

Collaboration diagram for Uniform Distributions:

Classes

- struct `std::uniform_real_distribution<_RealType>::param_type`
- class `std::uniform_real_distribution<_RealType>`

Functions

- template<typename _IntType >
bool `std::operator!=` (const `std::uniform_int_distribution<_IntType>` &__d1, const `std::uniform_int_distribution<_IntType>` &__d2)
- template<typename _IntType >
bool `std::operator!=` (const `std::uniform_real_distribution<_IntType>` &__d1, const `std::uniform_real_distribution<_IntType>` &__d2)
- template<typename _IntType, typename _CharT, typename _Traits >
`std::basic_ostream<_CharT, _Traits>` & `std::operator<<` (`std::basic_ostream<_CharT, _Traits>` &, const `std::uniform_int_distribution<_IntType>` &)
- template<typename _RealType, typename _CharT, typename _Traits >
`std::basic_ostream<_CharT, _Traits>` & `std::operator<<` (`std::basic_ostream<_CharT, _Traits>` &, const `std::uniform_real_distribution<_RealType>` &)
- template<typename _IntType, typename _CharT, typename _Traits >
`std::basic_istream<_CharT, _Traits>` & `std::operator>>` (`std::basic_istream<_CharT, _Traits>` &, `std::uniform_int_distribution<_IntType>` &)
- template<typename _RealType, typename _CharT, typename _Traits >
`std::basic_istream<_CharT, _Traits>` & `std::operator>>` (`std::basic_istream<_CharT, _Traits>` &, `std::uniform_real_distribution<_RealType>` &)

2.83.1 Detailed Description

2.83.2 Function Documentation

2.83.2.1 operator!=() [1/2]

```
template<typename _IntType >
bool std::operator!=(
    const std::uniform_int_distribution< _IntType > & __d1,
    const std::uniform_int_distribution< _IntType > & __d2 ) [inline]
```

Return true if two uniform integer distributions have different parameters.

Definition at line 1698 of file random.h.

2.83.2.2 operator!=() [2/2]

```
template<typename _IntType >
bool std::operator!=(
    const std::uniform_real_distribution< _IntType > & __d1,
    const std::uniform_real_distribution< _IntType > & __d2 ) [inline]
```

Return true if two uniform real distributions have different parameters.

Definition at line 1919 of file random.h.

2.83.2.3 operator<<() [1/2]

```
template<typename _IntType , typename _CharT , typename _Traits >
std::basic_ostream< _CharT, _Traits > & std::operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::uniform_int_distribution< _IntType > & __x )
```

Inserts a uniform_int_distribution random number distribution __x into the output stream os.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A uniform_int_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

Definition at line 867 of file bits/random.tcc.

References `std::basic_ios< _CharT, _Traits >::fill()`, `std::ios_base::flags()`, and `std::basic_ios< _CharT, _Traits >::widen()`.

2.83.2.4 operator<<() [2/2]

```
template<typename _RealType , typename _CharT , typename _Traits >
std::basic_ostream< _CharT, _Traits > & std::operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::uniform_real_distribution< _RealType > & __x )
```

Inserts a uniform_real_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A uniform_real_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

Definition at line 925 of file bits/random.tcc.

References std::basic_ios< _CharT, _Traits >::fill(), std::ios_base::flags(), std::ios_base::precision(), and std::basic_istream< _CharT, _Traits >::widen().

2.83.2.5 operator>>() [1/2]

```
template<typename _IntType , typename _CharT , typename _Traits >
std::basic_istream< _CharT, _Traits > & std::operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::uniform_int_distribution< _IntType > & __x )
```

Extracts a uniform_int_distribution random number distribution __x from the input stream __is.

Parameters

__is	An input stream.
__x	A uniform_int_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

Definition at line 887 of file bits/random.tcc.

References std::dec(), std::ios_base::flags(), std::uniform_int_distribution< _IntType >::param(), and std::skipws().

2.83.2.6 operator>>() [2/2]

```
template<typename _RealType , typename _CharT , typename _Traits >
std::basic_istream< _CharT, _Traits > & std::operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::uniform_real_distribution< _RealType > & __x )
```

Extracts a uniform_real_distribution random number distribution __x from the input stream __is.

Parameters

\leftrightarrow __is	An input stream.
\leftrightarrow __x	A uniform_real_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

Definition at line 948 of file bits/random.tcc.

References std::ios_base::flags(), std::uniform_real_distribution< _RealType >::param(), and std::skipws().

2.84 Unordered Associative

Collaboration diagram for Unordered Associative:

Modules

- [Base and Implementation Classes](#)

Classes

- class `std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>`
- class `std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>`
- class `std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>`
- class `std::unordered_set<_Value, _Hash, _Pred, _Alloc>`

2.84.1 Detailed Description

Unordered associative containers allow fast retrieval of data based on keys.

Each container type is parameterized on a `Key` type, a `Hash` type providing a hashing functor, and an ordering relation used to sort the elements of the container.

All unordered associative containers must meet certain requirements, summarized in [tables](#).

2.85 Utilities

Collaboration diagram for Utilities:

Modules

- [Function Objects](#)
- [Memory](#)
- [Metaprogramming](#)

2.85.1 Detailed Description

Components deemed generally useful. Includes pair, tuple, forward/move helpers, ratio, function object, metaprogramming and type traits, time, date, and memory functions.

2.85.2 Function Documentation

2.85.2.1 pair()

```
template<class _T1, class _T2>
template<typename... _Args1, typename... _Args2>
constexpr std::pair<_T1, _T2>::pair (
    piecewise_construct_t ,
    tuple<_Args1...> __first,
    tuple<_Args2...> __second ) [inline]
```

"piecewise construction" using a tuple of arguments for each member.

Parameters

<code>__first</code>	Arguments for the first member of the pair.
<code>__second</code>	Arguments for the second member of the pair.

The elements of each tuple will be used as the constructor arguments for the data members of the pair.

Definition at line 1678 of file tuple.

2.85.2.2 `__addressof()`

```
template<typename _Tp >
constexpr _Tp* std::__addressof (
    _Tp & __r ) [inline], [noexcept]
```

Same as C++11 `std::addressof`.

Definition at line 49 of file move.h.

Referenced by `std::_Destroy()`, `__gnu_debug::_Safe_sequence< map< _Key, _Tp, _Compare, _Allocator > >::_M_transfer_from_if()`, `std::addressof()`, `std::list< __inp, __rebind_inp >::merge()`, `std::sub_match< _Bi_iter >::operator<()`, `std::forward_list< _Tp, _Alloc >::operator=()`, `std::list< __inp, __rebind_inp >::operator=()`, `std::sub_match< _Bi_iter >::operator==()`, `std::forward_list< _Tp, _Alloc >::remove()`, `std::list< __inp, __rebind_inp >::remove()`, `std::rethrow_if_nested()`, and `std::list< __inp, __rebind_inp >::splice()`.

2.85.2.3 `__invoke()`

```
template<typename _Callable , typename... _Args>
constexpr __invoke_result<_Callable, _Args...>::type std::__invoke (
    _Callable && __fn,
    _Args &&... __args ) [noexcept]
```

Invoke a callable object.

Definition at line 89 of file invoke.h.

2.85.2.4 `addressof()`

```
template<typename _Tp >
constexpr _Tp* std::addressof (
    _Tp & __r ) [inline], [noexcept]
```

Returns the actual address of the object or function referenced by `r`, even in the presence of an overloaded operator`&`.

Parameters

↩	Reference to an object or function.
↩	
↩	
↩	
<i>r</i>	

Returns

The actual address.

Definition at line 140 of file move.h.

References `std::__addressof()`.

Referenced by `std::pointer_traits<_Tp*>::pointer_to()`.

2.85.2.5 forward() [1/2]

```
template<typename _Tp >
constexpr _Tp&& std::forward (
    typename std::remove_reference< _Tp >::type & __t ) [noexcept]
```

Forward an lvalue.

Returns

The parameter cast to the specified type.

This function is used to implement "perfect forwarding".

Definition at line 76 of file move.h.

2.85.2.6 forward() [2/2]

```
template<typename _Tp >
constexpr _Tp&& std::forward (
    typename std::remove_reference< _Tp >::type && __t ) [noexcept]
```

Forward an rvalue.

Returns

The parameter cast to the specified type.

This function is used to implement "perfect forwarding".

Definition at line 87 of file move.h.

2.85.2.7 forward_as_tuple()

```
template<typename... _Elements>
constexpr tuple<_Elements&&...> std::forward_as_tuple (
    _Elements &&... __args ) [noexcept]
```

std::forward_as_tuple

Definition at line 1490 of file tuple.

2.85.2.8 get() [1/8]

```
template<std::size_t __i, typename... _Elements>
constexpr __tuple_element_t<__i, tuple<_Elements...> >& std::get (
    tuple< _Elements... > & __t ) [noexcept]
```

Return a reference to the ith element of a tuple.

Definition at line 1298 of file tuple.

2.85.2.9 get() [2/8]

```
template<std::size_t __i, typename... _Elements>
constexpr const __tuple_element_t<__i, tuple<_Elements...> >& std::get (
    const tuple< _Elements... > & __t ) [noexcept]
```

Return a const reference to the ith element of a const tuple.

Definition at line 1304 of file tuple.

2.85.2.10 get() [3/8]

```
template<std::size_t __i, typename... _Elements>
constexpr __tuple_element_t<__i, tuple<_Elements...> >&& std::get (
    tuple< _Elements... > && __t ) [noexcept]
```

Return an rvalue reference to the ith element of a tuple rvalue.

Definition at line 1310 of file tuple.

2.85.2.11 `get()` [4/8]

```
template<std::size_t __i, typename... _Elements>
constexpr const __tuple_element_t<__i, tuple<_Elements...> >&& std::get (
    const tuple<_Elements...> && __t ) [noexcept]
```

Return a const rvalue reference to the *i*th element of a const tuple rvalue.

Definition at line 1319 of file tuple.

2.85.2.12 `get()` [5/8]

```
template<typename _Tp, typename... _Types>
constexpr _Tp& std::get (
    tuple<_Types...> & __t ) [noexcept]
```

Return a reference to the unique element of type *_Tp* of a tuple.

Definition at line 1342 of file tuple.

2.85.2.13 `get()` [6/8]

```
template<typename _Tp, typename... _Types>
constexpr _Tp&& std::get (
    tuple<_Types...> && __t ) [noexcept]
```

Return a reference to the unique element of type *_Tp* of a tuple rvalue.

Definition at line 1348 of file tuple.

2.85.2.14 `get()` [7/8]

```
template<typename _Tp, typename... _Types>
constexpr const _Tp& std::get (
    const tuple<_Types...> & __t ) [noexcept]
```

Return a const reference to the unique element of type *_Tp* of a tuple.

Definition at line 1354 of file tuple.

2.85.2.15 `get()` [8/8]

```
template<typename _Tp , typename... _Types>
constexpr const _Tp&& std::get (
    const tuple< _Types... > && __t ) [noexcept]
```

Return a const reference to the unique element of type `_Tp` of a const tuple rvalue.

Definition at line 1361 of file `tuple`.

2.85.2.16 `make_pair()`

```
template<typename _T1 , typename _T2 >
constexpr pair< typename __decay_and_strip< _T1 >::__type, typename __decay_and_strip< _T2 >::__type > make_pair (
    _T1 && __x,
    _T2 && __y ) [related]
```

A convenience wrapper for creating a pair from two objects.

Parameters

<code>__x</code>	The first object.
<code>__y</code>	The second object.

Returns

A newly-constructed `pair<>` object of the appropriate type.

The C++98 standard says the objects are passed by reference-to-const, but C++03 says they are passed by value (this was LWG issue #181).

Since C++11 they have been passed by forwarding reference and then forwarded to the new members of the pair. To create a pair with a member of reference type, pass a `reference_wrapper` to this function.

Definition at line 567 of file `std_pair.h`.

2.85.2.17 `move()`

```
template<typename _Tp >
constexpr std::remove_reference<_Tp>::type&& std::move (
    _Tp && __t ) [noexcept]
```

Convert a value to an rvalue.

Parameters

↔	A thing of arbitrary type.
↔	
↔	
↔	
<i>t</i>	

Returns

The parameter cast to an rvalue-reference to allow moving it.

Definition at line 101 of file move.h.

Referenced by `std::basic_regex< _Ch_type, _Rx_traits >::assign()`, `std::shared_ptr< _State >::atomic_compare_exchange_strong_explicit()`, `std::function< _Res(_ArgTypes...)>::function()`, `std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert()`, `std::multimap< _Key, _Tp, _Compare, _Alloc >::insert()`, `std::unordered_map< _Key, _Tp, _Hash, _Pred >::insert()`, `std::map< _Key, _Tp, _Compare, _Alloc >::insert()`, `std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert()`, `std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::insert()`, `std::list< __inp, __rebind_inp >::insert()`, `std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert()`, `std::deque< _StateSeqT >::insert()`, `std::forward_list< _Tp, _Alloc >::insert_after()`, `std::forward_list< _Tp, _Alloc >::merge()`, `std::move_if_noexcept()`, `std::function< _Res(_ArgTypes...)>::operator=()`, `std::basic_regex< _Ch_type, _Rx_traits >::operator=()`, `std::forward_list< _Tp, _Alloc >::operator=()`, `std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::operator=()`, `std::list< __inp, __rebind_inp >::operator=()`, `std::deque< _StateSeqT >::operator=()`, `std::unordered_map< _Key, _Tp, _Hash, _Pred >::operator[]()`, `std::forward_list< _Tp, _Alloc >::push_front()`, `std::unique_ptr< _Result< _Res > >::reset()`, `std::unique_ptr< _Tp[], _Dp >::reset()`, `std::list< __inp, __rebind_inp >::splice()`, and `std::unique_ptr< _Result< _Res > >::~~unique_ptr()`.

2.85.2.18 move_if_noexcept()

```
template<typename _Tp >
constexpr conditional<__move_if_noexcept_cond<_Tp>::value, const _Tp&, _Tp&&>::type std::move_if_noexcept (
    _Tp & __x ) [noexcept]
```

Conditionally convert a value to an rvalue.

Parameters

↔	A thing of arbitrary type.
<i>__x</i>	

Returns

The parameter, possibly cast to an rvalue-reference.

Same as `std::move` unless the type's move constructor could throw and the type is copyable, in which case an lvalue-reference is returned instead.

Definition at line 121 of file move.h.

References `std::move()`.

2.85.2.19 `operator!=()`

```
template<typename _T1 , typename _T2 >
constexpr bool operator!= (
    const pair< _T1, _T2 > & __x,
    const pair< _T1, _T2 > & __y ) [related]
```

Uses `operator==` to find the result.

Definition at line 496 of file stl_pair.h.

2.85.2.20 `operator<()`

```
template<typename _T1 , typename _T2 >
constexpr bool operator< (
    const pair< _T1, _T2 > & __x,
    const pair< _T1, _T2 > & __y ) [related]
```

Defines a lexicographical order for pairs.

For two pairs of the same type, `P` is ordered before `Q` if `P.first` is less than `Q.first`, or if `P.first` and `Q.first` are equivalent (neither is less than the other) and `P.second` is less than `Q.second`.

Definition at line 489 of file stl_pair.h.

2.85.2.21 `operator<=()`

```
template<typename _T1 , typename _T2 >
constexpr bool operator<= (
    const pair< _T1, _T2 > & __x,
    const pair< _T1, _T2 > & __y ) [related]
```

Uses `operator<` to find the result.

Definition at line 508 of file stl_pair.h.

2.85.2.22 operator==()

```
template<typename _T1 , typename _T2 >
constexpr bool operator== (
    const pair< _T1, _T2 > & __x,
    const pair< _T1, _T2 > & __y ) [related]
```

Two pairs of the same type are equal iff their members are equal.

Definition at line 466 of file stl_pair.h.

2.85.2.23 operator>()

```
template<typename _T1 , typename _T2 >
constexpr bool operator> (
    const pair< _T1, _T2 > & __x,
    const pair< _T1, _T2 > & __y ) [related]
```

Uses operator< to find the result.

Definition at line 502 of file stl_pair.h.

2.85.2.24 operator>=()

```
template<typename _T1 , typename _T2 >
constexpr bool operator>= (
    const pair< _T1, _T2 > & __x,
    const pair< _T1, _T2 > & __y ) [related]
```

Uses operator< to find the result.

Definition at line 514 of file stl_pair.h.

2.85.2.25 swap() [1/4]

```
template<typename _Tp >
constexpr enable_if<__and<__not<__is_tuple_like<_Tp> >, is_move_constructible<_Tp>, is_move_assignable<_Tp> >::value>::type std::swap (
    _Tp & __a,
    _Tp & __b ) [inline], [noexcept]
```

Swaps two values.

Parameters

\leftrightarrow _a	A thing of arbitrary type.
\leftrightarrow _b	Another thing of arbitrary type.

Returns

Nothing.

Definition at line 189 of file move.h.

2.85.2.26 swap() [2/4]

```
template<typename _Tp , size_t _Nm>
constexpr enable\_if<__is_swappable<_Tp>::value>::type std::swap (
    _Tp(&) __a[_Nm],
    _Tp(&) __b[_Nm] ) [inline], [noexcept]
```

Swap the contents of two arrays.

Definition at line 213 of file move.h.

2.85.2.27 swap() [3/4]

```
template<typename _T1 , typename _T2 >
constexpr enable\_if<__and< __is_swappable< _T1 >, __is_swappable< _T2 > >::value >::type swap
(
    pair< _T1, _T2 > & __x,
    pair< _T1, _T2 > & __y ) [related]
```

Swap overload for pairs. Calls std::pair::swap().

Note

This std::swap overload is not declared in C++03 mode, which has performance implications, e.g. see <https://gcc.gnu.org/PR38466>

Definition at line 533 of file stl_pair.h.

2.85.2.28 swap() [4/4]

```
template<typename... _Elements>
constexpr enable_if<__and<__is_swappable<_Elements>...>::value >::type std::swap (
    tuple< _Elements... > & __x,
    tuple< _Elements... > & __y ) [inline], [delete], [noexcept]
```

swap

Definition at line 1633 of file tuple.

2.85.2.29 tie()

```
template<typename... _Elements>
constexpr tuple<_Elements&...> std::tie (
    _Elements &... __args ) [noexcept]
```

tie

Definition at line 1619 of file tuple.

Referenced by std::basic_ios< char, _Traits >::copyfmt().

2.85.2.30 tuple_cat()

```
template<typename... _Tpls, typename = typename enable_if<__and<__is_tuple_like<_Tpls>...>↵
::value>::type>
constexpr auto std::tuple_cat (
    _Tpls &&... __tpls ) -> typename __tuple_cat_result<_Tpls...>::__type
```

tuple_cat

Definition at line 1605 of file tuple.

2.85.3 Variable Documentation**2.85.3.1 piecewise_construct**

```
constexpr piecewise_construct_t std::piecewise_construct [inline]
```

Tag for piecewise construction of std::pair objects.

Definition at line 83 of file stl_pair.h.

`rope< _CharT, _Alloc > identity_element (_Rope_Concat_fn< _CharT, _Alloc >)`

### 3.1.1 Detailed Description

GNU extensions for public use.

### 3.1.2 Typedef Documentation

#### 3.1.2.1 `__int_traits`

```
template<typename _Tp >
using __gnu_cxx::__int_traits = typedef __numeric_traits_integer<_Tp>
```

Convenience alias for `__numeric_traits<integer-type>`.

Definition at line 136 of file `numeric_traits.h`.

### 3.1.3 Function Documentation

#### 3.1.3.1 `__static_pointer_cast()` [1/2]

```
template<typename _ToType, typename _FromType >
_ToType __gnu_cxx::__static_pointer_cast (
 const _FromType & __arg) [inline]
```

Casting operations for cases where `_FromType` is not a standard pointer. `_ToType` can be a standard or non-standard pointer. Given that `_FromType` is not a pointer, it must have a `get()` method that returns the standard pointer equivalent of the address it points to, and must have an `element_type` typedef which names the type it points to.

Definition at line 68 of file `cast.h`.

### 3.1.3.2 `__static_pointer_cast()` [2/2]

```
template<typename _ToType , typename _FromType >
_ToType __gnu_cxx::__static_pointer_cast (
 _FromType * __arg) [inline]
```

Casting operations for cases where `_FromType` is a standard pointer. `_ToType` can be a standard or non-standard pointer.

Definition at line 96 of file `cast.h`.

### 3.1.3.3 `_Bit_scan_forward()`

```
std::size_t __gnu_cxx::_Bit_scan_forward (
 std::size_t __num) [inline]
```

Generic Version of the `bsf` instruction.

Definition at line 508 of file `bitmap_allocator.h`.

Referenced by `__gnu_cxx::bitmap_allocator<_Tp>::_M_allocate_single_object()`.

### 3.1.3.4 `operator!=()` [1/3]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
bool __gnu_cxx::operator!= (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test difference of two strings.

#### Parameters

|                    |                |
|--------------------|----------------|
| <code>__lhs</code> | First string.  |
| <code>__rhs</code> | Second string. |

#### Returns

True if `__lhs.compare(__rhs) != 0`. False otherwise.

Definition at line 2389 of file `vstring.h`.

### 3.1.3.5 operator!=(()) [2/3]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
bool __gnu_cxx::operator!=(
 const _CharT * __lhs,
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test difference of C string and string.

#### Parameters

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | C string. |
| <code>__rhs</code> | String.   |

#### Returns

True if `__rhs.compare(__lhs) != 0`. False otherwise.

Definition at line 2402 of file `vstring.h`.

### 3.1.3.6 operator!=(()) [3/3]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
bool __gnu_cxx::operator!=(
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
 const _CharT * __rhs) [inline]
```

Test difference of string and C string.

#### Parameters

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | String.   |
| <code>__rhs</code> | C string. |

#### Returns

True if `__lhs.compare(__rhs) != 0`. False otherwise.

Definition at line 2415 of file `vstring.h`.

### 3.1.3.7 `operator+()` [1/5]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base > __gnu_cxx::operator+ (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)
```

Concatenate two strings.

#### Parameters

|                    |               |
|--------------------|---------------|
| <code>__lhs</code> | First string. |
| <code>__rhs</code> | Last string.  |

#### Returns

New string with value of `__lhs` followed by `__rhs`.

Definition at line 181 of file `vstring.tcc`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::append()`, `__gnu_cxx::__versa_string< ↵  
_CharT, _Traits, _Alloc, _Base >::reserve()`, and `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::size()`.

### 3.1.3.8 `operator+()` [2/5]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base > __gnu_cxx::operator+ (
 const _CharT * __lhs,
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)
```

Concatenate C string and string.

#### Parameters

|                    |               |
|--------------------|---------------|
| <code>__lhs</code> | First string. |
| <code>__rhs</code> | Last string.  |

#### Returns

New string with value of `__lhs` followed by `__rhs`.

Definition at line 194 of file `vstring.tcc`.

## 3.1.3.9 operator+() [3/5]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base > __gnu_cxx::operator+ (
 _CharT __lhs,
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)
```

Concatenate character and string.

## Parameters

|                    |               |
|--------------------|---------------|
| <code>__lhs</code> | First string. |
| <code>__rhs</code> | Last string.  |

## Returns

New string with `__lhs` followed by `__rhs`.

Definition at line 211 of file `vstring.tcc`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::append()`, `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::push_back()`, `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::reserve()`, and `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::size()`.

## 3.1.3.10 operator+() [4/5]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base > __gnu_cxx::operator+ (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
 const _CharT * __rhs)
```

Concatenate string and C string.

## Parameters

|                    |               |
|--------------------|---------------|
| <code>__lhs</code> | First string. |
| <code>__rhs</code> | Last string.  |

## Returns

New string with `__lhs` followed by `__rhs`.

Definition at line 224 of file `vstring.tcc`.

3.1.3.11 `operator+()` [5/5]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base > __gnu_cxx::operator+ (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
 _CharT __rhs)
```

Concatenate string and character.

## Parameters

|                    |               |
|--------------------|---------------|
| <code>__lhs</code> | First string. |
| <code>__rhs</code> | Last string.  |

## Returns

New string with `__lhs` followed by `__rhs`.

Definition at line 241 of file `vstring.tcc`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::append()`, `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::push_back()`, `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::reserve()`, and `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::size()`.

3.1.3.12 `operator<()` [1/3]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
bool __gnu_cxx::operator< (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test if string precedes string.

## Parameters

|                    |                |
|--------------------|----------------|
| <code>__lhs</code> | First string.  |
| <code>__rhs</code> | Second string. |

## Returns

True if `__lhs` precedes `__rhs`. False otherwise.

Definition at line 2429 of file `vstring.h`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare()`.

## 3.1.3.13 operator&lt;() [2/3]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
bool __gnu_cxx::operator< (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
 const _CharT * __rhs) [inline]
```

Test if string precedes C string.

## Parameters

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | String.   |
| <code>__rhs</code> | C string. |

## Returns

True if `__lhs` precedes `__rhs`. False otherwise.

Definition at line 2442 of file `vstring.h`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare()`.

## 3.1.3.14 operator&lt;() [3/3]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
bool __gnu_cxx::operator< (
 const _CharT * __lhs,
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test if C string precedes string.

## Parameters

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | C string. |
| <code>__rhs</code> | String.   |

## Returns

True if `__lhs` precedes `__rhs`. False otherwise.

Definition at line 2455 of file `vstring.h`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare()`.

**3.1.3.15 operator<=()** [1/3]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
bool __gnu_cxx::operator<= (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test if string doesn't follow string.

**Parameters**

|                    |                |
|--------------------|----------------|
| <code>__lhs</code> | First string.  |
| <code>__rhs</code> | Second string. |

**Returns**

True if `__lhs` doesn't follow `__rhs`. False otherwise.

Definition at line 2509 of file `vstring.h`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare()`.

**3.1.3.16 operator<=()** [2/3]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
bool __gnu_cxx::operator<= (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
 const _CharT * __rhs) [inline]
```

Test if string doesn't follow C string.

**Parameters**

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | String.   |
| <code>__rhs</code> | C string. |

**Returns**

True if `__lhs` doesn't follow `__rhs`. False otherwise.

Definition at line 2522 of file `vstring.h`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare()`.

**3.1.3.17 operator<=()** [3/3]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
bool __gnu_cxx::operator<= (
 const _CharT * __lhs,
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test if C string doesn't follow string.

**Parameters**

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | C string. |
| <code>__rhs</code> | String.   |

**Returns**

True if `__lhs` doesn't follow `__rhs`. False otherwise.

Definition at line 2535 of file `vstring.h`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare()`.

**3.1.3.18 operator==(** [1/4]

```
template<typename _Tp >
bool __gnu_cxx::operator==(
 const _Pointer_adapter< _Tp > & __lhs,
 const _Pointer_adapter< _Tp > & __rhs) [inline]
```

Comparison operators for `_Pointer_adapter` defer to the base class' comparison operators, when possible.

Definition at line 546 of file `pointer.h`.

**3.1.3.19 operator==(** [2/4]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
bool __gnu_cxx::operator==(
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test equivalence of two strings.

**Parameters**

|                    |                |
|--------------------|----------------|
| <code>__lhs</code> | First string.  |
| <code>__rhs</code> | Second string. |

**Returns**

True if `__lhs.compare(__rhs) == 0`. False otherwise.

Definition at line 2338 of file `vstring.h`.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::compare()`.

**3.1.3.20 operator==( ) [ 3 / 4 ]**

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
bool __gnu_cxx::operator==(
 const _CharT * __lhs,
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test equivalence of C string and string.

**Parameters**

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | C string. |
| <code>__rhs</code> | String.   |

**Returns**

True if `__rhs.compare(__lhs) == 0`. False otherwise.

Definition at line 2362 of file `vstring.h`.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::compare()`.

**3.1.3.21 operator==( ) [ 4 / 4 ]**

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
bool __gnu_cxx::operator==(
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
 const _CharT * __rhs) [inline]
```

Test equivalence of string and C string.

## Parameters

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | String.   |
| <code>__rhs</code> | C string. |

## Returns

True if `__lhs.compare(__rhs) == 0`. False otherwise.

Definition at line 2375 of file `vstring.h`.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base>::compare()`.

3.1.3.22 `operator>()` [1/3]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
bool __gnu_cxx::operator> (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test if string follows string.

## Parameters

|                    |                |
|--------------------|----------------|
| <code>__lhs</code> | First string.  |
| <code>__rhs</code> | Second string. |

## Returns

True if `__lhs` follows `__rhs`. False otherwise.

Definition at line 2469 of file `vstring.h`.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base>::compare()`.

3.1.3.23 `operator>()` [2/3]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
bool __gnu_cxx::operator> (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
 const _CharT * __rhs) [inline]
```

Test if string follows C string.

**Parameters**

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | String.   |
| <code>__rhs</code> | C string. |

**Returns**

True if `__lhs` follows `__rhs`. False otherwise.

Definition at line 2482 of file `vstring.h`.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::compare()`.

**3.1.3.24 `operator>()`** [3/3]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
bool __gnu_cxx::operator> (
 const _CharT * __lhs,
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test if C string follows string.

**Parameters**

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | C string. |
| <code>__rhs</code> | String.   |

**Returns**

True if `__lhs` follows `__rhs`. False otherwise.

Definition at line 2495 of file `vstring.h`.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::compare()`.

**3.1.3.25 `operator>=()`** [1/3]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
bool __gnu_cxx::operator>= (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test if string doesn't precede string.

**Parameters**

|                    |                |
|--------------------|----------------|
| <code>__lhs</code> | First string.  |
| <code>__rhs</code> | Second string. |

**Returns**

True if `__lhs` doesn't precede `__rhs`. False otherwise.

Definition at line 2549 of file `vstring.h`.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::compare()`.

**3.1.3.26 operator>=()** [2/3]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
bool __gnu_cxx::operator>= (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
 const _CharT * __rhs) [inline]
```

Test if string doesn't precede C string.

**Parameters**

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | String.   |
| <code>__rhs</code> | C string. |

**Returns**

True if `__lhs` doesn't precede `__rhs`. False otherwise.

Definition at line 2562 of file `vstring.h`.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::compare()`.

**3.1.3.27 operator>=()** [3/3]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
bool __gnu_cxx::operator>= (
 const _CharT * __lhs,
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test if C string doesn't precede string.

**Parameters**

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | C string. |
| <code>__rhs</code> | String.   |

**Returns**

True if `__lhs` doesn't precede `__rhs`. False otherwise.

Definition at line 2575 of file `vstring.h`.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::compare()`.

**3.1.3.28 swap()**

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
void __gnu_cxx::swap (
 __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
 __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Swap contents of two strings.

**Parameters**

|                    |                |
|--------------------|----------------|
| <code>__lhs</code> | First string.  |
| <code>__rhs</code> | Second string. |

Exchanges the contents of `__lhs` and `__rhs` in constant time.

Definition at line 2589 of file `vstring.h`.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::swap()`.

**3.2 \_\_gnu\_cxx::\_\_detail Namespace Reference****Classes**

## Functions

- void `__bit_allocate` (std::size\_t \* \_\_pmap, std::size\_t \_\_pos) throw ()
- void `__bit_free` (std::size\_t \* \_\_pmap, std::size\_t \_\_pos) throw ()
- template<typename \_ForwardIterator, typename \_Tp, typename \_Compare >  
\_ForwardIterator `__lower_bound` (\_ForwardIterator \_\_first, \_ForwardIterator \_\_last, const \_Tp & \_\_val, \_Compare \_\_comp)
- template<typename \_AddrPair >  
std::size\_t `__num_bitmaps` (\_AddrPair \_\_ap)
- template<typename \_AddrPair >  
std::size\_t `__num_blocks` (\_AddrPair \_\_ap)

## 3.2.1 Detailed Description

Implementation details not part of the namespace `__gnu_cxx` interface.

## 3.2.2 Function Documentation

3.2.2.1 `__bit_allocate()`

```
void __gnu_cxx::__detail::__bit_allocate (
 std::size_t * __pmap,
 std::size_t __pos) throw () [inline]
```

Mark a memory address as allocated by re-setting the corresponding bit in the bit-map.

Definition at line 487 of file `bitmap_allocator.h`.

Referenced by `__gnu_cxx::bitmap_allocator<_Tp>::_M_allocate_single_object()`.

3.2.2.2 `__bit_free()`

```
void __gnu_cxx::__detail::__bit_free (
 std::size_t * __pmap,
 std::size_t __pos) throw () [inline]
```

Mark a memory address as free by setting the corresponding bit in the bit-map.

Definition at line 498 of file `bitmap_allocator.h`.

### 3.2.2.3 \_\_num\_bitmaps()

```
template<typename _AddrPair >
std::size_t __gnu_cxx::__detail::__num_bitmaps (
 _AddrPair __ap) [inline]
```

The number of Bit-maps pointed to by the address pair passed to the function.

Definition at line 274 of file bitmap\_allocator.h.

References [\\_\\_num\\_blocks\(\)](#).

Referenced by [\\_\\_gnu\\_cxx::bitmap\\_allocator<\\_Tp>::\\_M\\_allocate\\_single\\_object\(\)](#).

### 3.2.2.4 \_\_num\_blocks()

```
template<typename _AddrPair >
std::size_t __gnu_cxx::__detail::__num_blocks (
 _AddrPair __ap) [inline]
```

The number of Blocks pointed to by the address pair passed to the function.

Definition at line 266 of file bitmap\_allocator.h.

Referenced by [\\_\\_num\\_bitmaps\(\)](#).

## 3.3 \_\_gnu\_cxx::typelist Namespace Reference

### Functions

- [template<typename Fn , typename Typelist > void \*\*apply\*\* \(Fn &, Typelist\)](#)
- [template<typename Gn , typename Typelist > void \*\*apply\\_generator\*\* \(Gn &, Typelist\)](#)
- [template<typename Gn , typename TypelistT , typename TypelistV > void \*\*apply\\_generator\*\* \(Gn &, TypelistT, TypelistV\)](#)
- [template<typename Fn , typename Typelist > void \*\*apply\\_generator\*\* \(Fn &fn, Typelist\)](#)
- [template<typename Fn , typename TypelistT , typename TypelistV > void \*\*apply\\_generator\*\* \(Fn &fn, TypelistT, TypelistV\)](#)

### 3.3.1 Detailed Description

GNU typelist extensions for public compile-time use.

### 3.3.2 Function Documentation

#### 3.3.2.1 `apply_generator()`

```
template<typename Gn , typename Typelist >
void __gnu_cxx::typelist::apply_generator (
 Gn & ,
 Typelist)
```

Apply all typelist types to generator functor.

## 3.4 `__gnu_debug` Namespace Reference

### 3.4.1 Detailed Description

GNU debug classes for public use.

### 3.4.2 Enumeration Type Documentation

#### 3.4.2.1 `_Distance_precision`

```
enum __gnu_debug::_Distance_precision
```

The precision to which we can calculate the distance between two iterators.

Definition at line 52 of file `helper_functions.h`.

### 3.4.3 Function Documentation

#### 3.4.3.1 `__base()`

```
template<typename _Iterator >
constexpr _Iterator __gnu_debug::__base (
 _Iterator __it) [inline]
```

Helper function to extract base iterator of random access safe iterator in order to reduce performance impact of debug mode. Limited to random access iterator because it is the only category for which it is possible to check for correct iterators order in the `__valid_range` function thanks to the `<` operator.

Definition at line 299 of file `helper_functions.h`.

Referenced by `__gnu_parallel::__for_each_template_random_access_workstealing()`, `__gnu_debug::_Safe_iterator< _Iterator, _Sequence, std::forward_iterator_tag >::_M_before_dereferenceable()`, `std::boolalpha()`, `std::dec()`, `std::defaultfloat()`, `std::fixed()`, `std::hex()`, `std::hexfloat()`, `std::internal()`, `std::left()`, `std::noboolalpha()`, `std::noshowbase()`, `std::noshowpoint()`, `std::noshowpos()`, `std::noskipws()`, `std::nounitbuf()`, `std::nouppercase()`, `std::oct()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow()`, `std::right()`, `std::scientific()`, `std::showbase()`, `std::showpoint()`, `std::showpos()`, `std::skipws()`, `std::unitbuf()`, and `std::uppercase()`.

### 3.4.3.2 `__check_singular()`

```
template<typename _Tp >
bool __gnu_debug::__check_singular (
 _Tp *const & __ptr) [inline]
```

Non-NULL pointers are nonsingular.

Definition at line 130 of file `helper_functions.h`.

### 3.4.3.3 `__check_singular_aux()`

```
bool __gnu_debug::__check_singular_aux (
 const _Safe_iterator_base * __x) [inline]
```

Iterators that derive from `_Safe_iterator_base` can be determined singular or non-singular.

Definition at line 168 of file `safe_base.h`.

References `__gnu_debug::_Safe_iterator_base::_M_singular()`.

### 3.4.3.4 `__check_string()` [1/2]

```
template<typename _CharT , typename _Integer >
const _CharT* __gnu_debug::__check_string (
 const _CharT * __s,
 _Integer __n,
 const char * __file,
 unsigned int __line,
 const char * __function) [inline]
```

Checks that `__s` is non-NULL or `__n == 0`, and then returns `__s`.

Definition at line 49 of file `debug/string`.

### 3.4.3.5 `__check_string()` [2/2]

```
template<typename _CharT >
const _CharT* __gnu_debug::__check_string (
 const _CharT * __s,
 const char * __file,
 unsigned int __line,
 const char * __function) [inline]
```

Checks that `__s` is non-NULL and then returns `__s`.

Definition at line 65 of file `debug/string`.

## 3.4.3.6 \_\_foreign\_iterator\_aux2() [1/2]

```
template<typename _Iterator , typename _Sequence , typename _Category , typename _OtherIterator >
bool __gnu_debug::__foreign_iterator_aux2 (
 const __Safe_iterator< _Iterator, _Sequence, _Category > & __it,
 const __Safe_iterator< _OtherIterator, _Sequence, _Category > & __other,
 const __Safe_iterator< _OtherIterator, _Sequence, _Category > &) [inline]
```

Handle debug iterators from the same type of container.

Definition at line 127 of file functions.h.

## 3.4.3.7 \_\_foreign\_iterator\_aux2() [2/2]

```
template<typename _Iterator , typename _Sequence , typename _Category , typename _OtherIterator ,
typename _OtherSequence , typename _OtherCategory >
bool __gnu_debug::__foreign_iterator_aux2 (
 const __Safe_iterator< _Iterator, _Sequence, _Category > & ,
 const __Safe_iterator< _OtherIterator, _OtherSequence, _OtherCategory > & ,
 const __Safe_iterator< _OtherIterator, _OtherSequence, _OtherCategory > &) [inline]
```

Handle debug iterators from different types of container.

Definition at line 138 of file functions.h.

## 3.4.3.8 \_\_get\_distance()

```
template<typename _Iterator >
constexpr _Distance_traits<_Iterator>::__type __gnu_debug::__get_distance (
 _Iterator __lhs,
 _Iterator __rhs,
 std::random_access_iterator_tag) [inline]
```

Determine the distance between two iterators with some known precision.

Definition at line 94 of file helper\_functions.h.

## 3.4.3.9 \_\_valid\_range() [1/3]

```
template<typename _InputIterator >
constexpr bool __gnu_debug::__valid_range (
 _InputIterator __first,
 _InputIterator __last,
 typename _Distance_traits< _InputIterator >::__type & __dist) [inline]
```

Don't know what these iterators are, or if they are even iterators (we may get an integral type for InputIterator), so see if they are integral and pass them on to the next phase otherwise.

Definition at line 225 of file helper\_functions.h.

References \_\_valid\_range\_aux().

**3.4.3.10 \_\_valid\_range()** [2/3]

```
template<typename _Iterator , typename _Sequence , typename _Category >
bool __gnu_debug::__valid_range (
 const __Safe_iterator< _Iterator, _Sequence, _Category > & __first,
 const __Safe_iterator< _Iterator, _Sequence, _Category > & __last,
 typename _Distance_traits< _Iterator >::__type & __dist) [inline]
```

Safe iterators know how to check if they form a valid range.

Definition at line 934 of file `safe_iterator.h`.

**3.4.3.11 \_\_valid\_range()** [3/3]

```
template<typename _Iterator , typename _Sequence >
bool __gnu_debug::__valid_range (
 const __Safe_local_iterator< _Iterator, _Sequence > & __first,
 const __Safe_local_iterator< _Iterator, _Sequence > & __last,
 typename _Distance_traits< _Iterator >::__type & __dist_info) [inline]
```

Safe local iterators know how to check if they form a valid range.

Definition at line 407 of file `safe_local_iterator.h`.

**3.4.3.12 \_\_valid\_range\_aux()** [1/2]

```
template<typename _Integral >
constexpr bool __gnu_debug::__valid_range_aux (
 _Integral ,
 _Integral ,
 std::__true_type) [inline]
```

We say that integral types for a valid range, and defer to other routines to realize what to do with integral types instead of iterators.

Definition at line 140 of file `helper_functions.h`.

Referenced by `__valid_range()`, and `__valid_range_aux()`.

**3.4.3.13 \_\_valid\_range\_aux()** [2/2]

```
template<typename _InputIterator >
constexpr bool __gnu_debug::__valid_range_aux (
 _InputIterator __first,
 _InputIterator __last,
 std::__false_type) [inline]
```

We have iterators, so figure out what kind of iterators they are to see if we can check the range ahead of time.

Definition at line 181 of file `helper_functions.h`.

References `std::__iterator_category()`, and `__valid_range_aux()`.

## 3.5 `__gnu_internal` Namespace Reference

### 3.5.1 Detailed Description

GNU implementation details, not for public use or export. Used only when anonymous namespaces cannot be substituted.

## 3.6 `__gnu_parallel` Namespace Reference

## Variables

- static const int [\\_CASable\\_bits](#)
- static const [\\_CASable](#) [\\_CASable\\_mask](#)

### 3.6.1 Detailed Description

GNU parallel code for public use.

### 3.6.2 Typedef Documentation

#### 3.6.2.1 `_BinIndex`

```
typedef unsigned short __gnu_parallel::_BinIndex
```

Type to hold the index of a bin.

Since many variables of this type are allocated, it should be chosen as small as possible.

Definition at line 47 of file `random_shuffle.h`.

#### 3.6.2.2 `_CASable`

```
typedef int64_t __gnu_parallel::_CASable
```

Longest compare-and-swappable integer type on this platform.

Definition at line 127 of file `types.h`.

#### 3.6.2.3 `_SequenceIndex`

```
typedef uint64_t __gnu_parallel::_SequenceIndex
```

Unsigned integer to index `__elements`. The total number of elements for each algorithm must fit into this type.

Definition at line 117 of file `types.h`.

#### 3.6.2.4 `_ThreadIndex`

```
typedef uint16_t __gnu_parallel::_ThreadIndex
```

Unsigned integer to index a thread number. The maximum thread number (for each processor) must fit into this type.

Definition at line 123 of file `types.h`.

### 3.6.3 Enumeration Type Documentation

#### 3.6.3.1 `_AlgorithmStrategy`

```
enum __gnu_parallel::_AlgorithmStrategy
```

Strategies for run-time algorithm selection:

Definition at line 67 of file types.h.

#### 3.6.3.2 `_FindAlgorithm`

```
enum __gnu_parallel::_FindAlgorithm
```

Find algorithms:

Definition at line 106 of file types.h.

#### 3.6.3.3 `_MultiwayMergeAlgorithm`

```
enum __gnu_parallel::_MultiwayMergeAlgorithm
```

Merging algorithms:

Definition at line 85 of file types.h.

#### 3.6.3.4 `_Parallelism`

```
enum __gnu_parallel::_Parallelism
```

Run-time equivalents for the compile-time tags.

##### Enumerator

|                                       |                                              |
|---------------------------------------|----------------------------------------------|
| <code>sequential</code>               | Not parallel.                                |
| <code>parallel_unbalanced</code>      | Parallel unbalanced (equal-sized chunks).    |
| <code>parallel_balanced</code>        | Parallel balanced (work-stealing).           |
| <code>parallel_omp_loop</code>        | Parallel with OpenMP dynamic load-balancing. |
| <code>parallel_omp_loop_static</code> | Parallel with OpenMP static load-balancing.  |
| <code>parallel_taskqueue</code>       | Parallel with OpenMP taskqueue construct.    |

Definition at line 44 of file types.h.

### 3.6.3.5 \_\_PartialSumAlgorithm

```
enum __gnu_parallel::__PartialSumAlgorithm
```

Partial sum algorithms: recursive, linear.

Definition at line 91 of file types.h.

### 3.6.3.6 \_\_SortAlgorithm

```
enum __gnu_parallel::__SortAlgorithm
```

Sorting algorithms:

Definition at line 76 of file types.h.

### 3.6.3.7 \_\_SplittingAlgorithm

```
enum __gnu_parallel::__SplittingAlgorithm
```

Sorting/merging algorithms: sampling, \_\_exact.

Definition at line 98 of file types.h.

## 3.6.4 Function Documentation

### 3.6.4.1 \_\_calc\_borders()

```
template<typename _RAIter , typename _DifferenceTp >
void __gnu_parallel::__calc_borders (
 _RAIter __elements,
 _DifferenceTp __length,
 _DifferenceTp * __off)
```

Precalculate \_\_advances for Knuth-Morris-Pratt algorithm.

#### Parameters

|                         |                                           |
|-------------------------|-------------------------------------------|
| <code>__elements</code> | Begin iterator of sequence to search for. |
| <code>__length</code>   | Length of sequence to search for.         |
| <code>__off</code>      | Returned __offsets.                       |

Definition at line 51 of file search.h.

Referenced by `__search_template()`.

### 3.6.4.2 `__compare_and_swap()`

```
template<typename _Tp >
bool __gnu_parallel::__compare_and_swap (
 volatile _Tp * __ptr,
 _Tp __comparand,
 _Tp __replacement) [inline]
```

Compare-and-swap.

Compare `*__ptr` and `__comparand`. If equal, let `*__ptr=__replacement` and return true, return false otherwise.

#### Parameters

|                            |                            |
|----------------------------|----------------------------|
| <code>__ptr</code>         | Pointer to signed integer. |
| <code>__comparand</code>   | Compare value.             |
| <code>__replacement</code> | Replacement value.         |

Definition at line 108 of file parallel/compatibility.h.

Referenced by `__parallel_partition()`, `__gnu_parallel::_RestrictedBoundedConcurrentQueue< pair< _RAIter, _RAIter > ::pop_back()`, and `__gnu_parallel::_RestrictedBoundedConcurrentQueue< pair< _RAIter, _RAIter > > ::pop_↵front()`.

### 3.6.4.3 `__decode2()`

```
void __gnu_parallel::__decode2 (
 _CASable __x,
 int & __a,
 int & __b) [inline]
```

Decode two integers from one `gnu_parallel::_CASable`.

#### Parameters

|                        |                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------|
| <code>↵<br/>__x</code> | <code>__gnu_parallel::_CASable</code> to decode integers from.                                                 |
| <code>↵<br/>__a</code> | First integer, to be decoded from the most-significant <code>_CASable_bits/2</code> bits of <code>__x</code> . |
| <code>↵<br/>__b</code> | Second integer, to be encoded in the least-significant <code>_CASable_bits/2</code> bits of <code>__x</code> . |

#### 3.6.4.4 \_\_determine\_samples()

```
template<typename _RAIter , typename _DifferenceTp >
void __gnu_parallel::__determine_samples (
 _PMWSSortingData< _RAIter > * __sd,
 _DifferenceTp __num_samples)
```

Select [\\_M\\_samples](#) from a sequence.

Parameters

|                               |                                                                                           |
|-------------------------------|-------------------------------------------------------------------------------------------|
| <a href="#">__sd</a>          | Pointer to algorithm data. Result will be placed in <a href="#">__sd-&gt;_M_samples</a> . |
| <a href="#">__num_samples</a> | Number of <a href="#">_M_samples</a> to select.                                           |

Definition at line 97 of file multiway\_mergesort.h.

References [\\_\\_equally\\_split\(\)](#), [\\_\\_gnu\\_parallel::\\_PMWSSortingData< \\_RAIter >::\\_M\\_samples](#), [\\_\\_gnu\\_parallel::\\_PMWSSortingData< \\_RAIter >::\\_M\\_source](#), and [\\_\\_gnu\\_parallel::\\_PMWSSortingData< \\_RAIter >::\\_M\\_starts](#).

#### 3.6.4.5 \_\_encode2()

```
_CASable __gnu_parallel::__encode2 (
 int __a,
 int __b) [inline]
```

Encode two integers into one [gnu\\_parallel::\\_CASable](#).

Parameters

|                     |                                                                                              |
|---------------------|----------------------------------------------------------------------------------------------|
| <a href="#">__a</a> | First integer, to be encoded in the most-significant <a href="#">_CASable_bits/2</a> bits.   |
| <a href="#">__b</a> | Second integer, to be encoded in the least-significant <a href="#">_CASable_bits/2</a> bits. |

**Returns**

value encoding `__a` and `__b`.

**See also**

`__decode2`

Definition at line 119 of file `base.h`.

References `_CASable_bits`.

Referenced by `__gnu_parallel::_RestrictedBoundedConcurrentQueue< pair< _RAIter, _RAIter > >::_RestrictedBoundedConcurrentQueue()`, `__gnu_parallel::_RestrictedBoundedConcurrentQueue< pair< _RAIter, _RAIter > >::_pop_back()`, and `__gnu_parallel::_RestrictedBoundedConcurrentQueue< pair< _RAIter, _RAIter > >::_pop_front()`.

**3.6.4.6 `__equally_split()`**

```
template<typename _DifferenceType , typename _OutputIterator >
_OutputIterator __gnu_parallel::__equally_split (
 _DifferenceType __n,
 _ThreadIndex __num_threads,
 _OutputIterator __s)
```

function to split a sequence into parts of almost equal size.

The resulting sequence `__s` of length `__num_threads+1` contains the splitting positions when splitting the range `[0,__n)` into parts of almost equal size (plus minus 1). The first entry is 0, the last one `n`. There may result empty parts.

**Parameters**

|                            |                    |
|----------------------------|--------------------|
| <code>__n</code>           | Number of elements |
| <code>__num_threads</code> | Number of parts    |
| <code>__s</code>           | Splitters          |

**Returns**

End of `__splitter` sequence, i.e. `__s+__num_threads+1`

Definition at line 48 of file `equally_split.h`.

Referenced by `__determine_samples()`, `__find_template()`, `__parallel_partial_sum_linear()`, `__parallel_unique_copy()`, and `__search_template()`.

## 3.6.4.7 \_\_equally\_split\_point()

```
template<typename _DifferenceType >
_DifferenceType __gnu_parallel::__equally_split_point (
 _DifferenceType __n,
 _ThreadIndex __num_threads,
 _ThreadIndex __thread_no)
```

function to split a sequence into parts of almost equal size.

Returns the position of the splitting point between thread number `__thread_no` (included) and thread number `__thread_no+1` (excluded).

## Parameters

|                            |                    |
|----------------------------|--------------------|
| <code>__n</code>           | Number of elements |
| <code>__num_threads</code> | Number of parts    |
| <code>__thread_no</code>   | Number of threads  |

## Returns

splitting point

Definition at line 75 of file `equally_split.h`.

Referenced by `__for_each_template_random_access_ed()`.

## 3.6.4.8 \_\_fetch\_and\_add()

```
template<typename _Tp >
_Tp __gnu_parallel::__fetch_and_add (
 volatile _Tp * __ptr,
 _Tp __addend) [inline]
```

Add a value to a variable, atomically.

## Parameters

|                       |                              |
|-----------------------|------------------------------|
| <code>__ptr</code>    | Pointer to a signed integer. |
| <code>__addend</code> | Value to add.                |

Definition at line 74 of file `parallel/compatibility.h`.

Referenced by `__parallel_partition()`.

3.6.4.9 `__find_template()` [1/4]

```
template<typename _RAIter1 , typename _RAIter2 , typename _Pred , typename _Selector >
std::pair<_RAIter1, _RAIter2> __gnu_parallel::__find_template (
 _RAIter1 __begin1,
 _RAIter1 __end1,
 _RAIter2 __begin2,
 _Pred __pred,
 _Selector __selector) [inline]
```

Parallel `std::find`, switch for different algorithms.

## Parameters

|                         |                                                                                     |
|-------------------------|-------------------------------------------------------------------------------------|
| <code>__begin1</code>   | Begin iterator of first sequence.                                                   |
| <code>__end1</code>     | End iterator of first sequence.                                                     |
| <code>__begin2</code>   | Begin iterator of second sequence. Must have same length as first sequence.         |
| <code>__pred</code>     | Find predicate.                                                                     |
| <code>__selector</code> | _Functionality (e. g. <code>std::find_if()</code> , <code>std::equal()</code> ,...) |

## Returns

Place of finding in both sequences.

Definition at line 60 of file `find.h`.

References `__gnu_parallel::_Settings::get()`.

3.6.4.10 `__find_template()` [2/4]

```
template<typename _RAIter1 , typename _RAIter2 , typename _Pred , typename _Selector >
std::pair<_RAIter1, _RAIter2> __gnu_parallel::__find_template (
 _RAIter1 __begin1,
 _RAIter1 __end1,
 _RAIter2 __begin2,
 _Pred __pred,
 _Selector __selector,
 equal_split_tag)
```

Parallel `std::find`, equal splitting variant.

## Parameters

|                         |                                                                                               |
|-------------------------|-----------------------------------------------------------------------------------------------|
| <code>__begin1</code>   | Begin iterator of first sequence.                                                             |
| <code>__end1</code>     | End iterator of first sequence.                                                               |
| <code>__begin2</code>   | Begin iterator of second sequence. Second __sequence must have same length as first sequence. |
| <code>__pred</code>     | Find predicate.                                                                               |
| <code>__selector</code> | _Functionality (e. g. <code>std::find_if()</code> , <code>std::equal()</code> ,...)           |

**Returns**

Place of finding in both sequences.

Definition at line 97 of file find.h.

References `__equally_split()`, and `_GLIBCXX_CALL`.

**3.6.4.11 \_\_find\_template()** [3/4]

```
template<typename _RAIter1 , typename _RAIter2 , typename _Pred , typename _Selector >
std::pair<_RAIter1, _RAIter2> __gnu_parallel::__find_template (
 _RAIter1 __begin1,
 _RAIter1 __end1,
 _RAIter2 __begin2,
 _Pred __pred,
 _Selector __selector,
 growing_blocks_tag)
```

Parallel `std::find`, growing block size variant.

**Parameters**

|                         |                                                                                               |
|-------------------------|-----------------------------------------------------------------------------------------------|
| <code>__begin1</code>   | Begin iterator of first sequence.                                                             |
| <code>__end1</code>     | End iterator of first sequence.                                                               |
| <code>__begin2</code>   | Begin iterator of second sequence. Second __sequence must have same length as first sequence. |
| <code>__pred</code>     | Find predicate.                                                                               |
| <code>__selector</code> | _Functionality (e. g. <code>std::find_if()</code> , <code>std::equal()</code> ,...)           |

**Returns**

Place of finding in both sequences.

**See also**

`__gnu_parallel::_Settings::find_sequential_search_size`  
`__gnu_parallel::_Settings::find_scale_factor`

There are two main differences between the growing blocks and the constant-size blocks variants.

1. For GB, the block size grows; for CSB, the block size is fixed.
2. For GB, the blocks are allocated dynamically; for CSB, the blocks are allocated in a predetermined manner, namely spacial round-robin.

Definition at line 185 of file find.h.

References `_GLIBCXX_CALL`, `__gnu_parallel::_Settings::find_scale_factor`, `__gnu_parallel::_Settings::find_sequential_search_size`, `std::pair<_T1, _T2>::first`, and `__gnu_parallel::_Settings::get()`.

### 3.6.4.12 `__find_template()` [ 4 / 4 ]

```
template<typename _RAIter1 , typename _RAIter2 , typename _Pred , typename _Selector >
std::pair<_RAIter1, _RAIter2> __gnu_parallel::__find_template (
 _RAIter1 __begin1,
 _RAIter1 __end1,
 _RAIter2 __begin2,
 _Pred __pred,
 _Selector __selector,
 constant_size_blocks_tag)
```

Parallel `std::find`, constant block size variant.

#### Parameters

|                         |                                                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------------|
| <code>__begin1</code>   | Begin iterator of first sequence.                                                                          |
| <code>__end1</code>     | End iterator of first sequence.                                                                            |
| <code>__begin2</code>   | Begin iterator of second sequence. Second <code>__sequence</code> must have same length as first sequence. |
| <code>__pred</code>     | Find predicate.                                                                                            |
| <code>__selector</code> | <code>_Functionality</code> (e. g. <code>std::find_if()</code> , <code>std::equal()</code> ,...)           |

#### Returns

Place of finding in both sequences.

#### See also

`__gnu_parallel::_Settings::find_sequential_search_size`

`__gnu_parallel::_Settings::find_block_size` There are two main differences between the growing blocks and the constant-size blocks variants.

1. For GB, the block size grows; for CSB, the block size is fixed.
2. For GB, the blocks are allocated dynamically; for CSB, the blocks are allocated in a predetermined manner, namely spacial round-robin.

Definition at line 315 of file `find.h`.

### 3.6.4.13 `__for_each_template_random_access()`

```
template<typename _IIter , typename _UserOp , typename _Functionality , typename _Red , typename
_Result >
_UserOp __gnu_parallel::__for_each_template_random_access (
 _IIter __begin,
 _IIter __end,
 _UserOp __user_op,
```

```

_Functionality & __functionality,
_Red __reduction,
_Result __reduction_start,
_Result & __output,
typename std::iterator_traits< _Iter >::difference_type __bound,
_Parallelism __parallelism_tag)

```

Chose the desired algorithm by evaluating `__parallelism_tag`.

#### Parameters

|                                |                                                                                                                                                   |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__begin</code>           | Begin iterator of input sequence.                                                                                                                 |
| <code>__end</code>             | End iterator of input sequence.                                                                                                                   |
| <code>__user_op</code>         | A user-specified functor (comparator, predicate, associative operator,...)                                                                        |
| <code>__functionality</code>   | functor to <i>process</i> an element with <code>__user_op</code> (depends on desired functionality, e. g. accumulate, <code>for_each</code> ,...) |
| <code>__reduction</code>       | Reduction functor.                                                                                                                                |
| <code>__reduction_start</code> | Initial value for reduction.                                                                                                                      |
| <code>__output</code>          | Output iterator.                                                                                                                                  |
| <code>__bound</code>           | Maximum number of elements processed.                                                                                                             |
| <code>__parallelism_tag</code> | Parallelization method                                                                                                                            |

Definition at line 61 of file `for_each.h`.

References `__for_each_template_random_access_ed()`, `__for_each_template_random_access_omp_loop()`, `__for_each_template_random_access_workstealing()`, `parallel_omp_loop`, `parallel_omp_loop_static`, and `parallel_unbalanced`.

#### 3.6.4.14 `__for_each_template_random_access_ed()`

```

template<typename _RAIter , typename _Op , typename _Fu , typename _Red , typename _Result >
_Op __gnu_parallel::__for_each_template_random_access_ed (
 _RAIter __begin,
 _RAIter __end,
 _Op __o,
 _Fu & __f,
 _Red __r,
 _Result __base,
 _Result & __output,
 typename std::iterator_traits< _RAIter >::difference_type __bound)

```

Embarrassingly parallel algorithm for random access iterators, using hand-crafted parallelization by equal splitting the work.

#### Parameters

|                      |                                     |
|----------------------|-------------------------------------|
| <code>__begin</code> | Begin iterator of element sequence. |
| <code>__end</code>   | End iterator of element sequence.   |

## Parameters

|                       |                                                                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__o</code>      | User-supplied functor (comparator, predicate, adding functor, ...)                                                                       |
| <code>__f</code>      | Functor to "process" an element with <code>__op</code> (depends on desired functionality, e. g. for <code>std::for_each()</code> , ...). |
| <code>__r</code>      | Functor to "add" a single <code>__result</code> to the already processed elements (depends on functionality).                            |
| <code>__base</code>   | Base value for reduction.                                                                                                                |
| <code>__output</code> | Pointer to position where final result is written to                                                                                     |
| <code>__bound</code>  | Maximum number of elements processed (e. g. for <code>std::count_n()</code> ).                                                           |

## Returns

User-supplied functor (that may contain a part of the result).

Definition at line 67 of file `par_loop.h`.

References `__equally_split_point()`.

Referenced by `__for_each_template_random_access()`.

3.6.4.15 `__for_each_template_random_access_omp_loop()`

```
template<typename _RAIter , typename _Op , typename _Fu , typename _Red , typename _Result >
_Op __gnu_parallel::__for_each_template_random_access_omp_loop (
 _RAIter __begin,
 _RAIter __end,
 _Op __o,
 _Fu & __f,
 _Red __r,
 _Result __base,
 _Result & __output,
 typename std::iterator_traits< _RAIter >::difference_type __bound)
```

Embarrassingly parallel algorithm for random access iterators, using an OpenMP for loop.

## Parameters

|                       |                                                                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__begin</code>  | Begin iterator of element sequence.                                                                                                           |
| <code>__end</code>    | End iterator of element sequence.                                                                                                             |
| <code>__o</code>      | User-supplied functor (comparator, predicate, adding functor, etc.).                                                                          |
| <code>__f</code>      | Functor to <i>process</i> an element with <code>__op</code> (depends on desired functionality, e. g. for <code>std::for_each()</code> , ...). |
| <code>__r</code>      | Functor to <i>add</i> a single <code>__result</code> to the already processed elements (depends on functionality).                            |
| <code>__base</code>   | Base value for reduction.                                                                                                                     |
| <code>__output</code> | Pointer to position where final result is written to                                                                                          |
| <code>__bound</code>  | Maximum number of elements processed (e. g. for <code>std::count_n()</code> ).                                                                |

**Returns**

User-supplied functor (that may contain a part of the result).

Definition at line 67 of file omp\_loop.h.

Referenced by \_\_for\_each\_template\_random\_access().

**3.6.4.16 \_\_for\_each\_template\_random\_access\_omp\_loop\_static()**

```
template<typename _RAIter , typename _Op , typename _Fu , typename _Red , typename _Result >
_Op __gnu_parallel::__for_each_template_random_access_omp_loop_static (
 _RAIter __begin,
 _RAIter __end,
 _Op __o,
 _Fu & __f,
 _Red __r,
 _Result __base,
 _Result & __output,
 typename std::iterator_traits< _RAIter >::difference_type __bound)
```

Embarrassingly parallel algorithm for random access iterators, using an OpenMP for loop with static scheduling.

**Parameters**

|                       |                                                                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__begin</code>  | Begin iterator of element sequence.                                                                                                           |
| <code>__end</code>    | End iterator of element sequence.                                                                                                             |
| <code>__o</code>      | User-supplied functor (comparator, predicate, adding functor, ...).                                                                           |
| <code>__f</code>      | Functor to <i>process</i> an element with <code>__op</code> (depends on desired functionality, e. g. for <code>std::for_each()</code> , ...). |
| <code>__r</code>      | Functor to <i>add</i> a single <code>__result</code> to the already processed <code>__elements</code> (depends on functionality).             |
| <code>__base</code>   | Base value for reduction.                                                                                                                     |
| <code>__output</code> | Pointer to position where final result is written to                                                                                          |
| <code>__bound</code>  | Maximum number of elements processed (e. g. for <code>std::count_n()</code> ).                                                                |

**Returns**

User-supplied functor (that may contain a part of the result).

Definition at line 66 of file omp\_loop\_static.h.

**3.6.4.17 \_\_for\_each\_template\_random\_access\_workstealing()**

```
template<typename _RAIter , typename _Op , typename _Fu , typename _Red , typename _Result >
_Op __gnu_parallel::__for_each_template_random_access_workstealing (
 _RAIter __begin,
```

```

 _RAIter __end,
 _Op __op,
 _Fu & __f,
 _Red __r,
 _Result __base,
 _Result & __output,
 typename std::iterator_traits< _RAIter >::difference_type __bound)

```

Work stealing algorithm for random access iterators.

Uses O(1) additional memory. Synchronization at job lists is done with atomic operations.

#### Parameters

|                       |                                                                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__begin</code>  | Begin iterator of element sequence.                                                                                                           |
| <code>__end</code>    | End iterator of element sequence.                                                                                                             |
| <code>__op</code>     | User-supplied functor (comparator, predicate, adding functor, ...).                                                                           |
| <code>__f</code>      | Functor to <i>process</i> an element with <code>__op</code> (depends on desired functionality, e. g. for <code>std::for_each()</code> , ...). |
| <code>__r</code>      | Functor to <i>add</i> a single <code>__result</code> to the already processed elements (depends on functionality).                            |
| <code>__base</code>   | Base value for reduction.                                                                                                                     |
| <code>__output</code> | Pointer to position where final result is written to                                                                                          |
| <code>__bound</code>  | Maximum number of elements processed (e. g. for <code>std::count_n()</code> ).                                                                |

#### Returns

User-supplied functor (that may contain a part of the result).

Definition at line 99 of file `workstealing.h`.

References `__gnu_debug::__base()`, `__yield()`, `_GLIBCXX_CALL`, `__gnu_parallel::Job< _DifferenceTp >::M_first`, `__gnu_parallel::Job< _DifferenceTp >::M_last`, `__gnu_parallel::Job< _DifferenceTp >::M_load`, `__gnu_parallel::Settings::cache_line_size`, `__gnu_parallel::Settings::get()`, and `min()`.

Referenced by `__for_each_template_random_access()`.

#### 3.6.4.18 `__is_sorted()`

```

template<typename _IIter , typename _Compare >
bool __gnu_parallel::__is_sorted (
 _IIter __begin,
 _IIter __end,
 _Compare __comp)

```

Check whether `[__begin, __end)` is sorted according to `__comp`.

#### Parameters

|                      |                             |
|----------------------|-----------------------------|
| <code>__begin</code> | Begin iterator of sequence. |
| <code>__end</code>   | End iterator of sequence.   |
| <code>__comp</code>  | Comparator.                 |

**Returns**

`true` if sorted, `false` otherwise.

Definition at line 51 of file `checkers.h`.

**3.6.4.19 `__median_of_three_iterators()`**

```
template<typename _RAIter , typename _Compare >
_RAIter __gnu_parallel::__median_of_three_iterators (
 _RAIter __a,
 _RAIter __b,
 _RAIter __c,
 _Compare __comp)
```

Compute the median of three referenced elements, according to `__comp`.

**Parameters**

|                     |                  |
|---------------------|------------------|
| <code>__a</code>    | First iterator.  |
| <code>__b</code>    | Second iterator. |
| <code>__c</code>    | Third iterator.  |
| <code>__comp</code> | Comparator.      |

Definition at line 398 of file `base.h`.

**3.6.4.20 `__merge_advance()`**

```
template<typename _RAIter1 , typename _RAIter2 , typename _OutputIterator , typename _Difference↵
Tp , typename _Compare >
_OutputIterator __gnu_parallel::__merge_advance (
 _RAIter1 & __begin1,
 _RAIter1 __end1,
 _RAIter2 & __begin2,
 _RAIter2 __end2,
 _OutputIterator __target,
 _DifferenceTp __max_length,
 _Compare __comp) [inline]
```

Merge routine being able to merge only the `__max_length` smallest elements.

The `__begin` iterators are advanced accordingly, they might not reach `__end`, in contrast to the usual variant. Static switch on whether to use the conditional-move variant.

**Parameters**

|                       |                                   |
|-----------------------|-----------------------------------|
| <code>__begin1</code> | Begin iterator of first sequence. |
|-----------------------|-----------------------------------|

**Parameters**

|                           |                                      |
|---------------------------|--------------------------------------|
| <code>__end1</code>       | End iterator of first sequence.      |
| <code>__begin2</code>     | Begin iterator of second sequence.   |
| <code>__end2</code>       | End iterator of second sequence.     |
| <code>__target</code>     | Target begin iterator.               |
| <code>__max_length</code> | Maximum number of elements to merge. |
| <code>__comp</code>       | Comparator.                          |

**Returns**

Output end iterator.

Definition at line 171 of file merge.h.

References `__merge_advance_movc()`, and `_GLIBCXX_CALL`.

Referenced by `__parallel_merge_advance()`.

**3.6.4.21 `__merge_advance_movc()`**

```
template<typename _RAIter1 , typename _RAIter2 , typename _OutputIterator , typename _DifferenceTp , typename _Compare >
_OutputIterator __gnu_parallel::__merge_advance_movc (
 _RAIter1 & __begin1,
 _RAIter1 __end1,
 _RAIter2 & __begin2,
 _RAIter2 __end2,
 _OutputIterator __target,
 _DifferenceTp __max_length,
 _Compare __comp)
```

Merge routine being able to merge only the `__max_length` smallest elements.

The `__begin` iterators are advanced accordingly, they might not reach `__end`, in contrast to the usual variant. Specially designed code should allow the compiler to generate conditional moves instead of branches.

**Parameters**

|                           |                                      |
|---------------------------|--------------------------------------|
| <code>__begin1</code>     | Begin iterator of first sequence.    |
| <code>__end1</code>       | End iterator of first sequence.      |
| <code>__begin2</code>     | Begin iterator of second sequence.   |
| <code>__end2</code>       | End iterator of second sequence.     |
| <code>__target</code>     | Target begin iterator.               |
| <code>__max_length</code> | Maximum number of elements to merge. |
| <code>__comp</code>       | Comparator.                          |

**Returns**

Output end iterator.

Definition at line 105 of file merge.h.

Referenced by \_\_merge\_advance().

**3.6.4.22 \_\_merge\_advance\_usual()**

```
template<typename _RAIter1 , typename _RAIter2 , typename _OutputIterator , typename _DifferenceTp , typename _Compare >
_OutputIterator __gnu_parallel::__merge_advance_usual (
 _RAIter1 & __begin1,
 _RAIter1 __end1,
 _RAIter2 & __begin2,
 _RAIter2 __end2,
 _OutputIterator __target,
 _DifferenceTp __max_length,
 _Compare __comp)
```

Merge routine being able to merge only the \_\_max\_length smallest elements.

The \_\_begin iterators are advanced accordingly, they might not reach \_\_end, in contrast to the usual variant.

**Parameters**

|                           |                                      |
|---------------------------|--------------------------------------|
| <code>__begin1</code>     | Begin iterator of first sequence.    |
| <code>__end1</code>       | End iterator of first sequence.      |
| <code>__begin2</code>     | Begin iterator of second sequence.   |
| <code>__end2</code>       | End iterator of second sequence.     |
| <code>__target</code>     | Target begin iterator.               |
| <code>__max_length</code> | Maximum number of elements to merge. |
| <code>__comp</code>       | Comparator.                          |

**Returns**

Output end iterator.

Definition at line 57 of file merge.h.

**3.6.4.23 \_\_parallel\_merge\_advance()** [1/2]

```
template<typename _RAIter1 , typename _RAIter2 , typename _RAIter3 , typename _Compare >
_RAIter3 __gnu_parallel::__parallel_merge_advance (
```

```

_RAIter1 & __begin1,
_RAIter1 __end1,
_RAIter2 & __begin2,
_RAIter2 __end2,
_RAIter3 __target,
typename std::iterator_traits< _RAIter1 >::difference_type __max_length,
_Compare __comp) [inline]

```

Merge routine fallback to sequential in case the iterators of the two input sequences are of different type.

#### Parameters

|                           |                                      |
|---------------------------|--------------------------------------|
| <code>__begin1</code>     | Begin iterator of first sequence.    |
| <code>__end1</code>       | End iterator of first sequence.      |
| <code>__begin2</code>     | Begin iterator of second sequence.   |
| <code>__end2</code>       | End iterator of second sequence.     |
| <code>__target</code>     | Target begin iterator.               |
| <code>__max_length</code> | Maximum number of elements to merge. |
| <code>__comp</code>       | Comparator.                          |

#### Returns

Output end iterator.

Definition at line 195 of file merge.h.

References `__merge_advance()`.

#### 3.6.4.24 `__parallel_merge_advance()` [2/2]

```

template<typename _RAIter1 , typename _RAIter3 , typename _Compare >
_RAIter3 __gnu_parallel::__parallel_merge_advance (
 _RAIter1 & __begin1,
 _RAIter1 __end1,
 _RAIter1 & __begin2,
 _RAIter1 __end2,
 _RAIter3 __target,
 typename std::iterator_traits< _RAIter1 >::difference_type __max_length,
 _Compare __comp) [inline]

```

Parallel merge routine being able to merge only the `__max_length` smallest elements.

The `__begin` iterators are advanced accordingly, they might not reach `__end`, in contrast to the usual variant. The functionality is projected onto `parallel_multiway_merge`.

#### Parameters

|                       |                                   |
|-----------------------|-----------------------------------|
| <code>__begin1</code> | Begin iterator of first sequence. |
|-----------------------|-----------------------------------|

## Parameters

|                           |                                      |
|---------------------------|--------------------------------------|
| <code>__end1</code>       | End iterator of first sequence.      |
| <code>__begin2</code>     | Begin iterator of second sequence.   |
| <code>__end2</code>       | End iterator of second sequence.     |
| <code>__target</code>     | Target begin iterator.               |
| <code>__max_length</code> | Maximum number of elements to merge. |
| <code>__comp</code>       | Comparator.                          |

## Returns

Output end iterator.

Definition at line 223 of file `merge.h`.

References `multiway_merge_exact_splitting()`, and `parallel_multiway_merge()`.

3.6.4.25 `__parallel_nth_element()`

```
template<typename _RAIter , typename _Compare >
void __gnu_parallel::__parallel_nth_element (
 _RAIter __begin,
 _RAIter __nth,
 _RAIter __end,
 _Compare __comp)
```

Parallel implementation of `std::nth_element()`.

## Parameters

|                      |                                                          |
|----------------------|----------------------------------------------------------|
| <code>__begin</code> | Begin iterator of input sequence.                        |
| <code>__nth</code>   | Iterator of element that must be in position afterwards. |
| <code>__end</code>   | End iterator of input sequence.                          |
| <code>__comp</code>  | Comparator.                                              |

Definition at line 332 of file `partition.h`.

References `__parallel_partition()`, `_GLIBCXX_CALL`, `__gnu_parallel::_Settings::get()`, `std::max()`, `__gnu_parallel::_Settings::nth_element_minimal_n`, and `__gnu_parallel::_Settings::partition_minimal_n`.

Referenced by `__parallel_partial_sort()`.

### 3.6.4.26 `__parallel_partial_sort()`

```
template<typename _RAIter , typename _Compare >
void __gnu_parallel::__parallel_partial_sort (
 _RAIter __begin,
 _RAIter __middle,
 _RAIter __end,
 _Compare __comp)
```

Parallel implementation of `std::partial_sort()`.

#### Parameters

|                       |                                   |
|-----------------------|-----------------------------------|
| <code>__begin</code>  | Begin iterator of input sequence. |
| <code>__middle</code> | Sort until this position.         |
| <code>__end</code>    | End iterator of input sequence.   |
| <code>__comp</code>   | Comparator.                       |

Definition at line 422 of file `partition.h`.

References `__parallel_nth_element()`.

### 3.6.4.27 `__parallel_partial_sum()`

```
template<typename _IIter , typename _OutputIterator , typename _BinaryOperation >
_OutputIterator __gnu_parallel::__parallel_partial_sum (
 _IIter __begin,
 _IIter __end,
 _OutputIterator __result,
 _BinaryOperation __bin_op)
```

Parallel partial sum front-`__end`.

#### Parameters

|                       |                                    |
|-----------------------|------------------------------------|
| <code>__begin</code>  | Begin iterator of input sequence.  |
| <code>__end</code>    | End iterator of input sequence.    |
| <code>__result</code> | Begin iterator of output sequence. |
| <code>__bin_op</code> | Associative binary function.       |

#### Returns

End iterator of output sequence.

Definition at line 205 of file `partial_sum.h`.

References `__parallel_partial_sum_linear()`, `_GLIBCXX_CALL`, and `__gnu_parallel::_Settings::get()`.

## 3.6.4.28 \_\_parallel\_partial\_sum\_basecase()

```
template<typename _IIter , typename _OutputIterator , typename _BinaryOperation >
_OutputIterator __gnu_parallel::__parallel_partial_sum_basecase (
 _IIter __begin,
 _IIter __end,
 _OutputIterator __result,
 _BinaryOperation __bin_op,
 typename std::iterator_traits< _IIter >::value_type __value)
```

Base case prefix sum routine.

## Parameters

|                 |                                                                              |
|-----------------|------------------------------------------------------------------------------|
| <i>__begin</i>  | Begin iterator of input sequence.                                            |
| <i>__end</i>    | End iterator of input sequence.                                              |
| <i>__result</i> | Begin iterator of output sequence.                                           |
| <i>__bin_op</i> | Associative binary function.                                                 |
| <i>__value</i>  | Start value. Must be passed since the neutral element is unknown in general. |

## Returns

End iterator of output sequence.

Definition at line 58 of file partial\_sum.h.

Referenced by \_\_parallel\_partial\_sum\_linear().

## 3.6.4.29 \_\_parallel\_partial\_sum\_linear()

```
template<typename _IIter , typename _OutputIterator , typename _BinaryOperation >
_OutputIterator __gnu_parallel::__parallel_partial_sum_linear (
 _IIter __begin,
 _IIter __end,
 _OutputIterator __result,
 _BinaryOperation __bin_op,
 typename std::iterator_traits< _IIter >::difference_type __n)
```

Parallel partial sum implementation, two-phase approach, no recursion.

## Parameters

|                 |                                    |
|-----------------|------------------------------------|
| <i>__begin</i>  | Begin iterator of input sequence.  |
| <i>__end</i>    | End iterator of input sequence.    |
| <i>__result</i> | Begin iterator of output sequence. |
| <i>__bin_op</i> | Associative binary function.       |
| <i>__n</i>      | Length of sequence.                |

**Returns**

End iterator of output sequence.

Definition at line 89 of file `partial_sum.h`.

References `__equally_split()`, `__parallel_partial_sum_basecase()`, `std::accumulate()`, `__gnu_parallel::_Settings::get()`, and `__gnu_parallel::_Settings::partial_sum_dilation`.

Referenced by `__parallel_partial_sum()`.

**3.6.4.30 \_\_parallel\_partition()**

```
template<typename _RAIter , typename _Predicate >
std::iterator_traits<_RAIter>::difference_type __gnu_parallel::__parallel_partition (
 _RAIter __begin,
 _RAIter __end,
 _Predicate __pred,
 _ThreadIndex __num_threads)
```

Parallel implementation of `std::partition`.

**Parameters**

|                            |                                                             |
|----------------------------|-------------------------------------------------------------|
| <code>__begin</code>       | Begin iterator of input sequence to split.                  |
| <code>__end</code>         | End iterator of input sequence to split.                    |
| <code>__pred</code>        | Partition predicate, possibly including some kind of pivot. |
| <code>__num_threads</code> | Maximum number of threads to use for this task.             |

**Returns**

Number of elements not fulfilling the predicate.

Definition at line 56 of file `partition.h`.

References `__compare_and_swap()`, `__fetch_and_add()`, `_GLIBCXX_CALL`, `_GLIBCXX_VOLATILE`, `__gnu_parallel::_Settings::get()`, `__gnu_parallel::_Settings::partition_chunk_share`, and `__gnu_parallel::_Settings::partition_chunk_size`.

Referenced by `__parallel_nth_element()`.

**3.6.4.31 \_\_parallel\_random\_shuffle()**

```
template<typename _RAIter , typename _RandomNumberGenerator >
void __gnu_parallel::__parallel_random_shuffle (
 _RAIter __begin,
 _RAIter __end,
 _RandomNumberGenerator __rng = _RandomNumber()) [inline]
```

Parallel random public call.

## Parameters

|                      |                                 |
|----------------------|---------------------------------|
| <code>__begin</code> | Begin iterator of sequence.     |
| <code>__end</code>   | End iterator of sequence.       |
| <code>__rng</code>   | Random number generator to use. |

Definition at line 522 of file `random_shuffle.h`.

References `__parallel_random_shuffle_drs()`.

## 3.6.4.32 \_\_parallel\_random\_shuffle\_drs()

```
template<typename _RAIter, typename _RandomNumberGenerator >
void __gnu_parallel::__parallel_random_shuffle_drs (
 _RAIter __begin,
 _RAIter __end,
 typename std::iterator_traits< _RAIter >::difference_type __n,
 _ThreadIndex __num_threads,
 _RandomNumberGenerator & __rng)
```

Main parallel random shuffle step.

## Parameters

|                            |                                 |
|----------------------------|---------------------------------|
| <code>__begin</code>       | Begin iterator of sequence.     |
| <code>__end</code>         | End iterator of sequence.       |
| <code>__n</code>           | Length of sequence.             |
| <code>__num_threads</code> | Number of threads to use.       |
| <code>__rng</code>         | Random number generator to use. |

Definition at line 265 of file `random_shuffle.h`.

References `__gnu_parallel::_DRSSorterPU< _RAIter, _RandomNumberGenerator >::_bins_end`, `__parallel_random_shuffle_drs_pu()`, `__rd_log2()`, `__round_up_to_pow2()`, `__sequential_random_shuffle()`, `_GLIBCXX_CALL`, `__gnu_parallel::_DRandomShufflingGlobalData< _RAIter >::_M_bin_proc`, `__gnu_parallel::_DRSSorterPU< _RAIter, _RandomNumberGenerator >::_M_bins_begin`, `__gnu_parallel::_DRandomShufflingGlobalData< _RAIter >::_M_dist`, `__gnu_parallel::_DRandomShufflingGlobalData< _RAIter >::_M_num_bins`, `__gnu_parallel::_DRandomShufflingGlobalData< _RAIter >::_M_num_bits`, `__gnu_parallel::_DRSSorterPU< _RAIter, _RandomNumberGenerator >::_M_num_threads`, `__gnu_parallel::_DRSSorterPU< _RAIter, _RandomNumberGenerator >::_M_sd`, `__gnu_parallel::_DRSSorterPU< _RAIter, _RandomNumberGenerator >::_M_seed`, `__gnu_parallel::_DRandomShufflingGlobalData< _RAIter >::_M_starts`, `__gnu_parallel::_DRandomShufflingGlobalData< _RAIter >::_M_temporaries`, `__gnu_parallel::_Settings::get()`, `__gnu_parallel::_Settings::L2_cache_size`, `std::min()`, and `__gnu_parallel::_Settings::TLB_size`.

Referenced by `__parallel_random_shuffle()`.

### 3.6.4.33 `__parallel_random_shuffle_drs_pu()`

```
template<typename _RAIter , typename _RandomNumberGenerator >
void __gnu_parallel::__parallel_random_shuffle_drs_pu (
 _DRSSorterPU< _RAIter, _RandomNumberGenerator > * __pus)
```

Random shuffle code executed by each thread.

#### Parameters

|                    |                                     |
|--------------------|-------------------------------------|
| <code>__pus</code> | Array of thread-local data records. |
|--------------------|-------------------------------------|

Definition at line 122 of file `random_shuffle.h`.

References `__random_number_pow2()`, `__gnu_parallel::_DRandomShufflingGlobalData< _RAIter >::_M_dist`, `__gnu_parallel::_DRandomShufflingGlobalData< _RAIter >::_M_num_bins`, `__gnu_parallel::_DRandomShufflingGlobalData< _RAIter >::_M_num_bits`, `__gnu_parallel::_DRSSorterPU< _RAIter, _RandomNumberGenerator >::_M_num_threads`, `__gnu_parallel::_DRSSorterPU< _RAIter, _RandomNumberGenerator >::_M_sd`, `__gnu_parallel::_DRSSorterPU< _RAIter, _RandomNumberGenerator >::_M_seed`, `__gnu_parallel::_DRandomShufflingGlobalData< _RAIter >::_M_starts`, and `std::partial_sum()`.

Referenced by `__parallel_random_shuffle_drs()`.

### 3.6.4.34 `__parallel_sort()` [1/7]

```
template<bool __stable, typename _RAIter , typename _Compare >
void __gnu_parallel::__parallel_sort (
 _RAIter __begin,
 _RAIter __end,
 _Compare __comp,
 multiway_mergesort_tag __parallelism) [inline]
```

Choose multiway mergesort, splitting variant at run-time, for parallel sorting.

#### Parameters

|                      |                                   |
|----------------------|-----------------------------------|
| <code>__begin</code> | Begin iterator of input sequence. |
| <code>__end</code>   | End iterator of input sequence.   |
| <code>__comp</code>  | Comparator.                       |

#### Template Parameters

|                       |              |
|-----------------------|--------------|
| <code>__stable</code> | Sort stable. |
|-----------------------|--------------|

Definition at line 75 of file `sort.h`.

References \_\_gnu\_parallel::parallel\_tag::\_\_get\_num\_threads(), \_GLIBCXX\_CALL, and \_\_gnu\_parallel::\_Settings::\_\_get().

Here is the call graph for this function:

#### 3.6.4.35 \_\_parallel\_sort() [2/7]

```

template<bool __stable, typename _RAIter , typename _Compare >
void __gnu_parallel::__parallel_sort (
 _RAIter __begin,
 _RAIter __end,
 _Compare __comp,
 multiway_mergesort_exact_tag __parallelism) [inline]

```

Choose multiway mergesort with exact splitting, for parallel sorting.

##### Parameters

|                      |                                   |
|----------------------|-----------------------------------|
| <code>__begin</code> | Begin iterator of input sequence. |
| <code>__end</code>   | End iterator of input sequence.   |
| <code>__comp</code>  | Comparator.                       |

##### Template Parameters

|                       |              |
|-----------------------|--------------|
| <code>__stable</code> | Sort stable. |
|-----------------------|--------------|

Definition at line 99 of file `sort.h`.

References \_\_gnu\_parallel::parallel\_tag::\_\_get\_num\_threads(), and \_GLIBCXX\_CALL.

Here is the call graph for this function:

### 3.6.4.36 \_\_parallel\_sort() [3/7]

```

template<bool __stable, typename _RAIter , typename _Compare >
void __gnu_parallel::__parallel_sort (
 _RAIter __begin,
 _RAIter __end,
 _Compare __comp,
 multiway_mergesort_sampling_tag __parallelism) [inline]

```

Choose multiway mergesort with splitting by sampling, for parallel sorting.

#### Parameters

|                      |                                   |
|----------------------|-----------------------------------|
| <code>__begin</code> | Begin iterator of input sequence. |
| <code>__end</code>   | End iterator of input sequence.   |
| <code>__comp</code>  | Comparator.                       |

#### Template Parameters

|                       |              |
|-----------------------|--------------|
| <code>__stable</code> | Sort stable. |
|-----------------------|--------------|

Definition at line 120 of file sort.h.

References `__gnu_parallel::parallel_tag::__get_num_threads()`, and `_GLIBCXX_CALL`.

Here is the call graph for this function:

**3.6.4.37 \_\_parallel\_sort()** [4/7]

```
template<bool __stable, typename _RAIter, typename _Compare >
void __gnu_parallel::__parallel_sort (
 _RAIter __begin,
 _RAIter __end,
 _Compare __comp,
 quicksort_tag __parallelism) [inline]
```

Choose quicksort for parallel sorting.

**Parameters**

|                      |                                   |
|----------------------|-----------------------------------|
| <code>__begin</code> | Begin iterator of input sequence. |
| <code>__end</code>   | End iterator of input sequence.   |
| <code>__comp</code>  | Comparator.                       |

**Template Parameters**

|                       |              |
|-----------------------|--------------|
| <code>__stable</code> | Sort stable. |
|-----------------------|--------------|

Definition at line 140 of file sort.h.

References `_GLIBCXX_CALL`.

**3.6.4.38 \_\_parallel\_sort()** [5/7]

```
template<bool __stable, typename _RAIter, typename _Compare >
void __gnu_parallel::__parallel_sort (
 _RAIter __begin,
 _RAIter __end,
 _Compare __comp,
 balanced_quicksort_tag __parallelism) [inline]
```

Choose balanced quicksort for parallel sorting.

**Parameters**

|                      |                                   |
|----------------------|-----------------------------------|
| <code>__begin</code> | Begin iterator of input sequence. |
| <code>__end</code>   | End iterator of input sequence.   |
| <code>__comp</code>  | Comparator.                       |

## Template Parameters

|                       |              |
|-----------------------|--------------|
| <code>__stable</code> | Sort stable. |
|-----------------------|--------------|

Definition at line 161 of file sort.h.

References `_GLIBCXX_CALL`.

3.6.4.39 `__parallel_sort()` [6/7]

```
template<bool __stable, typename _RAIter, typename _Compare >
void __gnu_parallel::__parallel_sort (
 _RAIter __begin,
 _RAIter __end,
 _Compare __comp,
 default_parallel_tag __parallelism) [inline]
```

Choose multiway mergesort with exact splitting, for parallel sorting.

## Parameters

|                      |                                   |
|----------------------|-----------------------------------|
| <code>__begin</code> | Begin iterator of input sequence. |
| <code>__end</code>   | End iterator of input sequence.   |
| <code>__comp</code>  | Comparator.                       |

## Template Parameters

|                       |              |
|-----------------------|--------------|
| <code>__stable</code> | Sort stable. |
|-----------------------|--------------|

Definition at line 183 of file sort.h.

References `__gnu_parallel::parallel_tag::__get_num_threads()`, and `_GLIBCXX_CALL`.

Here is the call graph for this function:

## 3.6.4.40 \_\_parallel\_sort() [7/7]

```
template<bool __stable, typename _RAIter, typename _Compare >
void __gnu_parallel::__parallel_sort (
 _RAIter __begin,
 _RAIter __end,
 _Compare __comp,
 parallel_tag __parallelism) [inline]
```

Choose a parallel sorting algorithm.

## Parameters

|                      |                                   |
|----------------------|-----------------------------------|
| <code>__begin</code> | Begin iterator of input sequence. |
| <code>__end</code>   | End iterator of input sequence.   |
| <code>__comp</code>  | Comparator.                       |

## Template Parameters

|                       |              |
|-----------------------|--------------|
| <code>__stable</code> | Sort stable. |
|-----------------------|--------------|

Definition at line 203 of file sort.h.

References `__gnu_parallel::parallel_tag::__get_num_threads()`, `__parallel_sort_qs()`, `__parallel_sort_qsb()`, `_GLIBCXX_CALL`, and `__gnu_parallel::_Settings::get()`.

Here is the call graph for this function:

## 3.6.4.41 \_\_parallel\_sort\_qs()

```
template<typename _RAIter, typename _Compare >
void __gnu_parallel::__parallel_sort_qs (
 _RAIter __begin,
 _RAIter __end,
 _Compare __comp,
 _ThreadIndex __num_threads)
```

Unbalanced quicksort main call.

## Parameters

|                            |                                                          |
|----------------------------|----------------------------------------------------------|
| <code>__begin</code>       | Begin iterator of input sequence.                        |
| <code>__end</code>         | End iterator input sequence, ignored.                    |
| <code>__comp</code>        | Comparator.                                              |
| <code>__num_threads</code> | Number of threads that are allowed to work on this part. |

Definition at line 154 of file quicksort.h.

References `__parallel_sort_qs_conquer()`, and `_GLIBCXX_CALL`.

Referenced by `__parallel_sort()`.

3.6.4.42 `__parallel_sort_qs_conquer()`

```
template<typename _RAIter , typename _Compare >
void __gnu_parallel::__parallel_sort_qs_conquer (
 _RAIter __begin,
 _RAIter __end,
 _Compare __comp,
 _ThreadIndex __num_threads)
```

Unbalanced quicksort conquer step.

## Parameters

|                            |                                                          |
|----------------------------|----------------------------------------------------------|
| <code>__begin</code>       | Begin iterator of subsequence.                           |
| <code>__end</code>         | End iterator of subsequence.                             |
| <code>__comp</code>        | Comparator.                                              |
| <code>__num_threads</code> | Number of threads that are allowed to work on this part. |

Definition at line 101 of file quicksort.h.

Referenced by `__parallel_sort_qs()`.

3.6.4.43 `__parallel_sort_qs_divide()`

```
template<typename _RAIter , typename _Compare >
std::iterator_traits<_RAIter>::difference_type __gnu_parallel::__parallel_sort_qs_divide (
 _RAIter __begin,
 _RAIter __end,
 _Compare __comp,
 typename std::iterator_traits<_RAIter >::difference_type __pivot_rank,
 typename std::iterator_traits<_RAIter >::difference_type __num_samples,
 _ThreadIndex __num_threads)
```

Unbalanced quicksort divide step.

## Parameters

|                            |                                                          |
|----------------------------|----------------------------------------------------------|
| <code>__begin</code>       | Begin iterator of subsequence.                           |
| <code>__end</code>         | End iterator of subsequence.                             |
| <code>__comp</code>        | Comparator.                                              |
| <code>__pivot_rank</code>  | Desired <code>__rank</code> of the pivot.                |
| <code>__num_samples</code> | Choose pivot from that many samples.                     |
| <code>__num_threads</code> | Number of threads that are allowed to work on this part. |

Definition at line 51 of file quicksort.h.

References `std::min()`.

## 3.6.4.44 \_\_parallel\_sort\_qsb()

```
template<typename _RAIter , typename _Compare >
void __gnu_parallel::__parallel_sort_qsb (
 _RAIter __begin,
 _RAIter __end,
 _Compare __comp,
 _ThreadIndex __num_threads)
```

Top-level quicksort routine.

## Parameters

|                            |                                                          |
|----------------------------|----------------------------------------------------------|
| <code>__begin</code>       | Begin iterator of sequence.                              |
| <code>__end</code>         | End iterator of sequence.                                |
| <code>__comp</code>        | Comparator.                                              |
| <code>__num_threads</code> | Number of threads that are allowed to work on this part. |

Definition at line 433 of file balanced\_quicksort.h.

## 3.6.4.45 \_\_parallel\_unique\_copy() [1/2]

```
template<typename _IIter , class _OutputIterator , class _BinaryPredicate >
_OutputIterator __gnu_parallel::__parallel_unique_copy (
 _IIter __first,
 _IIter __last,
 _OutputIterator __result,
 _BinaryPredicate __binary_pred)
```

Parallel `std::unique_copy()`, w/`__o` explicit equality predicate.

**Parameters**

|                            |                                                    |
|----------------------------|----------------------------------------------------|
| <code>__first</code>       | Begin iterator of input sequence.                  |
| <code>__last</code>        | End iterator of input sequence.                    |
| <code>__result</code>      | Begin iterator of result <code>__sequence</code> . |
| <code>__binary_pred</code> | Equality predicate.                                |

**Returns**

End iterator of result `__sequence`.

Definition at line 50 of file `unique_copy.h`.

References `__equally_split()`, and `_GLIBCXX_CALL`.

Referenced by `__parallel_unique_copy()`.

**3.6.4.46 `__parallel_unique_copy()` [2/2]**

```
template<typename _IIter , class _OutputIterator >
_OutputIterator __gnu_parallel::__parallel_unique_copy (
 _IIter __first,
 _IIter __last,
 _OutputIterator __result) [inline]
```

Parallel `std::unique_copy()`, without explicit equality predicate.

**Parameters**

|                       |                                                    |
|-----------------------|----------------------------------------------------|
| <code>__first</code>  | Begin iterator of input sequence.                  |
| <code>__last</code>   | End iterator of input sequence.                    |
| <code>__result</code> | Begin iterator of result <code>__sequence</code> . |

**Returns**

End iterator of result `__sequence`.

Definition at line 186 of file `unique_copy.h`.

References `__parallel_unique_copy()`.

## 3.6.4.47 \_\_qsb\_conquer()

```
template<typename _RAIter , typename _Compare >
void __gnu_parallel::__qsb_conquer (
 _QSBThreadLocal< _RAIter > ** __tls,
 _RAIter __begin,
 _RAIter __end,
 _Compare __comp,
 _ThreadIndex __iam,
 _ThreadIndex __num_threads,
 bool __parent_wait)
```

Quicksort conquer step.

## Parameters

|                            |                                                          |
|----------------------------|----------------------------------------------------------|
| <code>__tls</code>         | Array of thread-local storages.                          |
| <code>__begin</code>       | Begin iterator of subsequence.                           |
| <code>__end</code>         | End iterator of subsequence.                             |
| <code>__comp</code>        | Comparator.                                              |
| <code>__iam</code>         | Number of the thread processing this function.           |
| <code>__num_threads</code> | Number of threads that are allowed to work on this part. |

Definition at line 174 of file `balanced_quicksort.h`.

## 3.6.4.48 \_\_qsb\_divide()

```
template<typename _RAIter , typename _Compare >
std::iterator_traits<_RAIter>::difference_type __gnu_parallel::__qsb_divide (
 _RAIter __begin,
 _RAIter __end,
 _Compare __comp,
 _ThreadIndex __num_threads)
```

Balanced quicksort divide step.

## Parameters

|                            |                                                          |
|----------------------------|----------------------------------------------------------|
| <code>__begin</code>       | Begin iterator of subsequence.                           |
| <code>__end</code>         | End iterator of subsequence.                             |
| <code>__comp</code>        | Comparator.                                              |
| <code>__num_threads</code> | Number of threads that are allowed to work on this part. |

**Precondition**

`(__end-__begin)>=1`

Definition at line 103 of file `balanced_quicksort.h`.

Referenced by `__qsb_conquer()`.

**3.6.4.49 `__qsb_local_sort_with_helping()`**

```
template<typename _RAIter , typename _Compare >
void __gnu_parallel::__qsb_local_sort_with_helping (
 _QSBThreadLocal< _RAIter > ** __tls,
 _Compare & __comp,
 _ThreadIndex __iam,
 bool __wait)
```

Quicksort step doing load-balanced local sort.

**Parameters**

|                     |                                                |
|---------------------|------------------------------------------------|
| <code>__tls</code>  | Array of thread-local storages.                |
| <code>__comp</code> | Comparator.                                    |
| <code>__iam</code>  | Number of the thread processing this function. |

Definition at line 250 of file `balanced_quicksort.h`.

**3.6.4.50 `__random_number_pow2()`**

```
template<typename _RandomNumberGenerator >
int __gnu_parallel::__random_number_pow2 (
 int __logp,
 _RandomNumberGenerator & __rng) [inline]
```

Generate a random number in  $[0, 2^{\text{__logp}})$ .

**Parameters**

|                     |                                                               |
|---------------------|---------------------------------------------------------------|
| <code>__logp</code> | Logarithm (basis 2) of the upper range <code>__bound</code> . |
| <code>__rng</code>  | Random number generator to use.                               |

Definition at line 115 of file random\_shuffle.h.

Referenced by \_\_parallel\_random\_shuffle\_drs\_pu(), and \_\_sequential\_random\_shuffle().

#### 3.6.4.51 \_\_rd\_log2()

```
template<typename _Size >
_Size __gnu_parallel::__rd_log2 (
 _Size __n) [inline]
```

Calculates the rounded-down logarithm of \_\_n for base 2.

##### Parameters

|                   |           |
|-------------------|-----------|
| $\leftrightarrow$ | Argument. |
| <code>__n</code>  |           |

##### Returns

Returns 0 for any argument <1.

Definition at line 102 of file base.h.

Referenced by \_\_parallel\_random\_shuffle\_drs(), \_\_parallel\_sort\_qsb(), \_\_round\_up\_to\_pow2(), \_\_sequential\_↔random\_shuffle(), \_\_gnu\_parallel::\_LoserTreeBase< \_Tp, \_Compare >::\_LoserTreeBase(), and multiseq\_selection().

#### 3.6.4.52 \_\_round\_up\_to\_pow2()

```
template<typename _Tp >
_Tp __gnu_parallel::__round_up_to_pow2 (
 _Tp __x)
```

Round up to the next greater power of 2.

##### Parameters

|                   |                     |
|-------------------|---------------------|
| $\leftrightarrow$ | Integer to round up |
| <code>__x</code>  |                     |

Definition at line 248 of file random\_shuffle.h.

References \_\_rd\_log2().

Referenced by \_\_parallel\_random\_shuffle\_drs(), \_\_sequential\_random\_shuffle(), and multiseq\_selection().

### 3.6.4.53 `__search_template()`

```
template<typename __RAIter1 , typename __RAIter2 , typename _Pred >
__RAIter1 __gnu_parallel::__search_template (
 __RAIter1 __begin1,
 __RAIter1 __end1,
 __RAIter2 __begin2,
 __RAIter2 __end2,
 _Pred __pred)
```

Parallel `std::search`.

#### Parameters

|                       |                                    |
|-----------------------|------------------------------------|
| <code>__begin1</code> | Begin iterator of first sequence.  |
| <code>__end1</code>   | End iterator of first sequence.    |
| <code>__begin2</code> | Begin iterator of second sequence. |
| <code>__end2</code>   | End iterator of second sequence.   |
| <code>__pred</code>   | Find predicate.                    |

#### Returns

Place of finding in first sequences.

Definition at line 81 of file `search.h`.

References `__calc_borders()`, `__equally_split()`, `_GLIBCXX_CALL`, and `std::min()`.

### 3.6.4.54 `__sequential_multiway_merge()`

```
template<bool __stable, bool __sentinels, typename _RAIterIterator , typename _RAIter3 , typename
_DifferenceTp , typename _Compare >
__RAIter3 __gnu_parallel::__sequential_multiway_merge (
 _RAIterIterator __seqs_begin,
 _RAIterIterator __seqs_end,
 _RAIter3 __target,
 const typename std::iterator_traits< typename std::iterator_traits< _RAIterIterator
>::value_type::first_type >::value_type & __sentinel,
 _DifferenceTp __length,
 _Compare __comp)
```

Sequential multi-way merging switch.

The `_GLIBCXX_PARALLEL_DECISION` is based on the branching factor and runtime settings.

#### Parameters

|                           |                                                                                 |
|---------------------------|---------------------------------------------------------------------------------|
| <code>__seqs_begin</code> | Begin iterator of iterator pair input sequence.                                 |
| <code>__seqs_end</code>   | End iterator of iterator pair input sequence.                                   |
| <code>__target</code>     | Begin iterator of output sequence.                                              |
| <code>__comp</code>       | Comparator.                                                                     |
| <code>__length</code>     | Maximum length to merge, possibly larger than the number of elements available. |
| <code>__sentinel</code>   | The sequences have a sentinel element.                                          |

**Returns**

End iterator of output sequence.

Definition at line 920 of file multiway\_merge.h.

References `_GLIBCXX_CALL`.

Referenced by `multiway_merge()`, and `multiway_merge_sentinels()`.

**3.6.4.55 \_\_sequential\_random\_shuffle()**

```
template<typename _RAIter , typename _RandomNumberGenerator >
void __gnu_parallel::__sequential_random_shuffle (
 _RAIter __begin,
 _RAIter __end,
 _RandomNumberGenerator & __rng)
```

Sequential cache-efficient random shuffle.

**Parameters**

|                      |                                 |
|----------------------|---------------------------------|
| <code>__begin</code> | Begin iterator of sequence.     |
| <code>__end</code>   | End iterator of sequence.       |
| <code>__rng</code>   | Random number generator to use. |

Definition at line 410 of file random\_shuffle.h.

References `__random_number_pow2()`, `__rd_log2()`, `__round_up_to_pow2()`, `__gnu_parallel::_Settings::get()`, `__gnu_parallel::_Settings::L2_cache_size`, `std::min()`, `std::partial_sum()`, and `__gnu_parallel::_Settings::TLB_size`.

Referenced by `__parallel_random_shuffle_drs()`.

**3.6.4.56 \_\_shrink()**

```
template<typename _IIter >
void __gnu_parallel::__shrink (
 std::vector<_IIter > & __os_starts,
 size_t & __count_to_two,
 size_t & __range_length)
```

Combines two ranges into one and thus halves the number of ranges.

**Parameters**

|                             |                                          |
|-----------------------------|------------------------------------------|
| <code>__os_starts</code>    | Start positions worked on (oversampled). |
| <code>__count_to_two</code> | Counts up to 2.                          |
| <code>__range_length</code> | Current length of a chunk.               |

Definition at line 70 of file list\_partition.h.

References `std::vector<_Tp, _Alloc >::size()`.

Referenced by `__shrink_and_double()`.

#### 3.6.4.57 `__shrink_and_double()`

```
template<typename _IIter >
void __gnu_parallel::__shrink_and_double (
 std::vector<_IIter > & __os_starts,
 size_t & __count_to_two,
 size_t & __range_length,
 const bool __make_twice)
```

Shrinks and doubles the ranges.

##### Parameters

|                             |                                                                    |
|-----------------------------|--------------------------------------------------------------------|
| <code>__os_starts</code>    | Start positions worked on (oversampled).                           |
| <code>__count_to_two</code> | Counts up to 2.                                                    |
| <code>__range_length</code> | Current length of a chunk.                                         |
| <code>__make_twice</code>   | Whether the <code>__os_starts</code> is allowed to be grown or not |

Definition at line 50 of file list\_partition.h.

References `__shrink()`, `std::vector<_Tp, _Alloc >::resize()`, and `std::vector<_Tp, _Alloc >::size()`.

Referenced by `list_partition()`.

#### 3.6.4.58 `__yield()`

```
void __gnu_parallel::__yield () [inline]
```

Yield control to another thread, without waiting for the end of the time slice.

Definition at line 121 of file parallel/compatibility.h.

Referenced by `__for_each_template_random_access_workstealing()`.

## 3.6.4.59 list\_partition()

```
template<typename _IIter , typename _FunctorType >
size_t __gnu_parallel::list_partition (
 const _IIter __begin,
 const _IIter __end,
 _IIter * __starts,
 size_t * __lengths,
 const int __num_parts,
 _FunctorType & __f,
 int __oversampling = 0)
```

Splits a sequence given by input iterators into parts of almost equal size.

The function needs only one pass over the sequence.

## Parameters

|                             |                                                                                                                                                                                                                                                   |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__begin</code>        | Begin iterator of input sequence.                                                                                                                                                                                                                 |
| <code>__end</code>          | End iterator of input sequence.                                                                                                                                                                                                                   |
| <code>__starts</code>       | Start iterators for the resulting parts, dimension <code>__num_parts+1</code> . For convenience, <code>__starts [ __num_parts ]</code> contains the end iterator of the sequence.                                                                 |
| <code>__lengths</code>      | Length of the resulting parts.                                                                                                                                                                                                                    |
| <code>__num_parts</code>    | Number of parts to split the sequence into.                                                                                                                                                                                                       |
| <code>__f</code>            | Functor to be applied to each element by traversing <code>__it</code>                                                                                                                                                                             |
| <code>__oversampling</code> | Oversampling factor. If 0, then the partitions will differ in at most $\sqrt{\text{end} - \text{begin}}$ elements. Otherwise, the ratio between the longest and the shortest part is bounded by $1/(\text{oversampling} \cdot \text{num\_parts})$ |

## Returns

Length of the whole sequence.

Definition at line 101 of file `list_partition.h`.

References `__shrink_and_double()`, and `std::vector< _Tp, _Alloc >::size()`.

## 3.6.4.60 max()

```
template<typename _Tp >
const _Tp& __gnu_parallel::max (
 const _Tp & __a,
 const _Tp & __b) [inline]
```

Equivalent to `std::max`.

Definition at line 150 of file `base.h`.

### 3.6.4.61 min()

```
template<typename _Tp >
const _Tp& __gnu_parallel::min (
 const _Tp & __a,
 const _Tp & __b) [inline]
```

Equivalent to `std::min`.

Definition at line 144 of file `base.h`.

Referenced by `__for_each_template_random_access_workstealing()`.

### 3.6.4.62 multiseq\_partition()

```
template<typename _RanSeqs , typename _RankType , typename _RankIterator , typename _Compare >
void __gnu_parallel::multiseq_partition (
 _RanSeqs __begin_seqs,
 _RanSeqs __end_seqs,
 _RankType __rank,
 _RankIterator __begin_offsets,
 _Compare __comp = std::less< typename std::iterator_traits<typename _RanSeqs>::value_type:: first_type>::value_type>())
```

Splits several sorted sequences at a certain global `__rank`, resulting in a splitting point for each sequence. The sequences are passed via a sequence of random-access iterator pairs, none of the sequences may be empty. If there are several equal elements across the split, the ones on the `__left` side will be chosen from sequences with smaller number.

#### Parameters

|                              |                                                                                                                                                                                                                                                              |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__begin_seqs</code>    | Begin of the sequence of iterator pairs.                                                                                                                                                                                                                     |
| <code>__end_seqs</code>      | End of the sequence of iterator pairs.                                                                                                                                                                                                                       |
| <code>__rank</code>          | The global rank to partition at.                                                                                                                                                                                                                             |
| <code>__begin_offsets</code> | A random-access <code>__sequence</code> <code>__begin</code> where the <code>__result</code> will be stored in. Each element of the sequence is an iterator that points to the first element on the greater part of the respective <code>__sequence</code> . |
| <code>__comp</code>          | The ordering functor, defaults to <code>std::less&lt;_Tp&gt;</code> .                                                                                                                                                                                        |

Definition at line 122 of file `multiseq_selection.h`.

References `_GLIBCXX_CALL`, and `std::distance()`.

### 3.6.4.63 multiseq\_selection()

```
template<typename _Tp , typename _RanSeqs , typename _RankType , typename _Compare >
_Tp __gnu_parallel::multiseq_selection (
```

```

_RanSeqs __begin_seqs,
_RanSeqs __end_seqs,
_RankType __rank,
_RankType & __offset,
_Compare __comp = std::less<_Tp>())

```

Selects the element at a certain global `__rank` from several sorted sequences.

The sequences are passed via a sequence of random-access iterator pairs, none of the sequences may be empty.

#### Parameters

|                           |                                                                                                                                                            |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__begin_seqs</code> | Begin of the sequence of iterator pairs.                                                                                                                   |
| <code>__end_seqs</code>   | End of the sequence of iterator pairs.                                                                                                                     |
| <code>__rank</code>       | The global rank to partition at.                                                                                                                           |
| <code>__offset</code>     | The rank of the selected element in the global subsequence of elements equal to the selected element. If the selected element is unique, this number is 0. |
| <code>__comp</code>       | The ordering functor, defaults to <code>std::less</code> .                                                                                                 |

Definition at line 388 of file `multiseq_selection.h`.

References `__rd_log2()`, `__round_up_to_pow2()`, `std::__sample()`, `_GLIBCXX_CALL`, `std::distance()`, and `std::max()`.

#### 3.6.4.64 `multiway_merge()`

```

template<typename _RAIterPairIterator , typename _RAIterOut , typename _DifferenceTp , typename _
_Compare >
_RAITerOut __gnu_parallel::multiway_merge (
 _RAIterPairIterator __seqs_begin,
 _RAIterPairIterator __seqs_end,
 _RAIterOut __target,
 _DifferenceTp __length,
 _Compare __comp,
 __gnu_parallel::sequential_tag)

```

Multiway Merge Frontend.

Merge the sequences specified by `seqs_begin` and `__seqs_end` into `__target`. `__seqs_begin` and `__seqs_end` must point to a sequence of pairs. These pairs must contain an iterator to the beginning of a sequence in their first entry and an iterator the `_M_end` of the same sequence in their second entry.

Ties are broken arbitrarily. See `stable_multiway_merge` for a variant that breaks ties by sequence number but is slower.

The first entries of the pairs (i.e. the begin iterators) will be moved forward.

The output sequence has to provide enough space for all elements that are written to it.

This function will merge the input sequences:

- not stable
- parallel, depending on the input size and Settings
- using sampling for splitting
- not using sentinels

Example:

```
int sequences[10][10];
for (int __i = 0; __i < 10; ++__i)
 for (int __j = 0; __j < 10; ++__j)
 sequences[__i][__j] = __j;

int __out[33];
std::vector<std::pair<int*> > seqs;
for (int __i = 0; __i < 10; ++__i)
 { seqs.push(std::make_pair<int*>(sequences[__i],
 sequences[__i] + 10)) }

multiway_merge(seqs.begin(), seqs.end(), __target, std::less<int>(), 33);
```

#### See also

`stable_multiway_merge`

#### Precondition

All input sequences must be sorted.

Target must provide enough space to merge out length elements or the number of elements in all sequences, whichever is smaller.

#### Postcondition

`[__target, return __value)` contains merged `__elements` from the input sequences.  
`return __value - __target = min(__length, number of elements in all sequences).`

#### Template Parameters

|                                  |                                                            |
|----------------------------------|------------------------------------------------------------|
| <code>_RAIterPairIterator</code> | iterator over sequence of pairs of iterators               |
| <code>_RAIterOut</code>          | iterator over target sequence                              |
| <code>_DifferenceTp</code>       | difference type for the sequence                           |
| <code>_Compare</code>            | strict weak ordering type to compare elements in sequences |

## Parameters

|                           |                                                                                 |
|---------------------------|---------------------------------------------------------------------------------|
| <code>__seqs_begin</code> | __begin of sequence __sequence                                                  |
| <code>__seqs_end</code>   | _M_end of sequence __sequence                                                   |
| <code>__target</code>     | target sequence to merge to.                                                    |
| <code>__comp</code>       | strict weak ordering to use for element comparison.                             |
| <code>__length</code>     | Maximum length to merge, possibly larger than the number of elements available. |

## Returns

\_M\_end iterator of output sequence

Definition at line 1418 of file multiway\_merge.h.

References `__sequential_multiway_merge()`, and `_GLIBCXX_CALL`.

## 3.6.4.65 multiway\_merge\_3\_variant()

```
template<template< typename _RAI, typename _Cp > class iterator, typename _RAIterIterator , typename
_RAIter3 , typename _DifferenceTp , typename _Compare >
_RAIter3 __gnu_parallel::multiway_merge_3_variant (
 _RAIterIterator __seqs_begin,
 _RAIterIterator __seqs_end,
 _RAIter3 __target,
 _DifferenceTp __length,
 _Compare __comp)
```

Highly efficient 3-way merging procedure.

Merging is done with the algorithm implementation described by Peter Sanders. Basically, the idea is to minimize the number of necessary comparison after merging an element. The implementation trick that makes this fast is that the order of the sequences is stored in the instruction pointer (translated into labels in C++).

This works well for merging up to 4 sequences.

Note that making the merging stable does *not* come at a performance hit.

Whether the merging is done guarded or unguarded is selected by the used iterator class.

## Parameters

|                           |                                                                                  |
|---------------------------|----------------------------------------------------------------------------------|
| <code>__seqs_begin</code> | Begin iterator of iterator pair input sequence.                                  |
| <code>__seqs_end</code>   | End iterator of iterator pair input sequence.                                    |
| <code>__target</code>     | Begin iterator of output sequence.                                               |
| <code>__comp</code>       | Comparator.                                                                      |
| <code>__length</code>     | Maximum length to merge, less equal than the total number of elements available. |

**Returns**

End iterator of output sequence.

Definition at line 241 of file multiway\_merge.h.

References `_GLIBCXX_CALL`.

**3.6.4.66 multiway\_merge\_4\_variant()**

```
template<template< typename _RAI, typename _Cp > class iterator, typename _RAIterIterator , typename
_RAIter3 , typename _DifferenceTp , typename _Compare >
_RAIter3 __gnu_parallel::multiway_merge_4_variant (
 _RAIterIterator __seqs_begin,
 _RAIterIterator __seqs_end,
 _RAIter3 __target,
 _DifferenceTp __length,
 _Compare __comp)
```

Highly efficient 4-way merging procedure.

Merging is done with the algorithm implementation described by Peter Sanders. Basically, the idea is to minimize the number of necessary comparison after merging an element. The implementation trick that makes this fast is that the order of the sequences is stored in the instruction pointer (translated into goto labels in C++).

This works well for merging up to 4 sequences.

Note that making the merging stable does *not* come at a performance hit.

Whether the merging is done guarded or unguarded is selected by the used iterator class.

**Parameters**

|                           |                                                                                  |
|---------------------------|----------------------------------------------------------------------------------|
| <code>__seqs_begin</code> | Begin iterator of iterator pair input sequence.                                  |
| <code>__seqs_end</code>   | End iterator of iterator pair input sequence.                                    |
| <code>__target</code>     | Begin iterator of output sequence.                                               |
| <code>__comp</code>       | Comparator.                                                                      |
| <code>__length</code>     | Maximum length to merge, less equal than the total number of elements available. |

**Returns**

End iterator of output sequence.

Definition at line 360 of file multiway\_merge.h.

References `_GLIBCXX_CALL`.

## 3.6.4.67 multiway\_merge\_exact\_splitting()

```
template<bool __stable, typename _RAIterIterator , typename _Compare , typename _DifferenceType >
void __gnu_parallel::multiway_merge_exact_splitting (
 _RAIterIterator __seqs_begin,
 _RAIterIterator __seqs_end,
 _DifferenceType __length,
 _DifferenceType __total_length,
 _Compare __comp,
 std::vector< std::pair< _DifferenceType, _DifferenceType > > * __pieces)
```

Exact splitting for parallel multiway-merge routine.

None of the passed sequences may be empty.

Definition at line 1120 of file multiway\_merge.h.

Referenced by \_\_parallel\_merge\_advance().

## 3.6.4.68 multiway\_merge\_loser\_tree()

```
template<typename _LT , typename _RAIterIterator , typename _RAIter3 , typename _DifferenceTp ,
typename _Compare >
_RAIter3 __gnu_parallel::multiway_merge_loser_tree (
 _RAIterIterator __seqs_begin,
 _RAIterIterator __seqs_end,
 _RAIter3 __target,
 _DifferenceTp __length,
 _Compare __comp)
```

Multi-way merging procedure for a high branching factor, guarded case.

This merging variant uses a LoserTree class as selected by \_LT.

Stability is selected through the used LoserTree class \_LT.

At least one non-empty sequence is required.

## Parameters

|                           |                                                                                  |
|---------------------------|----------------------------------------------------------------------------------|
| <code>__seqs_begin</code> | Begin iterator of iterator pair input sequence.                                  |
| <code>__seqs_end</code>   | End iterator of iterator pair input sequence.                                    |
| <code>__target</code>     | Begin iterator of output sequence.                                               |
| <code>__comp</code>       | Comparator.                                                                      |
| <code>__length</code>     | Maximum length to merge, less equal than the total number of elements available. |

**Returns**

End iterator of output sequence.

Definition at line 491 of file multiway\_merge.h.

References `_GLIBCXX_CALL`, and `_GLIBCXX_PARALLEL_LENGTH`.

**3.6.4.69 multiway\_merge\_loser\_tree\_sentinel()**

```
template<typename _UnguardedLoserTree , typename _RAIterIterator , typename _RAIter3 , typename ↵
_DifferenceTp , typename _Compare >
_RAIter3 __gnu_parallel::multiway_merge_loser_tree_sentinel (
 _RAIterIterator __seqs_begin,
 _RAIterIterator __seqs_end,
 _RAIter3 __target,
 const typename std::iterator_traits< typename std::iterator_traits< _RAIterIterator
>::value_type::first_type >::value_type & __sentinel,
 _DifferenceTp __length,
 _Compare __comp)
```

Multi-way merging procedure for a high branching factor, requiring sentinels to exist.

**Template Parameters**

|                                  |                                                      |
|----------------------------------|------------------------------------------------------|
| <code>_UnguardedLoserTree</code> | Loser Tree variant to use for the unguarded merging. |
|----------------------------------|------------------------------------------------------|

**Parameters**

|                           |                                                                                  |
|---------------------------|----------------------------------------------------------------------------------|
| <code>__seqs_begin</code> | Begin iterator of iterator pair input sequence.                                  |
| <code>__seqs_end</code>   | End iterator of iterator pair input sequence.                                    |
| <code>__target</code>     | Begin iterator of output sequence.                                               |
| <code>__comp</code>       | Comparator.                                                                      |
| <code>__length</code>     | Maximum length to merge, less equal than the total number of elements available. |

**Returns**

End iterator of output sequence.

Definition at line 662 of file multiway\_merge.h.

References `_GLIBCXX_CALL`.

## 3.6.4.70 multiway\_merge\_loser\_tree\_unguarded()

```
template<typename _LT , typename _RAIterIterator , typename _RAIter3 , typename _DifferenceTp ,
typename _Compare >
_RAIter3 __gnu_parallel::multiway_merge_loser_tree_unguarded (
 _RAIterIterator __seqs_begin,
 _RAIterIterator __seqs_end,
 _RAIter3 __target,
 const typename std::iterator_traits< typename std::iterator_traits< _RAIterIterator
>::value_type::first_type >::value_type & __sentinel,
 _DifferenceTp __length,
 _Compare __comp)
```

Multi-way merging procedure for a high branching factor, unguarded case.

Merging is done using the LoserTree class `_LT`.

Stability is selected by the used LoserTrees.

**Precondition**

No input will run out of elements during the merge.

**Parameters**

|                           |                                                                                  |
|---------------------------|----------------------------------------------------------------------------------|
| <code>__seqs_begin</code> | Begin iterator of iterator pair input sequence.                                  |
| <code>__seqs_end</code>   | End iterator of iterator pair input sequence.                                    |
| <code>__target</code>     | Begin iterator of output sequence.                                               |
| <code>__comp</code>       | Comparator.                                                                      |
| <code>__length</code>     | Maximum length to merge, less equal than the total number of elements available. |

**Returns**

End iterator of output sequence.

Definition at line 574 of file `multiway_merge.h`.

References `_GLIBCXX_CALL`.

## 3.6.4.71 multiway\_merge\_sampling\_splitting()

```
template<bool __stable, typename _RAIterIterator , typename _Compare , typename _DifferenceType >
void __gnu_parallel::multiway_merge_sampling_splitting (
 _RAIterIterator __seqs_begin,
 _RAIterIterator __seqs_end,
 _DifferenceType __length,
 _DifferenceType __total_length,
```

```
 _Compare __comp,
 std::vector< std::pair< _DifferenceType, _DifferenceType > > * __pieces)
```

Sampling based splitting for parallel multiway-merge routine.

Definition at line 1035 of file multiway\_merge.h.

References `_GLIBCXX_PARALLEL_LENGTH`, `__gnu_parallel::_Settings::get()`, and `__gnu_parallel::_Settings::merge_oversampling`.

#### 3.6.4.72 multiway\_merge\_sentinels()

```
template<typename _RAIterPairIterator , typename _RAIterOut , typename _DifferenceTp , typename _
_Compare >
_RAIterOut __gnu_parallel::multiway_merge_sentinels (
 _RAIterPairIterator __seqs_begin,
 _RAIterPairIterator __seqs_end,
 _RAIterOut __target,
 _DifferenceTp __length,
 _Compare __comp,
 __gnu_parallel::sequential_tag)
```

Multiway Merge Frontend.

Merge the sequences specified by `seqs_begin` and `__seqs_end` into `__target`. `__seqs_begin` and `__seqs_end` must point to a sequence of pairs. These pairs must contain an iterator to the beginning of a sequence in their first entry and an iterator the `_M_end` of the same sequence in their second entry.

Ties are broken arbitrarily. See `stable_multiway_merge` for a variant that breaks ties by sequence number but is slower.

The first entries of the pairs (i.e. the begin iterators) will be moved forward accordingly.

The output sequence has to provide enough space for all elements that are written to it.

This function will merge the input sequences:

- not stable
- parallel, depending on the input size and Settings
- using sampling for splitting
- using sentinels

You have to take care that the element the `_M_end` iterator points to is readable and contains a value that is greater than any other non-sentinel value in all sequences.

Example:

```

int sequences[10][11];
for (int __i = 0; __i < 10; ++__i)
 for (int __j = 0; __i < 11; ++__j)
 sequences[__i][__j] = __j; // __last one is sentinel!

int __out[33];
std::vector<std::pair<int*> > seqs;
for (int __i = 0; __i < 10; ++__i)
 { seqs.push(std::make_pair<int*>(sequences[__i],
 sequences[__i] + 10)) }

multiway_merge(seqs.begin(), seqs.end(), __target, std::less<int>(), 33);

```

**Precondition**

All input sequences must be sorted.

Target must provide enough space to merge out length elements or the number of elements in all sequences, whichever is smaller.

For each `__i`, `__seqs_begin[__i].second` must be the end marker of the sequence, but also reference the one more `__sentinel` element.

**Postcondition**

`[__target, return __value)` contains merged `__elements` from the input sequences.  
`return __value - __target = min(__length, number of elements in all sequences).`

**See also**

`stable_multiway_merge_sentinels`

**Template Parameters**

|                                  |                                                            |
|----------------------------------|------------------------------------------------------------|
| <code>_RAIterPairIterator</code> | iterator over sequence of pairs of iterators               |
| <code>_RAIterOut</code>          | iterator over target sequence                              |
| <code>_DifferenceTp</code>       | difference type for the sequence                           |
| <code>_Compare</code>            | strict weak ordering type to compare elements in sequences |

**Parameters**

|                           |                                                                                 |
|---------------------------|---------------------------------------------------------------------------------|
| <code>__seqs_begin</code> | <code>__begin</code> of sequence <code>__sequence</code>                        |
| <code>__seqs_end</code>   | <code>_M_end</code> of sequence <code>__sequence</code>                         |
| <code>__target</code>     | target sequence to merge to.                                                    |
| <code>__comp</code>       | strict weak ordering to use for element comparison.                             |
| <code>__length</code>     | Maximum length to merge, possibly larger than the number of elements available. |

**Returns**

`_M_end` iterator of output sequence

Definition at line 1782 of file `multiway_merge.h`.

References `__sequential_multiway_merge()`, and `_GLIBCXX_CALL`.

**3.6.4.73 parallel\_multiway\_merge()**

```
template<bool __stable, bool __sentinels, typename _RAIterIterator , typename _RAIter3 , typename
_DifferenceTp , typename _Splitter , typename _Compare >
_RAIter3 __gnu_parallel::parallel_multiway_merge (
 _RAIterIterator __seqs_begin,
 _RAIterIterator __seqs_end,
 _RAIter3 __target,
 _Splitter __splitter,
 _DifferenceTp __length,
 _Compare __comp,
 _ThreadIndex __num_threads)
```

Parallel multi-way merge routine.

The `_GLIBCXX_PARALLEL_DECISION` is based on the branching factor and runtime settings.

Must not be called if the number of sequences is 1.

**Template Parameters**

|                         |                                                                        |
|-------------------------|------------------------------------------------------------------------|
| <code>_Splitter</code>  | functor to split input (either <code>__exact</code> or sampling based) |
| <code>__stable</code>   | Stable merging incurs a performance penalty.                           |
| <code>__sentinel</code> | Ignored.                                                               |

**Parameters**

|                           |                                                                                 |
|---------------------------|---------------------------------------------------------------------------------|
| <code>__seqs_begin</code> | Begin iterator of iterator pair input sequence.                                 |
| <code>__seqs_end</code>   | End iterator of iterator pair input sequence.                                   |
| <code>__target</code>     | Begin iterator of output sequence.                                              |
| <code>__comp</code>       | Comparator.                                                                     |
| <code>__length</code>     | Maximum length to merge, possibly larger than the number of elements available. |

**Returns**

End iterator of output sequence.

Definition at line 1225 of file `multiway_merge.h`.

Referenced by `__parallel_merge_advance()`.

## 3.6.4.74 parallel\_sort\_mwms()

```
template<bool __stable, bool __exact, typename _RAIter , typename _Compare >
void __gnu_parallel::parallel_sort_mwms (
 _RAIter __begin,
 _RAIter __end,
 _Compare __comp,
 _ThreadIndex __num_threads)
```

PMWMS main call.

## Parameters

|                            |                             |
|----------------------------|-----------------------------|
| <code>__begin</code>       | Begin iterator of sequence. |
| <code>__end</code>         | End iterator of sequence.   |
| <code>__comp</code>        | Comparator.                 |
| <code>__num_threads</code> | Number of threads to use.   |

Definition at line 395 of file multiway\_mergesort.h.

References `_GLIBCXX_CALL`, `__gnu_parallel::PMWMSortingData< _RAIter >::M_num_threads`, `__gnu_parallel::PMWMSortingData< _RAIter >::M_offsets`, `__gnu_parallel::PMWMSortingData< _RAIter >::M_pieces`, `__gnu_parallel::PMWMSortingData< _RAIter >::M_samples`, `__gnu_parallel::PMWMSortingData< _RAIter >::M_source`, `__gnu_parallel::PMWMSortingData< _RAIter >::M_starts`, `__gnu_parallel::PMWMSortingData< _RAIter >::M_temporary`, `__gnu_parallel::Settings::get()`, and `__gnu_parallel::Settings::sort_mwms_oversampling`.

## 3.6.4.75 parallel\_sort\_mwms\_pu()

```
template<bool __stable, bool __exact, typename _RAIter , typename _Compare >
void __gnu_parallel::parallel_sort_mwms_pu (
 _PMWMSortingData< _RAIter > * __sd,
 _Compare & __comp)
```

PMWMS code executed by each thread.

## Parameters

|                     |                            |
|---------------------|----------------------------|
| <code>__sd</code>   | Pointer to algorithm data. |
| <code>__comp</code> | Comparator.                |

Definition at line 308 of file multiway\_mergesort.h.

References `__gnu_parallel::PMWMSortingData< _RAIter >::M_num_threads`, `__gnu_parallel::PMWMSortingData< _RAIter >::M_source`, `__gnu_parallel::PMWMSortingData< _RAIter >::M_starts`, `__gnu_parallel::PMWMSortingData< _RAIter >::M_temporary`, `__gnu_parallel::Settings::get()`, `__gnu_parallel::Settings::sort_mwms_oversampling`, and `std::uninitialized_copy()`.

### 3.6.5 Variable Documentation

#### 3.6.5.1 `_CASable_bits`

```
const int __gnu_parallel::_CASable_bits [static]
```

Number of bits of `_CASable`.

Definition at line 130 of file `types.h`.

Referenced by `__decode2()`, and `__encode2()`.

#### 3.6.5.2 `_CASable_mask`

```
const _CASable __gnu_parallel::_CASable_mask [static]
```

`_CASable` with the right half of bits set to 1.

Definition at line 133 of file `types.h`.

Referenced by `__decode2()`.

### 3.7.1 Detailed Description

GNU extensions for policy-based data structures for public use.

## 3.8 `__gnu_sequential` Namespace Reference

### 3.8.1 Detailed Description

GNU sequential classes for public use.

## 3.9 `abi` Namespace Reference

### 3.9.1 Detailed Description

The cross-vendor C++ Application Binary Interface. A namespace alias to `__cxxabiv1`, but user programs should use the alias `'abi'`.

A brief overview of an ABI is given in the `libstdc++` FAQ, question 5.8 (you may have a copy of the FAQ locally, or you can view the online version at [http://gcc.gnu.org/onlinedocs/libstdc++/faq.html#5\\_8](http://gcc.gnu.org/onlinedocs/libstdc++/faq.html#5_8)).

GCC subscribes to a cross-vendor ABI for C++, sometimes called the IA64 ABI because it happens to be the native ABI for that platform. It is summarized at <http://www.codesourcery.com/cxx-abi/> along with the current specification.

For users of GCC greater than or equal to 3.x, entry points are available in `<cxxabi.h>`, which notes, *'It is not normally necessary for user programs to include this header, or use the entry points directly. However, this header is available should that be needed.'*

## Standard Stream Objects

The `<iostream>` header declares the eight standard stream objects. For other declarations, see <http://gcc.gnu.org/onlinedocs/libstdc++/manual/io.html> and the [I/O forward declarations](#)

They are required by default to cooperate with the global C library's `FILE` streams, and to be available during program startup and termination. For more information, see the section of the manual linked to above.

- `istream cin`
- `ostream cout`
- `ostream cerr`
- `ostream clog`
- `wistream wcin`
- `wostream wcout`
- `wostream wcerr`
- `wostream wclog`

### 3.10.1 Detailed Description

ISO C++ entities toplevel namespace is std.

ISO C++ inline namespace for literal suffixes.

### 3.10.2 Typedef Documentation

#### 3.10.2.1 \_\_ptr\_rebind

```
template<typename _Ptr , typename _Tp >
using std::__ptr_rebind = typedef typename pointer_traits<_Ptr>::template rebind<_Tp>
```

Convenience alias for rebinding pointers.

Definition at line 152 of file ptr\_traits.h.

#### 3.10.2.2 \_\_umap\_traits

```
template<bool _Cache>
using std::__umap_traits = typedef __detail::_Hashtable_traits<_Cache, false, true>
```

Base types for unordered\_map.

Definition at line 40 of file unordered\_map.h.

#### 3.10.2.3 \_\_ummap\_traits

```
template<bool _Cache>
using std::__ummap_traits = typedef __detail::_Hashtable_traits<_Cache, false, false>
```

Base types for unordered\_multimap.

Definition at line 57 of file unordered\_map.h.

#### 3.10.2.4 \_\_umset\_traits

```
template<bool _Cache>
using std::__umset_traits = typedef __detail::_Hashtable_traits<_Cache, true, false>
```

Base types for unordered\_multiset.

Definition at line 55 of file unordered\_set.h.

#### 3.10.2.5 \_\_uset\_traits

```
template<bool _Cache>
using std::__uset_traits = typedef __detail::__Hashtable_traits<_Cache, true, true>
```

Base types for unordered\_set.

Definition at line 40 of file unordered\_set.h.

#### 3.10.2.6 index\_sequence

```
template<size_t... _Idx>
using std::index_sequence = typedef integer_sequence<size_t, _Idx...>
```

Alias template index\_sequence.

Definition at line 345 of file utility.

#### 3.10.2.7 index\_sequence\_for

```
template<typename... _Types>
using std::index_sequence_for = typedef make_index_sequence<sizeof...(_Types)>
```

Alias template index\_sequence\_for.

Definition at line 353 of file utility.

#### 3.10.2.8 make\_index\_sequence

```
template<size_t _Num>
using std::make_index_sequence = typedef make_integer_sequence<size_t, _Num>
```

Alias template make\_index\_sequence.

Definition at line 349 of file utility.

#### 3.10.2.9 make\_integer\_sequence

```
template<typename _Tp, _Tp _Num>
using std::make_integer_sequence = typedef integer_sequence<_Tp, __integer_pack(_Num)...>
```

Alias template make\_integer\_sequence.

Definition at line 338 of file utility.

#### 3.10.2.10 new\_handler

```
typedef void(* std::new_handler) ()
```

If you write your own error handler to be called by `new`, it must be of this type.

Definition at line 103 of file `new`.

#### 3.10.2.11 streamoff

```
typedef long long std::streamoff
```

Type used by `fpos`, `char_traits<char>`, and `char_traits<wchar_t>`.

In clauses 21.1.3.1 and 27.4.1 `streamoff` is described as an implementation defined type. Note: In versions of GCC up to and including GCC 3.3, `streamoff` was typedef `long`.

Definition at line 94 of file `postypes.h`.

#### 3.10.2.12 streampos

```
typedef fpos<mbstate_t> std::streampos
```

File position for char streams.

Definition at line 234 of file `postypes.h`.

#### 3.10.2.13 streamsize

```
typedef ptrdiff_t std::streamsize
```

Integral type for I/O operation counts and buffer sizes.

Definition at line 98 of file `postypes.h`.

#### 3.10.2.14 u16streampos

```
typedef fpos<mbstate_t> std::u16streampos
```

File position for `char16_t` streams.

Definition at line 245 of file `postypes.h`.

### 3.10.2.15 u32streampos

```
typedef fpos<mbstate_t> std::u32streampos
```

File position for char32\_t streams.

Definition at line 247 of file postypes.h.

### 3.10.2.16 wstreampos

```
typedef fpos<mbstate_t> std::wstreampos
```

File position for wchar\_t streams.

Definition at line 236 of file postypes.h.

## 3.10.3 Enumeration Type Documentation

### 3.10.3.1 anonymous enum

```
anonymous enum
```

**Todo** Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html) This controls some aspect of the sort routines.

Definition at line 1880 of file stl\_algo.h.

### 3.10.3.2 chars\_format

```
enum std::chars_format [strong]
```

floating-point format for primitive numerical conversion

Definition at line 658 of file charconv.

### 3.10.3.3 float\_denorm\_style

```
enum std::float_denorm_style
```

Describes the denormalization for floating-point types.

These values represent the presence or absence of a variable number of exponent bits. This type is used in the std↵::numeric\_limits class.

**Enumerator**

|                      |                                                                        |
|----------------------|------------------------------------------------------------------------|
| denorm_indeterminate | Indeterminate at compile time whether denormalized values are allowed. |
| denorm_absent        | The type does not allow denormalized values.                           |
| denorm_present       | The type allows denormalized values.                                   |

Definition at line 182 of file limits.

**3.10.3.4 float\_round\_style**

```
enum std::float_round_style
```

Describes the rounding style for floating-point types.

This is used in the std::numeric\_limits class.

**Enumerator**

|                           |                                     |
|---------------------------|-------------------------------------|
| round_toward_zero         | Intermediate.                       |
| round_to_nearest          | To zero.                            |
| round_toward_infinity     | To the nearest representable value. |
| round_toward_neg_infinity | To infinity.                        |

Definition at line 167 of file limits.

**3.10.3.5 io\_errc**

```
enum std::io_errc [strong]
```

I/O error code.

Definition at line 203 of file ios\_base.h.

**3.10.4 Function Documentation****3.10.4.1 \_\_allocate\_guarded()**

```
template<typename _Alloc >
__allocated_ptr<_Alloc> std::__allocate_guarded (
 _Alloc & __a)
```

Allocate space for a single object using \_\_a.

Definition at line 95 of file allocated\_ptr.h.

References std::allocator\_traits< \_Alloc >::allocate().

#### 3.10.4.2 `__final_insertion_sort()`

```
template<typename _RandomAccessIterator , typename _Compare >
constexpr void std::__final_insertion_sort (
 _RandomAccessIterator __first,
 _RandomAccessIterator __last,
 _Compare __comp)
```

This is a helper function for the sort routine.

Definition at line 1886 of file `stl_algo.h`.

References `__insertion_sort()`, and `__unguarded_insertion_sort()`.

#### 3.10.4.3 `__find_if()` [1/2]

```
template<typename _InputIterator , typename _Predicate >
constexpr _InputIterator std::__find_if (
 _InputIterator __first,
 _InputIterator __last,
 _Predicate __pred,
 input_iterator_tag) [inline]
```

This is an overload used by find algos for the Input Iterator case.

Definition at line 1909 of file `stl_algobase.h`.

Referenced by `__find_if_not()`, and `__search_n_aux()`.

#### 3.10.4.4 `__find_if()` [2/2]

```
template<typename _RandomAccessIterator , typename _Predicate >
constexpr _RandomAccessIterator std::__find_if (
 _RandomAccessIterator __first,
 _RandomAccessIterator __last,
 _Predicate __pred,
 random_access_iterator_tag)
```

This is an overload used by find algos for the RAI case.

Definition at line 1921 of file `stl_algobase.h`.

#### 3.10.4.5 \_\_find\_if\_not()

```
template<typename _InputIterator , typename _Predicate >
constexpr _InputIterator std::__find_if_not (
 _InputIterator __first,
 _InputIterator __last,
 _Predicate __pred) [inline]
```

Provided for `stable_partition` to use.

Definition at line 103 of file `stl_algo.h`.

References `__find_if()`.

#### 3.10.4.6 \_\_find\_if\_not\_n()

```
template<typename _InputIterator , typename _Predicate , typename _Distance >
constexpr _InputIterator std::__find_if_not_n (
 _InputIterator __first,
 _Distance & __len,
 _Predicate __pred)
```

Like `find_if_not()`, but uses and updates a count of the remaining range length instead of comparing against an end iterator.

Definition at line 117 of file `stl_algo.h`.

#### 3.10.4.7 \_\_gcd()

```
template<typename _EuclideanRingElement >
constexpr _EuclideanRingElement std::__gcd (
 _EuclideanRingElement __m,
 _EuclideanRingElement __n)
```

This is a helper function for the rotate algorithm specialized on RAs. It returns the greatest common divisor of two integer values.

Definition at line 1224 of file `stl_algo.h`.

#### 3.10.4.8 \_\_gen\_two\_uniform\_ints()

```
template<typename _IntType , typename _UniformRandomBitGenerator >
pair<_IntType, _IntType> std::__gen_two_uniform_ints (
 _IntType __b0,
 _IntType __b1,
 _UniformRandomBitGenerator && __g)
```

Generate two uniformly distributed integers using a single distribution invocation.

**Parameters**

|                   |                                         |
|-------------------|-----------------------------------------|
| <code>__b0</code> | The upper bound for the first integer.  |
| <code>__b1</code> | The upper bound for the second integer. |
| <code>__g</code>  | A UniformRandomBitGenerator.            |

**Returns**

A pair (i, j) with i and j uniformly distributed over [0, \_\_b0) and [0, \_\_b1), respectively.

Requires: `__b0 * __b1 <= __g.max() - __g.min()`.

Using `uniform_int_distribution` with a range that is very small relative to the range of the generator ends up wasting potentially expensively generated randomness, since `uniform_int_distribution` does not store leftover randomness between invocations.

If we know we want two integers in ranges that are sufficiently small, we can compose the ranges, use a single distribution invocation, and significantly reduce the waste.

Definition at line 3730 of file `stl_algo.h`.

Referenced by `__sample()`.

**3.10.4.9 `__heap_select()`**

```
template<typename _RandomAccessIterator , typename _Compare >
constexpr void std::__heap_select (
 _RandomAccessIterator __first,
 _RandomAccessIterator __middle,
 _RandomAccessIterator __last,
 _Compare __comp)
```

This is a helper function for the sort routines.

Definition at line 1667 of file `stl_algo.h`.

**3.10.4.10 `__inplace_stable_sort()`**

```
template<typename _RandomAccessIterator , typename _Compare >
void std::__inplace_stable_sort (
 _RandomAccessIterator __first,
 _RandomAccessIterator __last,
 _Compare __comp)
```

This is a helper function for the stable sorting routines.

Definition at line 2778 of file `stl_algo.h`.

References `__insertion_sort()`, and `__merge_without_buffer()`.

#### 3.10.4.11 \_\_insertion\_sort()

```
template<typename _RandomAccessIterator , typename _Compare >
constexpr void std::__insertion_sort (
 _RandomAccessIterator __first,
 _RandomAccessIterator __last,
 _Compare __comp)
```

This is a helper function for the sort routine.

Definition at line 1844 of file `stl_algo.h`.

Referenced by `__final_insertion_sort()`, and `__inplace_stable_sort()`.

#### 3.10.4.12 \_\_introsort\_loop()

```
template<typename _RandomAccessIterator , typename _Size , typename _Compare >
constexpr void std::__introsort_loop (
 _RandomAccessIterator __first,
 _RandomAccessIterator __last,
 _Size __depth_limit,
 _Compare __comp)
```

This is a helper function for the sort routine.

Definition at line 1950 of file `stl_algo.h`.

References `__unguarded_partition_pivot()`.

#### 3.10.4.13 \_\_lg()

```
constexpr int std::__lg (
 int __n) [inline]
```

This is a helper function for the sort routines and for `random.tcc`.

Definition at line 1364 of file `stl_algobase.h`.

Referenced by `std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::operator>()()`, and `std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed()`.

#### 3.10.4.14 `__merge_adaptive()`

```
template<typename _BidirectionalIterator , typename _Distance , typename _Pointer , typename _Compare >
void std::__merge_adaptive (
 _BidirectionalIterator __first,
 _BidirectionalIterator __middle,
 _BidirectionalIterator __last,
 _Distance __len1,
 _Distance __len2,
 _Pointer __buffer,
 _Distance __buffer_size,
 _Compare __comp)
```

This is a helper function for the merge routines.

Definition at line 2432 of file `stl_algo.h`.

#### 3.10.4.15 `__merge_without_buffer()`

```
template<typename _BidirectionalIterator , typename _Distance , typename _Compare >
void std::__merge_without_buffer (
 _BidirectionalIterator __first,
 _BidirectionalIterator __middle,
 _BidirectionalIterator __last,
 _Distance __len1,
 _Distance __len2,
 _Compare __comp)
```

This is a helper function for the merge routines.

Definition at line 2493 of file `stl_algo.h`.

References `advance()`, and `iter_swap()`.

Referenced by `__inplace_stable_sort()`.

#### 3.10.4.16 `__move_median_to_first()`

```
template<typename _Iterator , typename _Compare >
constexpr void std::__move_median_to_first (
 _Iterator __result,
 _Iterator __a,
 _Iterator __b,
 _Iterator __c,
 _Compare __comp)
```

Swaps the median value of `*__a`, `*__b` and `*__c` under `__comp` to `*__result`.

Definition at line 79 of file `stl_algo.h`.

References `iter_swap()`.

Referenced by `__unguarded_partition_pivot()`.

#### 3.10.4.17 \_\_move\_merge()

```
template<typename _InputIterator , typename _OutputIterator , typename _Compare >
_OutputIterator std::__move_merge (
 _InputIterator __first1,
 _InputIterator __last1,
 _InputIterator __first2,
 _InputIterator __last2,
 _OutputIterator __result,
 _Compare __comp)
```

This is a helper function for the \_\_merge\_sort\_loop routines.

Definition at line 2655 of file stl\_algo.h.

#### 3.10.4.18 \_\_move\_merge\_adaptive()

```
template<typename _InputIterator1 , typename _InputIterator2 , typename _OutputIterator , typename
_Compare >
void std::__move_merge_adaptive (
 _InputIterator1 __first1,
 _InputIterator1 __last1,
 _InputIterator2 __first2,
 _InputIterator2 __last2,
 _OutputIterator __result,
 _Compare __comp)
```

This is a helper function for the \_\_merge\_adaptive routines.

Definition at line 2325 of file stl\_algo.h.

#### 3.10.4.19 \_\_move\_merge\_adaptive\_backward()

```
template<typename _BidirectionalIterator1 , typename _BidirectionalIterator2 , typename _Bidirectional↵
Iterator3 , typename _Compare >
void std::__move_merge_adaptive_backward (
 _BidirectionalIterator1 __first1,
 _BidirectionalIterator1 __last1,
 _BidirectionalIterator2 __first2,
 _BidirectionalIterator2 __last2,
 _BidirectionalIterator3 __result,
 _Compare __comp)
```

This is a helper function for the \_\_merge\_adaptive routines.

Definition at line 2351 of file stl\_algo.h.

**3.10.4.20** `__partition()` [1/2]

```
template<typename _ForwardIterator , typename _Predicate >
constexpr _ForwardIterator std::__partition (
 _ForwardIterator __first,
 _ForwardIterator __last,
 _Predicate __pred,
 forward_iterator_tag)
```

This is a helper function...

Definition at line 1486 of file `stl_algo.h`.

References `iter_swap()`.

**3.10.4.21** `__partition()` [2/2]

```
template<typename _BidirectionalIterator , typename _Predicate >
constexpr _BidirectionalIterator std::__partition (
 _BidirectionalIterator __first,
 _BidirectionalIterator __last,
 _Predicate __pred,
 bidirectional_iterator_tag)
```

This is a helper function...

Definition at line 1512 of file `stl_algo.h`.

References `iter_swap()`.

**3.10.4.22** `__reverse()` [1/2]

```
template<typename _BidirectionalIterator >
constexpr void std::__reverse (
 _BidirectionalIterator __first,
 _BidirectionalIterator __last,
 bidirectional_iterator_tag)
```

This is an uglified `reverse(_BidirectionalIterator, _BidirectionalIterator)` overloaded for bidirectional iterators.

Definition at line 1120 of file `stl_algo.h`.

References `iter_swap()`.

**3.10.4.23 \_\_reverse()** [2/2]

```
template<typename _RandomAccessIterator >
constexpr void std::__reverse (
 _RandomAccessIterator __first,
 _RandomAccessIterator __last,
 random_access_iterator_tag)
```

This is an uglified reverse(\_BidirectionalIterator, \_BidirectionalIterator) overloaded for random access iterators.

Definition at line 1141 of file stl\_algo.h.

References iter\_swap().

**3.10.4.24 \_\_rotate\_adaptive()**

```
template<typename _BidirectionalIterator1 , typename _BidirectionalIterator2 , typename _Distance
>
_BidirectionalIterator1 std::__rotate_adaptive (
 _BidirectionalIterator1 __first,
 _BidirectionalIterator1 __middle,
 _BidirectionalIterator1 __last,
 _Distance __len1,
 _Distance __len2,
 _BidirectionalIterator2 __buffer,
 _Distance __buffer_size)
```

This is a helper function for the merge routines.

Definition at line 2394 of file stl\_algo.h.

**3.10.4.25 \_\_sample()** [1/2]

```
template<typename _InputIterator , typename _RandomAccessIterator , typename _Size , typename _URBG
UniformRandomBitGenerator >
_RandomAccessIterator std::__sample (
 _InputIterator __first,
 _InputIterator __last,
 input_iterator_tag ,
 _RandomAccessIterator __out,
 random_access_iterator_tag ,
 _Size __n,
 UniformRandomBitGenerator && __g)
```

Reservoir sampling algorithm.

Definition at line 5767 of file stl\_algo.h.

Referenced by \_\_gnu\_parallel::multiseq\_selection().

**3.10.4.26** `__sample()` [2/2]

```
template<typename _ForwardIterator , typename _OutputIterator , typename _Cat , typename _Size ,
typename _UniformRandomBitGenerator >
_OutputIterator std::__sample (
 _ForwardIterator __first,
 _ForwardIterator __last,
 forward_iterator_tag ,
 _OutputIterator __out,
 _Cat ,
 _Size __n,
 _UniformRandomBitGenerator && __g)
```

Selection sampling algorithm.

Definition at line 5794 of file `stl_algo.h`.

References `__gen_two_uniform_ints()`, `distance()`, `std::pair< _T1, _T2 >::first`, `min()`, and `std::pair< _T1, _T2 >::second`.

**3.10.4.27** `__search_n_aux()` [1/2]

```
template<typename _ForwardIterator , typename _Integer , typename _UnaryPredicate >
constexpr _ForwardIterator std::__search_n_aux (
 _ForwardIterator __first,
 _ForwardIterator __last,
 _Integer __count,
 _UnaryPredicate __unary_pred,
 std::forward_iterator_tag)
```

This is an helper function for `search_n` overloaded for forward iterators.

Definition at line 194 of file `stl_algo.h`.

References `__find_if()`.

**3.10.4.28** `__search_n_aux()` [2/2]

```
template<typename _RandomAccessIter , typename _Integer , typename _UnaryPredicate >
constexpr _RandomAccessIter std::__search_n_aux (
 _RandomAccessIter __first,
 _RandomAccessIter __last,
 _Integer __count,
 _UnaryPredicate __unary_pred,
 std::random_access_iterator_tag)
```

This is an helper function for `search_n` overloaded for random access iterators.

Definition at line 227 of file `stl_algo.h`.

#### 3.10.4.29 \_\_stable\_partition\_adaptive()

```
template<typename _ForwardIterator , typename _Pointer , typename _Predicate , typename _Distance
>
_FForwardIterator std::__stable_partition_adaptive (
 _ForwardIterator __first,
 _ForwardIterator __last,
 _Predicate __pred,
 _Distance __len,
 _Pointer __buffer,
 _Distance __buffer_size)
```

This is a helper function... Requires `__first != __last` and `!__pred(__first)` and `__len == distance(__first, __last)`.

`!__pred(__first)` allows us to guarantee that we don't move-assign an element onto itself.

Definition at line 1548 of file `stl_algo.h`.

#### 3.10.4.30 \_\_unguarded\_insertion\_sort()

```
template<typename _RandomAccessIterator , typename _Compare >
constexpr void std::__unguarded_insertion_sort (
 _RandomAccessIterator __first,
 _RandomAccessIterator __last,
 _Compare __comp) [inline]
```

This is a helper function for the sort routine.

Definition at line 1868 of file `stl_algo.h`.

References `__unguarded_linear_insert()`.

Referenced by `__final_insertion_sort()`.

#### 3.10.4.31 \_\_unguarded\_linear\_insert()

```
template<typename _RandomAccessIterator , typename _Compare >
constexpr void std::__unguarded_linear_insert (
 _RandomAccessIterator __last,
 _Compare __comp)
```

This is a helper function for the sort routine.

Definition at line 1824 of file `stl_algo.h`.

Referenced by `__unguarded_insertion_sort()`.

### 3.10.4.32 `__unguarded_partition()`

```
template<typename _RandomAccessIterator , typename _Compare >
constexpr _RandomAccessIterator std::__unguarded_partition (
 _RandomAccessIterator __first,
 _RandomAccessIterator __last,
 _RandomAccessIterator __pivot,
 _Compare __comp)
```

This is a helper function...

Definition at line 1903 of file `stl_algo.h`.

References `iter_swap()`.

Referenced by `__unguarded_partition_pivot()`.

### 3.10.4.33 `__unguarded_partition_pivot()`

```
template<typename _RandomAccessIterator , typename _Compare >
constexpr _RandomAccessIterator std::__unguarded_partition_pivot (
 _RandomAccessIterator __first,
 _RandomAccessIterator __last,
 _Compare __comp) [inline]
```

This is a helper function...

Definition at line 1925 of file `stl_algo.h`.

References `__move_median_to_first()`, and `__unguarded_partition()`.

Referenced by `__introsort_loop()`.

### 3.10.4.34 `__unique_copy()` [1/3]

```
template<typename _ForwardIterator , typename _OutputIterator , typename _BinaryPredicate >
constexpr _OutputIterator std::__unique_copy (
 _ForwardIterator __first,
 _ForwardIterator __last,
 _OutputIterator __result,
 _BinaryPredicate __binary_pred,
 forward_iterator_tag ,
 output_iterator_tag)
```

This is an uglified `unique_copy(_InputIterator, _InputIterator, _OutputIterator, _BinaryPredicate)` overloaded for forward iterators and output iterator as result.

Definition at line 1034 of file `stl_algo.h`.

**3.10.4.35 \_\_unique\_copy()** [2/3]

```
template<typename _InputIterator , typename _OutputIterator , typename _BinaryPredicate >
constexpr _OutputIterator std::__unique_copy (
 _InputIterator __first,
 _InputIterator __last,
 _OutputIterator __result,
 _BinaryPredicate __binary_pred,
 input_iterator_tag ,
 output_iterator_tag)
```

This is an uglified `unique_copy(_InputIterator, _InputIterator, _OutputIterator, _BinaryPredicate)` overloaded for input iterators and output iterator as result.

Definition at line 1064 of file `stl_algo.h`.

**3.10.4.36 \_\_unique\_copy()** [3/3]

```
template<typename _InputIterator , typename _ForwardIterator , typename _BinaryPredicate >
constexpr _ForwardIterator std::__unique_copy (
 _InputIterator __first,
 _InputIterator __last,
 _ForwardIterator __result,
 _BinaryPredicate __binary_pred,
 input_iterator_tag ,
 forward_iterator_tag)
```

This is an uglified `unique_copy(_InputIterator, _InputIterator, _OutputIterator, _BinaryPredicate)` overloaded for input iterators and forward iterator as result.

Definition at line 1097 of file `stl_algo.h`.

**3.10.4.37 \_Construct()**

```
template<typename _Tp , typename... _Args>
void std::_Construct (
 _Tp * __p,
 _Args &&... __args) [inline]
```

Constructs an object in existing memory by invoking an allocated object's constructor with an initializer.

Definition at line 108 of file `stl_construct.h`.

**3.10.4.38** `_Destroy()` [1/3]

```
template<typename _ForwardIterator >
constexpr void std::_Destroy (
 _ForwardIterator __first,
 _ForwardIterator __last) [inline]
```

Destroy a range of objects. If the value\_type of the object has a trivial destructor, the compiler should optimize all of this away, otherwise the objects' destructors must be invoked.

Definition at line 171 of file `stl_construct.h`.

**3.10.4.39** `_Destroy()` [2/3]

```
template<typename _Tp >
constexpr void std::_Destroy (
 _Tp * __pointer) [inline]
```

Destroy the object pointed to by a pointer type.

Definition at line 135 of file `stl_construct.h`.

**3.10.4.40** `_Destroy()` [3/3]

```
template<typename _ForwardIterator , typename _Allocator >
void std::_Destroy (
 _ForwardIterator __first,
 _ForwardIterator __last,
 _Allocator & __alloc)
```

Destroy a range of objects using the supplied allocator. For non-default allocators we do not optimize away invocation of `destroy()` even if `_Tp` has a trivial destructor.

Definition at line 721 of file `bits/alloc_traits.h`.

References `__addressof()`, and `std::allocator_traits<_Alloc>::destroy()`.

Referenced by `std::vector< sub_match< _Bi_iter >, allocator< sub_match< _Bi_iter > > >::~~vector()`.

**3.10.4.41** `_Destroy_n()`

```
template<typename _ForwardIterator , typename _Size >
constexpr _ForwardIterator std::_Destroy_n (
 _ForwardIterator __first,
 _Size __count) [inline]
```

Destroy a range of objects. If the value\_type of the object has a trivial destructor, the compiler should optimize all of this away, otherwise the objects' destructors must be invoked.

Definition at line 220 of file `stl_construct.h`.

## 3.10.4.42 acos()

```
template<typename _Tp >
std::complex< _Tp > std::acos (
 const std::complex< _Tp > & __z) [inline]
```

acos(\_\_z) [8.1.2].

Definition at line 1634 of file complex.

## 3.10.4.43 acosh()

```
template<typename _Tp >
std::complex< _Tp > std::acosh (
 const std::complex< _Tp > & __z) [inline]
```

acosh(\_\_z) [8.1.5].

Definition at line 1750 of file complex.

## 3.10.4.44 advance()

```
template<typename _InputIterator , typename _Distance >
constexpr void std::advance (
 _InputIterator & __i,
 _Distance __n) [inline]
```

A generalization of pointer arithmetic.

## Parameters

|                     |                                          |
|---------------------|------------------------------------------|
| $\leftarrow$<br>__i | An input iterator.                       |
| $\leftarrow$<br>__n | The <i>delta</i> by which to change __i. |

## Returns

Nothing.

This increments *i* by *n*. For bidirectional and random access iterators, \_\_n may be negative, in which case \_\_i is decremented.

For random access iterators, this uses their + and – operations and are constant time. For other iterator classes they are linear time.

Definition at line 202 of file `stl_iterator_base_funcs.h`.

References `__iterator_category()`.

Referenced by `__merge_without_buffer()`.

#### 3.10.4.45 `arg()`

```
template<typename _Tp >
__gnu_cxx::__promote<_Tp>::__type std::arg (
 _Tp __x) [inline]
```

Additional overloads [8.1.9].

Definition at line 1848 of file `complex`.

#### 3.10.4.46 `asin()`

```
template<typename _Tp >
std::complex<_Tp > std::asin (
 const std::complex<_Tp > & __z) [inline]
```

`asin(__z)` [8.1.3].

Definition at line 1670 of file `complex`.

#### 3.10.4.47 `asinh()`

```
template<typename _Tp >
std::complex<_Tp > std::asinh (
 const std::complex<_Tp > & __z) [inline]
```

`asinh(__z)` [8.1.6].

Definition at line 1789 of file `complex`.

#### 3.10.4.48 `atan()`

```
template<typename _Tp >
std::complex<_Tp > std::atan (
 const std::complex<_Tp > & __z) [inline]
```

`atan(__z)` [8.1.4].

Definition at line 1714 of file `complex`.

## 3.10.4.49 atanh()

```
template<typename _Tp >
std::complex< _Tp > std::atanh (
 const std::complex< _Tp > & __z) [inline]
```

atanh(\_\_z) [8.1.7].

Definition at line 1833 of file complex.

## 3.10.4.50 begin() [1/3]

```
template<typename _Container >
constexpr auto std::begin (
 _Container & __cont) -> decltype(__cont.begin()) [inline]
```

Return an iterator pointing to the first element of the container.

## Parameters

|        |            |
|--------|------------|
| __cont | Container. |
|--------|------------|

Definition at line 51 of file range\_access.h.

## 3.10.4.51 begin() [2/3]

```
template<typename _Container >
constexpr auto std::begin (
 const _Container & __cont) -> decltype(__cont.begin()) [inline]
```

Return an iterator pointing to the first element of the const container.

## Parameters

|        |            |
|--------|------------|
| __cont | Container. |
|--------|------------|

Definition at line 61 of file range\_access.h.

## 3.10.4.52 begin() [3/3]

```
template<typename _Tp , size_t _Nm>
constexpr _Tp* std::begin (
 _Tp(&) __arr[_Nm]) [inline], [noexcept]
```

Return an iterator pointing to the first element of the array.

## Parameters

|                    |        |
|--------------------|--------|
| <code>__arr</code> | Array. |
|--------------------|--------|

Definition at line 90 of file `range_access.h`.

## 3.10.4.53 boolalpha()

```
ios_base& std::boolalpha (
 ios_base & __base) [inline]
```

Calls `base.setf(ios_base::boolalpha)`.

Definition at line 908 of file `ios_base.h`.

References `__gnu_debug::__base()`, and `std::ios_base::boolalpha`.

## 3.10.4.54 cbegin()

```
template<typename _Container >
constexpr auto std::cbegin (
 const _Container & __cont) -> decltype(std::begin(__cont)) [inline], [noexcept]
```

Return an iterator pointing to the first element of the const container.

## Parameters

|                     |            |
|---------------------|------------|
| <code>__cont</code> | Container. |
|---------------------|------------|

Definition at line 119 of file `range_access.h`.

References `begin()`.

## 3.10.4.55 cend()

```
template<typename _Container >
constexpr auto std::cend (
 const _Container & __cont) -> decltype(std::end(__cont)) [inline], [noexcept]
```

Return an iterator pointing to one past the last element of the const container.

**Parameters**

|                     |            |
|---------------------|------------|
| <code>__cont</code> | Container. |
|---------------------|------------|

Definition at line 130 of file `range_access.h`.

References `end()`.

**3.10.4.56 `const_pointer_cast()`**

```
template<typename _Tp , typename _Tp1 , _Lock_policy _Lp>
__shared_ptr<_Tp, _Lp> std::const_pointer_cast (
 const __shared_ptr< _Tp1, _Lp > & __r) [inline], [noexcept]
```

**`const_pointer_cast`**

Definition at line 1588 of file `shared_ptr_base.h`.

**3.10.4.57 `crbegin()`**

```
template<typename _Container >
constexpr auto std::crbegin (
 const _Container & __cont) -> decltype(std::rbegin(__cont)) [inline]
```

Return a reverse iterator pointing to the last element of the const container.

**Parameters**

|                     |            |
|---------------------|------------|
| <code>__cont</code> | Container. |
|---------------------|------------|

Definition at line 221 of file `range_access.h`.

References `rbegin()`.

**3.10.4.58 `crend()`**

```
template<typename _Container >
constexpr auto std::crend (
 const _Container & __cont) -> decltype(std::rend(__cont)) [inline]
```

Return a reverse iterator pointing one past the first element of the const container.

## Parameters

|                     |            |
|---------------------|------------|
| <code>__cont</code> | Container. |
|---------------------|------------|

Definition at line 231 of file `range_access.h`.

References `rend()`.

3.10.4.59 `dec()`

```
ios_base& std::dec (
 ios_base & __base) [inline]
```

Calls `base.setf(ios_base::dec, ios_base::basefield)`.

Definition at line 1046 of file `ios_base.h`.

References `__gnu_debug::__base()`, `std::ios_base::basefield`, and `std::ios_base::dec`.

Referenced by operator `>>()`.

3.10.4.60 `defaultfloat()`

```
ios_base& std::defaultfloat (
 ios_base & __base) [inline]
```

Calls `base.unsetf(ios_base::floatfield)`

Definition at line 1099 of file `ios_base.h`.

References `__gnu_debug::__base()`, and `std::ios_base::floatfield`.

3.10.4.61 `distance()`

```
template<typename _InputIterator >
constexpr iterator_traits<_InputIterator>::difference_type std::distance (
 _InputIterator __first,
 _InputIterator __last) [inline]
```

A generalization of pointer arithmetic.

## Parameters

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

**Returns**

The distance between them.

Returns `n` such that `__first + n == __last`. This requires that `__last` must be reachable from `__first`. Note that `n` may be negative.

For random access iterators, this uses their `+` and `-` operations and are constant time. For other iterator classes they are linear time.

Definition at line 138 of file `stl_iterator_base_funcs.h`.

References `__iterator_category()`.

Referenced by `__sample()`, `std::deque<_StateSeqT>::_M_range_initialize()`, `std::sub_match<_Bi_iter>::length()`, `__gnu_parallel::multiseq_partition()`, `__gnu_parallel::multiseq_selection()`, and `std::match_results<_Bi_iter>::position()`.

**3.10.4.62 `dynamic_pointer_cast()`**

```
template<typename _Tp , typename _Tp1 , _Lock_policy _Lp>
__shared_ptr<_Tp, _Lp> std::dynamic_pointer_cast (
 const __shared_ptr<_Tp1, _Lp > & __r) [inline], [noexcept]
```

`dynamic_pointer_cast`

Definition at line 1601 of file `shared_ptr_base.h`.

**3.10.4.63 `end()` [1/3]**

```
template<typename _Container >
constexpr auto std::end (
 _Container & __cont) -> decltype(__cont.end()) [inline]
```

Return an iterator pointing to one past the last element of the container.

**Parameters**

|                     |            |
|---------------------|------------|
| <code>__cont</code> | Container. |
|---------------------|------------|

Definition at line 71 of file `range_access.h`.

**3.10.4.64 `end()` [2/3]**

```
template<typename _Container >
```

```
constexpr auto std::end (
 const _Container & __cont) -> decltype(__cont.end()) [inline]
```

Return an iterator pointing to one past the last element of the const container.

#### Parameters

|                     |            |
|---------------------|------------|
| <code>__cont</code> | Container. |
|---------------------|------------|

Definition at line 81 of file `range_access.h`.

#### 3.10.4.65 `end()` [3/3]

```
template<typename _Tp , size_t _Nm>
constexpr _Tp* std::end (
 _Tp(&) __arr[_Nm]) [inline], [noexcept]
```

Return an iterator pointing to one past the last element of the array.

#### Parameters

|                    |        |
|--------------------|--------|
| <code>__arr</code> | Array. |
|--------------------|--------|

Definition at line 100 of file `range_access.h`.

#### 3.10.4.66 `endl()`

```
template<typename _CharT , typename _Traits >
basic_ostream<_CharT, _Traits>& std::endl (
 basic_ostream< _CharT, _Traits > & __os) [inline]
```

Write a newline and flush the stream.

This manipulator is often mistakenly used when a simple newline is desired, leading to poor buffering performance. See <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.↔streambuf.buffering> for more on this subject.

Definition at line 681 of file `ostream`.

#### 3.10.4.67 ends()

```
template<typename _CharT , typename _Traits >
basic_ostream<_CharT, _Traits>& std::ends (
 basic_ostream< _CharT, _Traits > & __os) [inline]
```

Write a null character into the output sequence.

*Null character* is `CharT()` by definition. For `CharT` of `char`, this correctly writes the ASCII NUL character string terminator.

Definition at line 693 of file `ostream`.

#### 3.10.4.68 exchange()

```
template<typename _Tp , typename _Up = _Tp>
constexpr _Tp std::exchange (
 _Tp & __obj,
 _Up && __new_val) [inline]
```

Assign `__new_val` to `__obj` and return its previous value.

Definition at line 291 of file `utility`.

#### 3.10.4.69 fabs()

```
template<typename _Tp >
_Tp std::fabs (
 const std::complex< _Tp > & __z) [inline]
```

`fabs(__z)` [8.1.8].

Definition at line 1842 of file `complex`.

#### 3.10.4.70 fixed()

```
ios_base& std::fixed (
 ios_base & __base) [inline]
```

Calls `base.setf(ios_base::fixed, ios_base::floatfield)`.

Definition at line 1071 of file `ios_base.h`.

References `__gnu_debug::__base()`, `std::ios_base::fixed`, and `std::ios_base::floatfield`.

#### 3.10.4.71 flush()

```
template<typename _CharT , typename _Traits >
basic_ostream<_CharT, _Traits>& std::flush (
 basic_ostream< _CharT, _Traits > & __os) [inline]
```

Flushes the output stream.

This manipulator simply calls the stream's `flush()` member function.

Definition at line 703 of file ostream.

#### 3.10.4.72 from\_chars()

```
template<typename _Tp >
__detail::__integer_from_chars_result_type<_Tp> std::from_chars (
 const char * __first,
 const char * __last,
 _Tp & __value,
 int __base = 10)
```

`std::from_chars` for integral types.

Definition at line 595 of file charconv.

#### 3.10.4.73 get\_money()

```
template<typename _MoneyT >
_Get_money<_MoneyT> std::get_money (
 _MoneyT & __mon,
 bool __intl = false) [inline]
```

Extended manipulator for extracting money.

##### Parameters

|                     |                                                                       |
|---------------------|-----------------------------------------------------------------------|
| <code>__mon</code>  | Either long double or a specialization of <code>basic_string</code> . |
| <code>__intl</code> | A bool indicating whether international format is to be used.         |

Sent to a stream object, this manipulator extracts `__mon`.

Definition at line 259 of file iomanip.

#### 3.10.4.74 `get_new_handler()`

```
new_handler std::get_new_handler () [noexcept]
```

Return the current new handler.

#### 3.10.4.75 `get_temporary_buffer()`

```
template<typename _Tp >
pair<_Tp*, ptrdiff_t> std::get_temporary_buffer (
 ptrdiff_t __len) [noexcept]
```

Allocates a temporary buffer.

##### Parameters

|                    |                                                 |
|--------------------|-------------------------------------------------|
| <code>__len</code> | The number of objects of type <code>Tp</code> . |
|--------------------|-------------------------------------------------|

##### Returns

See full description.

Reinventing the wheel, but this time with prettier spokes!

This function tries to obtain storage for `__len` adjacent `Tp` objects. The objects themselves are not constructed, of course. A `pair<>` is returned containing *the buffer's address and capacity (in the units of `sizeof(_Tp)`)*, or a pair of 0 values if no storage can be obtained. Note that the capacity obtained may be less than that requested if the memory is unavailable; you should compare `len` with the `.second` return value.

Provides the nothrow exception guarantee.

Definition at line 100 of file `stl_tempbuf.h`.

#### 3.10.4.76 `get_time()`

```
template<typename _CharT >
_Get_time<_CharT> std::get_time (
 std::tm * __tmb,
 const _CharT * __fmt) [inline]
```

Extended manipulator for extracting time.

This manipulator uses `time_get::get` to extract time. [ext.manip]

## Parameters

|                    |                                     |
|--------------------|-------------------------------------|
| <code>__tmb</code> | struct to extract the time data to. |
| <code>__fmt</code> | format string.                      |

Definition at line 413 of file `iomanip`.

3.10.4.77 `getline()` [1/6]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
basic_istream< _CharT, _Traits > & std::getline (
 basic_istream< _CharT, _Traits > & __is,
 __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
 _CharT __delim)
```

Read a line from stream into a string.

## Parameters

|                      |                                |
|----------------------|--------------------------------|
| <code>__is</code>    | Input stream.                  |
| <code>__str</code>   | Buffer to store into.          |
| <code>__delim</code> | Character marking end of line. |

## Returns

Reference to the input stream.

Stores characters from `__is` into `__str` until `__delim` is found, the end of the stream is encountered, or `str.max_size()` is reached. If `is.width()` is non-zero, that is the limit on the number of characters stored into `__str`. Any previous contents of `__str` are erased. If `delim` was encountered, it is extracted but not stored into `__str`.

Definition at line 627 of file `vstring.tcc`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::max_size()`.

3.10.4.78 `getline()` [2/6]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
basic_istream<_CharT, _Traits>& std::getline (
 basic_istream< _CharT, _Traits > & __is,
 __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base > & __str) [inline]
```

Read a line from stream into a string.

**Parameters**

|                    |                       |
|--------------------|-----------------------|
| <code>__is</code>  | Input stream.         |
| <code>__str</code> | Buffer to store into. |

**Returns**

Reference to the input stream.

Stores characters from `is` into `__str` until '

' is found, the end of the stream is encountered, or `str.max_size()` is reached. If `is.width()` is non-zero, that is the limit on the number of characters stored into `__str`. Any previous contents of `__str` are erased. If end of line was encountered, it is extracted but not stored into `__str`.

Definition at line 2677 of file `vstring.h`.

References `getline()`, and `std::basic_ios<_CharT, _Traits >::widen()`.

**3.10.4.79 `getline()` [3/6]**

```
template<typename _CharT , typename _Traits , typename _Alloc >
basic_istream< _CharT, _Traits > & std::getline (
 basic_istream< _CharT, _Traits > & __is,
 basic_string< _CharT, _Traits, _Alloc > & __str,
 _CharT __delim)
```

Read a line from stream into a string.

**Parameters**

|                      |                                |
|----------------------|--------------------------------|
| <code>__is</code>    | Input stream.                  |
| <code>__str</code>   | Buffer to store into.          |
| <code>__delim</code> | Character marking end of line. |

**Returns**

Reference to the input stream.

Stores characters from `__is` into `__str` until `__delim` is found, the end of the stream is encountered, or `str.max_size()` is reached. Any previous contents of `__str` are erased. If `__delim` is encountered, it is extracted but not stored into `__str`.

Definition at line 1540 of file `basic_string.tcc`.

References `std::basic_string<_CharT, _Traits, _Alloc >::max_size()`.

Referenced by `getline()`.

**3.10.4.80** `getline()` [4/6]

```
template<typename _CharT , typename _Traits , typename _Alloc >
basic_istream<_CharT, _Traits>& std::getline (
 basic_istream< _CharT, _Traits > & __is,
 basic_string< _CharT, _Traits, _Alloc > & __str) [inline]
```

Read a line from stream into a string.

**Parameters**

|                    |                       |
|--------------------|-----------------------|
| <code>__is</code>  | Input stream.         |
| <code>__str</code> | Buffer to store into. |

**Returns**

Reference to the input stream.

Stores characters from `is` into `__str` until '  
' is found, the end of the stream is encountered, or `str.max_size()` is reached. Any previous contents of `__str` are erased. If end of line is encountered, it is extracted but not stored into `__str`.

Definition at line 6508 of file `basic_string.h`.

References `getline()`, and `std::basic_ios< _CharT, _Traits >::widen()`.

**3.10.4.81** `getline()` [5/6]

```
template<typename _CharT , typename _Traits , typename _Alloc >
basic_istream<_CharT, _Traits>& std::getline (
 basic_istream< _CharT, _Traits > && __is,
 basic_string< _CharT, _Traits, _Alloc > & __str,
 _CharT __delim) [inline]
```

Read a line from an rvalue stream into a string.

Definition at line 6516 of file `basic_string.h`.

References `getline()`.

**3.10.4.82** `getline()` [6/6]

```
template<typename _CharT , typename _Traits , typename _Alloc >
basic_istream<_CharT, _Traits>& std::getline (
 basic_istream< _CharT, _Traits > && __is,
 basic_string< _CharT, _Traits, _Alloc > & __str) [inline]
```

Read a line from an rvalue stream into a string.

Definition at line 6523 of file `basic_string.h`.

References `getline()`.

#### 3.10.4.83 hex()

```
ios_base& std::hex (
 ios_base & __base) [inline]
```

Calls `base.setf(ios_base::hex, ios_base::basefield)`.

Definition at line 1054 of file `ios_base.h`.

References `__gnu_debug::__base()`, `std::ios_base::basefield`, and `std::ios_base::hex`.

#### 3.10.4.84 hexfloat()

```
ios_base& std::hexfloat (
 ios_base & __base) [inline]
```

Calls `base.setf(ios_base::fixed|ios_basescientific, ios_base::floatfield)`

Definition at line 1091 of file `ios_base.h`.

References `__gnu_debug::__base()`, `std::ios_base::fixed`, `std::ios_base::floatfield`, and `std::ios_base::scientific`.

#### 3.10.4.85 internal()

```
ios_base& std::internal (
 ios_base & __base) [inline]
```

Calls `base.setf(ios_base::internal, ios_base::adjustfield)`.

Definition at line 1021 of file `ios_base.h`.

References `__gnu_debug::__base()`, `std::ios_base::adjustfield`, and `std::ios_base::internal`.

#### 3.10.4.86 isalnum()

```
template<typename _CharT >
bool std::isalnum (
 _CharT __c,
 const locale & __loc) [inline]
```

Convenience interface to `ctype.is(ctype_base::alnum, __c)`.

Definition at line 2623 of file `locale_facets.h`.

#### 3.10.4.87 isalpha()

```
template<typename _CharT >
bool std::isalpha (
 _CharT __c,
 const locale & __loc) [inline]
```

Convenience interface to `ctype.is(ctype_base::alpha, __c)`.

Definition at line 2599 of file `locale_facets.h`.

#### 3.10.4.88 isblank()

```
template<typename _CharT >
bool std::isblank (
 _CharT __c,
 const locale & __loc) [inline]
```

Convenience interface to `ctype.is(ctype_base::blank, __c)`.

Definition at line 2636 of file `locale_facets.h`.

#### 3.10.4.89 iscntrl()

```
template<typename _CharT >
bool std::iscntrl (
 _CharT __c,
 const locale & __loc) [inline]
```

Convenience interface to `ctype.is(ctype_base::cntrl, __c)`.

Definition at line 2581 of file `locale_facets.h`.

#### 3.10.4.90 isdigit()

```
template<typename _CharT >
bool std::isdigit (
 _CharT __c,
 const locale & __loc) [inline]
```

Convenience interface to `ctype.is(ctype_base::digit, __c)`.

Definition at line 2605 of file `locale_facets.h`.

#### 3.10.4.91 isgraph()

```
template<typename _CharT >
bool std::isgraph (
 _CharT __c,
 const locale & __loc) [inline]
```

Convenience interface to `ctype.is(ctype_base::graph, __c)`.

Definition at line 2629 of file `locale_facets.h`.

#### 3.10.4.92 islower()

```
template<typename _CharT >
bool std::islower (
 _CharT __c,
 const locale & __loc) [inline]
```

Convenience interface to `ctype.is(ctype_base::lower, __c)`.

Definition at line 2593 of file `locale_facets.h`.

#### 3.10.4.93 isprint()

```
template<typename _CharT >
bool std::isprint (
 _CharT __c,
 const locale & __loc) [inline]
```

Convenience interface to `ctype.is(ctype_base::print, __c)`.

Definition at line 2575 of file `locale_facets.h`.

#### 3.10.4.94 ispunct()

```
template<typename _CharT >
bool std::ispunct (
 _CharT __c,
 const locale & __loc) [inline]
```

Convenience interface to `ctype.is(ctype_base::punct, __c)`.

Definition at line 2611 of file `locale_facets.h`.

#### 3.10.4.95 isspace()

```
template<typename _CharT >
bool std::isspace (
 _CharT __c,
 const locale & __loc) [inline]
```

Convenience interface to `ctype.is(ctype_base::space, __c)`.

Definition at line 2569 of file `locale_facets.h`.

#### 3.10.4.96 isupper()

```
template<typename _CharT >
bool std::isupper (
 _CharT __c,
 const locale & __loc) [inline]
```

Convenience interface to `ctype.is(ctype_base::upper, __c)`.

Definition at line 2587 of file `locale_facets.h`.

#### 3.10.4.97 isxdigit()

```
template<typename _CharT >
bool std::isxdigit (
 _CharT __c,
 const locale & __loc) [inline]
```

Convenience interface to `ctype.is(ctype_base::xdigit, __c)`.

Definition at line 2617 of file `locale_facets.h`.

#### 3.10.4.98 left()

```
ios_base& std::left (
 ios_base & __base) [inline]
```

Calls `base.setf(ios_base::left, ios_base::adjustfield)`.

Definition at line 1029 of file `ios_base.h`.

References `__gnu_debug::__base()`, `std::ios_base::adjustfield`, and `std::ios_base::left`.

#### 3.10.4.99 noboolalpha()

```
ios_base& std::noboolalpha (
 ios_base & __base) [inline]
```

Calls base.unsetf(ios\_base::boolalpha).

Definition at line 916 of file ios\_base.h.

References `__gnu_debug::__base()`, and `std::ios_base::boolalpha`.

#### 3.10.4.100 noshowbase()

```
ios_base& std::noshowbase (
 ios_base & __base) [inline]
```

Calls base.unsetf(ios\_base::showbase).

Definition at line 932 of file ios\_base.h.

References `__gnu_debug::__base()`, and `std::ios_base::showbase`.

#### 3.10.4.101 noshowpoint()

```
ios_base& std::noshowpoint (
 ios_base & __base) [inline]
```

Calls base.unsetf(ios\_base::showpoint).

Definition at line 948 of file ios\_base.h.

References `__gnu_debug::__base()`, and `std::ios_base::showpoint`.

#### 3.10.4.102 noshowpos()

```
ios_base& std::noshowpos (
 ios_base & __base) [inline]
```

Calls base.unsetf(ios\_base::showpos).

Definition at line 964 of file ios\_base.h.

References `__gnu_debug::__base()`, and `std::ios_base::showpos`.

#### 3.10.4.103 noskipws()

```
ios_base& std::noskipws (
 ios_base & __base) [inline]
```

Calls base.unsetf(ios\_base::skipws).

Definition at line 980 of file ios\_base.h.

References `__gnu_debug::__base()`, and `std::ios_base::skipws`.

#### 3.10.4.104 nunitbuf()

```
ios_base& std::nunitbuf (
 ios_base & __base) [inline]
```

Calls base.unsetf(ios\_base::unitbuf).

Definition at line 1012 of file ios\_base.h.

References `__gnu_debug::__base()`, and `std::ios_base::unitbuf`.

#### 3.10.4.105 nouppercase()

```
ios_base& std::nouppercase (
 ios_base & __base) [inline]
```

Calls base.unsetf(ios\_base::uppercase).

Definition at line 996 of file ios\_base.h.

References `__gnu_debug::__base()`, and `std::ios_base::uppercase`.

#### 3.10.4.106 oct()

```
ios_base& std::oct (
 ios_base & __base) [inline]
```

Calls base.setf(ios\_base::oct, ios\_base::basefield).

Definition at line 1062 of file ios\_base.h.

References `__gnu_debug::__base()`, `std::ios_base::basefield`, and `std::ios_base::oct`.

**3.10.4.107 operator!=(())** [1/15]

```
template<typename _Tp , typename _Seq >
bool std::operator!=(
 const stack< _Tp, _Seq > & __x,
 const stack< _Tp, _Seq > & __y) [inline]
```

Based on operator==.

Definition at line 343 of file stl\_stack.h.

**3.10.4.108 operator!=(())** [2/15]

```
template<typename _Tp , typename _Seq >
bool std::operator!=(
 const queue< _Tp, _Seq > & __x,
 const queue< _Tp, _Seq > & __y) [inline]
```

Based on operator==.

Definition at line 368 of file stl\_queue.h.

**3.10.4.109 operator!=(())** [3/15]

```
template<typename _Res , typename... _Args>
bool std::operator!=(
 const function< _Res(_Args...)> & __f,
 nullptr_t) [inline], [noexcept]
```

Compares a polymorphic function object wrapper against 0 (the NULL pointer).

**Returns**

`false` if the wrapper has no target, `true` otherwise

This function will not throw an exception.

Definition at line 699 of file std\_function.h.

**3.10.4.110 operator!=()** [4/15]

```
template<typename _Res , typename... _Args>
bool std::operator!= (
 nullptr_t ,
 const function< _Res(_Args...)> & __f) [inline], [noexcept]
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

Definition at line 705 of file std\_function.h.

**3.10.4.111 operator!=()** [5/15]

```
template<typename _Key , typename _Compare , typename _Alloc >
bool std::operator!= (
 const multiset< _Key, _Compare, _Alloc > & __x,
 const multiset< _Key, _Compare, _Alloc > & __y) [inline]
```

Returns !(x == y).

Definition at line 1016 of file stl\_multiset.h.

**3.10.4.112 operator!=()** [6/15]

```
template<typename _Key , typename _Compare , typename _Alloc >
bool std::operator!= (
 const set< _Key, _Compare, _Alloc > & __x,
 const set< _Key, _Compare, _Alloc > & __y) [inline]
```

Returns !(x == y).

Definition at line 1030 of file stl\_set.h.

**3.10.4.113 operator!=()** [7/15]

```
template<typename _Key , typename _Tp , typename _Compare , typename _Alloc >
bool std::operator!= (
 const multimap< _Key, _Tp, _Compare, _Alloc > & __x,
 const multimap< _Key, _Tp, _Compare, _Alloc > & __y) [inline]
```

Based on operator==.

Definition at line 1173 of file stl\_multimap.h.

**3.10.4.114 operator!=()** [8/15]

```
template<typename _Tp , typename _Alloc >
bool std::operator!= (
 const forward_list< _Tp, _Alloc > & __lx,
 const forward_list< _Tp, _Alloc > & __ly) [inline]
```

Based on operator==.

Definition at line 1476 of file forward\_list.h.

**3.10.4.115 operator!=()** [9/15]

```
template<typename _Key , typename _Tp , typename _Compare , typename _Alloc >
bool std::operator!= (
 const map< _Key, _Tp, _Compare, _Alloc > & __x,
 const map< _Key, _Tp, _Compare, _Alloc > & __y) [inline]
```

Based on operator==.

Definition at line 1508 of file stl\_map.h.

**3.10.4.116 operator!=()** [10/15]

```
template<typename _Tp , typename _Alloc >
bool std::operator!= (
 const vector< _Tp, _Alloc > & __x,
 const vector< _Tp, _Alloc > & __y) [inline]
```

Based on operator==.

Definition at line 1937 of file stl\_vector.h.

**3.10.4.117 operator!=()** [11/15]

```
template<typename _Tp , typename _Alloc >
bool std::operator!= (
 const list< _Tp, _Alloc > & __x,
 const list< _Tp, _Alloc > & __y) [inline]
```

Based on operator==.

Definition at line 2057 of file stl\_list.h.

**3.10.4.118 operator!=()** [12/15]

```
template<typename _Tp , typename _Alloc >
bool std::operator!= (
 const deque< _Tp, _Alloc > & __x,
 const deque< _Tp, _Alloc > & __y) [inline]
```

Based on operator==.

Definition at line 2286 of file `stl_deque.h`.

**3.10.4.119 operator!=()** [13/15]

```
template<typename _CharT , typename _Traits , typename _Alloc >
bool std::operator!= (
 const basic_string< _CharT, _Traits, _Alloc > & __lhs,
 const basic_string< _CharT, _Traits, _Alloc > & __rhs) [inline], [noexcept]
```

Test difference of two strings.

**Parameters**

|                    |                |
|--------------------|----------------|
| <code>__lhs</code> | First string.  |
| <code>__rhs</code> | Second string. |

**Returns**

True if `__lhs.compare(__rhs) != 0`. False otherwise.

Definition at line 6239 of file `basic_string.h`.

**3.10.4.120 operator!=()** [14/15]

```
template<typename _CharT , typename _Traits , typename _Alloc >
bool std::operator!= (
 const _CharT * __lhs,
 const basic_string< _CharT, _Traits, _Alloc > & __rhs) [inline]
```

Test difference of C string and string.

**Parameters**

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | C string. |
| <code>__rhs</code> | String.   |

**Returns**

True if `__rhs.compare(__lhs) != 0`. False otherwise.

Definition at line 6252 of file `basic_string.h`.

**3.10.4.121 operator!=()** [15/15]

```
template<typename _CharT , typename _Traits , typename _Alloc >
bool std::operator!= (
 const basic_string< _CharT, _Traits, _Alloc > & __lhs,
 const _CharT * __rhs) [inline]
```

Test difference of string and C string.

**Parameters**

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | String.   |
| <code>__rhs</code> | C string. |

**Returns**

True if `__lhs.compare(__rhs) != 0`. False otherwise.

Definition at line 6264 of file `basic_string.h`.

**3.10.4.122 operator&()**

```
template<size_t _Nb>
bitset<_Nb> std::operator& (
 const bitset< _Nb > & __x,
 const bitset< _Nb > & __y) [inline], [noexcept]
```

Global bitwise operations on bitsets.

**Parameters**

|                  |                                                 |
|------------------|-------------------------------------------------|
| <code>__x</code> | A bitset.                                       |
| <code>__y</code> | A bitset of the same size as <code>__x</code> . |

**Returns**

A new bitset.

These should be self-explanatory.

Definition at line 1435 of file bitset.

**3.10.4.123 operator+()** [1/5]

```
template<typename _CharT , typename _Traits , typename _Alloc >
basic_string<_CharT, _Traits, _Alloc> std::operator+ (
 const basic_string< _CharT, _Traits, _Alloc > & __lhs,
 const basic_string< _CharT, _Traits, _Alloc > & __rhs)
```

Concatenate two strings.

**Parameters**

|                    |               |
|--------------------|---------------|
| <code>__lhs</code> | First string. |
| <code>__rhs</code> | Last string.  |

**Returns**

New string with value of `__lhs` followed by `__rhs`.

Definition at line 6032 of file basic\_string.h.

**3.10.4.124 operator+()** [2/5]

```
template<typename _CharT , typename _Traits , typename _Alloc >
basic_string< _CharT, _Traits, _Alloc > std::operator+ (
 const _CharT * __lhs,
 const basic_string< _CharT, _Traits, _Alloc > & __rhs)
```

Concatenate C string and string.

**Parameters**

|                    |               |
|--------------------|---------------|
| <code>__lhs</code> | First string. |
| <code>__rhs</code> | Last string.  |

**Returns**

New string with value of `__lhs` followed by `__rhs`.

Definition at line 1152 of file `basic_string.tcc`.

**3.10.4.125 operator+()** [3/5]

```
template<typename _CharT , typename _Traits , typename _Alloc >
basic_string< _CharT, _Traits, _Alloc > std::operator+ (
 _CharT __lhs,
 const basic_string< _CharT, _Traits, _Alloc > & __rhs)
```

Concatenate character and string.

**Parameters**

|                    |               |
|--------------------|---------------|
| <code>__lhs</code> | First string. |
| <code>__rhs</code> | Last string.  |

**Returns**

New string with `__lhs` followed by `__rhs`.

Definition at line 1172 of file `basic_string.tcc`.

References `std::basic_string< _CharT, _Traits, _Alloc >::get_allocator()`, and `std::basic_string< _CharT, _Traits, _Alloc >::size()`.

**3.10.4.126 operator+()** [4/5]

```
template<typename _CharT , typename _Traits , typename _Alloc >
basic_string<_CharT, _Traits, _Alloc> std::operator+ (
 const basic_string< _CharT, _Traits, _Alloc > & __lhs,
 const _CharT * __rhs) [inline]
```

Concatenate string and C string.

**Parameters**

|                    |               |
|--------------------|---------------|
| <code>__lhs</code> | First string. |
| <code>__rhs</code> | Last string.  |

**Returns**

New string with `__lhs` followed by `__rhs`.

Definition at line 6069 of file `basic_string.h`.

**3.10.4.127 operator+()** [5/5]

```
template<typename _CharT , typename _Traits , typename _Alloc >
basic_string<_CharT, _Traits, _Alloc> std::operator+ (
 const basic_string< _CharT, _Traits, _Alloc > & __lhs,
 _CharT __rhs) [inline]
```

Concatenate string and character.

**Parameters**

|                    |               |
|--------------------|---------------|
| <code>__lhs</code> | First string. |
| <code>__rhs</code> | Last string.  |

**Returns**

New string with `__lhs` followed by `__rhs`.

Definition at line 6085 of file `basic_string.h`.

**3.10.4.128 operator<()** [1/13]

```
template<typename _Tp , typename _Seq >
bool std::operator< (
 const stack< _Tp, _Seq > & __x,
 const stack< _Tp, _Seq > & __y) [inline]
```

Stack ordering relation.

**Parameters**

|                  |                                              |
|------------------|----------------------------------------------|
| <code>__x</code> | A stack.                                     |
| <code>__y</code> | A stack of the same type as <code>x</code> . |

**Returns**

True iff  $x$  is lexicographically less than  $\_\_y$ .

This is an total ordering relation. Complexity and semantics depend on the underlying sequence type, but the expected rules are: this relation is linear in the size of the sequences, the elements must be comparable with  $<$ , and `std::lexicographical_compare()` is usually used to make the determination.

Definition at line 337 of file `stl_stack.h`.

**3.10.4.129 operator<()** [2/13]

```
template<typename _Tp , typename _Seq >
bool std::operator< (
 const queue< _Tp, _Seq > & __x,
 const queue< _Tp, _Seq > & __y) [inline]
```

Queue ordering relation.

**Parameters**

|         |                                   |
|---------|-----------------------------------|
| $\_\_x$ | A queue.                          |
| $\_\_y$ | A queue of the same type as $x$ . |

**Returns**

True iff  $\_\_x$  is lexicographically less than  $\_\_y$ .

This is an total ordering relation. Complexity and semantics depend on the underlying sequence type, but the expected rules are: this relation is linear in the size of the sequences, the elements must be comparable with  $<$ , and `std::lexicographical_compare()` is usually used to make the determination.

Definition at line 362 of file `stl_queue.h`.

References `std::queue< _Tp, _Sequence >::c`.

**3.10.4.130 operator<()** [3/13]

```
template<typename _Key , typename _Compare , typename _Alloc >
bool std::operator< (
 const multiset< _Key, _Compare, _Alloc > & __x,
 const multiset< _Key, _Compare, _Alloc > & __y) [inline]
```

Multiset ordering relation.

**Parameters**

|       |                                        |
|-------|----------------------------------------|
| $\_x$ | A multiset.                            |
| $\_y$ | A multiset of the same type as $\_x$ . |

**Returns**

True iff  $\_x$  is lexicographically less than  $\_y$ .

This is a total ordering relation. It is linear in the size of the sets. The elements must be comparable with  $<$ .

See `std::lexicographical_compare()` for how the determination is made.

Definition at line 1009 of file `std_multiset.h`.

**3.10.4.131 operator<()** [4/13]

```
template<typename _Key , typename _Compare , typename _Alloc >
bool std::operator< (
 const set< _Key, _Compare, _Alloc > & __x,
 const set< _Key, _Compare, _Alloc > & __y) [inline]
```

Set ordering relation.

**Parameters**

|       |                                   |
|-------|-----------------------------------|
| $\_x$ | A set.                            |
| $\_y$ | A set of the same type as $\_x$ . |

**Returns**

True iff  $\_x$  is lexicographically less than  $\_y$ .

This is a total ordering relation. It is linear in the size of the sets. The elements must be comparable with  $<$ .

See `std::lexicographical_compare()` for how the determination is made.

Definition at line 1023 of file `std_set.h`.

**3.10.4.132 operator<()** [5/13]

```
template<typename _Key , typename _Tp , typename _Compare , typename _Alloc >
bool std::operator< (
 const multimap< _Key, _Tp, _Compare, _Alloc > & __x,
 const multimap< _Key, _Tp, _Compare, _Alloc > & __y) [inline]
```

Multimap ordering relation.

**Parameters**

|                          |                                     |
|--------------------------|-------------------------------------|
| $\leftrightarrow$<br>__x | A multimap.                         |
| $\leftrightarrow$<br>__y | A multimap of the same type as __x. |

**Returns**

True iff *x* is lexicographically less than *y*.

This is a total ordering relation. It is linear in the size of the multimaps. The elements must be comparable with <.

See std::lexicographical\_compare() for how the determination is made.

Definition at line 1166 of file stl\_multimap.h.

**3.10.4.133 operator<()** [6/13]

```
template<typename _Tp , typename _Alloc >
bool std::operator< (
 const forward_list< _Tp, _Alloc > & __lx,
 const forward_list< _Tp, _Alloc > & __ly) [inline]
```

Forward list ordering relation.

**Parameters**

|                           |                                          |
|---------------------------|------------------------------------------|
| $\leftrightarrow$<br>__lx | A forward_list.                          |
| $\leftrightarrow$<br>__ly | A forward_list of the same type as __lx. |

**Returns**

True iff \_\_lx is lexicographically less than \_\_ly.

This is a total ordering relation. It is linear in the number of elements of the forward lists. The elements must be comparable with <.

See `std::lexicographical_compare()` for how the determination is made.

Definition at line 1468 of file `forward_list.h`.

References `std::forward_list<_Tp, _Alloc>::cbegin()`, `std::forward_list<_Tp, _Alloc>::cend()`, and `lexicographical_compare()`.

#### 3.10.4.134 `operator<()` [7/13]

```
template<typename _Key , typename _Tp , typename _Compare , typename _Alloc >
bool std::operator< (
 const map< _Key, _Tp, _Compare, _Alloc > & __x,
 const map< _Key, _Tp, _Compare, _Alloc > & __y) [inline]
```

Map ordering relation.

##### Parameters

|                  |                                            |
|------------------|--------------------------------------------|
| <code>__x</code> | A map.                                     |
| <code>__y</code> | A map of the same type as <code>x</code> . |

##### Returns

True iff `x` is lexicographically less than `y`.

This is a total ordering relation. It is linear in the size of the maps. The elements must be comparable with `<`.

See `std::lexicographical_compare()` for how the determination is made.

Definition at line 1501 of file `stl_map.h`.

#### 3.10.4.135 `operator<()` [8/13]

```
template<typename _Tp , typename _Alloc >
bool std::operator< (
 const vector< _Tp, _Alloc > & __x,
 const vector< _Tp, _Alloc > & __y) [inline]
```

Vector ordering relation.

##### Parameters

|                  |                                                 |
|------------------|-------------------------------------------------|
| <code>__x</code> | A vector.                                       |
| <code>__y</code> | A vector of the same type as <code>__x</code> . |

**Returns**

True iff `__x` is lexicographically less than `__y`.

This is a total ordering relation. It is linear in the size of the vectors. The elements must be comparable with `<`.

See `std::lexicographical_compare()` for how the determination is made.

Definition at line 1930 of file `stl_vector.h`.

References `std::vector<_Tp, _Alloc>::begin()`, `std::vector<_Tp, _Alloc>::end()`, and `lexicographical_compare()`.

**3.10.4.136 operator<()** [9/13]

```
template<typename _Tp , typename _Alloc >
bool std::operator< (
 const list< _Tp, _Alloc > & __x,
 const list< _Tp, _Alloc > & __y) [inline]
```

List ordering relation.

**Parameters**

|                  |                                               |
|------------------|-----------------------------------------------|
| <code>__x</code> | A list.                                       |
| <code>__y</code> | A list of the same type as <code>__x</code> . |

**Returns**

True iff `__x` is lexicographically less than `__y`.

This is a total ordering relation. It is linear in the size of the lists. The elements must be comparable with `<`.

See `std::lexicographical_compare()` for how the determination is made.

Definition at line 2050 of file `stl_list.h`.

References `std::list<_Tp, _Alloc>::begin()`, `std::list<_Tp, _Alloc>::end()`, and `lexicographical_compare()`.

**3.10.4.137 operator<()** [10/13]

```
template<typename _Tp , typename _Alloc >
bool std::operator< (
 const deque< _Tp, _Alloc > & __x,
 const deque< _Tp, _Alloc > & __y) [inline]
```

Deque ordering relation.

**Parameters**

|                  |                                                |
|------------------|------------------------------------------------|
| <code>__x</code> | A deque.                                       |
| <code>__y</code> | A deque of the same type as <code>__x</code> . |

**Returns**

True iff `x` is lexicographically less than `__y`.

This is a total ordering relation. It is linear in the size of the deques. The elements must be comparable with `<`.

See `std::lexicographical_compare()` for how the determination is made.

Definition at line 2279 of file `std_deque.h`.

References `std::deque<_Tp, _Alloc>::begin()`, `std::deque<_Tp, _Alloc>::end()`, and `lexicographical_compare()`.

**3.10.4.138 operator<() [11/13]**

```
template<typename _CharT , typename _Traits , typename _Alloc >
bool std::operator< (
 const basic_string< _CharT, _Traits, _Alloc > & __lhs,
 const basic_string< _CharT, _Traits, _Alloc > & __rhs) [inline], [noexcept]
```

Test if string precedes string.

**Parameters**

|                    |                |
|--------------------|----------------|
| <code>__lhs</code> | First string.  |
| <code>__rhs</code> | Second string. |

**Returns**

True if `__lhs` precedes `__rhs`. False otherwise.

Definition at line 6277 of file `basic_string.h`.

**3.10.4.139 operator<() [12/13]**

```
template<typename _CharT , typename _Traits , typename _Alloc >
bool std::operator< (
 const basic_string< _CharT, _Traits, _Alloc > & __lhs,
 const _CharT * __rhs) [inline]
```

Test if string precedes C string.

**Parameters**

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | String.   |
| <code>__rhs</code> | C string. |

**Returns**

True if `__lhs` precedes `__rhs`. False otherwise.

Definition at line 6290 of file `basic_string.h`.

**3.10.4.140 operator<>() [13/13]**

```
template<typename _CharT , typename _Traits , typename _Alloc >
bool std::operator< (
 const _CharT * __lhs,
 const basic_string< _CharT, _Traits, _Alloc > & __rhs) [inline]
```

Test if C string precedes string.

**Parameters**

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | C string. |
| <code>__rhs</code> | String.   |

**Returns**

True if `__lhs` precedes `__rhs`. False otherwise.

Definition at line 6302 of file `basic_string.h`.

**3.10.4.141 operator<<>() [1/14]**

```
template<typename _CharT , typename _Traits >
basic_ostream<_CharT, _Traits>& std::operator<< (
 basic_ostream< _CharT, _Traits > & __out,
 char __c) [inline]
```

Character inserters.

**Parameters**

|                    |                   |
|--------------------|-------------------|
| <code>__out</code> | An output stream. |
| <code>__c</code>   | A character.      |

**Returns**`out`

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts a single character and any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

If `__c` is of type `char` and the character type of the stream is not `char`, the character is widened before insertion.

Definition at line 511 of file `ostream`.

**3.10.4.142 operator<<()** [2/14]

```
template<typename _Traits >
basic_ostream<char, _Traits>& std::operator<< (
 basic_ostream< char, _Traits > & __out,
 char __c) [inline]
```

Character inserters.

**Parameters**

|                    |                   |
|--------------------|-------------------|
| <code>__out</code> | An output stream. |
| <code>__c</code>   | A character.      |

**Returns**`out`

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts a single character and any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

If `__c` is of type `char` and the character type of the stream is not `char`, the character is widened before insertion.

Definition at line 517 of file `ostream`.

**3.10.4.143 operator<<()** [3/14]

```
template<typename _Traits >
basic_ostream<char, _Traits>& std::operator<< (
 basic_ostream< char, _Traits > & __out,
 signed char __c) [inline]
```

Character inserters.

**Parameters**

|                    |                   |
|--------------------|-------------------|
| <code>__out</code> | An output stream. |
| <code>__c</code>   | A character.      |

**Returns**

`out`

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts a single character and any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

If `__c` is of type `char` and the character type of the stream is not `char`, the character is widened before insertion.

Definition at line 523 of file `ostream`.

**3.10.4.144 operator<<()** [4/14]

```
template<typename _Traits >
basic_ostream<char, _Traits>& std::operator<< (
 basic_ostream< char, _Traits > & __out,
 unsigned char __c) [inline]
```

Character inserters.

**Parameters**

|                    |                   |
|--------------------|-------------------|
| <code>__out</code> | An output stream. |
| <code>__c</code>   | A character.      |

**Returns**

`out`

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts a single character and any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

If `__c` is of type `char` and the character type of the stream is not `char`, the character is widened before insertion.

Definition at line 528 of file `ostream`.

**3.10.4.145 operator<<()** [5/14]

```
template<typename _CharT, typename _Traits >
basic_ostream< _CharT, _Traits > & std::operator<< (
 basic_ostream< _CharT, _Traits > & __out,
 const char * __s)
```

String inserters.

**Parameters**

|                    |                     |
|--------------------|---------------------|
| <code>__out</code> | An output stream.   |
| <code>__s</code>   | A character string. |

**Returns**

`out`

**Precondition**

`__s` must be a non-NULL pointer

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts `traits::length(__s)` characters starting at `__s`, widened if necessary, followed by any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

Definition at line 321 of file `ostream.tcc`.

References `std::ios_base::badbit`, and `std::basic_ios< _CharT, _Traits >::setstate()`.

**3.10.4.146 operator<<()** [6/14]

```
template<typename _Traits >
basic_ostream<char, _Traits>& std::operator<< (
 basic_ostream< char, _Traits > & __out,
 const char * __s) [inline]
```

String inserters.

**Parameters**

|                    |                     |
|--------------------|---------------------|
| <code>__out</code> | An output stream.   |
| <code>__s</code>   | A character string. |

**Returns**

out

**Precondition**

\_\_s must be a non-NULL pointer

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts `traits::length(__s)` characters starting at `__s`, widened if necessary, followed by any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

Definition at line 606 of file ostream.

**3.10.4.147 operator<<()** [7/14]

```
template<typename _Traits >
basic_ostream<char, _Traits>& std::operator<< (
 basic_ostream< char, _Traits > & __out,
 const signed char * __s) [inline]
```

String inserters.

**Parameters**

|                    |                     |
|--------------------|---------------------|
| <code>__out</code> | An output stream.   |
| <code>__s</code>   | A character string. |

**Returns**

out

**Precondition**

\_\_s must be a non-NULL pointer

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts `traits::length(__s)` characters starting at `__s`, widened if necessary, followed by any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

Definition at line 619 of file ostream.

**3.10.4.148 operator<<()** [8/14]

```
template<typename _Traits >
basic_ostream<char, _Traits>& std::operator<< (
 basic_ostream< char, _Traits > & __out,
 const unsigned char * __s) [inline]
```

String inserters.

## Parameters

|                    |                     |
|--------------------|---------------------|
| <code>__out</code> | An output stream.   |
| <code>__s</code>   | A character string. |

## Returns

`out`

## Precondition

`__s` must be a non-NULL pointer

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts `traits::length(__s)` characters starting at `__s`, widened if necessary, followed by any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

Definition at line 624 of file `ostream`.

3.10.4.149 `operator<<()` [9/14]

```
template<typename _CharT, typename _Traits>
basic_ostream<_CharT, _Traits>& std::operator<< (
 basic_ostream<_CharT, _Traits> & __out,
 const _CharT * __s) [inline]
```

String inserters.

## Parameters

|                    |                     |
|--------------------|---------------------|
| <code>__out</code> | An output stream.   |
| <code>__s</code>   | A character string. |

## Returns

`out`

## Precondition

`__s` must be a non-NULL pointer

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts `traits::length(__s)` characters starting at `__s`, widened if necessary, followed by any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

Definition at line 589 of file `ostream`.

**3.10.4.150 operator<<()** [10/14]

```
template<typename _CharT , typename _Traits >
basic_ostream<_CharT, _Traits>& std::operator<< (
 basic_ostream< _CharT, _Traits > & __out,
 _CharT __c) [inline]
```

Character inserters.

**Parameters**

|                    |                   |
|--------------------|-------------------|
| <code>__out</code> | An output stream. |
| <code>__c</code>   | A character.      |

**Returns**

`out`

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts a single character and any required padding (as determined by [22.2.2.2]). `__out.width(0)` is then called.

If `__c` is of type `char` and the character type of the stream is not `char`, the character is widened before insertion.

Definition at line 506 of file `ostream`.

**3.10.4.151 operator<<()** [11/14]

```
template<typename _Ostream , typename _Tp >
enable_if<__and<__not<is_lvalue_reference<_Ostream> >, __is_convertible_to_basic_ostream<_Ostream>, __is_insertable<__rvalue_ostream_type<_Ostream>, const _Tp&> >::value, __rvalue_ostream_type<_Ostream> >::type std::operator<< (
 _Ostream && __os,
 const _Tp & __x) [inline]
```

Generic inserter for rvalue stream.

**Parameters**

|                   |                                           |
|-------------------|-------------------------------------------|
| <code>__os</code> | An input stream.                          |
| <code>__x</code>  | A reference to the object being inserted. |

**Returns**

`os`

This is just a forwarding function to allow insertion to rvalue streams since they won't bind to the inserter functions that take an lvalue reference.

Definition at line 773 of file ostream.

#### 3.10.4.152 operator<<() [12/14]

```
template<class _CharT , class _Traits , size_t _Nb>
std::basic_ostream<_CharT, _Traits>& std::operator<< (
 std::basic_ostream< _CharT, _Traits > & __os,
 const bitset< _Nb > & __x)
```

Global I/O operators for bitsets.

Direct I/O between streams and bitsets is supported. Output is straightforward. Input will skip whitespace, only accept 0 and 1 characters, and will only extract as many digits as the bitset will hold.

Definition at line 1540 of file bitset.

#### 3.10.4.153 operator<<() [13/14]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
basic_ostream<_CharT, _Traits>& std::operator<< (
 basic_ostream< _CharT, _Traits > & __os,
 const __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base > & __str) [inline]
```

Write string to a stream.

##### Parameters

|                    |                      |
|--------------------|----------------------|
| <code>__os</code>  | Output stream.       |
| <code>__str</code> | String to write out. |

##### Returns

Reference to the output stream.

Output characters of `__str` into `os` following the same rules as for writing a C string.

Definition at line 2631 of file vstring.h.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::data()`, and `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::size()`.

**3.10.4.154** `operator<<()` [14/14]

```
template<typename _CharT , typename _Traits , typename _Alloc >
basic_ostream<_CharT, _Traits>& std::operator<< (
 basic_ostream< _CharT, _Traits > & __os,
 const basic_string< _CharT, _Traits, _Alloc > & __str) [inline]
```

Write string to a stream.

**Parameters**

|                    |                      |
|--------------------|----------------------|
| <code>__os</code>  | Output stream.       |
| <code>__str</code> | String to write out. |

**Returns**

Reference to the output stream.

Output characters of `__str` into `os` following the same rules as for writing a C string.

Definition at line 6468 of file `basic_string.h`.

**3.10.4.155** `operator<=()` [1/13]

```
template<typename _Tp , typename _Seq >
bool std::operator<= (
 const stack< _Tp, _Seq > & __x,
 const stack< _Tp, _Seq > & __y) [inline]
```

Based on `operator<`.

Definition at line 355 of file `stl_stack.h`.

**3.10.4.156** `operator<=()` [2/13]

```
template<typename _Tp , typename _Seq >
bool std::operator<= (
 const queue< _Tp, _Seq > & __x,
 const queue< _Tp, _Seq > & __y) [inline]
```

Based on `operator<`.

Definition at line 380 of file `stl_queue.h`.

**3.10.4.157 operator<=()** [3/13]

```
template<typename _Key , typename _Compare , typename _Alloc >
bool std::operator<= (
 const multiset< _Key, _Compare, _Alloc > & __x,
 const multiset< _Key, _Compare, _Alloc > & __y) [inline]
```

Returns !(y < x)

Definition at line 1030 of file stl\_multiset.h.

**3.10.4.158 operator<=()** [4/13]

```
template<typename _Key , typename _Compare , typename _Alloc >
bool std::operator<= (
 const set< _Key, _Compare, _Alloc > & __x,
 const set< _Key, _Compare, _Alloc > & __y) [inline]
```

Returns !(y < x)

Definition at line 1044 of file stl\_set.h.

**3.10.4.159 operator<=()** [5/13]

```
template<typename _Key , typename _Tp , typename _Compare , typename _Alloc >
bool std::operator<= (
 const multimap< _Key, _Tp, _Compare, _Alloc > & __x,
 const multimap< _Key, _Tp, _Compare, _Alloc > & __y) [inline]
```

Based on operator<.

Definition at line 1187 of file stl\_multimap.h.

**3.10.4.160 operator<=()** [6/13]

```
template<typename _Tp , typename _Alloc >
bool std::operator<= (
 const forward_list< _Tp, _Alloc > & __lx,
 const forward_list< _Tp, _Alloc > & __ly) [inline]
```

Based on operator<.

Definition at line 1497 of file forward\_list.h.

**3.10.4.161 operator<=()** [7/13]

```
template<typename _Key , typename _Tp , typename _Compare , typename _Alloc >
bool std::operator<= (
 const map< _Key, _Tp, _Compare, _Alloc > & __x,
 const map< _Key, _Tp, _Compare, _Alloc > & __y) [inline]
```

Based on operator<.

Definition at line 1522 of file stl\_map.h.

**3.10.4.162 operator<=()** [8/13]

```
template<typename _Tp , typename _Alloc >
bool std::operator<= (
 const vector< _Tp, _Alloc > & __x,
 const vector< _Tp, _Alloc > & __y) [inline]
```

Based on operator<.

Definition at line 1949 of file stl\_vector.h.

**3.10.4.163 operator<=()** [9/13]

```
template<typename _Tp , typename _Alloc >
bool std::operator<= (
 const list< _Tp, _Alloc > & __x,
 const list< _Tp, _Alloc > & __y) [inline]
```

Based on operator<.

Definition at line 2069 of file stl\_list.h.

**3.10.4.164 operator<=()** [10/13]

```
template<typename _Tp , typename _Alloc >
bool std::operator<= (
 const deque< _Tp, _Alloc > & __x,
 const deque< _Tp, _Alloc > & __y) [inline]
```

Based on operator<.

Definition at line 2298 of file stl\_deque.h.

**3.10.4.165 operator<=()** [11/13]

```
template<typename _CharT , typename _Traits , typename _Alloc >
bool std::operator<= (
 const basic_string< _CharT, _Traits, _Alloc > & __lhs,
 const basic_string< _CharT, _Traits, _Alloc > & __rhs) [inline], [noexcept]
```

Test if string doesn't follow string.

## Parameters

|                    |                |
|--------------------|----------------|
| <code>__lhs</code> | First string.  |
| <code>__rhs</code> | Second string. |

## Returns

True if `__lhs` doesn't follow `__rhs`. False otherwise.

Definition at line 6353 of file `basic_string.h`.

3.10.4.166 `operator<=()` [12/13]

```
template<typename _CharT , typename _Traits , typename _Alloc >
bool std::operator<= (
 const basic_string< _CharT, _Traits, _Alloc > & __lhs,
 const _CharT * __rhs) [inline]
```

Test if string doesn't follow C string.

## Parameters

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | String.   |
| <code>__rhs</code> | C string. |

## Returns

True if `__lhs` doesn't follow `__rhs`. False otherwise.

Definition at line 6366 of file `basic_string.h`.

3.10.4.167 `operator<=()` [13/13]

```
template<typename _CharT , typename _Traits , typename _Alloc >
bool std::operator<= (
 const _CharT * __lhs,
 const basic_string< _CharT, _Traits, _Alloc > & __rhs) [inline]
```

Test if C string doesn't follow string.

## Parameters

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | C string. |
| <code>__rhs</code> | String.   |

**Returns**

True if `__lhs` doesn't follow `__rhs`. False otherwise.

Definition at line 6378 of file `basic_string.h`.

**3.10.4.168 operator==(** [1/16]

```
template<typename _StateT >
bool std::operator==(
 const fpos< _StateT > & __lhs,
 const fpos< _StateT > & __rhs) [inline]
```

Test if equivalent to another position.

Definition at line 222 of file `postypes.h`.

**3.10.4.169 operator==(** [2/16]

```
template<typename _Tp , typename _Seq >
bool std::operator==(
 const stack< _Tp, _Seq > & __x,
 const stack< _Tp, _Seq > & __y) [inline]
```

Stack equality comparison.

**Parameters**

|                  |                                                |
|------------------|------------------------------------------------|
| <code>__x</code> | A stack.                                       |
| <code>__y</code> | A stack of the same type as <code>__x</code> . |

**Returns**

True iff the size and elements of the stacks are equal.

This is an equivalence relation. Complexity and semantics depend on the underlying sequence type, but the expected rules are: this relation is linear in the size of the sequences, and stacks are considered equivalent if their sequences compare equal.

Definition at line 319 of file `stl_stack.h`.

**3.10.4.170 operator==()** [3/16]

```
template<typename _Tp , typename _Seq >
bool std::operator== (
 const queue< _Tp, _Seq > & __x,
 const queue< _Tp, _Seq > & __y) [inline]
```

Queue equality comparison.

**Parameters**

|                  |                                                |
|------------------|------------------------------------------------|
| <code>__x</code> | A queue.                                       |
| <code>__y</code> | A queue of the same type as <code>__x</code> . |

**Returns**

True iff the size and elements of the queues are equal.

This is an equivalence relation. Complexity and semantics depend on the underlying sequence type, but the expected rules are: this relation is linear in the size of the sequences, and queues are considered equivalent if their sequences compare equal.

Definition at line 344 of file `stl_queue.h`.

References `std::queue< _Tp, _Sequence >::c`.

**3.10.4.171 operator==()** [4/16]

```
template<typename _Res , typename... _Args>
bool std::operator== (
 const function< _Res(_Args...) > & __f,
 nullptr_t) [inline], [noexcept]
```

Compares a polymorphic function object wrapper against 0 (the NULL pointer).

**Returns**

`true` if the wrapper has no target, `false` otherwise

This function will not throw an exception.

Definition at line 680 of file `std_function.h`.

**3.10.4.172 operator==(** [5/16]

```
template<typename _Res , typename... _Args>
bool std::operator==(
 nullptr_t ,
 const function< _Res(_Args...)> & __f) [inline], [noexcept]
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

Definition at line 687 of file std\_function.h.

**3.10.4.173 operator==(** [6/16]

```
template<typename _Key , typename _Compare , typename _Alloc >
bool std::operator==(
 const multiset< _Key, _Compare, _Alloc > & __x,
 const multiset< _Key, _Compare, _Alloc > & __y) [inline]
```

Multiset equality comparison.

**Parameters**

|       |                                        |
|-------|----------------------------------------|
| $\_x$ | A multiset.                            |
| $\_y$ | A multiset of the same type as $\_x$ . |

**Returns**

True iff the size and elements of the multisets are equal.

This is an equivalence relation. It is linear in the size of the multisets. Multisets are considered equivalent if their sizes are equal, and if corresponding elements compare equal.

Definition at line 971 of file stl\_multiset.h.

**3.10.4.174 operator==(** [7/16]

```
template<typename _Key , typename _Compare , typename _Alloc >
bool std::operator==(
 const set< _Key, _Compare, _Alloc > & __x,
 const set< _Key, _Compare, _Alloc > & __y) [inline]
```

Set equality comparison.

**Parameters**

|       |                              |
|-------|------------------------------|
| $\_x$ | A set.                       |
| $\_y$ | A set of the same type as x. |

**Returns**

True iff the size and elements of the sets are equal.

This is an equivalence relation. It is linear in the size of the sets. Sets are considered equivalent if their sizes are equal, and if corresponding elements compare equal.

Definition at line 985 of file `stl_set.h`.

**3.10.4.175 operator==()** [8/16]

```
template<typename _Key , typename _Tp , typename _Compare , typename _Alloc >
bool std::operator== (
 const multimap< _Key, _Tp, _Compare, _Alloc > & __x,
 const multimap< _Key, _Tp, _Compare, _Alloc > & __y) [inline]
```

Multimap equality comparison.

**Parameters**

|       |                                     |
|-------|-------------------------------------|
| $\_x$ | A multimap.                         |
| $\_y$ | A multimap of the same type as __x. |

**Returns**

True iff the size and elements of the maps are equal.

This is an equivalence relation. It is linear in the size of the multimaps. Multimaps are considered equivalent if their sizes are equal, and if corresponding elements compare equal.

Definition at line 1128 of file `stl_multimap.h`.

**3.10.4.176** `operator==()` [9/16]

```
template<typename _Tp , typename _Alloc >
bool std::operator== (
 const forward_list< _Tp, _Alloc > & __lx,
 const forward_list< _Tp, _Alloc > & __ly)
```

Forward list equality comparison.

**Parameters**

|       |                                            |
|-------|--------------------------------------------|
| $\_x$ | A forward_list                             |
| $\_y$ | A forward_list of the same type as $\_x$ . |

**Returns**

True iff the elements of the forward lists are equal.

This is an equivalence relation. It is linear in the number of elements of the forward lists. Deques are considered equivalent if corresponding elements compare equal.

Definition at line 393 of file forward\_list.tcc.

References `std::forward_list<_Tp, _Alloc >::cbegin()`, and `std::forward_list<_Tp, _Alloc >::cend()`.

**3.10.4.177 operator==(** [10/16]

```
template<typename _Key , typename _Tp , typename _Compare , typename _Alloc >
bool std::operator==(
 const map<_Key, _Tp, _Compare, _Alloc > & __x,
 const map<_Key, _Tp, _Compare, _Alloc > & __y) [inline]
```

Map equality comparison.

**Parameters**

|       |                                   |
|-------|-----------------------------------|
| $\_x$ | A map.                            |
| $\_y$ | A map of the same type as $\_x$ . |

**Returns**

True iff the size and elements of the maps are equal.

This is an equivalence relation. It is linear in the size of the maps. Maps are considered equivalent if their sizes are equal, and if corresponding elements compare equal.

Definition at line 1463 of file stl\_map.h.

**3.10.4.178 operator==()** [11/16]

```
template<typename _Tp , typename _Alloc >
bool std::operator== (
 const vector< _Tp, _Alloc > & __x,
 const vector< _Tp, _Alloc > & __y) [inline]
```

Vector equality comparison.

**Parameters**

|                     |                                   |
|---------------------|-----------------------------------|
| $\leftarrow$<br>__x | A vector.                         |
| $\leftarrow$<br>__y | A vector of the same type as __x. |

**Returns**

True iff the size and elements of the vectors are equal.

This is an equivalence relation. It is linear in the size of the vectors. Vectors are considered equivalent if their sizes are equal, and if corresponding elements compare equal.

Definition at line 1892 of file stl\_vector.h.

References std::vector< \_Tp, \_Alloc >::begin(), std::vector< \_Tp, \_Alloc >::end(), equal(), and std::vector< \_Tp, \_Alloc >::size().

**3.10.4.179 operator==()** [12/16]

```
template<typename _Tp , typename _Alloc >
bool std::operator== (
 const list< _Tp, _Alloc > & __x,
 const list< _Tp, _Alloc > & __y) [inline]
```

List equality comparison.

**Parameters**

|                     |                                 |
|---------------------|---------------------------------|
| $\leftarrow$<br>__x | A list.                         |
| $\leftarrow$<br>__y | A list of the same type as __x. |

**Returns**

True iff the size and elements of the lists are equal.

This is an equivalence relation. It is linear in the size of the lists. Lists are considered equivalent if their sizes are equal, and if corresponding elements compare equal.

Definition at line 1995 of file `stl_list.h`.

References `std::list<_Tp, _Alloc>::begin()`, `std::list<_Tp, _Alloc>::end()`, and `std::list<_Tp, _Alloc>::size()`.

#### 3.10.4.180 `operator==()` [13/16]

```
template<typename _Tp , typename _Alloc >
bool std::operator== (
 const deque<_Tp, _Alloc > &__x,
 const deque<_Tp, _Alloc > &__y) [inline]
```

Deque equality comparison.

##### Parameters

|                          |                                  |
|--------------------------|----------------------------------|
| $\leftrightarrow$<br>__x | A deque.                         |
| $\leftrightarrow$<br>__y | A deque of the same type as __x. |

##### Returns

True iff the size and elements of the deques are equal.

This is an equivalence relation. It is linear in the size of the deques. Deques are considered equivalent if their sizes are equal, and if corresponding elements compare equal.

Definition at line 2241 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::begin()`, `std::deque<_Tp, _Alloc>::end()`, `equal()`, and `std::deque<_Tp,  $\leftrightarrow$  _Alloc>::size()`.

#### 3.10.4.181 `operator==()` [14/16]

```
template<typename _CharT , typename _Traits , typename _Alloc >
bool std::operator== (
 const basic_string<_CharT, _Traits, _Alloc > &__lhs,
 const basic_string<_CharT, _Traits, _Alloc > &__rhs) [inline], [noexcept]
```

Test equivalence of two strings.

**Parameters**

|                    |                |
|--------------------|----------------|
| <code>__lhs</code> | First string.  |
| <code>__rhs</code> | Second string. |

**Returns**

True if `__lhs.compare(__rhs) == 0`. False otherwise.

Definition at line 6163 of file `basic_string.h`.

**3.10.4.182 operator==(** [15/16]

```
template<typename _CharT , typename _Traits , typename _Alloc >
bool std::operator==(
 const basic_string< _CharT, _Traits, _Alloc > & __lhs,
 const _CharT * __rhs) [inline]
```

Test equivalence of string and C string.

**Parameters**

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | String.   |
| <code>__rhs</code> | C string. |

**Returns**

True if `__lhs.compare(__rhs) == 0`. False otherwise.

Definition at line 6185 of file `basic_string.h`.

**3.10.4.183 operator==(** [16/16]

```
template<typename _CharT , typename _Traits , typename _Alloc >
bool std::operator==(
 const _CharT * __lhs,
 const basic_string< _CharT, _Traits, _Alloc > & __rhs) [inline]
```

Test equivalence of C string and string.

**Parameters**

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | C string. |
| <code>__rhs</code> | String.   |

**Returns**

True if `__rhs.compare(__lhs) == 0`. False otherwise.

Definition at line 6226 of file `basic_string.h`.

**3.10.4.184 operator>()** [1/13]

```
template<typename _Tp , typename _Seq >
bool std::operator> (
 const stack< _Tp, _Seq > & __x,

template<typename _CharT , typename _Traits , typename _Alloc >
bool std::operator>= (
 const basic_string< _CharT, _Traits, _Alloc > & __lhs,
 const basic_string< _CharT, _Traits, _Alloc > & __rhs) [inline], [noexcept]
```

Test if string doesn't precede string.

**Parameters**

|                    |                |
|--------------------|----------------|
| <code>__lhs</code> | First string.  |
| <code>__rhs</code> | Second string. |

**Returns**

True if `__lhs` doesn't precede `__rhs`. False otherwise.

Definition at line 6391 of file basic\_string.h.

**3.10.4.208 operator>=()** [12/13]

```
template<typename _CharT , typename _Traits , typename _Alloc >
bool std::operator>= (
 const basic_string< _CharT, _Traits, _Alloc > & __lhs,
 const _CharT * __rhs) [inline]
```

Test if string doesn't precede C string.

**Parameters**

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | String.   |
| <code>__rhs</code> | C string. |

**Returns**

True if `__lhs` doesn't precede `__rhs`. False otherwise.

Definition at line 6404 of file `basic_string.h`.

**3.10.4.209 operator>=()** [13/13]

```
template<typename _CharT , typename _Traits , typename _Alloc >
bool std::operator>= (
 const _CharT * __lhs,
 const basic_string< _CharT, _Traits, _Alloc > & __rhs) [inline]
```

Test if C string doesn't precede string.

**Parameters**

|                    |           |
|--------------------|-----------|
| <code>__lhs</code> | C string. |
| <code>__rhs</code> | String.   |

**Returns**

True if `__lhs` doesn't precede `__rhs`. False otherwise.

Definition at line 6416 of file `basic_string.h`.

**3.10.4.210 operator>>()** [1/11]

```
template<typename _CharT , typename _Traits >
basic_istream< _CharT, _Traits > & std::operator>> (
```

```
basic_istream< _CharT, _Traits > & __in,
_CharT & __c)
```

Character extractors.

**Parameters**

|                          |                        |
|--------------------------|------------------------|
| $\leftrightarrow$<br>_in | An input stream.       |
| $\leftrightarrow$<br>_c  | A character reference. |

**Returns**

in

Behaves like one of the formatted arithmetic extractors described in `std::basic_istream`. After constructing a sentry object with good status, this function extracts a character (if one is available) and stores it in `__c`. Otherwise, sets failbit in the input stream.

Definition at line 931 of file `istream.tcc`.

References `std::ios_base::goodbit`.

**3.10.4.211 operator>>() [2/11]**

```
template<class _Traits >
basic_istream<char, _Traits>& std::operator>> (
 basic_istream< char, _Traits > & __in,
 unsigned char & __c) [inline]
```

Character extractors.

**Parameters**

|                          |                        |
|--------------------------|------------------------|
| $\leftrightarrow$<br>_in | An input stream.       |
| $\leftrightarrow$<br>_c  | A character reference. |

**Returns**

in

Behaves like one of the formatted arithmetic extractors described in `std::basic_istream`. After constructing a sentry object with good status, this function extracts a character (if one is available) and stores it in `__c`. Otherwise, sets failbit in the input stream.

Definition at line 756 of file `istream`.

## 3.10.4.212 operator&gt;&gt;() [3/11]

```
template<class _Traits >
basic_istream<char, _Traits>& std::operator>> (
 basic_istream< char, _Traits > & __in,
 signed char & __c) [inline]
```

Character extractors.

## Parameters

|                                                                                           |                        |
|-------------------------------------------------------------------------------------------|------------------------|
| <br>__in | An input stream.       |
| <br>__c  | A character reference. |

## Returns

in

Behaves like one of the formatted arithmetic extractors described in `std::basic_istream`. After constructing a sentry object with good status, this function extracts a character (if one is available) and stores it in `__c`. Otherwise, sets failbit in the input stream.

Definition at line 761 of file `istream`.

## 3.10.4.213 operator&gt;&gt;() [4/11]

```
template<typename _CharT , typename _Traits >
basic_istream< _CharT, _Traits > & std::operator>> (
 basic_istream< _CharT, _Traits > & __in,
 _CharT * __s)
```

Character string extractors.

## Parameters

|                                                                                             |                                 |
|---------------------------------------------------------------------------------------------|---------------------------------|
| <br>__in | An input stream.                |
| <br>__s  | A pointer to a character array. |

## Returns

\_\_in

Behaves like one of the formatted arithmetic extractors described in `std::basic_istream`. After constructing a sentry

object with good status, this function extracts up to `n` characters and stores them into the array starting at `__s`. `n` is defined as:

- if `width()` is greater than zero, `n` is `width()` otherwise
- `n` is *the number of elements of the largest array of \**
- *char\_type that can store a terminating eos.*
- `[27.6.1.2.3]/6`

Characters are extracted and stored until one of the following happens:

- `n-1` characters are stored
- EOF is reached
- the next character is whitespace according to the current locale
- the next character is a null byte (i.e., `charT()` )

`width(0)` is then called for the input stream.

If no characters are extracted, sets failbit.

Definition at line 963 of file `istream.tcc`.

References `std::ios_base::goodbit`.

#### 3.10.4.214 `operator>>()` [5/11]

```
template<>
basic_istream<char>& std::operator>> (
 basic_istream< char > & __in,
 char * __s)
```

Character string extractors.

##### Parameters

|                   |                                 |
|-------------------|---------------------------------|
| <code>__in</code> | An input stream.                |
| <code>__s</code>  | A pointer to a character array. |

##### Returns

`__in`

Behaves like one of the formatted arithmetic extractors described in `std::basic_istream`. After constructing a sentry object with good status, this function extracts up to `n` characters and stores them into the array starting at `__s`. `n` is defined as:

- if `width()` is greater than zero, `n` is `width()` otherwise
- `n` is *the number of elements of the largest array of \**
- *char\_type that can store a terminating eos.*
- [27.6.1.2.3]/6

Characters are extracted and stored until one of the following happens:

- `n-1` characters are stored
- EOF is reached
- the next character is whitespace according to the current locale
- the next character is a null byte (i.e., `charT()` )

`width(0)` is then called for the input stream.

If no characters are extracted, sets failbit.

#### 3.10.4.215 operator>>() [6/11]

```
template<class _Traits >
basic_istream<char, _Traits>& std::operator>> (
 basic_istream< char, _Traits > & __in,
 unsigned char * __s) [inline]
```

Character string extractors.

##### Parameters

|                   |                                 |
|-------------------|---------------------------------|
| <code>__in</code> | An input stream.                |
| <code>__s</code>  | A pointer to a character array. |

##### Returns

`__in`

Behaves like one of the formatted arithmetic extractors described in `std::basic_istream`. After constructing a sentry object with good status, this function extracts up to `n` characters and stores them into the array starting at `__s`. `n` is defined as:

- if `width()` is greater than zero, `n` is `width()` otherwise
- `n` is *the number of elements of the largest array of \**
- *char\_type that can store a terminating eos.*
- [27.6.1.2.3]/6

Characters are extracted and stored until one of the following happens:

- `n-1` characters are stored
- EOF is reached
- the next character is whitespace according to the current locale
- the next character is a null byte (i.e., `charT()` )

`width(0)` is then called for the input stream.

If no characters are extracted, sets failbit.

Definition at line 803 of file `istream`.

#### 3.10.4.216 `operator>>()` [7/11]

```
template<class _Traits >
basic_istream<char, _Traits>& std::operator>> (
 basic_istream< char, _Traits > & __in,
 signed char * __s) [inline]
```

Character string extractors.

##### Parameters

|                   |                                 |
|-------------------|---------------------------------|
| <code>__in</code> | An input stream.                |
| <code>__s</code>  | A pointer to a character array. |

##### Returns

`__in`

Behaves like one of the formatted arithmetic extractors described in `std::basic_istream`. After constructing a sentry object with good status, this function extracts up to `n` characters and stores them into the array starting at `__s`. `n` is defined as:

- if `width()` is greater than zero, `n` is `width()` otherwise

- *n* is the number of elements of the largest array of \*
- *char\_type* that can store a terminating eos.
- [27.6.1.2.3]/6

Characters are extracted and stored until one of the following happens:

- *n*-1 characters are stored
- EOF is reached
- the next character is whitespace according to the current locale
- the next character is a null byte (i.e., `charT()` )

`width(0)` is then called for the input stream.

If no characters are extracted, sets failbit.

Definition at line 808 of file `istream`.

#### 3.10.4.217 `operator>>()` [8/11]

```
template<typename _Istream, typename _Tp >
enable_if<__and<__not<is_lvalue_reference<_Istream> >, __is_convertible_to_basic_istream<_Istream>, __is_extractable<__rvalue_istream_type<_Istream>, _Tp&&> >::value, __rvalue_istream_type<_Istream> >::type std::operator>> (
 _Istream && __is,
 _Tp && __x) [inline]
```

Generic extractor for rvalue stream.

##### Parameters

|                   |                                       |
|-------------------|---------------------------------------|
| <code>__is</code> | An input stream.                      |
| <code>__x</code>  | A reference to the extraction target. |

##### Returns

`is`

This is just a forwarding function to allow extraction from rvalue streams since they won't bind to the extractor functions that take an lvalue reference.

Definition at line 980 of file `istream`.

**3.10.4.218 operator>>()** [9/11]

```
template<class _CharT , class _Traits , size_t _Nb>
std::basic_istream<_CharT, _Traits>& std::operator>> (
 std::basic_istream< _CharT, _Traits > & __is,
 bitset< _Nb > & __x)
```

Global I/O operators for bitsets.

Direct I/O between streams and bitsets is supported. Output is straightforward. Input will skip whitespace, only accept 0 and 1 characters, and will only extract as many digits as the bitset will hold.

Definition at line 1472 of file bitset.

**3.10.4.219 operator>>()** [10/11]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
basic_istream< _CharT, _Traits > & std::operator>> (
 basic_istream< _CharT, _Traits > & __is,
 __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base > & __str)
```

Read stream into a string.

**Parameters**

|                    |                       |
|--------------------|-----------------------|
| <code>__is</code>  | Input stream.         |
| <code>__str</code> | Buffer to store into. |

**Returns**

Reference to the input stream.

Stores characters from `__is` into `__str` until whitespace is found, the end of the stream is encountered, or `str.max_size()` is reached. If `is.width()` is non-zero, that is the limit on the number of characters stored into `__str`. Any previous contents of `__str` are erased.

Definition at line 552 of file vstring.tcc.

**3.10.4.220 operator>>()** [11/11]

```
template<typename _CharT , typename _Traits , typename _Alloc >
basic_istream< _CharT, _Traits > & std::operator>> (
 basic_istream< _CharT, _Traits > & __is,
 basic_string< _CharT, _Traits, _Alloc > & __str)
```

Read stream into a string.

## Parameters

|                    |                       |
|--------------------|-----------------------|
| <code>__is</code>  | Input stream.         |
| <code>__str</code> | Buffer to store into. |

## Returns

Reference to the input stream.

Stores characters from `__is` into `__str` until whitespace is found, the end of the stream is encountered, or `str.max_size()` is reached. If `is.width()` is non-zero, that is the limit on the number of characters stored into `__str`. Any previous contents of `__str` are erased.

Definition at line 1468 of file `basic_string.tcc`.

3.10.4.221 `operator^()`

```
template<size_t _Nb>
bitset<_Nb> std::operator^ (
 const bitset< _Nb > & __x,
 const bitset< _Nb > & __y) [inline], [noexcept]
```

Global bitwise operations on bitsets.

## Parameters

|                  |                                                 |
|------------------|-------------------------------------------------|
| <code>__x</code> | A bitset.                                       |
| <code>__y</code> | A bitset of the same size as <code>__x</code> . |

## Returns

A new bitset.

These should be self-explanatory.

Definition at line 1453 of file `bitset`.

3.10.4.222 `operator" | ()`

```
template<size_t _Nb>
bitset<_Nb> std::operator| (
 const bitset< _Nb > & __x,
 const bitset< _Nb > & __y) [inline], [noexcept]
```

Global bitwise operations on bitsets.

**Parameters**

|                  |                                                 |
|------------------|-------------------------------------------------|
| <code>__x</code> | A bitset.                                       |
| <code>__y</code> | A bitset of the same size as <code>__x</code> . |

**Returns**

A new bitset.

These should be self-explanatory.

Definition at line 1444 of file `bitset`.

**3.10.4.223 `put_money()`**

```
template<typename _MoneyT >
_Put_money<_MoneyT> std::put_money (
 const _MoneyT & __mon,
 bool __intl = false) [inline]
```

Extended manipulator for inserting money.

**Parameters**

|                     |                                                                       |
|---------------------|-----------------------------------------------------------------------|
| <code>__mon</code>  | Either long double or a specialization of <code>basic_string</code> . |
| <code>__intl</code> | A bool indicating whether international format is to be used.         |

Sent to a stream object, this manipulator inserts `__mon`.

Definition at line 306 of file `iomanip`.

**3.10.4.224 `put_time()`**

```
template<typename _CharT >
_Put_time<_CharT> std::put_time (
 const std::tm * __tmb,
 const _CharT * __fmt) [inline]
```

Extended manipulator for formatting time.

This manipulator uses `time_put::put` to format time. [ext.manip]

## Parameters

|                    |                                |
|--------------------|--------------------------------|
| <code>__tmb</code> | struct tm time data to format. |
| <code>__fmt</code> | format string.                 |

Definition at line 358 of file `iomaniip`.

**3.10.4.225 quoted()**

```
template<typename _CharT >
auto std::quoted (
 const _CharT * __string,
 _CharT __delim = _CharT('\"'),
 _CharT __escape = _CharT('\\')) [inline]
```

Manipulator for quoted strings.

## Parameters

|                       |                                                       |
|-----------------------|-------------------------------------------------------|
| <code>__string</code> | String to quote.                                      |
| <code>__delim</code>  | Character to quote string with.                       |
| <code>__escape</code> | Escape character to escape itself or quote character. |

Definition at line 461 of file `iomaniip`.

**3.10.4.226 rbegin()** [1/4]

```
template<typename _Container >
constexpr auto std::rbegin (
 _Container & __cont) -> decltype(__cont.rbegin()) [inline]
```

Return a reverse iterator pointing to the last element of the container.

## Parameters

|                     |            |
|---------------------|------------|
| <code>__cont</code> | Container. |
|---------------------|------------|

Definition at line 141 of file `range_access.h`.

Referenced by `crbegin()`.

**3.10.4.227** `rbegin()` [2/4]

```
template<typename _Container >
constexpr auto std::rbegin (
 const _Container & __cont) -> decltype(__cont.rbegin()) [inline]
```

Return a reverse iterator pointing to the last element of the const container.

**Parameters**

|                     |            |
|---------------------|------------|
| <code>__cont</code> | Container. |
|---------------------|------------|

Definition at line 151 of file `range_access.h`.

**3.10.4.228** `rbegin()` [3/4]

```
template<typename _Tp , size_t _Nm>
constexpr reverse_iterator<_Tp*> std::rbegin (
 _Tp(&) __arr[_Nm]) [inline], [noexcept]
```

Return a reverse iterator pointing to the last element of the array.

**Parameters**

|                    |        |
|--------------------|--------|
| <code>__arr</code> | Array. |
|--------------------|--------|

Definition at line 181 of file `range_access.h`.

**3.10.4.229** `rbegin()` [4/4]

```
template<typename _Tp >
constexpr reverse_iterator<const _Tp*> std::rbegin (
 initializer_list< _Tp > __il) [inline], [noexcept]
```

Return a reverse iterator pointing to the last element of the `initializer_list`.

**Parameters**

|                   |                                 |
|-------------------|---------------------------------|
| <code>__il</code> | <code>initializer_list</code> . |
|-------------------|---------------------------------|

Definition at line 201 of file `range_access.h`.

**3.10.4.230** `rend()` [1/4]

```
template<typename _Container >
constexpr auto std::rend (
 _Container & __cont) -> decltype(__cont.rend()) [inline]
```

Return a reverse iterator pointing one past the first element of the container.

**Parameters**

|                     |            |
|---------------------|------------|
| <code>__cont</code> | Container. |
|---------------------|------------|

Definition at line 161 of file `range_access.h`.

Referenced by `crend()`.

**3.10.4.231** `rend()` [2/4]

```
template<typename _Container >
constexpr auto std::rend (
 const _Container & __cont) -> decltype(__cont.rend()) [inline]
```

Return a reverse iterator pointing one past the first element of the const container.

**Parameters**

|                     |            |
|---------------------|------------|
| <code>__cont</code> | Container. |
|---------------------|------------|

Definition at line 171 of file `range_access.h`.

**3.10.4.232** `rend()` [3/4]

```
template<typename _Tp , size_t _Nm>
constexpr reverse_iterator<_Tp*> std::rend (
 _Tp(&) __arr[_Nm]) [inline], [noexcept]
```

Return a reverse iterator pointing one past the first element of the array.

**Parameters**

|                    |        |
|--------------------|--------|
| <code>__arr</code> | Array. |
|--------------------|--------|

Definition at line 191 of file `range_access.h`.

3.10.4.233 `rend()` [4/4]

```
template<typename _Tp >
constexpr reverse_iterator<const _Tp*> std::rend (
 initializer_list< _Tp > __il) [inline], [noexcept]
```

Return a reverse iterator pointing one past the first element of the `initializer_list`.

## Parameters

|                   |                                 |
|-------------------|---------------------------------|
| <code>__il</code> | <code>initializer_list</code> . |
|-------------------|---------------------------------|

Definition at line 211 of file `range_access.h`.

3.10.4.234 `replace_copy()`

```
template<typename _InputIterator , typename _OutputIterator , typename _Tp >
constexpr _OutputIterator std::replace_copy (
 _InputIterator __first,
 _InputIterator __last,
 _OutputIterator __result,
 const _Tp & __old_value,
 const _Tp & __new_value) [inline]
```

Copy a sequence, replacing each element of one value with another value.

## Parameters

|                          |                           |
|--------------------------|---------------------------|
| <code>__first</code>     | An input iterator.        |
| <code>__last</code>      | An input iterator.        |
| <code>__result</code>    | An output iterator.       |
| <code>__old_value</code> | The value to be replaced. |
| <code>__new_value</code> | The replacement value.    |

## Returns

The end of the output sequence, `result+(last-first)`.

Copies each element in the input range [`__first`,`__last`) to the output range [`__result`,`__result+(__last-__first)`) replacing elements equal to `__old_value` with `__new_value`.

Definition at line 3164 of file `stl_algo.h`.

## 3.10.4.235 resetiosflags()

```
_Resetiosflags std::resetiosflags (
 ios_base::fmtflags __mask) [inline]
```

Manipulator for `setf`.

## Parameters

|                     |                      |
|---------------------|----------------------|
| <code>__mask</code> | A format flags mask. |
|---------------------|----------------------|

Sent to a stream object, this manipulator resets the specified flags, via `stream.setf(0, __mask)`.

Definition at line 66 of file `iosmanip`.

## 3.10.4.236 return\_temporary\_buffer()

```
template<typename _Tp >
void std::return_temporary_buffer (
 _Tp * __p) [inline]
```

The companion to `get_temporary_buffer()`.

## Parameters

|                  |                                                                      |
|------------------|----------------------------------------------------------------------|
| <code>__p</code> | A buffer previously allocated by <code>get_temporary_buffer</code> . |
|------------------|----------------------------------------------------------------------|

## Returns

None.

Frees the memory pointed to by `__p`.

Definition at line 127 of file `stl_tempbuf.h`.

## 3.10.4.237 right()

```
ios_base& std::right (
 ios_base & __base) [inline]
```

Calls `base.setf(ios_base::right, ios_base::adjustfield)`.

Definition at line 1037 of file `ios_base.h`.

References `__gnu_debug::__base()`, `std::ios_base::adjustfield`, and `std::ios_base::right`.

**3.10.4.238 scientific()**

```
ios_base& std::scientific (
 ios_base & __base) [inline]
```

Calls `base.setf(ios_base::scientific, ios_base::floatfield)`.

Definition at line 1079 of file `ios_base.h`.

References `__gnu_debug::__base()`, `std::ios_base::floatfield`, and `std::ios_base::scientific`.

**3.10.4.239 set\_new\_handler()**

```
new_handler std::set_new_handler (
 new_handler) throw ()
```

Takes a replacement handler as the argument, returns the previous handler.

**3.10.4.240 setbase()**

```
_Setbase std::setbase (
 int __base) [inline]
```

Manipulator for `setf`.

**Parameters**

|                     |                 |
|---------------------|-----------------|
| <code>__base</code> | A numeric base. |
|---------------------|-----------------|

Sent to a stream object, this manipulator changes the `ios_base::basefield` flags to `oct`, `dec`, or `hex` when `base` is 8, 10, or 16, accordingly, and to 0 if `__base` is any other value.

Definition at line 127 of file `iomanip`.

**3.10.4.241 setfill()**

```
template<typename _CharT >
_Setfill<_CharT> std::setfill (
 _CharT __c) [inline]
```

Manipulator for `fill`.

**Parameters**

|                  |                         |
|------------------|-------------------------|
| <code>__c</code> | The new fill character. |
|------------------|-------------------------|

Sent to a stream object, this manipulator calls `fill(__c)` for that object.

Definition at line 165 of file `iomanip`.

**3.10.4.242 setiosflags()**

```
_Setiosflags std::setiosflags (
 ios_base::fmtflags __mask) [inline]
```

Manipulator for `setf`.

**Parameters**

|                     |                      |
|---------------------|----------------------|
| <code>__mask</code> | A format flags mask. |
|---------------------|----------------------|

Sent to a stream object, this manipulator sets the format flags to `__mask`.

Definition at line 96 of file `iomanip`.

**3.10.4.243 setprecision()**

```
_Setprecision std::setprecision (
 int __n) [inline]
```

Manipulator for `precision`.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>__n</code> | The new precision. |
|------------------|--------------------|

Sent to a stream object, this manipulator calls `precision(__n)` for that object.

Definition at line 195 of file `iomanip`.

#### 3.10.4.244 setw()

```
_Setw std::setw (
 int __n) [inline]
```

Manipulator for `width`.

##### Parameters

|                  |                |
|------------------|----------------|
| <code>__n</code> | The new width. |
|------------------|----------------|

Sent to a stream object, this manipulator calls `width(__n)` for that object.

Definition at line 225 of file `iosmanip`.

#### 3.10.4.245 showbase()

```
ios_base& std::showbase (
 ios_base & __base) [inline]
```

Calls `base.setf(ios_base::showbase)`.

Definition at line 924 of file `ios_base.h`.

References `__gnu_debug::__base()`, and `std::ios_base::showbase`.

#### 3.10.4.246 showpoint()

```
ios_base& std::showpoint (
 ios_base & __base) [inline]
```

Calls `base.setf(ios_base::showpoint)`.

Definition at line 940 of file `ios_base.h`.

References `__gnu_debug::__base()`, and `std::ios_base::showpoint`.

#### 3.10.4.247 showpos()

```
ios_base& std::showpos (
 ios_base & __base) [inline]
```

Calls `base.setf(ios_base::showpos)`.

Definition at line 956 of file `ios_base.h`.

References `__gnu_debug::__base()`, and `std::ios_base::showpos`.

**3.10.4.248 skipws()**

```
ios_base& std::skipws (
 ios_base & __base) [inline]
```

Calls base.setf(ios\_base::skipws).

Definition at line 972 of file ios\_base.h.

References `__gnu_debug::__base()`, and `std::ios_base::skipws`.

Referenced by `std::__detail::operator>>()`, and `operator>>()`.

**3.10.4.249 static\_pointer\_cast()**

```
template<typename _Tp , typename _Tp1 , _Lock_policy _Lp>
__shared_ptr<_Tp, _Lp> std::static_pointer_cast (
 const __shared_ptr< _Tp1, _Lp > & __r) [inline], [noexcept]
```

`static_pointer_cast`

Definition at line 1575 of file `shared_ptr_base.h`.

**3.10.4.250 swap()** [1/18]

```
template<typename _Res , typename... _Args>
void std::swap (
 function< _Res(_Args...)> & __x,
 function< _Res(_Args...)> & __y) [inline], [noexcept]
```

Swap the targets of two polymorphic function object wrappers.

This function will not throw an exception.

Definition at line 720 of file `std_function.h`.

**3.10.4.251 swap()** [2/18]

```
template<class _CharT , class _Traits , class _Allocator >
void std::swap (
 basic_stringbuf< _CharT, _Traits, _Allocator > & __x,
 basic_stringbuf< _CharT, _Traits, _Allocator > & __y) [inline]
```

Swap specialization for stringbufs.

Definition at line 849 of file `sstream`.

**3.10.4.252 swap()** [3/18]

```
template<class _CharT , class _Traits , class _Allocator >
void std::swap (
 basic_istreamstream< _CharT, _Traits, _Allocator > & __x,
 basic_istreamstream< _CharT, _Traits, _Allocator > & __y) [inline]
```

Swap specialization for istringstreams.

Definition at line 856 of file sstream.

**3.10.4.253 swap()** [4/18]

```
template<class _CharT , class _Traits , class _Allocator >
void std::swap (
 basic_ostringstream< _CharT, _Traits, _Allocator > & __x,
 basic_ostringstream< _CharT, _Traits, _Allocator > & __y) [inline]
```

Swap specialization for ostringstreams.

Definition at line 863 of file sstream.

**3.10.4.254 swap()** [5/18]

```
template<class _CharT , class _Traits , class _Allocator >
void std::swap (
 basic_stringstream< _CharT, _Traits, _Allocator > & __x,
 basic_stringstream< _CharT, _Traits, _Allocator > & __y) [inline]
```

Swap specialization for stringstreams.

Definition at line 870 of file sstream.

**3.10.4.255 swap()** [6/18]

```
template<typename _Key , typename _Compare , typename _Alloc >
void std::swap (
 multiset< _Key, _Compare, _Alloc > & __x,
 multiset< _Key, _Compare, _Alloc > & __y) [inline], [noexcept]
```

See std::multiset::swap().

Definition at line 1045 of file stl\_multiset.h.

**3.10.4.256 swap()** [7/18]

```
template<typename _Key , typename _Compare , typename _Alloc >
void std::swap (
 set< _Key, _Compare, _Alloc > & __x,
 set< _Key, _Compare, _Alloc > & __y) [inline], [noexcept]
```

See `std::set::swap()`.

Definition at line 1059 of file `stl_set.h`.

**3.10.4.257 swap()** [8/18]

```
template<typename _Key , typename _Tp , typename _Compare , typename _Alloc >
void std::swap (
 multimap< _Key, _Tp, _Compare, _Alloc > & __x,
 multimap< _Key, _Tp, _Compare, _Alloc > & __y) [inline], [noexcept]
```

See `std::multimap::swap()`.

Definition at line 1202 of file `stl_multimap.h`.

**3.10.4.258 swap()** [9/18]

```
template<class _CharT , class _Traits >
void std::swap (
 basic_filebuf< _CharT, _Traits > & __x,
 basic_filebuf< _CharT, _Traits > & __y) [inline]
```

Swap specialization for filebufs.

Definition at line 1264 of file `fstream`.

**3.10.4.259 swap()** [10/18]

```
template<class _CharT , class _Traits >
void std::swap (
 basic_ifstream< _CharT, _Traits > & __x,
 basic_ifstream< _CharT, _Traits > & __y) [inline]
```

Swap specialization for ifstreams.

Definition at line 1271 of file `fstream`.

**3.10.4.260 swap()** [11/18]

```
template<class _CharT , class _Traits >
void std::swap (
 basic_ofstream< _CharT, _Traits > & __x,
 basic_ofstream< _CharT, _Traits > & __y) [inline]
```

Swap specialization for ofstreams.

Definition at line 1278 of file fstream.

**3.10.4.261 swap()** [12/18]

```
template<class _CharT , class _Traits >
void std::swap (
 basic_fstream< _CharT, _Traits > & __x,
 basic_fstream< _CharT, _Traits > & __y) [inline]
```

Swap specialization for fstreams.

Definition at line 1285 of file fstream.

**3.10.4.262 swap()** [13/18]

```
template<typename _Tp , typename _Alloc >
void std::swap (
 forward_list< _Tp, _Alloc > & __lx,
 forward_list< _Tp, _Alloc > & __ly) [inline], [noexcept]
```

See `std::forward_list::swap()`.

Definition at line 1505 of file `forward_list.h`.

**3.10.4.263 swap()** [14/18]

```
template<typename _Key , typename _Tp , typename _Compare , typename _Alloc >
void std::swap (
 map< _Key, _Tp, _Compare, _Alloc > & __x,
 map< _Key, _Tp, _Compare, _Alloc > & __y) [inline], [noexcept]
```

See `std::map::swap()`.

Definition at line 1537 of file `stl_map.h`.

**3.10.4.264 swap()** [15/18]

```
template<typename _Tp , typename _Alloc >
void std::swap (
 vector< _Tp, _Alloc > & __x,
 vector< _Tp, _Alloc > & __y) [inline], [noexcept]
```

See `std::vector::swap()`.

Definition at line 1962 of file `stl_vector.h`.

**3.10.4.265 swap()** [16/18]

```
template<typename _Tp , typename _Alloc >
void std::swap (
 list< _Tp, _Alloc > & __x,
 list< _Tp, _Alloc > & __y) [inline], [noexcept]
```

See `std::list::swap()`.

Definition at line 2082 of file `stl_list.h`.

**3.10.4.266 swap()** [17/18]

```
template<typename _Tp , typename _Alloc >
void std::swap (
 deque< _Tp, _Alloc > & __x,
 deque< _Tp, _Alloc > & __y) [inline], [noexcept]
```

See `std::deque::swap()`.

Definition at line 2311 of file `stl_deque.h`.

**3.10.4.267 swap()** [18/18]

```
template<typename _CharT , typename _Traits , typename _Alloc >
void std::swap (
 basic_string< _CharT, _Traits, _Alloc > & __lhs,
 basic_string< _CharT, _Traits, _Alloc > & __rhs) [inline], [noexcept]
```

Swap contents of two strings.

**Parameters**

|                    |                |
|--------------------|----------------|
| <code>__lhs</code> | First string.  |
| <code>__rhs</code> | Second string. |

Exchanges the contents of `__lhs` and `__rhs` in constant time.

Definition at line 6430 of file `basic_string.h`.

#### 3.10.4.268 `tolower()`

```
template<typename _CharT >
_CharT std::tolower (
 _CharT __c,
 const locale & __loc) [inline]
```

Convenience interface to `ctype::tolower(__c)`.

Definition at line 2649 of file `locale_facets.h`.

#### 3.10.4.269 `toupper()`

```
template<typename _CharT >
_CharT std::toupper (
 _CharT __c,
 const locale & __loc) [inline]
```

Convenience interface to `ctype::toupper(__c)`.

Definition at line 2643 of file `locale_facets.h`.

#### 3.10.4.270 `unitbuf()`

```
ios_base& std::unitbuf (
 ios_base & __base) [inline]
```

Calls `base.setf(ios_base::unitbuf)`.

Definition at line 1004 of file `ios_base.h`.

References `__gnu_debug::__base()`, and `std::ios_base::unitbuf`.

#### 3.10.4.271 `uppercase()`

```
ios_base& std::uppercase (
 ios_base & __base) [inline]
```

Calls `base.setf(ios_base::uppercase)`.

Definition at line 988 of file `ios_base.h`.

References `__gnu_debug::__base()`, and `std::ios_base::uppercase`.

#### 3.10.4.272 ws()

```
template<typename _CharT , typename _Traits >
basic_istream< _CharT, _Traits > & std::ws (
 basic_istream< _CharT, _Traits > & __is)
```

Quick and easy way to eat whitespace.

This manipulator extracts whitespace characters, stopping when the next character is non-whitespace, or when the input sequence is empty. If the sequence is empty, `eofbit` is set in the stream, but not `failbit`.

The current locale is used to distinguish whitespace characters.

Example:

```
MyClass mc;
std::cin >> std::ws >> mc;
```

will skip leading whitespace before calling operator>> on cin and your object. Note that the same effect can be achieved by creating a `std::basic_istream::sentry` inside your definition of operator>>.

Definition at line 1024 of file `istream.tcc`.

References `std::ios_base::eofbit`, `std::ios_base::getloc()`, `std::basic_ios< _CharT, _Traits >::rdbuf()`, and `std::basic_ios< _CharT, _Traits >::setstate()`.

### 3.10.5 Variable Documentation

#### 3.10.5.1 \_\_ioint

```
ios_base::Init std::__ioint [static]
```

Linked to standard error (buffered)

Definition at line 74 of file `iostream`.

#### 3.10.5.2 cerr

```
ostream std::cerr
```

Linked to standard output.

### 3.10.5.3 cin

```
istream std::cin
```

Linked to standard input.

### 3.10.5.4 clog

```
ostream std::clog
```

Linked to standard error (unbuffered)

### 3.10.5.5 cout

```
ostream std::cout
```

Linked to standard input.

### 3.10.5.6 is\_nothrow\_swappable\_v

```
template<typename _Tp >
constexpr bool std::is_nothrow_swappable_v [inline]
```

is\_nothrow\_swappable\_v

Definition at line 2744 of file type\_traits.

### 3.10.5.7 is\_nothrow\_swappable\_with\_v

```
template<typename _Tp , typename _Up >
constexpr bool std::is_nothrow_swappable_with_v [inline]
```

is\_nothrow\_swappable\_with\_v

Definition at line 2828 of file type\_traits.

#### 3.10.5.8 is\_swappable\_v

```
template<typename _Tp >
constexpr bool std::is_swappable_v [inline]
```

is\_swappable\_v

Definition at line 2739 of file type\_traits.

#### 3.10.5.9 is\_swappable\_with\_v

```
template<typename _Tp , typename _Up >
constexpr bool std::is_swappable_with_v [inline]
```

is\_swappable\_with\_v

Definition at line 2823 of file type\_traits.

#### 3.10.5.10 wcerr

```
wostream std::wcerr
```

Linked to standard output.

#### 3.10.5.11 wcin

```
wistream std::wcin
```

Linked to standard error (buffered)

#### 3.10.5.12 wlog

```
wostream std::wlog
```

Linked to standard error (unbuffered)

#### 3.10.5.13 wcout

```
wostream std::wcout
```

Linked to standard input.

### 3.11.1 Detailed Description

GNU debug code, replaces standard behavior with debug behavior.

Macros and namespaces used by the implementation outside of debug wrappers to verify certain properties. The `__glibcxx_requires_xxx` macros are merely wrappers around the `__glibcxx_check_xxx` wrappers when we are compiling with debug mode, but disappear when we are in release mode so that there is no checking performed in, e.g., the standard library algorithms.

### 3.11.2 Function Documentation

#### 3.11.2.1 operator<=()

```
template<typename _Tp, typename _Alloc >
bool std::__debug::operator<= (
 const forward_list< _Tp, _Alloc > & __lx,
 const forward_list< _Tp, _Alloc > & __ly) [inline]
```

Based on `operator<`.

Definition at line 877 of file `debug/forward_list`.

## 3.11.2.2 operator&gt;()

```
template<typename _Tp , typename _Alloc >
bool std::__debug::operator> (
 const forward_list< _Tp, _Alloc > & __lx,
 const forward_list< _Tp, _Alloc > & __ly) [inline]
```

Based on operator<.

Definition at line 863 of file debug/forward\_list.

## 3.11.2.3 operator&gt;=()

```
template<typename _Tp , typename _Alloc >
bool std::__debug::operator>= (
 const forward_list< _Tp, _Alloc > & __lx,
 const forward_list< _Tp, _Alloc > & __ly) [inline]
```

Based on operator<.

Definition at line 870 of file debug/forward\_list.

## 3.11.2.4 swap()

```
template<typename _Tp , typename _Alloc >
void std::__debug::swap (
 forward_list< _Tp, _Alloc > & __lx,
 forward_list< _Tp, _Alloc > & __ly) [inline], [noexcept]
```

See std::forward\_list::swap().

Definition at line 885 of file debug/forward\_list.

## Variables

- `static const _StateIdT _S_invalid_state_id`

### 3.12.1 Detailed Description

Implementation details not part of the namespace std interface.

### 3.12.2 Function Documentation

#### 3.12.2.1 \_\_from\_chars\_alnum()

```
template<typename _Tp >
bool std::__detail::__from_chars_alnum (
 const char *& __first,
 const char * __last,
 _Tp & __val,
 int __base)
```

std::from\_chars implementation for integers in bases 11 to 26.

Definition at line 560 of file charconv.

#### 3.12.2.2 \_\_from\_chars\_binary()

```
template<typename _Tp >
bool std::__detail::__from_chars_binary (
 const char *& __first,
 const char * __last,
 _Tp & __val)
```

std::from\_chars implementation for integers in base 2.

Definition at line 414 of file charconv.

### 3.12.2.3 `__from_chars_digit()`

```
template<typename _Tp >
bool std::__detail::__from_chars_digit (
 const char *& __first,
 const char * __last,
 _Tp & __val,
 int __base)
```

`std::from_chars` implementation for integers in bases 3 to 10.

Definition at line 441 of file `charconv`.

### 3.12.2.4 `operator<<()` [1/2]

```
template<typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& std::__detail::operator<< (
 std::basic_ostream< _CharT, _Traits > & __os,
 const _Quoted_string< const _CharT *, _CharT > & __str)
```

Insertion for quoted strings.

`_GLIBCXX_RESOLVE_LIB_DEFECTS` DR 2344 `quoted()`'s interaction with padding is unclear

Definition at line 93 of file `quoted_string.h`.

References `std::basic_ostringstream< _CharT, _Traits, _Alloc >::str()`.

### 3.12.2.5 `operator<<()` [2/2]

```
template<typename _CharT , typename _Traits , typename _String >
std::basic_ostream<_CharT, _Traits>& std::__detail::operator<< (
 std::basic_ostream< _CharT, _Traits > & __os,
 const _Quoted_string< _String, _CharT > & __str)
```

Insertion for quoted strings.

`_GLIBCXX_RESOLVE_LIB_DEFECTS` DR 2344 `quoted()`'s interaction with padding is unclear

Definition at line 117 of file `quoted_string.h`.

References `std::basic_ostringstream< _CharT, _Traits, _Alloc >::str()`.

## 3.12.2.6 operator&gt;&gt;()

```
template<typename _CharT , typename _Traits , typename _Alloc >
std::basic_istream<_CharT, _Traits>& std::__detail::operator>> (
 std::basic_istream< _CharT, _Traits > & __is,
 const _Quoted_string< basic_string< _CharT, _Traits, _Alloc > &, _CharT > & __str)
```

Extractor for delimited strings. The left and right delimiters can be different.

Definition at line 139 of file quoted\_string.h.

References `std::basic_ios< _CharT, _Traits >::clear()`, `std::ios_base::flags()`, `std::basic_ios< _CharT, _Traits >::good()`, `std::ios_base::setf()`, `std::skipws()`, and `std::basic_istream< _CharT, _Traits >::unget()`.

### 3.13.1 Detailed Description

GNU parallel code, replaces standard behavior with parallel behavior.

## 3.14 `std::chrono` Namespace Reference

### Classes

- struct [duration](#)
- struct [duration\\_values](#)
- struct [time\\_point](#)
- struct [treat\\_as\\_floating\\_point](#)

### Typedefs

- using [hours](#) = [duration](#)< int64\_t, [ratio](#)< 3600 > >
- using [microseconds](#) = [duration](#)< int64\_t, [micro](#) >
- using [milliseconds](#) = [duration](#)< int64\_t, [milli](#) >
- using [minutes](#) = [duration](#)< int64\_t, [ratio](#)< 60 > >
- using [nanoseconds](#) = [duration](#)< int64\_t, [nano](#) >
- using [seconds](#) = [duration](#)< int64\_t >

### Functions

- `template<typename _ToDur, typename _Rep, typename _Period >  
constexpr \_\_enable\_if\_is\_duration< _ToDur > duration\_cast (const duration< _Rep, _Period > &__d)`
- `template<typename _ToDur, typename _Clock, typename _Dur >  
constexpr enable\_if< \_\_is\_duration< _ToDur >::value, time\_point< _Clock, _ToDur > >::type time\_point\_cast  
(const time\_point< _Clock, _Dur > &__t)`

### 3.14.1 Detailed Description

ISO C++ 2011 namespace for date and time utilities.

## 3.15 std::decimal Namespace Reference

## Classes

### 3.15.1 Detailed Description

ISO/IEC TR 24733 Decimal floating-point arithmetic.

### 3.15.2 Function Documentation

#### 3.15.2.1 decimal32\_to\_long\_long()

```
long long std::decimal::decimal32_to_long_long (
 decimal32 __d)
```

Non-conforming extension: Conversion to integral type.

## 3.16 std::experimental Namespace Reference

### 3.16.1 Detailed Description

Namespace for features defined in ISO Technical Specifications.

## 3.17 std::literals::chrono\_literals Namespace Reference

### Functions

- constexpr [chrono::duration](#)< long double, [ratio](#)< 3600, 1 > > [operator""h](#) (long double \_\_hours)
- template<char... \_Digits>  
constexpr [chrono::hours](#) [operator""h](#) ()
- constexpr [chrono::duration](#)< long double, [ratio](#)< 60, 1 > > [operator""min](#) (long double \_\_mins)
- template<char... \_Digits>  
constexpr [chrono::minutes](#) [operator""min](#) ()
- constexpr [chrono::duration](#)< long double, [milli](#) > [operator""ms](#) (long double \_\_msecs)
- template<char... \_Digits>  
constexpr [chrono::milliseconds](#) [operator""ms](#) ()
- constexpr [chrono::duration](#)< long double, [nano](#) > [operator""ns](#) (long double \_\_nsecs)
- template<char... \_Digits>  
constexpr [chrono::nanoseconds](#) [operator""ns](#) ()
- constexpr [chrono::duration](#)< long double > [operator""s](#) (long double \_\_secs)
- template<char... \_Digits>  
constexpr [chrono::seconds](#) [operator""s](#) ()
- constexpr [chrono::duration](#)< long double, [micro](#) > [operator""us](#) (long double \_\_usecs)
- template<char... \_Digits>  
constexpr [chrono::microseconds](#) [operator""us](#) ()

### 3.17.1 Detailed Description

ISO C++ 2014 namespace for suffixes for duration literals.

These suffixes can be used to create `chrono::duration` values with tick periods of hours, minutes, seconds, milliseconds, microseconds or nanoseconds. For example, `std::chrono::seconds(5)` can be written as `5s` after making the suffix visible in the current scope. The suffixes can be made visible by a `using-directive` or `using-declaration` such as:

- `using namespace std::chrono_literals;`
- `using namespace std::literals;`
- `using namespace std::chrono;`
- `using namespace std;`
- `using std::chrono_literals::operator""s;`

The result of these suffixes on an integer literal is one of the standard typedefs such as `std::chrono::hours`. The result on a floating-point literal is a duration type with the specified tick period and an unspecified floating-point representation, for example `1.5e2ms` might be equivalent to `chrono::duration<long double, chrono::milli>(1.5e2)`.

### 3.17.2 Function Documentation

#### 3.17.2.1 operator""h() [1/2]

```
constexpr chrono::duration<long double, ratio<3600,1> > std::literals::chrono_literals::operator""h
(
 long double __hours)
```

Literal suffix for durations representing non-integer hours.

Definition at line 1180 of file `chrono`.

#### 3.17.2.2 operator""h() [2/2]

```
template<char... _Digits>
constexpr chrono::hours std::literals::chrono_literals::operator""h ()
```

Literal suffix for durations of type `std::chrono::hours`

Definition at line 1186 of file `chrono`.

### 3.17.2.3 `operator""min()` [1/2]

```
constexpr chrono::duration<long double, ratio<60,1> > std::literals::chrono_literals::operator""min
(
 long double __mins)
```

Literal suffix for durations representing non-integer minutes.

Definition at line 1191 of file chrono.

### 3.17.2.4 `operator""min()` [2/2]

```
template<char... _Digits>
constexpr chrono::minutes std::literals::chrono_literals::operator""min ()
```

Literal suffix for durations of type `std::chrono::minutes`

Definition at line 1197 of file chrono.

### 3.17.2.5 `operator""ms()` [1/2]

```
constexpr chrono::duration<long double, milli> std::literals::chrono_literals::operator""ms (
 long double __msecs)
```

Literal suffix for durations representing non-integer milliseconds.

Definition at line 1213 of file chrono.

### 3.17.2.6 `operator""ms()` [2/2]

```
template<char... _Digits>
constexpr chrono::milliseconds std::literals::chrono_literals::operator""ms ()
```

Literal suffix for durations of type `std::chrono::milliseconds`

Definition at line 1219 of file chrono.

### 3.17.2.7 `operator""ns()` [1/2]

```
constexpr chrono::duration<long double, nano> std::literals::chrono_literals::operator""ns (
 long double __nsecs)
```

Literal suffix for durations representing non-integer nanoseconds.

Definition at line 1235 of file chrono.

### 3.17.2.8 operator""ns() [2/2]

```
template<char... _Digits>
constexpr chrono::nanoseconds std::literals::chrono_literals::operator""ns ()
```

Literal suffix for durations of type `std::chrono::nanoseconds`

Definition at line 1241 of file `chrono`.

### 3.17.2.9 operator""s() [1/2]

```
constexpr chrono::duration<long double> std::literals::chrono_literals::operator""s (
 long double __secs)
```

Literal suffix for durations representing non-integer seconds.

Definition at line 1202 of file `chrono`.

### 3.17.2.10 operator""s() [2/2]

```
template<char... _Digits>
constexpr chrono::seconds std::literals::chrono_literals::operator""s ()
```

Literal suffix for durations of type `std::chrono::seconds`

Definition at line 1208 of file `chrono`.

### 3.17.2.11 operator""us() [1/2]

```
constexpr chrono::duration<long double, micro> std::literals::chrono_literals::operator""us (
 long double __usecs)
```

Literal suffix for durations representing non-integer microseconds.

Definition at line 1224 of file `chrono`.

### 3.17.2.12 operator""us() [2/2]

```
template<char... _Digits>
constexpr chrono::microseconds std::literals::chrono_literals::operator""us ()
```

Literal suffix for durations of type `std::chrono::microseconds`

Definition at line 1230 of file `chrono`.

### 3.18 `std::placeholders` Namespace Reference

#### Variables

- `const _Placeholder< 1 > _1`
- `const _Placeholder< 10 > _10`
- `const _Placeholder< 11 > _11`
- `const _Placeholder< 12 > _12`
- `const _Placeholder< 13 > _13`
- `const _Placeholder< 14 > _14`
- `const _Placeholder< 15 > _15`
- `const _Placeholder< 16 > _16`
- `const _Placeholder< 17 > _17`
- `const _Placeholder< 18 > _18`
- `const _Placeholder< 19 > _19`
- `const _Placeholder< 2 > _2`
- `const _Placeholder< 20 > _20`
- `const _Placeholder< 21 > _21`
- `const _Placeholder< 22 > _22`
- `const _Placeholder< 23 > _23`

- `const _Placeholder< 7 > _7`
- `const _Placeholder< 8 > _8`
- `const _Placeholder< 9 > _9`

#### 3.18.1 Detailed Description

ISO C++ 2011 namespace for `std::bind` placeholders.

### 3.19 `std::regex_constants` Namespace Reference

#### 5.1 Regular Expression Syntax Options

- `enum __syntax_option {  
    _S_icode, _S_nosubs, _S_optimize, _S_collate,  
    _S_ECMAScript, _S_basic, _S_extended, _S_awk,  
    _S_grep, _S_egrep, _S_polynomial, _S_syntax_last }`
- `enum syntax_option_type` : unsigned int
- `constexpr syntax_option_type icode`

- constexpr [syntax\\_option\\_type](#) nosubs
- constexpr [syntax\\_option\\_type](#) optimize
- constexpr [syntax\\_option\\_type](#) collate
- constexpr [syntax\\_option\\_type](#) ECMAScript
- constexpr [syntax\\_option\\_type](#) basic
- constexpr [syntax\\_option\\_type](#) extended
- constexpr [syntax\\_option\\_type](#) awk
- constexpr [syntax\\_option\\_type](#) grep
- constexpr [syntax\\_option\\_type](#) egrep
- constexpr [syntax\\_option\\_type](#) \_\_polynomial
- constexpr [syntax\\_option\\_type](#) operator& ([syntax\\_option\\_type](#) \_\_a, [syntax\\_option\\_type](#) \_\_b)
- constexpr [syntax\\_option\\_type](#) operator| ([syntax\\_option\\_type](#) \_\_a, [syntax\\_option\\_type](#) \_\_b)
- constexpr [syntax\\_option\\_type](#) operator^ ([syntax\\_option\\_type](#) \_\_a, [syntax\\_option\\_type](#) \_\_b)
- constexpr [syntax\\_option\\_type](#) operator~ ([syntax\\_option\\_type](#) \_\_a)
- [syntax\\_option\\_type](#) & operator&= ([syntax\\_option\\_type](#) &\_\_a, [syntax\\_option\\_type](#) \_\_b)
- [syntax\\_option\\_type](#) & operator|= ([syntax\\_option\\_type](#) &\_\_a, [syntax\\_option\\_type](#) \_\_b)
- [syntax\\_option\\_type](#) & operator^= ([syntax\\_option\\_type](#) &\_\_a, [syntax\\_option\\_type](#) \_\_b)

## 5.2 Matching Rules

Matching a regular expression against a sequence of characters [first, last) proceeds according to the rules of the grammar specified for the regular expression object, modified according to the effects listed below for any bitmask elements set.

- enum [\\_\\_match\\_flag](#) {  
[\\_S\\_not\\_bol](#), [\\_S\\_not\\_eol](#), [\\_S\\_not\\_bow](#), [\\_S\\_not\\_eow](#),  
[\\_S\\_any](#), [\\_S\\_not\\_null](#), [\\_S\\_continuous](#), [\\_S\\_prev\\_avail](#),  
[\\_S\\_sed](#), [\\_S\\_no\\_copy](#), [\\_S\\_first\\_only](#), [\\_S\\_match\\_flag\\_last](#) }
- enum [match\\_flag\\_type](#) : unsigned int
- constexpr [match\\_flag\\_type](#) match\_default
- constexpr [match\\_flag\\_type](#) match\_not\_bol
- constexpr [match\\_flag\\_type](#) match\_not\_eol
- constexpr [match\\_flag\\_type](#) match\_not\_bow
- constexpr [match\\_flag\\_type](#) match\_not\_eow
- constexpr [match\\_flag\\_type](#) match\_any
- constexpr [match\\_flag\\_type](#) match\_not\_null
- constexpr [match\\_flag\\_type](#) match\_continuous
- constexpr [match\\_flag\\_type](#) match\_prev\_avail
- constexpr [match\\_flag\\_type](#) format\_default
- constexpr [match\\_flag\\_type](#) format\_sed
- constexpr [match\\_flag\\_type](#) format\_no\_copy
- constexpr [match\\_flag\\_type](#) format\_first\_only
- constexpr [match\\_flag\\_type](#) operator& ([match\\_flag\\_type](#) \_\_a, [match\\_flag\\_type](#) \_\_b)
- constexpr [match\\_flag\\_type](#) operator| ([match\\_flag\\_type](#) \_\_a, [match\\_flag\\_type](#) \_\_b)
- constexpr [match\\_flag\\_type](#) operator^ ([match\\_flag\\_type](#) \_\_a, [match\\_flag\\_type](#) \_\_b)
- constexpr [match\\_flag\\_type](#) operator~ ([match\\_flag\\_type](#) \_\_a)
- [match\\_flag\\_type](#) & operator&= ([match\\_flag\\_type](#) &\_\_a, [match\\_flag\\_type](#) \_\_b)
- [match\\_flag\\_type](#) & operator|= ([match\\_flag\\_type](#) &\_\_a, [match\\_flag\\_type](#) \_\_b)
- [match\\_flag\\_type](#) & operator^= ([match\\_flag\\_type](#) &\_\_a, [match\\_flag\\_type](#) \_\_b)

### 5.3 Error Types

- enum `error_type` {  
    `_S_error_collate`, `_S_error_ctype`, `_S_error_escape`, `_S_error_backref`,  
    `_S_error_brack`, `_S_error_paren`, `_S_error_brace`, `_S_error_badbrace`,  
    `_S_error_range`, `_S_error_space`, `_S_error_badrepeat`, `_S_error_complexity`,  
    `_S_error_stack` }
- constexpr `error_type error_collate` (`_S_error_collate`)
- constexpr `error_type error_ctype` (`_S_error_ctype`)
- constexpr `error_type error_escape` (`_S_error_escape`)
- constexpr `error_type error_backref` (`_S_error_backref`)
- constexpr `error_type error_brack` (`_S_error_brack`)
- constexpr `error_type error_paren` (`_S_error_paren`)
- constexpr `error_type error_brace` (`_S_error_brace`)
- constexpr `error_type error_badbrace` (`_S_error_badbrace`)
- constexpr `error_type error_range` (`_S_error_range`)
- constexpr `error_type error_space` (`_S_error_space`)
- constexpr `error_type error_badrepeat` (`_S_error_badrepeat`)
- constexpr `error_type error_complexity` (`_S_error_complexity`)
- constexpr `error_type error_stack` (`_S_error_stack`)

#### 3.19.1 Detailed Description

ISO C++ 2011 namespace for options and flags used with `std::regex`.

#### 3.19.2 Enumeration Type Documentation

##### 3.19.2.1 `__match_flag`

```
enum std::regex_constants::__match_flag
```

This is a bitmask type indicating regex matching rules.

The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

Definition at line 232 of file `regex_constants.h`.

### 3.19.2.2 \_\_syntax\_option

```
enum std::regex_constants::__syntax_option
```

This is a bitmask type indicating how to interpret the regex.

The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

A valid value of type `syntax_option_type` shall have exactly one of the elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep` set.

Definition at line 54 of file `regex_constants.h`.

### 3.19.2.3 error\_type

```
enum std::regex_constants::error_type
```

The expression contained an invalid collating element name.

Definition at line 49 of file `regex_error.h`.

### 3.19.2.4 match\_flag\_type

```
enum std::regex_constants::match_flag_type : unsigned int
```

This is a bitmask type indicating regex matching rules.

The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

Definition at line 255 of file `regex_constants.h`.

### 3.19.2.5 syntax\_option\_type

```
enum std::regex_constants::syntax_option_type : unsigned int
```

This is a bitmask type indicating how to interpret the regex.

The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

A valid value of type `syntax_option_type` shall have exactly one of the elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep` set.

Definition at line 81 of file `regex_constants.h`.

### 3.19.3 Function Documentation

#### 3.19.3.1 `error_backref()`

```
constexpr error_type std::regex_constants::error_backref (
 _S_error_backref)
```

The expression contained an invalid back reference.

#### 3.19.3.2 `error_badbrace()`

```
constexpr error_type std::regex_constants::error_badbrace (
 _S_error_badbrace)
```

The expression contained an invalid range in a {} expression.

#### 3.19.3.3 `error_badrepeat()`

```
constexpr error_type std::regex_constants::error_badrepeat (
 _S_error_badrepeat)
```

One of \*?+{ was not preceded by a valid regular expression.

#### 3.19.3.4 `error_brace()`

```
constexpr error_type std::regex_constants::error_brace (
 _S_error_brace)
```

The expression contained mismatched { and }

#### 3.19.3.5 `error_brack()`

```
constexpr error_type std::regex_constants::error_brack (
 _S_error_brack)
```

The expression contained mismatched [ and ].

#### 3.19.3.6 `error_collate()`

```
constexpr error_type std::regex_constants::error_collate (
 _S_error_collate)
```

The expression contained an invalid collating element name.

#### 3.19.3.7 error\_complexity()

```
constexpr error_type std::regex_constants::error_complexity (
 _S_error_complexity)
```

The complexity of an attempted match against a regular expression exceeded a pre-set level.

#### 3.19.3.8 error\_ctype()

```
constexpr error_type std::regex_constants::error_ctype (
 _S_error_ctype)
```

The expression contained an invalid character class name.

#### 3.19.3.9 error\_escape()

```
constexpr error_type std::regex_constants::error_escape (
 _S_error_escape)
```

The expression contained an invalid escaped character, or a trailing escape.

#### 3.19.3.10 error\_paren()

```
constexpr error_type std::regex_constants::error_paren (
 _S_error_paren)
```

The expression contained mismatched ( and ).

#### 3.19.3.11 error\_range()

```
constexpr error_type std::regex_constants::error_range (
 _S_error_range)
```

The expression contained an invalid character range, such as [b-a] in most encodings.

#### 3.19.3.12 error\_space()

```
constexpr error_type std::regex_constants::error_space (
 _S_error_space)
```

There was insufficient memory to convert the expression into a finite state machine.

#### 3.19.3.13 error\_stack()

```
constexpr error_type std::regex_constants::error_stack (
 _S_error_stack)
```

There was insufficient memory to determine whether the regular expression could match the specified character sequence.

**3.19.3.14 operator&()** [1/2]

```
constexpr syntax_option_type std::regex_constants::operator& (
 syntax_option_type __a,
 syntax_option_type __b) [inline]
```

This is a bitmask type indicating how to interpret the regex.

The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

A valid value of type `syntax_option_type` shall have exactly one of the elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep` set.

Definition at line 183 of file `regex_constants.h`.

**3.19.3.15 operator&()** [2/2]

```
constexpr match_flag_type std::regex_constants::operator& (
 match_flag_type __a,
 match_flag_type __b) [inline]
```

This is a bitmask type indicating regex matching rules.

The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

Definition at line 374 of file `regex_constants.h`.

**3.19.3.16 operator&=()** [1/2]

```
syntax_option_type& std::regex_constants::operator&= (
 syntax_option_type & __a,
 syntax_option_type __b) [inline]
```

This is a bitmask type indicating how to interpret the regex.

The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

A valid value of type `syntax_option_type` shall have exactly one of the elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep` set.

Definition at line 208 of file `regex_constants.h`.

### 3.19.3.17 operator&=() [2/2]

```
match_flag_type& std::regex_constants::operator&= (
 match_flag_type & __a,
 match_flag_type __b) [inline]
```

This is a bitmask type indicating regex matching rules.

The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

Definition at line 399 of file `regex_constants.h`.

### 3.19.3.18 operator^() [1/2]

```
constexpr syntax_option_type std::regex_constants::operator^ (
 syntax_option_type __a,
 syntax_option_type __b) [inline]
```

This is a bitmask type indicating how to interpret the regex.

The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

A valid value of type `syntax_option_type` shall have exactly one of the elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep` set.

Definition at line 197 of file `regex_constants.h`.

### 3.19.3.19 operator^() [2/2]

```
constexpr match_flag_type std::regex_constants::operator^ (
 match_flag_type __a,
 match_flag_type __b) [inline]
```

This is a bitmask type indicating regex matching rules.

The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

Definition at line 388 of file `regex_constants.h`.

**3.19.3.20 operator^=()** [1/2]

```
syntax_option_type& std::regex_constants::operator^= (
 syntax_option_type & __a,
 syntax_option_type __b) [inline]
```

This is a bitmask type indicating how to interpret the regex.

The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

A valid value of type `syntax_option_type` shall have exactly one of the elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep` set.

Definition at line 216 of file `regex_constants.h`.

**3.19.3.21 operator^=()** [2/2]

```
match_flag_type& std::regex_constants::operator^= (
 match_flag_type & __a,
 match_flag_type __b) [inline]
```

This is a bitmask type indicating regex matching rules.

The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

Definition at line 407 of file `regex_constants.h`.

**3.19.3.22 operator" | ()** [1/2]

```
constexpr syntax_option_type std::regex_constants::operator| (
 syntax_option_type __a,
 syntax_option_type __b) [inline]
```

This is a bitmask type indicating how to interpret the regex.

The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

A valid value of type `syntax_option_type` shall have exactly one of the elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep` set.

Definition at line 190 of file `regex_constants.h`.

### 3.19.3.23 operator" | () [2/2]

```
constexpr match_flag_type std::regex_constants::operator| (
 match_flag_type __a,
 match_flag_type __b) [inline]
```

This is a bitmask type indicating regex matching rules.

The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

Definition at line 381 of file `regex_constants.h`.

### 3.19.3.24 operator" |=() [1/2]

```
syntax_option_type& std::regex_constants::operator|= (
 syntax_option_type & __a,
 syntax_option_type __b) [inline]
```

This is a bitmask type indicating how to interpret the regex.

The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

A valid value of type `syntax_option_type` shall have exactly one of the elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep` set.

Definition at line 212 of file `regex_constants.h`.

### 3.19.3.25 operator" |=() [2/2]

```
match_flag_type& std::regex_constants::operator|= (
 match_flag_type & __a,
 match_flag_type __b) [inline]
```

This is a bitmask type indicating regex matching rules.

The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

Definition at line 403 of file `regex_constants.h`.

### 3.19.3.26 `operator~()` [1/2]

```
constexpr syntax_option_type std::regex_constants::operator~ (
 syntax_option_type __a) [inline]
```

This is a bitmask type indicating how to interpret the regex.

The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

A valid value of type `syntax_option_type` shall have exactly one of the elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep` set.

Definition at line 204 of file `regex_constants.h`.

### 3.19.3.27 `operator~()` [2/2]

```
constexpr match_flag_type std::regex_constants::operator~ (
 match_flag_type __a) [inline]
```

This is a bitmask type indicating regex matching rules.

The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

Definition at line 395 of file `regex_constants.h`.

## 3.19.4 Variable Documentation

### 3.19.4.1 `__polynomial`

```
constexpr syntax_option_type std::regex_constants::__polynomial [inline]
```

Extension: Ensure both space complexity of compiled regex and time complexity execution are not exponential. If specified in a regex with back-references, the exception `regex_constants::error_complexity` will be thrown.

Definition at line 179 of file `regex_constants.h`.

### 3.19.4.2 `awk`

```
constexpr syntax_option_type std::regex_constants::awk [inline]
```

Specifies that the grammar recognized by the regular expression engine is that used by POSIX utility `awk` in IEEE Std 1003.1-2001. This option is identical to `syntax_option_type` `extended`, except that C-style escape sequences are supported. These sequences are: `\\`, `\a`, `\b`, `\f`, `\n`, `\r`, `\t`, `\v`, `\&apos;`, `&apos;`, and `\ddd` (where `ddd` is one, two, or three octal digits).

Definition at line 152 of file `regex_constants.h`.

#### 3.19.4.3 basic

```
constexpr syntax_option_type std::regex_constants::basic [inline]
```

Specifies that the grammar recognized by the regular expression engine is that used by POSIX basic regular expressions in IEEE Std 1003.1-2001, Portable Operating System Interface (POSIX), Base Definitions and Headers, Section 9, Regular Expressions [IEEE, Information Technology – Portable Operating System Interface (POSIX), IEEE Standard 1003.1-2001].

Definition at line 132 of file `regex_constants.h`.

#### 3.19.4.4 collate

```
constexpr syntax_option_type std::regex_constants::collate [inline]
```

Specifies that character ranges of the form `[a-b]` should be locale sensitive.

Definition at line 111 of file `regex_constants.h`.

#### 3.19.4.5 ECMAScript

```
constexpr syntax_option_type std::regex_constants::ECMAScript [inline]
```

Specifies that the grammar recognized by the regular expression engine is that used by ECMAScript in ECMA-262 [Ecma International, ECMAScript Language Specification, Standard Ecma-262, third edition, 1999], as modified in section [28.13]. This grammar is similar to that defined in the PERL scripting language but extended with elements found in the POSIX regular expression grammar.

Definition at line 122 of file `regex_constants.h`.

#### 3.19.4.6 egrep

```
constexpr syntax_option_type std::regex_constants::egrep [inline]
```

Specifies that the grammar recognized by the regular expression engine is that used by POSIX utility `grep` when given the `-E` option in IEEE Std 1003.1-2001. This option is identical to `syntax_option_type` extended, except that newlines are treated as whitespace.

Definition at line 170 of file `regex_constants.h`.

### 3.19.4.7 extended

```
constexpr syntax_option_type std::regex_constants::extended [inline]
```

Specifies that the grammar recognized by the regular expression engine is that used by POSIX extended regular expressions in IEEE Std 1003.1-2001, Portable Operating System Interface (POSIX), Base Definitions and Headers, Section 9, Regular Expressions.

Definition at line 141 of file `regex_constants.h`.

### 3.19.4.8 format\_default

```
constexpr match_flag_type std::regex_constants::format_default [inline]
```

When a regular expression match is to be replaced by a new string, the new string is constructed using the rules used by the ECMAScript replace function in ECMA- 262 [Ecma International, ECMAScript Language Specification, Standard Ecma-262, third edition, 1999], part 15.5.4.11 String.prototype.replace. In addition, during search and replace operations all non-overlapping occurrences of the regular expression are located and replaced, and sections of the input that did not match the expression are copied unchanged to the output string.

Format strings (from ECMA-262 [15.5.4.11]):

- `$$` The dollar-sign itself (`$`).
- `$&` The matched substring.
- `$`` The portion of *string* that precedes the matched substring. This would be `match_results::prefix()`.
- `$'` The portion of *string* that follows the matched substring. This would be `match_results::suffix()`.
- `$n` The *n*th capture, where *n* is in [1,9] and `$n` is not followed by a decimal digit. If `n <= match_results::size()` and the *n*th capture is undefined, use the empty string instead. If `n > match_results::size()`, the result is implementation-defined.
- `$nn` The *nn*th capture, where *nn* is a two-digit decimal number on [01, 99]. If `nn <= match_results::size()` and the *n*th capture is undefined, use the empty string instead. If `nn > match_results::size()`, the result is implementation-defined.

Definition at line 346 of file `regex_constants.h`.

### 3.19.4.9 format\_first\_only

```
constexpr match_flag_type std::regex_constants::format_first_only [inline]
```

When specified during a search and replace operation, only the first occurrence of the regular expression shall be replaced.

Definition at line 370 of file `regex_constants.h`.

#### 3.19.4.10 format\_no\_copy

```
constexpr match_flag_type std::regex_constants::format_no_copy [inline]
```

During a search and replace operation, sections of the character container sequence being searched that do not match the regular expression shall not be copied to the output string.

Definition at line 363 of file `regex_constants.h`.

#### 3.19.4.11 format\_sed

```
constexpr match_flag_type std::regex_constants::format_sed [inline]
```

When a regular expression match is to be replaced by a new string, the new string is constructed using the rules used by the POSIX sed utility in IEEE Std 1003.1- 2001 [IEEE, Information Technology – Portable Operating System Interface (POSIX), IEEE Standard 1003.1-2001].

Definition at line 355 of file `regex_constants.h`.

#### 3.19.4.12 grep

```
constexpr syntax_option_type std::regex_constants::grep [inline]
```

Specifies that the grammar recognized by the regular expression engine is that used by POSIX utility grep in IEEE Std 1003.1-2001. This option is identical to `syntax_option_type basic`, except that newlines are treated as whitespace.

Definition at line 161 of file `regex_constants.h`.

#### 3.19.4.13 icase

```
constexpr syntax_option_type std::regex_constants::icase [inline]
```

Specifies that the matching of regular expressions against a character sequence shall be performed without regard to case.

Definition at line 87 of file `regex_constants.h`.

#### 3.19.4.14 match\_any

```
constexpr match_flag_type std::regex_constants::match_any [inline]
```

If more than one match is possible then any match is an acceptable result.

Definition at line 297 of file `regex_constants.h`.

#### 3.19.4.15 `match_continuous`

```
constexpr match_flag_type std::regex_constants::match_continuous [inline]
```

The expression only matches a sub-sequence that begins at first .

Definition at line 309 of file `regex_constants.h`.

#### 3.19.4.16 `match_default`

```
constexpr match_flag_type std::regex_constants::match_default [inline]
```

The default matching rules.

Definition at line 260 of file `regex_constants.h`.

#### 3.19.4.17 `match_not_bol`

```
constexpr match_flag_type std::regex_constants::match_not_bol [inline]
```

The first character in the sequence [first, last) is treated as though it is not at the beginning of a line, so the character (^) in the regular expression shall not match [first, first).

Definition at line 268 of file `regex_constants.h`.

#### 3.19.4.18 `match_not_bow`

```
constexpr match_flag_type std::regex_constants::match_not_bow [inline]
```

The expression \b is not matched against the sub-sequence [first,first).

Definition at line 283 of file `regex_constants.h`.

#### 3.19.4.19 `match_not_eol`

```
constexpr match_flag_type std::regex_constants::match_not_eol [inline]
```

The last character in the sequence [first, last) is treated as though it is not at the end of a line, so the character (\$) in the regular expression shall not match [last, last).

Definition at line 276 of file `regex_constants.h`.

#### 3.19.4.20 match\_not\_eow

```
constexpr match_flag_type std::regex_constants::match_not_eow [inline]
```

The expression \b should not be matched against the sub-sequence [last,last).

Definition at line 290 of file regex\_constants.h.

#### 3.19.4.21 match\_not\_null

```
constexpr match_flag_type std::regex_constants::match_not_null [inline]
```

The expression does not match an empty sequence.

Definition at line 303 of file regex\_constants.h.

#### 3.19.4.22 match\_prev\_avail

```
constexpr match_flag_type std::regex_constants::match_prev_avail [inline]
```

—first is a valid iterator position. When this flag is set then the flags match\_not\_bol and match\_not\_bow are ignored by the regular expression algorithms 28.11 and iterators 28.12.

Definition at line 317 of file regex\_constants.h.

#### 3.19.4.23 nosubs

```
constexpr syntax_option_type std::regex_constants::nosubs [inline]
```

Specifies that when a regular expression is matched against a character container sequence, no sub-expression matches are to be stored in the supplied match\_results structure.

Definition at line 95 of file regex\_constants.h.

#### 3.19.4.24 optimize

```
constexpr syntax_option_type std::regex_constants::optimize [inline]
```

Specifies that the regular expression engine should pay more attention to the speed with which regular expressions are matched, and less to the speed with which regular expression objects are constructed. Otherwise it has no detectable effect on the program output.

Definition at line 104 of file regex\_constants.h.

## 3.20 std::rel\_ops Namespace Reference

### Functions

- `template<class _Tp >`  
`bool operator!= (const _Tp &__x, const _Tp &__y)`
- `template<class _Tp >`  
`bool operator<= (const _Tp &__x, const _Tp &__y)`
- `template<class _Tp >`  
`bool operator> (const _Tp &__x, const _Tp &__y)`
- `template<class _Tp >`  
`bool operator>= (const _Tp &__x, const _Tp &__y)`

### 3.20.1 Detailed Description

The generated relational operators are sequestered here.

### 3.20.2 Function Documentation

#### 3.20.2.1 operator"!=()"

```
template<class _Tp >
bool std::rel_ops::operator!= (
 const _Tp & __x,
 const _Tp & __y) [inline]
```

Defines != for arbitrary types, in terms of ==.

#### Parameters

|                          |                |
|--------------------------|----------------|
| $\leftrightarrow$<br>__x | A thing.       |
| $\leftrightarrow$<br>__y | Another thing. |

#### Returns

`__x != __y`

This function uses == to determine its result.

Definition at line 87 of file stl\_relops.h.

### 3.20.2.2 operator<=()

```
template<class _Tp >
bool std::rel_ops::operator<= (
 const _Tp & __x,
 const _Tp & __y) [inline]
```

Defines <= for arbitrary types, in terms of <.

#### Parameters

|       |                |
|-------|----------------|
| $\_x$ | A thing.       |
| $\_y$ | Another thing. |

#### Returns

$\_x <= \_y$

This function uses < to determine its result.

Definition at line 113 of file stl\_relops.h.

### 3.20.2.3 operator>()

```
template<class _Tp >
bool std::rel_ops::operator> (
 const _Tp & __x,
 const _Tp & __y) [inline]
```

Defines > for arbitrary types, in terms of <.

#### Parameters

|       |                |
|-------|----------------|
| $\_x$ | A thing.       |
| $\_y$ | Another thing. |

#### Returns

$\_x > \_y$

This function uses < to determine its result.

Definition at line 100 of file stl\_relops.h.

### 3.20.2.4 operator>=()

```
template<class _Tp >
bool std::rel_ops::operator>= (
 const _Tp & __x,
 const _Tp & __y) [inline]
```

Defines >= for arbitrary types, in terms of <.

#### Parameters

|       |                |
|-------|----------------|
| $\_x$ | A thing.       |
| $\_y$ | Another thing. |

#### Returns

$\_x \geq \_y$

This function uses < to determine its result.

Definition at line 126 of file stl\_relops.h.

## 3.21 std::this\_thread Namespace Reference

### Functions

- void **\_\_sleep\_for** ([chrono::seconds](#), [chrono::nanoseconds](#))
- [thread::id get\\_id](#) () noexcept
- template<typename \_Rep , typename \_Period >  
void [sleep\\_for](#) (const [chrono::duration](#)< \_Rep, \_Period > &\_\_rtime)
- template<typename \_Clock , typename \_Duration >  
void [sleep\\_until](#) (const [chrono::time\\_point](#)< \_Clock, \_Duration > &\_\_atime)
- void [yield](#) () noexcept

#### 3.21.1 Detailed Description

ISO C++ 2011 namespace for interacting with the current thread.

C++11 30.3.2 [thread.thread.this] Namespace this\_thread.

#### 3.21.2 Function Documentation

### 3.21.2.1 get\_id()

```
thread::id std::this_thread::get_id () [inline], [noexcept]
```

get\_id

Definition at line 365 of file thread.

### 3.21.2.2 sleep\_for()

```
template<typename _Rep , typename _Period >
void std::this_thread::sleep_for (
 const chrono::duration< _Rep, _Period > & __rtime) [inline]
```

sleep\_for

Definition at line 389 of file thread.

### 3.21.2.3 sleep\_until()

```
template<typename _Clock , typename _Duration >
void std::this_thread::sleep_until (
 const chrono::time_point< _Clock, _Duration > & __atime) [inline]
```

sleep\_until

Definition at line 411 of file thread.

### 3.21.2.4 yield()

```
void std::this_thread::yield () [inline], [noexcept]
```

yield

Definition at line 376 of file thread.

`dynamic_bitset< _WordT, _Alloc > &__y)`
- `template<typename _WordT, typename _Alloc >`  
`dynamic_bitset< _WordT, _Alloc > operator- (const dynamic_bitset< _WordT, _Alloc > &__x, const`  
`dynamic_bitset< _WordT, _Alloc > &__y)`

#### 3.24.1 Detailed Description

Namespace for non-standard "TR2" extensions.

### 3.25 std::tr2::\_\_detail Namespace Reference

#### 3.25.1 Detailed Description

Implementation details not part of the namespace std::tr2 interface.

## 4 Class Documentation

### 4.1 \_\_gnu\_parallel::\_\_accumulate\_binop\_reduct< \_BinOp > Struct Template Reference

#### Public Member Functions

- `__accumulate_binop_reduct (_BinOp &__b)`
- `template<typename _Result, typename _Addend >`  
`_Result operator() (const _Result &__x, const _Addend &__y)`

#### Public Attributes

- `_BinOp & __binop`

#### 4.1.1 Detailed Description

```
template<typename _BinOp>
struct __gnu_parallel::__accumulate_binop_reduct< _BinOp >
```

General reduction, using a binary operator.

Definition at line 335 of file for\_each\_selectors.h.

The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

4.2 `__gnu_parallel::__accumulate_selector<_It>` Struct Template Reference

Inheritance diagram for `__gnu_parallel::__accumulate_selector<_It>`:

## Public Member Functions

- `template<typename _Op>`  
`std::iterator_traits<_It>::value_type operator() (_Op __o, _It __i)`

## Public Attributes

- `_It _M_finish_iterator`

## 4.2.1 Detailed Description

```
template<typename _It>
struct __gnu_parallel::__accumulate_selector<_It>
```

`std::accumulate()` selector.

Definition at line 208 of file `for_each_selectors.h`.

## 4.2.2 Member Function Documentation

4.2.2.1 `operator()`

```
template<typename _It>
template<typename _Op>
std::iterator_traits<_It>::value_type __gnu_parallel::__accumulate_selector<_It>::operator() (
 _Op __o,
 _It __i) [inline]
```

Functor execution.

## Parameters

|                        |                              |
|------------------------|------------------------------|
| <code>_↔<br/>_o</code> | Operator (unused).           |
| <code>_↔<br/>_i</code> | iterator referencing object. |

## Returns

The current value.

Definition at line 216 of file `for_each_selectors.h`.

## 4.2.3 Member Data Documentation

4.2.3.1 `_M_finish_iterator`

```
template<typename _It >
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator [inherited]
```

`_Iterator` on last element processed; needed for some algorithms (e. g. `std::transform()`).

Definition at line 47 of file `for_each_selectors.h`.

The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

4.3 `std::__add_pointer_helper< _Tp, bool >` Struct Template Reference

## Public Types

- `typedef _Tp type`

## 4.3.1 Detailed Description

```
template<typename _Tp, bool = __or_<__is_referenceable<_Tp>, is_void<_Tp>>::value>
struct std::__add_pointer_helper< _Tp, bool >
```

`add_pointer`

Definition at line 2025 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

4.4 `__gnu_parallel::__adjacent_difference_selector<_It>` Struct Template Reference

Inheritance diagram for `__gnu_parallel::__adjacent_difference_selector<_It>`:

## Public Member Functions

- `template<typename _Op >`  
`bool operator() (_Op &__o, _It __i)`

## Public Attributes

- `_It \_M\_finish\_iterator`

## 4.4.1 Detailed Description

```

template<typename _It>
struct __gnu_parallel::__adjacent_difference_selector<_It>

```

Selector that returns the difference between two adjacent `__elements`.

Definition at line 269 of file `for_each_selectors.h`.

## 4.4.2 Member Data Documentation

#### 4.4.2.1 `_M_finish_iterator`

```
template<typename _It >
__It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator [inherited]
```

`_Iterator` on last element processed; needed for some algorithms (e. g. `std::transform()`).

Definition at line 47 of file `for_each_selectors.h`.

The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

#### 4.5 `__gnu_parallel::__adjacent_find_selector` Struct Reference

Inheritance diagram for `__gnu_parallel::__adjacent_find_selector`:

#### Public Member Functions

- `template<typename _RAIter1, typename _RAIter2, typename _Pred >`  
`std::pair< _RAIter1, _RAIter2 > \_M\_sequential\_algorithm ( _RAIter1 __begin1, _RAIter1 __end1, _RAIter2 __begin2, _Pred __pred)`
- `template<typename _RAIter1, typename _RAIter2, typename _Pred >`  
`bool operator ( _RAIter1 __i1, _RAIter2 __i2, _Pred __pred)`

##### 4.5.1 Detailed Description

Test predicate on two adjacent elements.

Definition at line 80 of file `find_selectors.h`.

## 4.5.2 Member Function Documentation

## 4.5.2.1 \_M\_sequential\_algorithm()

```
template<typename _RAIter1 , typename _RAIter2 , typename _Pred >
std::pair<_RAIter1, _RAIter2> __gnu_parallel::__adjacent_find_selector::_M_sequential_algorithm (
 _RAIter1 __begin1,
 _RAIter1 __end1,
 _RAIter2 __begin2,
 _Pred __pred) [inline]
```

Corresponding sequential algorithm on a sequence.

## Parameters

|                       |                                    |
|-----------------------|------------------------------------|
| <code>__begin1</code> | Begin iterator of first sequence.  |
| <code>__end1</code>   | End iterator of first sequence.    |
| <code>__begin2</code> | Begin iterator of second sequence. |
| <code>__pred</code>   | Find predicate.                    |

Definition at line 105 of file `find_selectors.h`.

## 4.5.2.2 operator()()

```
template<typename _RAIter1 , typename _RAIter2 , typename _Pred >
bool __gnu_parallel::__adjacent_find_selector::operator() (
 _RAIter1 __i1,
 _RAIter2 __i2,
 _Pred __pred) [inline]
```

Test on one position.

## Parameters

|                     |                                        |
|---------------------|----------------------------------------|
| <code>__i1</code>   | _Iterator on first sequence.           |
| <code>__i2</code>   | _Iterator on second sequence (unused). |
| <code>__pred</code> | Find predicate.                        |

Definition at line 90 of file `find_selectors.h`.

The documentation for this struct was generated from the following file:

- [find\\_selectors.h](#)

#### 4.6 `__gnu_cxx::__alloc_traits<_Alloc, typename >` Struct Template Reference

Inheritance diagram for `__gnu_cxx::__alloc_traits<_Alloc, typename >`:

##### Public Types

- typedef `std::allocator_traits<_Alloc>` **\_Base\_type**
- typedef `_Alloc` **allocator\_type**
- typedef `_Base_type::const_pointer` **const\_pointer**
- typedef `const value_type & const_reference`
- using `const_void_pointer` = `typename _Ptr<__cv_pointer, const void>::type`
- typedef `_Base_type::difference_type` **difference\_type**
- using `is_always_equal` = `__detected_or_t<typename is_empty<_Alloc>::type, __equal, _Alloc>`
- typedef `_Base_type::pointer` **pointer**
- using `propagate_on_container_copy_assignment` = `__detected_or_t<false_type, __pocca, _Alloc>`
- using `propagate_on_container_move_assignment` = `__detected_or_t<false_type, __pocma, _Alloc>`
- using `propagate_on_container_swap` = `__detected_or_t<false_type, __pocs, _Alloc>`
- template<typename `_Tp`>  
using **rebind\_alloc** = `__alloc_rebind<_Alloc, _Tp>`
- template<typename `_Tp`>  
using **rebind\_traits** = `allocator_traits<rebind_alloc<_Tp>>`
- typedef `value_type & reference`
- typedef `_Base_type::size_type` **size\_type**
- typedef `_Base_type::value_type` **value\_type**
- using `void_pointer` = `typename _Ptr<__v_pointer, void>::type`

##### Static Public Member Functions

#### 4.6.1 Detailed Description

```
template<typename _Alloc, typename = typename _Alloc::value_type>
struct __gnu_cxx::__alloc_traits< _Alloc, typename >
```

Uniform interface to C++98 and C++11 allocators.

Definition at line 48 of file ext/alloc\_traits.h.

#### 4.6.2 Member Typedef Documentation

##### 4.6.2.1 const\_void\_pointer

```
template<typename _Alloc>
using std::allocator_traits< _Alloc >::const_void_pointer = typename _Ptr<__cv_pointer, const
void>::type [inherited]
```

The allocator's const void pointer type.

`Alloc::const_void_pointer` if that type exists, otherwise `pointer_traits<pointer>::rebind<const void>`

Definition at line 154 of file bits/alloc\_traits.h.

##### 4.6.2.2 is\_always\_equal

```
template<typename _Alloc>
using std::allocator_traits< _Alloc >::is_always_equal = __detected_or_t<typename is_empty<_↵
Alloc>::type, __equal, _Alloc> [inherited]
```

Whether all instances of the allocator type compare equal.

`Alloc::is_always_equal` if that type exists, otherwise `is_empty<Alloc>::type`

Definition at line 206 of file bits/alloc\_traits.h.

##### 4.6.2.3 propagate\_on\_container\_copy\_assignment

```
template<typename _Alloc>
using std::allocator_traits< _Alloc >::propagate_on_container_copy_assignment = __detected_or_↵
t<false_type, __pocca, _Alloc> [inherited]
```

How the allocator is propagated on copy assignment.

`Alloc::propagate_on_container_copy_assignment` if that type exists, otherwise `false_type`

Definition at line 179 of file bits/alloc\_traits.h.

4.6.2.4 `propagate_on_container_move_assignment`

```
template<typename _Alloc>
using std::allocator_traits< _Alloc >::propagate_on_container_move_assignment = __detected_or_t<
false_type, __pocma, _Alloc> [inherited]
```

How the allocator is propagated on move assignment.

`Alloc::propagate_on_container_move_assignment` if that type exists, otherwise `false_type`

Definition at line 188 of file `bits/alloc_traits.h`.

4.6.2.5 `propagate_on_container_swap`

```
template<typename _Alloc>
using std::allocator_traits< _Alloc >::propagate_on_container_swap = __detected_or_t<false_type,
__pocs, _Alloc> [inherited]
```

How the allocator is propagated on swap.

`Alloc::propagate_on_container_swap` if that type exists, otherwise `false_type`

Definition at line 197 of file `bits/alloc_traits.h`.

4.6.2.6 `void_pointer`

```
template<typename _Alloc>
using std::allocator_traits< _Alloc >::void_pointer = typename _Ptr<__v_pointer, void>::type
[inherited]
```

The allocator's void pointer type.

`Alloc::void_pointer` if that type exists, otherwise `pointer_traits<pointer>::rebind<void>`

Definition at line 146 of file `bits/alloc_traits.h`.

## 4.6.3 Member Function Documentation

4.6.3.1 `allocate()` [1/4]

```
template<typename _Alloc, typename = typename _Alloc::value_type>
static constexpr pointer std::allocator_traits< _Alloc >::allocate [inline], [static]
```

Allocate memory.

**Parameters**

|                                      |                                              |
|--------------------------------------|----------------------------------------------|
| $\leftrightarrow$<br><code>_a</code> | An allocator.                                |
| $\leftrightarrow$<br><code>_n</code> | The number of objects to allocate space for. |

Calls `a.allocate(n)`

Definition at line 313 of file `bits/alloc_traits.h`.

**4.6.3.2 allocate()** [2/4]

```
template<typename _Alloc, typename = typename _Alloc::value_type>
static constexpr pointer std::allocator_traits< _Alloc >::allocate [inline], [static]
```

Allocate memory.

**Parameters**

|                     |                                              |
|---------------------|----------------------------------------------|
| <code>__a</code>    | An allocator.                                |
| <code>__n</code>    | The number of objects to allocate space for. |
| <code>__hint</code> | Aid to locality.                             |

**Returns**

Memory of suitable size and alignment for *n* objects of type `value_type`

Returns `a.allocate(n, hint)` if that expression is well-formed, otherwise returns `a.allocate(n)`

Definition at line 328 of file `bits/alloc_traits.h`.

**4.6.3.3 allocate()** [3/4]

```
template<typename _Alloc>
static constexpr pointer std::allocator_traits< _Alloc >::allocate (
 _Alloc & __a,
 size_type __n) [inline], [static], [inherited]
```

Allocate memory.

**Parameters**

|                                      |                                              |
|--------------------------------------|----------------------------------------------|
| $\leftrightarrow$<br><code>_a</code> | An allocator.                                |
| $\leftrightarrow$<br><code>_n</code> | The number of objects to allocate space for. |

Calls `a.allocate(n)`

Definition at line 313 of file `bits/alloc_traits.h`.

Referenced by `std::__allocate_guarded()`.

#### 4.6.3.4 `allocate()` [4/4]

```
template<typename _Alloc>
static constexpr pointer std::allocator_traits< _Alloc >::allocate (
 _Alloc & __a,
 size_type __n,
 const_void_pointer __hint) [inline], [static], [inherited]
```

Allocate memory.

##### Parameters

|                     |                                              |
|---------------------|----------------------------------------------|
| <code>__a</code>    | An allocator.                                |
| <code>__n</code>    | The number of objects to allocate space for. |
| <code>__hint</code> | Aid to locality.                             |

##### Returns

Memory of suitable size and alignment for *n* objects of type `value_type`

Returns `a.allocate(n, hint)` if that expression is well-formed, otherwise returns `a.allocate(n)`

Definition at line 328 of file `bits/alloc_traits.h`.

#### 4.6.3.5 `construct()` [1/2]

```
template<typename _Alloc, typename = typename _Alloc::value_type>
template<typename _Tp , typename... _Args>
static constexpr auto std::allocator_traits< _Alloc >::construct (
 typename _Tp ,
 typename... _Args) [inline], [static], [noexcept]
```

Construct an object of type `_Tp`.

##### Parameters

|                     |                                                                      |
|---------------------|----------------------------------------------------------------------|
| <code>__a</code>    | An allocator.                                                        |
| <code>__p</code>    | Pointer to memory of suitable size and alignment for <code>Tp</code> |
| <code>__args</code> | Constructor arguments.                                               |

Calls `__a.construct(__p, std::forward<Args>(__args) ...)` if that expression is well-formed, otherwise uses placement-new to construct an object of type `_Tp` at location `__p` from the arguments `__args...`

Definition at line 356 of file `bits/alloc_traits.h`.

#### 4.6.3.6 `construct()` [2/2]

```
template<typename _Alloc>
template<typename _Tp, typename... _Args>
static constexpr auto std::allocator_traits< _Alloc >::construct (
 _Alloc & __a,
 _Tp * __p,
 _Args &&... __args) -> decltype(_S_construct(__a, __p, std::forward<_Args>(__↵
args)...)) [inline], [static], [noexcept], [inherited]
```

Construct an object of type `_Tp`.

##### Parameters

|                     |                                                                      |
|---------------------|----------------------------------------------------------------------|
| <code>__a</code>    | An allocator.                                                        |
| <code>__p</code>    | Pointer to memory of suitable size and alignment for <code>Tp</code> |
| <code>__args</code> | Constructor arguments.                                               |

Calls `__a.construct(__p, std::forward<Args>(__args) ...)` if that expression is well-formed, otherwise uses placement-new to construct an object of type `_Tp` at location `__p` from the arguments `__args...`

Definition at line 356 of file `bits/alloc_traits.h`.

#### 4.6.3.7 `deallocate()` [1/2]

```
template<typename _Alloc, typename = typename _Alloc::value_type>
static constexpr void std::allocator_traits< _Alloc >::deallocate [inline], [static]
```

Deallocate memory.

##### Parameters

|                        |                                                |
|------------------------|------------------------------------------------|
| <code>↵<br/>__a</code> | An allocator.                                  |
| <code>↵<br/>__p</code> | Pointer to the memory to deallocate.           |
| <code>↵<br/>__n</code> | The number of objects space was allocated for. |

Calls `a.deallocate(p, n)`

Definition at line 340 of file `bits/alloc_traits.h`.

#### 4.6.3.8 `deallocate()` [2/2]

```
template<typename _Alloc>
static constexpr void std::allocator_traits<_Alloc >::deallocate (
 _Alloc & __a,
 pointer __p,
 size_type __n) [inline], [static], [inherited]
```

Deallocate memory.

##### Parameters

|                  |                                                |
|------------------|------------------------------------------------|
| <code>__a</code> | An allocator.                                  |
| <code>__p</code> | Pointer to the memory to deallocate.           |
| <code>__n</code> | The number of objects space was allocated for. |

Calls `a.deallocate(p, n)`

Definition at line 340 of file `bits/alloc_traits.h`.

Referenced by `std::__allocated_ptr<_Alloc >::~~__allocated_ptr()`.

#### 4.6.3.9 `destroy()` [1/2]

```
template<typename _Alloc, typename = typename _Alloc::value_type>
template<typename _Tp >
static constexpr void std::allocator_traits<_Alloc >::destroy (
 typename _Tp) [inline], [static], [noexcept]
```

Destroy an object of type `_Tp`.

##### Parameters

|                  |                                  |
|------------------|----------------------------------|
| <code>__a</code> | An allocator.                    |
| <code>__p</code> | Pointer to the object to destroy |

Calls `__a.destroy(__p)` if that expression is well-formed, otherwise calls `__p->~_Tp()`

Definition at line 372 of file `bits/alloc_traits.h`.

**4.6.3.10 destroy()** [2/2]

```
template<typename _Alloc>
template<typename _Tp >
static constexpr void std::allocator_traits< _Alloc >::destroy (
 _Alloc & __a,
 _Tp * __p) [inline], [static], [noexcept], [inherited]
```

Destroy an object of type `_Tp`.

**Parameters**

|                  |                                  |
|------------------|----------------------------------|
| <code>__a</code> | An allocator.                    |
| <code>__p</code> | Pointer to the object to destroy |

Calls `__a.destroy(__p)` if that expression is well-formed, otherwise calls `__p->~_Tp()`

Definition at line 372 of file `bits/alloc_traits.h`.

Referenced by `std::_Destroy()`.

**4.6.3.11 max\_size()** [1/2]

```
template<typename _Alloc, typename = typename _Alloc::value_type>
static constexpr size_type std::allocator_traits< _Alloc >::max_size [inline], [static], [noexcept]
```

The maximum supported allocation size.

**Parameters**

|                  |               |
|------------------|---------------|
| <code>__a</code> | An allocator. |
|------------------|---------------|

**Returns**

`__a.max_size()` or `numeric_limits<size_type>::max()`

Returns `__a.max_size()` if that expression is well-formed, otherwise returns `numeric_limits<size_type>::max()`

Definition at line 385 of file `bits/alloc_traits.h`.

4.6.3.12 `max_size()` [2/2]

```
template<typename _Alloc>
static constexpr size_type std::allocator_traits<_Alloc>::max_size (
 const _Alloc & __a) [inline], [static], [noexcept], [inherited]
```

The maximum supported allocation size.

## Parameters

|                  |               |
|------------------|---------------|
| <code>__a</code> | An allocator. |
|------------------|---------------|

## Returns

`__a.max_size()` or `numeric_limits<size_type>::max()`

Returns `__a.max_size()` if that expression is well-formed, otherwise returns `numeric_limits<size_type>::max()`

Definition at line 385 of file `bits/alloc_traits.h`.

Referenced by `std::forward_list<_Tp, _Alloc>::max_size()`, and `std::list<__inp, __rebind_inp>::max_size()`.

4.6.3.13 `select_on_container_copy_construction()`

```
template<typename _Alloc>
static constexpr _Alloc std::allocator_traits<_Alloc>::select_on_container_copy_construction (
 const _Alloc & __rhs) [inline], [static], [inherited]
```

Obtain an allocator to use when copying a container.

## Parameters

|                    |               |
|--------------------|---------------|
| <code>__rhs</code> | An allocator. |
|--------------------|---------------|

## Returns

`__rhs.select_on_container_copy_construction()` or `__rhs`

Returns `__rhs.select_on_container_copy_construction()` if that expression is well-formed, otherwise returns `__rhs`

Definition at line 397 of file `bits/alloc_traits.h`.

The documentation for this struct was generated from the following file:

- [ext/alloc\\_traits.h](#)

## 4.7 std::\_\_allocated\_ptr< \_Alloc > Struct Template Reference

### Public Types

- using **pointer** = typename `allocator_traits< _Alloc >::pointer`
- using **value\_type** = typename `allocator_traits< _Alloc >::value_type`

### Public Member Functions

- `__allocated_ptr ( _Alloc &__a, pointer __ptr ) noexcept`
- `template<typename _Ptr , typename _Req = _Require<is_same<_Ptr, value_type*>>>> __allocated_ptr ( _Alloc &__a, _Ptr __ptr )`
- `__allocated_ptr ( __allocated_ptr &&__gd ) noexcept`
- `~__allocated_ptr ()`
- `value_type * get ()`
- `__allocated_ptr & operator= (std::nullptr_t) noexcept`

#### 4.7.1 Detailed Description

```
template<typename _Alloc>
struct std::__allocated_ptr< _Alloc >
```

Non-standard RAII type for managing pointers obtained from allocators.

Definition at line 46 of file `allocated_ptr.h`.

#### 4.7.2 Constructor & Destructor Documentation

##### 4.7.2.1 \_\_allocated\_ptr() [1/3]

```
template<typename _Alloc >
std::__allocated_ptr< _Alloc >::__allocated_ptr (
 _Alloc & __a,
 pointer __ptr) [inline], [noexcept]
```

Take ownership of `__ptr`.

Definition at line 52 of file `allocated_ptr.h`.

## 4.7.2.2 \_\_allocated\_ptr() [2/3]

```
template<typename _Alloc >
template<typename _Ptr , typename _Req = _Require<is_same<_Ptr, value_type*>>>
std::__allocated_ptr< _Alloc >::__allocated_ptr (
 _Alloc & __a,
 _Ptr __ptr) [inline]
```

Convert \_\_ptr to allocator's pointer type and take ownership of it.

Definition at line 59 of file allocated\_ptr.h.

## 4.7.2.3 \_\_allocated\_ptr() [3/3]

```
template<typename _Alloc >
std::__allocated_ptr< _Alloc >::__allocated_ptr (
 __allocated_ptr< _Alloc > && __gd) [inline], [noexcept]
```

Transfer ownership of the owned pointer.

Definition at line 65 of file allocated\_ptr.h.

## 4.7.2.4 ~\_\_allocated\_ptr()

```
template<typename _Alloc >
std::__allocated_ptr< _Alloc >::~~__allocated_ptr () [inline]
```

Deallocate the owned pointer.

Definition at line 70 of file allocated\_ptr.h.

References std::allocator\_traits<\_Alloc>::deallocate().

## 4.7.3 Member Function Documentation

## 4.7.3.1 get()

```
template<typename _Alloc >
value_type* std::__allocated_ptr< _Alloc >::get (
 void) [inline]
```

Get the address that the owned pointer refers to.

Definition at line 85 of file allocated\_ptr.h.

#### 4.7.3.2 operator=()

```
template<typename _Alloc >
__allocated_ptr& std::__allocated_ptr< _Alloc >::operator= (
 std::nullptr_t) [inline], [noexcept]
```

Release ownership of the owned pointer.

Definition at line 78 of file `allocated_ptr.h`.

The documentation for this struct was generated from the following file:

- [allocated\\_ptr.h](#)

### 4.9.1 Detailed Description

```
template<typename _PTp>
struct std::__atomic_base<_PTp*>
```

Partial specialization for pointer types.

Definition at line 599 of file atomic\_base.h.

The documentation for this struct was generated from the following file:

- [atomic\\_base.h](#)

## 4.10 std::\_\_atomic\_flag\_base Struct Reference

Inheritance diagram for std::\_\_atomic\_flag\_base:

### Public Attributes

- \_\_atomic\_flag\_data\_type **M**i

#### 4.10.1 Detailed Description

Base type for atomic\_flag.

Base type is POD with data, allowing atomic\_flag to derive from it and meet the standard layout type requirement. In addition to compatibility with a C interface, this allows different implementations of atomic\_flag to use the same atomic operation functions, via a standard conversion to the \_\_atomic\_flag\_base argument.

Definition at line 176 of file atomic\_base.h.

The documentation for this struct was generated from the following file:

- [atomic\\_base.h](#)

#### 4.11 `std::__basic_future<_Res>` Class Template Reference

Inheritance diagram for `std::__basic_future<_Res>`:

##### Public Types

- `template<typename _Res>`  
`using _Ptr = unique\_ptr<_Res, \_Result\_base::Deleter>`
- `using \_State\_base = \_State\_baseV2`

##### Public Member Functions

- `\_\_basic\_future (const \_\_basic\_future &)=delete`
- `\_\_basic\_future & operator= (const \_\_basic\_future &)=delete`
- `bool valid () const noexcept`
- `void wait () const`
- `template<typename _Rep, typename _Period>`

- `template<typename _Clock, typename _Duration>`  
`future\_status wait\_until (const chrono::time\_point<_Clock, _Duration> &__abs) const`

##### Static Public Member Functions

- `template<typename _Res, typename _Allocator>`  
`static \_Ptr<\_Result\_alloc<_Res, _Allocator>> \_S\_allocate\_result (const _Allocator &__a)`
- `template<typename _Res, typename _Tp>`  
`static \_Ptr<\_Result<_Res>> \_S\_allocate\_result (const std::allocator<_Tp> &__a)`
- `template<typename _BoundFn>`  
`static std::shared\_ptr<_State_base> \_S\_make\_async\_state (_BoundFn &&__fn)`
- `template<typename _BoundFn>`  
`static std::shared\_ptr<_State_base> \_S\_make\_deferred\_state (_BoundFn &&__fn)`
- `template<typename _Res_ptr, typename _BoundFn>`  
`static \_Task\_setter<_Res_ptr, _BoundFn> \_S\_task\_setter (_Res_ptr &__ptr, _BoundFn &__call)`

### Protected Types

- typedef `__future_base::Result<_Res>` & `__result_type`
- typedef `shared_ptr<_State_base>` `__state_type`

### Protected Member Functions

- `__basic_future` (const `__state_type` & `__state`)
- `__basic_future` (const `shared_future<_Res>` &) noexcept
- `__basic_future` (`shared_future<_Res>` &&) noexcept
- `__basic_future` (`future<_Res>` &&) noexcept
- `__result_type _M_get_result` () const
- void `_M_swap` (`__basic_future` & `__that`) noexcept

#### 4.11.1 Detailed Description

```
template<typename _Res>
class std::__basic_future<_Res>
```

Common implementation for future and shared\_future.

Definition at line 682 of file future.

#### 4.11.2 Member Typedef Documentation

##### 4.11.2.1 `_Ptr`

```
template<typename _Res>
using std::__future_base::_Ptr = unique_ptr<_Res, _Result_base::_Deleter> [inherited]
```

A `unique_ptr` for result objects.

Definition at line 223 of file future.

#### 4.11.3 Member Function Documentation

#### 4.11.3.1 `_M_get_result()`

```
template<typename _Res>
__result_type std::__basic_future< _Res >::_M_get_result () const [inline], [protected]
```

Wait for the state to be ready and rethrow any stored exception.

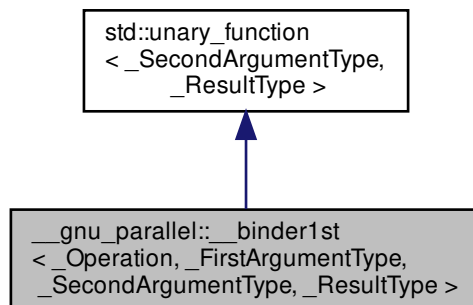

Definition at line 725 of file future.

The documentation for this class was generated from the following file:

- [future](#)

#### 4.12 `__gnu_parallel::__binder1st< _Operation, _FirstArgumentType, _SecondArgumentType, _ResultType >` Class Template Reference

Inheritance diagram for `__gnu_parallel::__binder1st< _Operation, _FirstArgumentType, _SecondArgumentType, _ResultType >`:

#### Public Types

- typedef `_SecondArgumentType` [argument\\_type](#)
- typedef `_ResultType` [result\\_type](#)

#### Public Member Functions

- `__binder1st` (const `_Operation` &\_\_x, const `_FirstArgumentType` &\_\_y)
- `_ResultType operator()` (const `_SecondArgumentType` &\_\_x)
- `_ResultType operator()` (`_SecondArgumentType` &\_\_x) const

#### Protected Attributes

- `_Operation` **`_M_op`**
- `_FirstArgumentType` **`_M_value`**

#### 4.12.1 Detailed Description

```
template<typename _Operation, typename _FirstArgumentType, typename _SecondArgumentType, typename _ResultType>
class __gnu_parallel::__binder1st<_Operation, _FirstArgumentType, _SecondArgumentType, _ResultType >
```

Similar to `std::binder1st`, but giving the argument types explicitly.

Definition at line 192 of file `base.h`.

#### 4.12.2 Member Typedef Documentation

##### 4.12.2.1 `argument_type`

```
typedef _SecondArgumentType std::unary_function<_SecondArgumentType, _ResultType >::argument_type
[inherited]
```

`argument_type` is the type of the argument

Definition at line 108 of file `stl_function.h`.

##### 4.12.2.2 `result_type`

```
typedef _ResultType std::unary_function<_SecondArgumentType, _ResultType >::result_type [inherited]
```

`result_type` is the return type

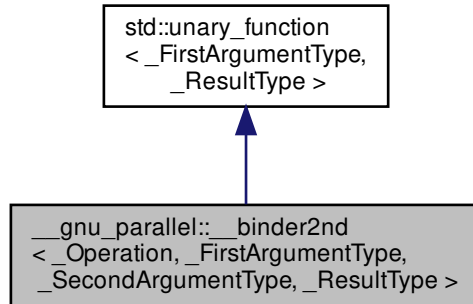

Definition at line 111 of file `stl_function.h`.

The documentation for this class was generated from the following file:

- [base.h](#)

#### 4.13 `__gnu_parallel::__binder2nd< _Operation, _FirstArgumentType, _SecondArgumentType, _ResultType >` Class Template Reference

Inheritance diagram for `__gnu_parallel::__binder2nd< _Operation, _FirstArgumentType, _SecondArgumentType, _ResultType >`:

##### Public Types

- typedef `_FirstArgumentType` `argument_type`
- typedef `_ResultType` `result_type`

##### Public Member Functions

- `__binder2nd` (`const _Operation &__x, const _SecondArgumentType &__y`)
- `_ResultType operator()` (`const _FirstArgumentType &__x`) `const`
- `_ResultType operator()` (`_FirstArgumentType &__x`)

##### Protected Attributes

- `_Operation` `_M_op`
- `_SecondArgumentType` `_M_value`

##### 4.13.1 Detailed Description

```
template<typename _Operation, typename _FirstArgumentType, typename _SecondArgumentType, typename _ResultType>
class __gnu_parallel::__binder2nd< _Operation, _FirstArgumentType, _SecondArgumentType, _ResultType >
```

Similar to `std::binder2nd`, but giving the argument types explicitly.

Definition at line 220 of file `base.h`.

## 4.13.2 Member Typedef Documentation

## 4.13.2.1 argument\_type

```
typedef _FirstArgumentType std::unary_function< _FirstArgumentType , _ResultType >::argument_type
[inherited]
```

argument\_type is the type of the argument

Definition at line 108 of file stl\_function.h.

## 4.13.2.2 result\_type

```
typedef _ResultType std::unary_function< _FirstArgumentType , _ResultType >::result_type [inherited]
```

result\_type is the return type

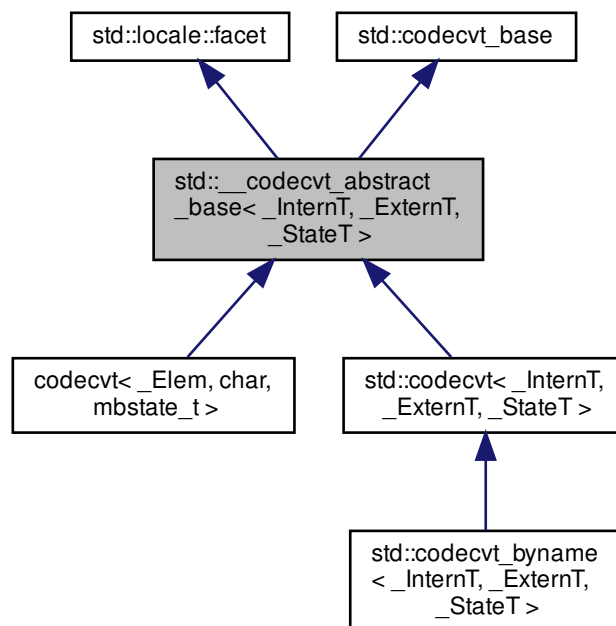

Definition at line 111 of file stl\_function.h.

The documentation for this class was generated from the following file:

- [base.h](#)

## 4.14.1 Detailed Description

```
template<typename _InternT, typename _ExternT, typename _StateT>
class std::__codecvt_abstract_base<_InternT, _ExternT, _StateT>
```

Common base for codecvt functions.

This template class provides implementations of the public functions that forward to the protected virtual functions.

This template also provides abstract stubs for the protected virtual functions.

Definition at line 68 of file `codecvt.h`.

## 4.14.2 Member Function Documentation

4.14.2.1 `do_out()`

```
template<typename _InternT, typename _ExternT, typename _StateT>
virtual result std::__codecvt_abstract_base<_InternT, _ExternT, _StateT>::do_out (
 state_type & __state,
 const intern_type * __from,
 const intern_type * __from_end,
 const intern_type *& __from_next,
 extern_type * __to,
 extern_type * __to_end,
 extern_type *& __to_next) const [protected], [pure virtual]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This function is a hook for derived classes to change the value returned.

## See also

`out` for more information.

Implemented in `std::codecvt<char32_t, char, mbstate_t>`, `std::codecvt<char16_t, char, mbstate_t>`, `std::codecvt<wchar_t, char, mbstate_t>`, `std::codecvt<char, char, mbstate_t>`, `std::codecvt<_InternT, _ExternT, _StateT>`, `std::codecvt<_Elem, char, mbstate_t>`, and `std::codecvt<_InternT, _ExternT, encoding_state>`.

Referenced by `std::__codecvt_abstract_base<char32_t, char, mbstate_t>::out()`.

#### 4.14.2.2 in()

```
template<typename _InternT, typename _ExternT, typename _StateT>
result std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >::in (
 state_type & __state,
 const extern_type * __from,
 const extern_type * __from_end,
 const extern_type *& __from_next,
 intern_type * __to,
 intern_type * __to_end,
 intern_type *& __to_next) const [inline]
```

Convert from external to internal character set.

Converts input string of `extern_type` to output string of `intern_type`. This is analogous to `mbsrtowcs`. It does this by calling `codecvt::do_in`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

##### Parameters

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

##### Returns

`codecvt_base::result`.

Definition at line 196 of file `codecvt.h`.

4.14.2.3 `out()`

```
template<typename _InternT, typename _ExternT, typename _StateT>
result std::__codecvt_abstract_base<_InternT, _ExternT, _StateT >::out (
 state_type & __state,
 const intern_type * __from,
 const intern_type * __from_end,
 const intern_type *& __from_next,
 extern_type * __to,
 extern_type * __to_end,
 extern_type *& __to_next) const [inline]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This is analogous to `wcsrtombs`. It does this by calling `codecvt::do_out`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

## Parameters

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

## Returns

`codecvt_base::result`.

Definition at line 116 of file `codecvt.h`.

#### 4.14.2.4 unshift()

```
template<typename _InternT, typename _ExternT, typename _StateT>
result std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >::unshift (
 state_type & __state,
 extern_type * __to,
 extern_type * __to_end,
 extern_type *& __to_next) const [inline]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

##### Parameters

|                        |                                      |
|------------------------|--------------------------------------|
| <code>__state</code>   | Persistent conversion state data.    |
| <code>__to</code>      | Start of output buffer.              |
| <code>__to_end</code>  | End of output buffer.                |
| <code>__to_next</code> | Returns start of unused output area. |

##### Returns

`codecvt_base::result`.

#### 4.18.1 Detailed Description

```
template<typename _CharT>
class std::__ctype_abstract_base< _CharT >
```

Common base for ctype facet.

This template class provides implementations of the public functions that forward to the protected virtual functions.

This template also provides abstract stubs for the protected virtual functions.

Definition at line 150 of file locale\_facets.h.

## 4.18.2 Member Typedef Documentation

## 4.18.2.1 char\_type

```
template<typename _CharT>
typedef _CharT std::__ctype_abstract_base< _CharT >::char_type
```

Typedef for the template parameter.

Definition at line 155 of file locale\_facets.h.

## 4.18.3 Member Function Documentation

## 4.18.3.1 do\_is() [1/2]

```
template<typename _CharT>
virtual bool std::__ctype_abstract_base< _CharT >::do_is (
 mask __m,
 char_type __c) const [protected], [pure virtual]
```

Test char\_type classification.

This function finds a mask *M* for *c* and compares it to mask *m*.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

## Parameters

|                          |                                    |
|--------------------------|------------------------------------|
| $\leftrightarrow$<br>__c | The char_type to find the mask of. |
| $\leftrightarrow$<br>__m | The mask to compare against.       |

## Returns

(*M* & \_\_m) != 0.

Implemented in [std::ctype<wchar\\_t>](#), and [std::ctype<\\_CharT>](#).

Referenced by [std::\\_\\_ctype\\_abstract\\_base<wchar\\_t>::is\(\)](#).

#### 4.18.3.2 `do_is()` [2/2]

```
template<typename _CharT>
virtual const char_type* std::__ctype_abstract_base< _CharT >::do_is (
 const char_type * __lo,
 const char_type * __hi,
 mask * __vec) const [protected], [pure virtual]
```

Return a mask array.

This function finds the mask for each `char_type` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the input.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

##### Parameters

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

##### Returns

`__hi`.

Implemented in `std::ctype< wchar_t >`, and `std::ctype< _CharT >`.

#### 4.18.3.3 `do_narrow()` [1/2]

```
template<typename _CharT>
virtual char std::__ctype_abstract_base< _CharT >::do_narrow (
 char_type __c,
 char __dfault) const [protected], [pure virtual]
```

Narrow `char_type` to `char`.

This virtual function converts the argument to `char` using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

##### Parameters

|                       |                                        |
|-----------------------|----------------------------------------|
| <code>__c</code>      | The <code>char_type</code> to convert. |
| <code>__dfault</code> | Char to return if conversion fails.    |

**Returns**

The converted char.

Implemented in [std::ctype<wchar\\_t>](#), and [std::ctype<\\_CharT>](#).

Referenced by [std::\\_\\_ctype\\_abstract\\_base<wchar\\_t>::narrow\(\)](#).

**4.18.3.4 do\_narrow()** [2/2]

```
template<typename _CharT>
virtual const char_type* std::__ctype_abstract_base<_CharT>::do_narrow (
 const char_type * __lo,
 const char_type * __hi,
 char __default,
 char * __to) const [protected], [pure virtual]
```

Narrow char\_type array to char.

This virtual function converts each char\_type in the range [[\\_\\_lo](#),[\\_\\_hi](#)) to char using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, [\\_\\_default](#) is used instead.

[do\\_narrow\(\)](#) is a hook for a derived facet to change the behavior of narrowing. [do\\_narrow\(\)](#) must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See [codecvt](#) for that.

**Parameters**

|                           |                                   |
|---------------------------|-----------------------------------|
| <a href="#">__lo</a>      | Pointer to start of range.        |
| <a href="#">__hi</a>      | Pointer to end of range.          |
| <a href="#">__default</a> | Char to use if conversion fails.  |
| <a href="#">__to</a>      | Pointer to the destination array. |

**Returns**

[\\_\\_hi](#).

Implemented in [std::ctype<wchar\\_t>](#), and [std::ctype<\\_CharT>](#).

**4.18.3.5 do\_scan\_is()**

```
template<typename _CharT>
virtual const char_type* std::__ctype_abstract_base<_CharT>::do_scan_is (
```

```

mask __m,
const char_type * __lo,
const char_type * __hi) const [protected], [pure virtual]

```

Find char\_type matching mask.

This function searches for and returns the first char\_type c in [`__lo`,`__hi`) for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

#### Parameters

|                   |                              |
|-------------------|------------------------------|
| <code>__m</code>  | The mask to compare against. |
| <code>__lo</code> | Pointer to start of range.   |
| <code>__hi</code> | Pointer to end of range.     |

#### Returns

Pointer to a matching char\_type if found, else `__hi`.

Implemented in `std::ctype< wchar_t >`, and `std::ctype< _CharT >`.

Referenced by `std::__ctype_abstract_base< wchar_t >::scan_is()`.

#### 4.18.3.6 do\_scan\_not()

```

template<typename _CharT>
virtual const char_type* std::__ctype_abstract_base< _CharT >::do_scan_not (
 mask __m,
 const char_type * __lo,
 const char_type * __hi) const [protected], [pure virtual]

```

Find char\_type not matching mask.

This function searches for and returns a pointer to the first char\_type c of [`lo`,`hi`) for which `is(m,c)` is false.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

#### Parameters

|                   |                              |
|-------------------|------------------------------|
| <code>__m</code>  | The mask to compare against. |
| <code>__lo</code> | Pointer to start of range.   |
| <code>__hi</code> | Pointer to end of range.     |

**Returns**

Pointer to a non-matching char\_type if found, else \_\_hi.

Implemented in [std::ctype<wchar\\_t>](#), and [std::ctype<\\_CharT>](#).

Referenced by [std::\\_\\_ctype\\_abstract\\_base<wchar\\_t>::scan\\_not\(\)](#).

**4.18.3.7 do\_tolower()** [1/2]

```
template<typename _CharT>
virtual char_type std::__ctype_abstract_base<_CharT>::do_tolower (
 char_type __c) const [protected], [pure virtual]
```

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

**Parameters**

|                                                                                     |                           |
|-------------------------------------------------------------------------------------|---------------------------|
|  | The char_type to convert. |
| __c                                                                                 |                           |

**Returns**

The lowercase char\_type if convertible, else \_\_c.

Implemented in [std::ctype<wchar\\_t>](#), and [std::ctype<\\_CharT>](#).

Referenced by [std::\\_\\_ctype\\_abstract\\_base<wchar\\_t>::tolower\(\)](#).

**4.18.3.8 do\_tolower()** [2/2]

```
template<typename _CharT>
virtual const char_type* std::__ctype_abstract_base<_CharT>::do_tolower (
 char_type * __lo,
 const char_type * __hi) const [protected], [pure virtual]
```

Convert array to lowercase.

This virtual function converts each char\_type in the range [\_\_lo,\_\_hi) to lowercase if possible. Other elements remain untouched.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

**Parameters**

|                                                                                                                       |                            |
|-----------------------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"></a><br><code>_lo</code> | Pointer to start of range. |
| <a href="#"></a><br><code>_hi</code> | Pointer to end of range.   |

**Returns**

`__hi`.

Implemented in [std::ctype< wchar\\_t >](#), and [std::ctype< \\_CharT >](#).

**4.18.3.9 do\_toupper()** [1/2]

```
template<typename _CharT>
virtual char_type std::__ctype_abstract_base< _CharT >::do_toupper (
 char_type __c) const [protected], [pure virtual]
```

Convert to uppercase.

This virtual function converts the `char_type` argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

**Parameters**

|                                                                                                                         |                                        |
|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------|
| <a href="#"></a><br><code>__c</code> | The <code>char_type</code> to convert. |
|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------|

**Returns**

The uppercase `char_type` if convertible, else `__c`.

Implemented in [std::ctype< wchar\\_t >](#), and [std::ctype< \\_CharT >](#).

Referenced by `std::__ctype_abstract_base< wchar_t >::toupper()`.

**4.18.3.10 do\_toupper()** [2/2]

```
template<typename _CharT>
virtual const char_type* std::__ctype_abstract_base< _CharT >::do_toupper (
```

```
char_type * __lo,
const char_type * __hi) const [protected], [pure virtual]
```

Convert array to uppercase.

This virtual function converts each char\_type in the range [\_\_lo,\_\_hi) to uppercase if possible. Other elements remain untouched.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

#### Parameters

|                                                                                                           |                            |
|-----------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"></a><br>__lo | Pointer to start of range. |
| <a href="#"></a><br>__hi | Pointer to end of range.   |

#### Returns

\_\_hi.

Implemented in [std::ctype< wchar\\_t >](#), and [std::ctype< \\_CharT >](#).

#### 4.18.3.11 do\_widen() [1/2]

```
template<typename _CharT>
virtual char_type std::__ctype_abstract_base<_CharT>::do_widen (
 char __c) const [protected], [pure virtual]
```

Widen char.

This virtual function converts the char to char\_type using the simplest reasonable transformation.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

|                                                                                                            |                      |
|------------------------------------------------------------------------------------------------------------|----------------------|
| <a href="#"></a><br>__c | The char to convert. |
|------------------------------------------------------------------------------------------------------------|----------------------|

#### Returns

The converted char\_type

Implemented in [std::ctype< wchar\\_t >](#), and [std::ctype< \\_CharT >](#).

Referenced by [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >::widen\(\)](#).

#### 4.18.3.12 do\_widen() [2/2]

```
template<typename _CharT>
virtual const char* std::__ctype_abstract_base< _CharT >::do_widen (
 const char * __lo,
 const char * __hi,
 char_type * __to) const [protected], [pure virtual]
```

Widen char array.

This function converts each char in the input to [char\\_type](#) using the simplest reasonable transformation.

[do\\_widen\(\)](#) is a hook for a derived facet to change the behavior of widening. [do\\_widen\(\)](#) must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See [codecvt](#) for that.

##### Parameters

|                            |                                   |
|----------------------------|-----------------------------------|
| <a href="#">_↵<br/>_lo</a> | Pointer to start range.           |
| <a href="#">_↵<br/>_hi</a> | Pointer to end of range.          |
| <a href="#">_↵<br/>_to</a> | Pointer to the destination array. |

##### Returns

[\\_\\_hi](#).

Implemented in [std::ctype< wchar\\_t >](#), and [std::ctype< \\_CharT >](#).

#### 4.18.3.13 is() [1/2]

```
template<typename _CharT>
bool std::__ctype_abstract_base< _CharT >::is (
 mask __m,
 char_type __c) const [inline]
```

Test [char\\_type](#) classification.

This function finds a mask M for [\\_\\_c](#) and compares it to mask [\\_\\_m](#). It does so by returning the value of [ctype<char\\_↵  
type>::do\\_is\(\)](#).

## Parameters

|                        |                                       |
|------------------------|---------------------------------------|
| $\hookleftarrow$<br>_c | The char_type to compare the mask of. |
| $\hookleftarrow$<br>_m | The mask to compare against.          |

## Returns

(M & \_\_m) != 0.

Definition at line 169 of file locale\_facets.h.

Referenced by std::time\_get<\_CharT, \_InIter>::get().

## 4.18.3.14 is() [2/2]

```
template<typename _CharT>
const char_type* std::__ctype_abstract_base<_CharT>::is (
 const char_type * __lo,
 const char_type * __hi,
 mask * __vec) const [inline]
```

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char\_type>::do\_is().

## Parameters

|       |                                      |
|-------|--------------------------------------|
| __lo  | Pointer to start of range.           |
| __hi  | Pointer to end of range.             |
| __vec | Pointer to an array of mask storage. |

## Returns

\_\_hi.

Definition at line 186 of file locale\_facets.h.

## 4.18.3.15 narrow() [1/2]

```
template<typename _CharT>
char std::__ctype_abstract_base<_CharT>::narrow (
```

```
char_type __c,
char __default) const [inline]
```

Narrow char\_type to char.

This function converts the char\_type to char using the simplest reasonable transformation. If the conversion fails, default is returned instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_c).

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

|                        |                                     |
|------------------------|-------------------------------------|
| <code>__c</code>       | The char_type to convert.           |
| <code>__default</code> | Char to return if conversion fails. |

#### Returns

The converted char.

Definition at line 331 of file locale\_facets.h.

Referenced by std::time\_get<\_CharT, \_InIter >::get(), and std::time\_put<\_CharT, \_OutIter >::put().

#### 4.18.3.16 narrow() [2/2]

```
template<typename _CharT>
const char_type* std::__ctype_abstract_base<_CharT >::narrow (
 const char_type * __lo,
 const char_type * __hi,
 char __default,
 char * __to) const [inline]
```

Narrow array to char array.

This function converts each char\_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char\_type in the input that cannot be converted, default is used instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_lo, \_\_hi, \_\_default, \_\_to).

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

|                        |                                   |
|------------------------|-----------------------------------|
| <code>__lo</code>      | Pointer to start of range.        |
| <code>__hi</code>      | Pointer to end of range.          |
| <code>__default</code> | Char to use if conversion fails.  |
| <code>__to</code>      | Pointer to the destination array. |

**Returns**`__hi`.

Definition at line 353 of file locale\_facets.h.

**4.18.3.17 scan\_is()**

```
template<typename _CharT>
const char_type* std::__ctype_abstract_base<_CharT>::scan_is (
 mask __m,
 const char_type * __lo,
 const char_type * __hi) const [inline]
```

Find char\_type matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char\_type>::do\_scan\_is().

**Parameters**

|                         |                              |
|-------------------------|------------------------------|
| <code>↔<br/>__m</code>  | The mask to compare against. |
| <code>↔<br/>__lo</code> | Pointer to start of range.   |
| <code>↔<br/>__hi</code> | Pointer to end of range.     |

**Returns**Pointer to matching char\_type if found, else `__hi`.

Definition at line 202 of file locale\_facets.h.

**4.18.3.18 scan\_not()**

```
template<typename _CharT>
const char_type* std::__ctype_abstract_base<_CharT>::scan_not (
 mask __m,
 const char_type * __lo,
 const char_type * __hi) const [inline]
```

Find char\_type not matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char\_type>::do\_scan\_not().

**Parameters**

|                                                                                          |                                 |
|------------------------------------------------------------------------------------------|---------------------------------|
| <br>_m  | The mask to compare against.    |
| <br>_lo | Pointer to first char in range. |
| <br>_hi | Pointer to end of range.        |

**Returns**

Pointer to non-matching char if found, else \_\_hi.

Definition at line 218 of file locale\_facets.h.

**4.18.3.19 tolower()** [1/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::tolower (
 char_type __c) const [inline]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char\_type>::do\_tolower(c).

**Parameters**

|                                                                                           |                           |
|-------------------------------------------------------------------------------------------|---------------------------|
| <br>_c | The char_type to convert. |
|-------------------------------------------------------------------------------------------|---------------------------|

**Returns**

The lowercase char\_type if convertible, else \_\_c.

Definition at line 261 of file locale\_facets.h.

Referenced by std::time\_get< \_CharT, \_Inlter >::get().

**4.18.3.20 tolower()** [2/2]

```
template<typename _CharT>
const char_type* std::__ctype_abstract_base< _CharT >::tolower (
```

```
char_type * __lo,
const char_type * __hi) const [inline]
```

Convert array to lowercase.

This function converts each char\_type in the range [\_\_lo,\_\_hi) to lowercase if possible. Other elements remain untouched. It does so by returning ctype<char\_type>::do\_tolower(\_\_lo, \_\_hi).

## Parameters

|                                                                                           |                            |
|-------------------------------------------------------------------------------------------|----------------------------|
| <br>__lo | Pointer to start of range. |
| <br>__hi | Pointer to end of range.   |

## Returns

\_\_hi.

Definition at line 276 of file locale\_facets.h.

## 4.18.3.21 toupper() [1/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::toupper (
 char_type __c) const [inline]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char\_type>::do\_toupper().

## Parameters

|                                                                                            |                           |
|--------------------------------------------------------------------------------------------|---------------------------|
| <br>__c | The char_type to convert. |
|--------------------------------------------------------------------------------------------|---------------------------|

## Returns

The uppercase char\_type if convertible, else \_\_c.

Definition at line 232 of file locale\_facets.h.

Referenced by std::time\_get< \_CharT, \_Inlter >::get().

## 4.18.3.22 toupper() [2/2]

```
template<typename _CharT>
const char_type* std::__ctype_abstract_base< _CharT >::toupper (
 char_type * __lo,
 const char_type * __hi) const [inline]
```

Convert array to uppercase.

This function converts each char\_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning ctype<char\_type>::do\_toupper(lo, hi).

## Parameters

|                                                                                                                        |                            |
|------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"></a><br><code>__lo</code> | Pointer to start of range. |
| <a href="#"></a><br><code>__hi</code> | Pointer to end of range.   |

## Returns

`__hi`.

Definition at line 247 of file locale\_facets.h.

## 4.18.3.23 widen() [1/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base<_CharT>::widen (
 char __c) const [inline]
```

Widen char to char\_type.

This function converts the char argument to char\_type using the simplest reasonable transformation. It does so by returning ctype<char\_type>::do\_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

|                                                                                                                         |                      |
|-------------------------------------------------------------------------------------------------------------------------|----------------------|
| <a href="#"></a><br><code>__c</code> | The char to convert. |
|-------------------------------------------------------------------------------------------------------------------------|----------------------|

## Returns

The converted char\_type.

Definition at line 293 of file locale\_facets.h.

Referenced by std::time\_get<\_CharT, \_InIter>::do\_get(), std::money\_get<\_CharT, \_InIter>::do\_get(), std::time\_put<\_CharT, \_OutIter>::do\_put(), and std::money\_put<\_CharT, \_OutIter>::do\_put().

## 4.18.3.24 widen() [2/2]

```
template<typename _CharT>
const char* std::__ctype_abstract_base<_CharT>::widen (
```

```
const char * __lo,
const char * __hi,
char_type * __to) const [inline]
```

Widen array to char\_type.

This function converts each char in the input to char\_type using the simplest reasonable transformation. It does so by returning ctype<char\_type>::do\_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

|                                   |                                   |
|-----------------------------------|-----------------------------------|
| <a href="#"><code>__lo</code></a> | Pointer to start of range.        |
| <a href="#"><code>__hi</code></a> | Pointer to end of range.          |
| <a href="#"><code>__to</code></a> | Pointer to the destination array. |

#### Returns

[`\_\_hi`](#).

Definition at line 312 of file locale\_facets.h.

The documentation for this class was generated from the following file:

- [locale\\_facets.h](#)

## 4.19 std::\_\_detector< \_Default, \_AlwaysVoid, \_Op, \_Args > Struct Template Reference

### Public Types

- using **type** = \_Default
- using **value\_t** = [false\\_type](#)

#### 4.19.1 Detailed Description

```
template<typename _Default, typename _AlwaysVoid, template< typename... > class _Op, typename... _Args>
struct std::__detector< _Default, _AlwaysVoid, _Op, _Args >
```

Implementation of the detection idiom (negative case).

Definition at line 2582 of file type\_traits.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

4.20 `std::__detector<_Default, __void_t<_Op<_Args...>>, _Op, _Args...>` Struct Template Reference

## Public Types

4.22 `__gnu_parallel::__fill_selector<_It>` Struct Template Reference

Inheritance diagram for `__gnu_parallel::__fill_selector<_It>`:

## Public Member Functions

- `template<typename _ValueType >  
bool operator() (_ValueType &__v, _It __i)`

## Public Attributes

- `_It _M_finish_iterator`

### 4.22.1 Detailed Description

```
template<typename _It>
struct __gnu_parallel::__fill_selector< _It >
```

`std::fill()` selector.

Definition at line 84 of file `for_each_selectors.h`.

### 4.22.2 Member Function Documentation

#### 4.22.2.1 operator>()

```
template<typename _It >
template<typename _ValueType >
bool __gnu_parallel::__fill_selector< _It >::operator() (
 _ValueType & __v,
 _It __i) [inline]
```

Functor execution.

#### Parameters

|                       |                              |
|-----------------------|------------------------------|
| <code>↔<br/>_v</code> | Current value.               |
| <code>↔<br/>_i</code> | iterator referencing object. |

Definition at line 91 of file `for_each_selectors.h`.

### 4.22.3 Member Data Documentation

4.22.3.1 `_M_finish_iterator`

```
template<typename _It >
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator [inherited]
```

`_Iterator` on last element processed; needed for some algorithms (e. g. `std::transform()`).

Definition at line 47 of file `for_each_selectors.h`.

The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

4.23 `__gnu_parallel::__find_first_of_selector<_FIterator>` Struct Template Reference

Inheritance diagram for `__gnu_parallel::__find_first_of_selector<_FIterator>`:

## Public Member Functions

- `__find_first_of_selector` (`_FIterator __begin`, `_FIterator __end`)
- `template<typename _RAIter1, typename _RAIter2, typename _Pred >`  
`std::pair<_RAIter1, _RAIter2 > _M_sequential_algorithm` (`_RAIter1 __begin1`, `_RAIter1 __end1`, `_RAIter2 __begin2`, `_Pred __pred`)
- `template<typename _RAIter1, typename _RAIter2, typename _Pred >`  
`bool operator()` (`_RAIter1 __i1`, `_RAIter2 __i2`, `_Pred __pred`)

## Public Attributes

- `_FIterator` `_M_begin`
- `_FIterator` `_M_end`

#### 4.23.1 Detailed Description

```
template<typename _FIterator>
struct __gnu_parallel::__find_first_of_selector< _FIterator >
```

Test predicate on several elements.

Definition at line 153 of file find\_selectors.h.

#### 4.23.2 Member Function Documentation

##### 4.23.2.1 \_M\_sequential\_algorithm()

```
template<typename _FIterator >
template<typename _RAIter1 , typename _RAIter2 , typename _Pred >
std::pair<_RAIter1, _RAIter2> __gnu_parallel::__find_first_of_selector< _FIterator >::_M↵
sequential_algorithm (
 _RAIter1 __begin1,
 _RAIter1 __end1,
 _RAIter2 __begin2,
 _Pred __pred) [inline]
```

Corresponding sequential algorithm on a sequence.

##### Parameters

|                       |                                    |
|-----------------------|------------------------------------|
| <code>__begin1</code> | Begin iterator of first sequence.  |
| <code>__end1</code>   | End iterator of first sequence.    |
| <code>__begin2</code> | Begin iterator of second sequence. |
| <code>__pred</code>   | Find predicate.                    |

Definition at line 186 of file find\_selectors.h.

##### 4.23.2.2 operator()()

```
template<typename _FIterator >
template<typename _RAIter1 , typename _RAIter2 , typename _Pred >
bool __gnu_parallel::__find_first_of_selector< _FIterator >::operator() (
 _RAIter1 __i1,
 _RAIter2 __i2,
 _Pred __pred) [inline]
```

Test on one position.

## Parameters

|                     |                                        |
|---------------------|----------------------------------------|
| <code>__i1</code>   | _Iterator on first sequence.           |
| <code>__i2</code>   | _Iterator on second sequence (unused). |
| <code>__pred</code> | Find predicate.                        |

Definition at line 169 of file `find_selectors.h`.

The documentation for this struct was generated from the following file:

- [find\\_selectors.h](#)

## 4.24 \_\_gnu\_parallel::\_\_find\_if\_selector Struct Reference

Inheritance diagram for `__gnu_parallel::__find_if_selector`:

## Public Member Functions

- `template<typename _RAIter1, typename _RAIter2, typename _Pred >`  
`std::pair< _RAIter1, _RAIter2 > \_M\_sequential\_algorithm (_RAIter1 __begin1, _RAIter1 __end1, _RAIter2 __begin2, _Pred __pred)`
- `template<typename _RAIter1, typename _RAIter2, typename _Pred >`  
`bool operator() (_RAIter1 __i1, _RAIter2 __i2, _Pred __pred)`

## 4.24.1 Detailed Description

Test predicate on a single element, used for `std::find()` and `std::find_if()`.

Definition at line 50 of file `find_selectors.h`.

## 4.24.2 Member Function Documentation

### 4.24.2.1 `_M_sequential_algorithm()`

```
template<typename _RAIter1 , typename _RAIter2 , typename _Pred >
std::pair<_RAIter1, _RAIter2> __gnu_parallel::__find_if_selector::_M_sequential_algorithm (
 _RAIter1 __begin1,
 _RAIter1 __end1,
 _RAIter2 __begin2,
 _Pred __pred) [inline]
```

Corresponding sequential algorithm on a sequence.

#### Parameters

|                       |                                    |
|-----------------------|------------------------------------|
| <code>__begin1</code> | Begin iterator of first sequence.  |
| <code>__end1</code>   | End iterator of first sequence.    |
| <code>__begin2</code> | Begin iterator of second sequence. |
| <code>__pred</code>   | Find predicate.                    |

Definition at line 72 of file `find_selectors.h`.

### 4.24.2.2 `operator()()`

```
template<typename _RAIter1 , typename _RAIter2 , typename _Pred >
bool __gnu_parallel::__find_if_selector::operator() (
 _RAIter1 __i1,
 _RAIter2 __i2,
 _Pred __pred) [inline]
```

Test on one position.

#### Parameters

|                     |                                        |
|---------------------|----------------------------------------|
| <code>__i1</code>   | _Iterator on first sequence.           |
| <code>__i2</code>   | _Iterator on second sequence (unused). |
| <code>__pred</code> | Find predicate.                        |

Definition at line 60 of file `find_selectors.h`.

The documentation for this struct was generated from the following file:

- [find\\_selectors.h](#)

## 4.25 \_\_gnu\_parallel::\_\_for\_each\_selector&lt;\_It&gt; Struct Template Reference

Inheritance diagram for \_\_gnu\_parallel::\_\_for\_each\_selector<\_It>:

## Public Member Functions

- `template<typename _Op>`  
`bool operator() (_Op &__o, _It __i)`

## Public Attributes

- `_It _M_finish_iterator`

## 4.25.1 Detailed Description

```
template<typename _It>
struct __gnu_parallel::__for_each_selector<_It>
```

`std::for_each()` selector.

Definition at line 52 of file `for_each_selectors.h`.

## 4.25.2 Member Function Documentation

## 4.25.2.1 operator&gt;()

```
template<typename _It>
template<typename _Op>
bool __gnu_parallel::__for_each_selector<_It>::operator() (
 _Op & __o,
 _It __i) [inline]
```

Functor execution.

**Parameters**

|                                                                                                                      |                              |
|----------------------------------------------------------------------------------------------------------------------|------------------------------|
| <a href="#"></a><br><code>_o</code> | Operator.                    |
| <a href="#"></a><br><code>_i</code> | iterator referencing object. |

Definition at line 59 of file `for_each_selectors.h`.

**4.25.3 Member Data Documentation****4.25.3.1 `_M_finish_iterator`**

```
template<typename _It >
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator [inherited]
```

`_Iterator` on last element processed; needed for some algorithms (e. g. `std::transform()`).

Definition at line 47 of file `for_each_selectors.h`.

The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

**4.26 `__cxxabiv1::__forced_unwind` Class Reference****4.26.1 Detailed Description**

Thrown as part of forced unwinding.

A magic placeholder class that can be caught by reference to recognize forced unwinding.

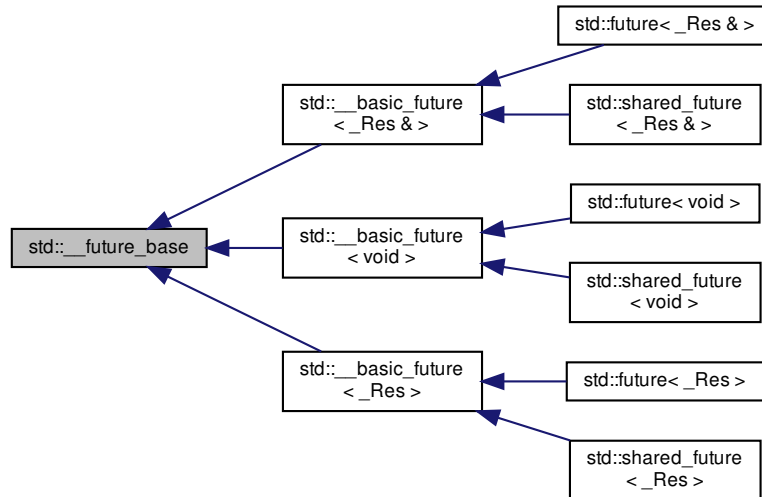

Definition at line 48 of file `cxxabi_forced.h`.

The documentation for this class was generated from the following file:

- [cxxabi\\_forced.h](#)

## 4.27 std::\_\_future\_base Struct Reference

Inheritance diagram for std::\_\_future\_base:

## Classes

- struct [\\_Result](#)
- struct [\\_Result<\\_Res &>](#)
- struct [\\_Result<void>](#)
- struct [\\_Result\\_alloc](#)
- struct [\\_Result\\_base](#)

## Public Types

- template<typename [\\_Res](#)>  
using [\\_Ptr](#) = [unique\\_ptr](#)<[\\_Res](#), [\\_Result\\_base::Deleter](#)>
- using [\\_State\\_base](#) = [\\_State\\_baseV2](#)

## Static Public Member Functions

- template<typename [\\_Res](#), typename [\\_Allocator](#)>  
static [\\_Ptr](#)<[\\_Result\\_alloc](#)<[\\_Res](#), [\\_Allocator](#)>> [\\_S\\_allocate\\_result](#) (const [\\_Allocator](#) &\_\_a)
- template<typename [\\_Res](#), typename [\\_Tp](#)>  
static [\\_Ptr](#)<[\\_Result](#)<[\\_Res](#)>> [\\_S\\_allocate\\_result](#) (const [std::allocator](#)<[\\_Tp](#)> &\_\_a)

static [\\_Task\\_setter](#)<[\\_Res\\_ptr](#), [\\_BoundFn](#)> [\\_S\\_task\\_setter](#) ([\\_Res\\_ptr](#) &\_\_ptr, [\\_BoundFn](#) &\_\_call)

#### 4.27.1 Detailed Description

Base class and enclosing scope.

Definition at line 198 of file future.

#### 4.27.2 Member Typedef Documentation

##### 4.27.2.1 \_Ptr

```
template<typename _Res >
using std::__future_base::_Ptr = unique_ptr<_Res, _Result_base::_Deleter>
```

A `unique_ptr` for result objects.

Definition at line 223 of file future.

The documentation for this struct was generated from the following file:

- [future](#)

#### 4.28 \_\_gnu\_parallel::\_\_generate\_selector<\_It> Struct Template Reference

Inheritance diagram for `__gnu_parallel::__generate_selector<_It>`:

#### Public Member Functions

- `template<typename _Op >`  
`bool operator() (_Op &__o, _It __i)`

## Public Attributes

- [\\_It \\_M\\_finish\\_iterator](#)

## 4.28.1 Detailed Description

```
template<typename _It>
struct __gnu_parallel::__generate_selector<_It>
```

std::generate() selector.

Definition at line 68 of file `for_each_selectors.h`.

## 4.28.2 Member Function Documentation

## 4.28.2.1 operator&gt;()

```
template<typename _It>
template<typename _Op>
bool __gnu_parallel::__generate_selector<_It>::operator() (
 _Op & __o,
 _It __i) [inline]
```

Functor execution.

## Parameters

|                           |                              |
|---------------------------|------------------------------|
| <a href="#">_↔<br/>_o</a> | Operator.                    |
| <a href="#">_↔<br/>_i</a> | iterator referencing object. |

Definition at line 75 of file `for_each_selectors.h`.

## 4.28.3 Member Data Documentation

## 4.28.3.1 \_M\_finish\_iterator

```
template<typename _It>
_It __gnu_parallel::__generic_for_each_selector<_It>::_M_finish_iterator [inherited]
```

`_Iterator` on last element processed; needed for some algorithms (e. g. `std::transform()`).

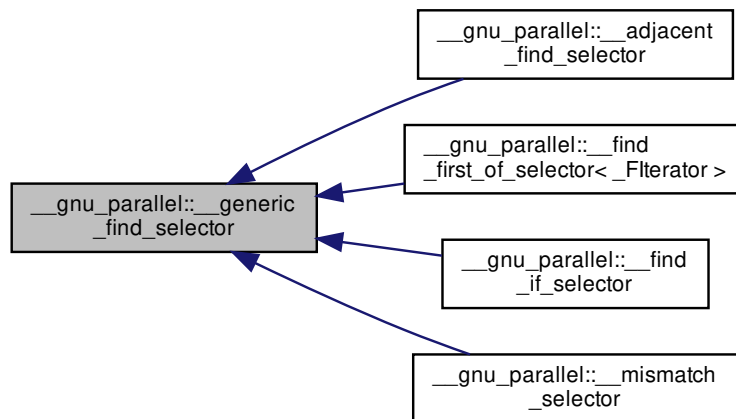

Definition at line 47 of file `for_each_selectors.h`.

The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

## 4.29 `__gnu_parallel::__generic_find_selector` Struct Reference

Inheritance diagram for `__gnu_parallel::__generic_find_selector`:

### 4.29.1 Detailed Description

Base class of all `__gnu_parallel::__find_template` selectors.

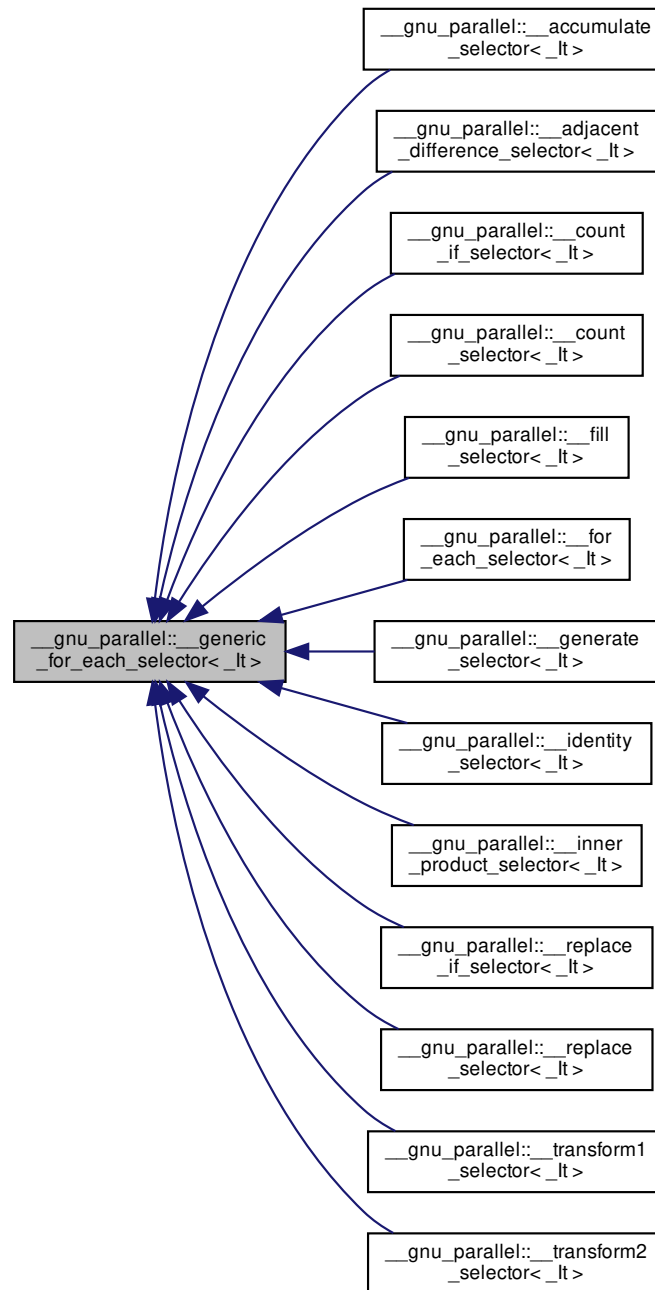

Definition at line 43 of file `find_selectors.h`.

The documentation for this struct was generated from the following file:

- [find\\_selectors.h](#)

## 4.30 \_\_gnu\_parallel::\_\_generic\_for\_each\_selector&lt;\_It&gt; Struct Template Reference

Inheritance diagram for \_\_gnu\_parallel::\_\_generic\_for\_each\_selector<\_It>:

## Public Attributes

- [\\_It \\_M\\_finish\\_iterator](#)

## 4.30.1 Detailed Description

```
template<typename _It>
struct __gnu_parallel::__generic_for_each_selector< _It >
```

Generic \_\_selector for embarrassingly parallel functions.

Definition at line 42 of file `for_each_selectors.h`.

## 4.30.2 Member Data Documentation

## 4.30.2.1 \_M\_finish\_iterator

```
template<typename _It >
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator
```

\_Iterator on last element processed; needed for some algorithms (e. g. `std::transform()`).

Definition at line 47 of file `for_each_selectors.h`.

The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

## 4.31 \_\_gnu\_parallel::\_\_identity\_selector&lt; \_It &gt; Struct Template Reference

Inheritance diagram for `__gnu_parallel::__identity_selector< _It >`:

### Public Member Functions

- `template<typename _Op>  
_It operator() (_Op __o, _It __i)`

### Public Attributes

- `_It _M_finish_iterator`

#### 4.31.1 Detailed Description

```
template<typename _It>
struct __gnu_parallel::__identity_selector<_It>
```

Selector that just returns the passed iterator.

Definition at line 253 of file `for_each_selectors.h`.

#### 4.31.2 Member Function Documentation

##### 4.31.2.1 `operator()()`

```
template<typename _It>
template<typename _Op>
_It __gnu_parallel::__identity_selector<_It>::operator() (
 _Op __o,
 _It __i) [inline]
```

Functor execution.

#### Parameters

|                       |                              |
|-----------------------|------------------------------|
| <code>↵<br/>_o</code> | Operator (unused).           |
| <code>↵<br/>_i</code> | iterator referencing object. |

#### Returns

Passed iterator.

Definition at line 261 of file `for_each_selectors.h`.

### 4.31.3 Member Data Documentation

#### 4.31.3.1 \_M\_finish\_iterator

```
template<typename _It >
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator [inherited]
```

\_Iterator on last element processed; needed for some algorithms (e. g. `std::transform()`).

Definition at line 47 of file `for_each_selectors.h`.

The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

### 4.32 \_\_gnu\_parallel::\_\_inner\_product\_selector< \_It, \_It2, \_Tp > Struct Template Reference

Inheritance diagram for `__gnu_parallel::__inner_product_selector< _It, _It2, _Tp >`:

#### Public Member Functions

- [\\_\\_inner\\_product\\_selector](#) (`_It __b1, _It2 __b2`)
- `template<typename _Op >`  
`_Tp operator()` (`_Op __mult, _It __current`)

#### Public Attributes

- `_It` [\\_\\_begin1\\_iterator](#)
- `_It2` [\\_\\_begin2\\_iterator](#)
- `_It` [\\_M\\_finish\\_iterator](#)

## 4.32.1 Detailed Description

```
template<typename _It, typename _It2, typename _Tp>
struct __gnu_parallel::__inner_product_selector<_It, _It2, _Tp>
```

`std::inner_product()` selector.

Definition at line 222 of file `for_each_selectors.h`.

## 4.32.2 Constructor &amp; Destructor Documentation

4.32.2.1 `__inner_product_selector()`

```
template<typename _It , typename _It2 , typename _Tp >
__gnu_parallel::__inner_product_selector<_It, _It2, _Tp>::__inner_product_selector (
 _It __b1,
 _It2 __b2) [inline], [explicit]
```

Constructor.

## Parameters

|                   |                                    |
|-------------------|------------------------------------|
| <code>__b1</code> | Begin iterator of first sequence.  |
| <code>__b2</code> | Begin iterator of second sequence. |

Definition at line 234 of file `for_each_selectors.h`.

## 4.32.3 Member Function Documentation

4.32.3.1 `operator>()()`

```
template<typename _It , typename _It2 , typename _Tp >
template<typename _Op >
_Tp __gnu_parallel::__inner_product_selector<_It, _It2, _Tp>::operator() (
 _Op __mult,
 _It __current) [inline]
```

Functor execution.

## Parameters

|                        |                              |
|------------------------|------------------------------|
| <code>__mult</code>    | Multiplication functor.      |
| <code>__current</code> | iterator referencing object. |

## Returns

Inner product elemental `__result`.

Definition at line 243 of file `for_each_selectors.h`.

References `__gnu_parallel::__inner_product_selector<_It, _It2, _Tp>::__begin1_iterator`, and `__gnu_parallel::__inner_product_selector<_It, _It2, _Tp>::__begin2_iterator`.

## 4.32.4 Member Data Documentation

### 4.32.4.1 `__begin1_iterator`

```
template<typename _It , typename _It2 , typename _Tp >
_It __gnu_parallel::__inner_product_selector< _It, _It2, _Tp >::__begin1_iterator
```

Begin iterator of first sequence.

Definition at line 225 of file `for_each_selectors.h`.

Referenced by `__gnu_parallel::__inner_product_selector<_It, _It2, _Tp>::operator()()`.

### 4.32.4.2 `__begin2_iterator`

```
template<typename _It , typename _It2 , typename _Tp >
_It2 __gnu_parallel::__inner_product_selector< _It, _It2, _Tp >::__begin2_iterator
```

Begin iterator of second sequence.

Definition at line 228 of file `for_each_selectors.h`.

Referenced by `__gnu_parallel::__inner_product_selector<_It, _It2, _Tp>::operator()()`.

### 4.32.4.3 `_M_finish_iterator`

```
template<typename _It >
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator [inherited]
```

`_Iterator` on last element processed; needed for some algorithms (e. g. `std::transform()`).

Definition at line 47 of file `for_each_selectors.h`.

The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

### 4.33 `std::__is_location_invariant< _Tp >` Struct Template Reference

Inherits type `< _Tp >`.

#### 4.33.1 Detailed Description

```
template<typename _Tp>
struct std::__is_location_invariant< _Tp >
```

Trait identifying "location-invariant" types, meaning that the address of the object (or any of its members) will not escape. Trivially copyable types are location-invariant and users can specialize this trait for other types.

Definition at line 71 of file `std_function.h`.

The documentation for this struct was generated from the following file:

- [std\\_function.h](#)

### 4.34 `std::__is_nullptr_t< _Tp >` Struct Template Reference

Inheritance diagram for `std::__is_nullptr_t< _Tp >`:

#### 4.34.1 Detailed Description

```
template<typename _Tp>
struct std::__is_nullptr_t< _Tp >
```

`__is_nullptr_t` (deprecated extension).

Definition at line 519 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

### 4.35 `std::__is_tuple_like_impl< std::pair< _T1, _T2 > >` Struct Template Reference

Inheritance diagram for `std::__is_tuple_like_impl< std::pair< _T1, _T2 > >`:

#### Public Types

- typedef [integral\\_constant< \\_Tp, \\_\\_v >](#) **type**
- typedef `_Tp` **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept
- constexpr value\_type **operator()** () const noexcept

#### Static Public Attributes

- static constexpr `_Tp` **value**

#### 4.35.1 Detailed Description

```
template<typename _T1, typename _T2>
struct std::__is_tuple_like_impl< std::pair< _T1, _T2 > >
```

Partial specialization for `std::pair`.

Definition at line 152 of file `utility`.

The documentation for this struct was generated from the following file:

- [utility](#)

## 4.36 `__gnu_parallel::__max_element_reduct<_Compare, _It>` Struct Template Reference

### Public Member Functions

- `__max_element_reduct` (`_Compare &__c`)
- `_It operator()` (`_It __x, _It __y`)

### Public Attributes

- `_Compare & __comp`

#### 4.36.1 Detailed Description

```
template<typename _Compare, typename _It>
struct __gnu_parallel::__max_element_reduct<_Compare, _It>
```

Reduction for finding the maximum element, using a comparator.

Definition at line 321 of file `for_each_selectors.h`.

The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

## 4.37 `__gnu_parallel::__min_element_reduct<_Compare, _It>` Struct Template Reference

### Public Member Functions

- `__min_element_reduct` (`_Compare &__c`)
- `_It operator()` (`_It __x, _It __y`)

### Public Attributes

- `_Compare & __comp`

#### 4.37.1 Detailed Description

```
template<typename _Compare, typename _It>
struct __gnu_parallel::__min_element_reduct<_Compare, _It>
```

Reduction for finding the maximum element, using a comparator.

Definition at line 307 of file `for_each_selectors.h`.

The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

### 4.38 `__gnu_cxx::__detail::__mini_vector<_Tp>` Class Template Reference

#### Public Types

- typedef const `_Tp` & **const\_reference**
- typedef `std::ptrdiff_t` **difference\_type**
- typedef pointer **iterator**
- typedef `_Tp *` **pointer**
- typedef `_Tp &` **reference**
- typedef `std::size_t` **size\_type**
- typedef `_Tp` **value\_type**

#### Public Member Functions

- reference **back** () const throw ()
- iterator **begin** () const throw ()
- void **clear** () throw ()
- iterator **end** () const throw ()
- void **erase** (iterator `__pos`) throw ()
- void **insert** (iterator `__pos`, const\_reference `__x`)
- reference **operator[]** (const size\_type `__pos`) const throw ()
- void **pop\_back** () throw ()
- void **push\_back** (const\_reference `__x`)
- size\_type **size** () const throw ()

#### 4.38.1 Detailed Description

```
template<typename _Tp>
class __gnu_cxx::__detail::__mini_vector<_Tp>
```

`__mini_vector<>` is a stripped down version of the full-fledged `std::vector<>`.

It is to be used only for built-in types or PODs. Notable differences are:

1. Not all accessor functions are present.
2. Used ONLY for PODs.
3. No Allocator template argument. Uses `operator new()` to get memory, and `operator delete()` to free it. Caveat: The dtor does NOT free the memory allocated, so this a memory-leaking vector!

Definition at line 67 of file `bitmap_allocator.h`.

The documentation for this class was generated from the following file:

- [bitmap\\_allocator.h](#)

## 4.39 \_\_gnu\_parallel::\_\_mismatch\_selector Struct Reference

Inheritance diagram for \_\_gnu\_parallel::\_\_mismatch\_selector:

## Public Member Functions

- `template<typename _RAIter1, typename _RAIter2, typename _Pred >`  
`std::pair<_RAIter1, _RAIter2 > \_M\_sequential\_algorithm (_RAIter1 __begin1, _RAIter1 __end1, _RAIter2 __begin2, _Pred __pred)`
- `template<typename _RAIter1, typename _RAIter2, typename _Pred >`  
`bool operator\(\) (_RAIter1 __i1, _RAIter2 __i2, _Pred __pred)`

## 4.39.1 Detailed Description

Test inverted predicate on a single element.

Definition at line 119 of file `find_selectors.h`.

## 4.39.2 Member Function Documentation

4.39.2.1 `_M_sequential_algorithm()`

```

template<typename _RAIter1, typename _RAIter2, typename _Pred >
std::pair<_RAIter1, _RAIter2> __gnu_parallel::__mismatch_selector::_M_sequential_algorithm (
 _RAIter1 __begin1,
 _RAIter1 __end1,
 _RAIter2 __begin2,
 _Pred __pred) [inline]

```

Corresponding sequential algorithm on a sequence.

**Parameters**

|                       |                                    |
|-----------------------|------------------------------------|
| <code>__begin1</code> | Begin iterator of first sequence.  |
| <code>__end1</code>   | End iterator of first sequence.    |
| <code>__begin2</code> | Begin iterator of second sequence. |
| <code>__pred</code>   | Find predicate.                    |

Definition at line 143 of file `find_selectors.h`.

**4.39.2.2 operator()()**

```
template<typename _RAIter1 , typename _RAIter2 , typename _Pred >
bool __gnu_parallel::__mismatch_selector::operator() (
 _RAIter1 __i1,
 _RAIter2 __i2,
 _Pred __pred) [inline]
```

Test on one position.

**Parameters**

|                     |                                        |
|---------------------|----------------------------------------|
| <code>__i1</code>   | _Iterator on first sequence.           |
| <code>__i2</code>   | _Iterator on second sequence (unused). |
| <code>__pred</code> | Find predicate.                        |

4.40 `__gnu_cxx::__mt_alloc<_Tp, _Poolp>` Class Template Reference

Inheritance diagram for `__gnu_cxx::__mt_alloc<_Tp, _Poolp>`:

## Public Types

- `typedef _Poolp __policy_type`
- `typedef _Poolp::pool_type __pool_type`
- `typedef const _Tp * const_pointer`
- `typedef const _Tp & const_reference`
- `typedef std::ptrdiff_t difference_type`
- `typedef _Tp * pointer`
- `typedef std::true\_type propagate_on_container_move_assignment`
- `typedef _Tp & reference`
- `typedef std::size_t size_type`
- `typedef _Tp value_type`

## Public Member Functions

- `__mt_alloc (const \_\_mt\_alloc &) noexcept`
- `template<typename _Tp1, typename _Poolp1 >  
__mt_alloc (const \_\_mt\_alloc<_Tp1, _Poolp1> &) noexcept`
- `const __pool_base::_Tune M_get_options ()`
- `void M_set_options (__pool_base::_Tune __t)`
- `pointer address (reference __x) const noexcept`
- `const_pointer address (const_reference __x) const noexcept`
- `pointer allocate (size_type __n, const void * = 0)`
- `template<typename _Up, typename... _Args>  
void construct (_Up * __p, _Args &&... __args)`
- `void deallocate (pointer __p, size_type __n)`
- `template<typename _Up >  
void destroy (_Up * __p)`
- `size_type max_size () const noexcept`

#### 4.40.1 Detailed Description

```
template<typename _Tp, typename _Poolp = __common_pool_policy<__pool, true >>
class __gnu_cxx::__mt_alloc< _Tp, _Poolp >
```

This is a fixed size (power of 2) allocator which - when compiled with thread support - will maintain one freelist per size per thread plus a *global* one. Steps are taken to limit the per thread freelist sizes (by returning excess back to the *global* list).

Further details: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/mt\\_allocator.html](https://gcc.gnu.org/onlinedocs/libstdc++/manual/mt_allocator.html).

## 4.48.1 Detailed Description

Part of `std::numeric_limits`.

The `static const` members are usable as integral constant expressions.

## Note

This is a separate class for purposes of efficiency; you should only access these members as part of an instantiation of the `std::numeric_limits` class.

Definition at line 202 of file `limits`.

## 4.48.2 Member Data Documentation

#### 4.48.2.1 digits

```
constexpr int std::__numeric_limits_base::digits [static]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

Definition at line 211 of file `limits`.

#### 4.48.2.2 digits10

```
constexpr int std::__numeric_limits_base::digits10 [static]
```

The number of base 10 digits that can be represented without change.

Definition at line 214 of file `limits`.

#### 4.48.2.3 has\_denorm

```
constexpr float_denorm_style std::__numeric_limits_base::has_denorm [static]
```

See `std::float_denorm_style` for more information.

Definition at line 266 of file `limits`.

#### 4.48.2.4 has\_denorm\_loss

```
constexpr bool std::__numeric_limits_base::has_denorm_loss [static]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

Definition at line 270 of file `limits`.

#### 4.48.2.5 has\_infinity

```
constexpr bool std::__numeric_limits_base::has_infinity [static]
```

True if the type has a representation for positive infinity.

Definition at line 255 of file `limits`.

#### 4.48.2.6 `has_quiet_NaN`

```
constexpr bool std::__numeric_limits_base::has_quiet_NaN [static]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

Definition at line 259 of file `limits`.

#### 4.48.2.7 `has_signaling_NaN`

```
constexpr bool std::__numeric_limits_base::has_signaling_NaN [static]
```

True if the type has a representation for a signaling Not a Number.

Definition at line 263 of file `limits`.

#### 4.48.2.8 `is_bounded`

```
constexpr bool std::__numeric_limits_base::is_bounded [static]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

Definition at line 279 of file `limits`.

#### 4.48.2.9 `is_exact`

```
constexpr bool std::__numeric_limits_base::is_exact [static]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

Definition at line 231 of file `limits`.

#### 4.48.2.10 `is_iec559`

```
constexpr bool std::__numeric_limits_base::is_iec559 [static]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

Definition at line 274 of file `limits`.

#### 4.48.2.11 `is_integer`

```
constexpr bool std::__numeric_limits_base::is_integer [static]
```

True if the type is integer.

Definition at line 226 of file limits.

#### 4.48.2.12 `is_modulo`

```
constexpr bool std::__numeric_limits_base::is_modulo [static]
```

True if the type is *modulo*. A type is modulo if, for any operation involving `+`, `-`, or `*` on values of that type whose result would fall outside the range `[min(),max()]`, the value returned differs from the true value by an integer multiple of `max() - min() + 1`. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

Definition at line 288 of file limits.

#### 4.48.2.13 `is_signed`

```
constexpr bool std::__numeric_limits_base::is_signed [static]
```

True if the type is signed.

Definition at line 223 of file limits.

#### 4.48.2.14 `is_specialized`

```
constexpr bool std::__numeric_limits_base::is_specialized [static]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

Definition at line 206 of file limits.

#### 4.48.2.15 `max_digits10`

```
constexpr int std::__numeric_limits_base::max_digits10 [static]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

Definition at line 219 of file limits.

#### 4.48.2.16 `max_exponent`

```
constexpr int std::numeric_limits_base::max_exponent [static]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

Definition at line 248 of file `limits`.

#### 4.48.2.17 `max_exponent10`

```
constexpr int std::numeric_limits_base::max_exponent10 [static]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

Definition at line 252 of file `limits`.

#### 4.48.2.18 `min_exponent`

```
constexpr int std::numeric_limits_base::min_exponent [static]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

Definition at line 239 of file `limits`.

#### 4.48.2.19 `min_exponent10`

```
constexpr int std::numeric_limits_base::min_exponent10 [static]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

Definition at line 243 of file `limits`.

#### 4.48.2.20 `radix`

```
constexpr int std::numeric_limits_base::radix [static]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

Definition at line 235 of file `limits`.

#### 4.48.2.21 round\_style

```
constexpr float_round_style std::__numeric_limits_base::round_style [static]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

Definition at line 299 of file `limits`.

#### 4.48.2.22 tinyness\_before

```
constexpr bool std::__numeric_limits_base::tinyness_before [static]
```

True if tininess is detected before rounding. (see IEC 559)

Definition at line 294 of file `limits`.

#### 4.48.2.23 traps

```
constexpr bool std::__numeric_limits_base::traps [static]
```

True if trapping is implemented for this type.

Definition at line 291 of file `limits`.

The documentation for this struct was generated from the following file:

- [limits](#)

### 4.49 \_\_gnu\_cxx::\_\_per\_type\_pool\_policy<\_Tp, \_PoolTp, \_Thread> Struct Template Reference

Inherits `__gnu_cxx::__per_type_pool_base<_Tp, _PoolTp, _Thread>`.

#### 4.49.1 Detailed Description

```
template<typename _Tp, template< bool > class _PoolTp, bool _Thread>
struct __gnu_cxx::__per_type_pool_policy<_Tp, _PoolTp, _Thread>
```

Policy for individual `__pool` objects.

Definition at line 555 of file `mt_allocator.h`.

The documentation for this struct was generated from the following file:

- [mt\\_allocator.h](#)

## 4.50 \_\_gnu\_cxx::\_\_pool&lt;\_Thread&gt; Class Template Reference

## 4.50.1 Detailed Description

```
template<bool _Thread>
class __gnu_cxx::__pool<_Thread>
```

Data describing the underlying memory pool, parameterized on threading support.

Definition at line 191 of file `mt_allocator.h`.

The documentation for this class was generated from the following file:

- [mt\\_allocator.h](#)

## 4.51 \_\_gnu\_cxx::\_\_pool&lt;false&gt; Class Template Reference

Inheritance diagram for `__gnu_cxx::__pool<false>`:

## Public Types

- typedef unsigned short int **\_Binmap\_type**

#### 4.54.1 Detailed Description

Base class for `__pool_alloc`.

Uses various allocators to fulfill underlying requests (and makes as few requests as possible when in default high-speed pool mode).

Important implementation properties: 0. If globally mandated, then allocate objects from new

1. If the clients request an object of size  $> \_S\_max\_bytes$ , the resulting object will be obtained directly from new
2. In all other cases, we allocate an object of size exactly `\_S_round_up(requested_size)`. Thus the client has enough size information that we can return the object to the proper free list without permanently losing part of the object.

Definition at line 75 of file `pool_allocator.h`.

The documentation for this class was generated from the following file:

- [pool\\_allocator.h](#)

#### 4.55 `__gnu_cxx::__pool_base` Struct Reference

Inheritance diagram for `__gnu_cxx::__pool_base`:

## 4.56.1 Detailed Description

```
template<typename _CharT, typename _Traits, typename _Alloc>
class __gnu_cxx::__rc_string_base<_CharT, _Traits, _Alloc>
```

Documentation? What's that? Nathan Myers [ncm@cantrip.org](mailto:ncm@cantrip.org).

A string looks like this:

```

 [_Rep]
 _M_length
[__rc_string_base<char_type>] _M_capacity
_M_dataplus _M_refcount
_M_p -----> unnamed array of char_type
```

Where the `_M_p` points to the first character in the string, and you cast it to a pointer-to-`_Rep` and subtract 1 to get a pointer to the header.

This approach has the enormous advantage that a string object requires only one allocation. All the ugliness is confined within a single pair of inline functions, which each compile to a single *add* instruction: `_Rep::_M_refdata()`, and `__rc_string_base::_M_rep()`; and the allocation function which gets a block of raw bytes and with room enough and constructs a `_Rep` object at the front.

The reason you want `_M_data` pointing to the character array and not the `_Rep` is so that the debugger can see the string contents. (Probably we should add a non-inline member to get the `_Rep` for the debugger to use, so users can check the actual string length.)

Note that the `_Rep` object is a POD so that you can have a static *empty string* `_Rep` object already *constructed* before static constructors have run. The reference-count encoding is chosen so that a 0 indicates one reference, so you never try to destroy the empty-string `_Rep` object.

All but the last paragraph is considered pretty conventional for a C++ string implementation.

## Public Attributes

- const `_Tp` & [\\_\\_new\\_val](#)
- `_It` [\\_M\\_finish\\_iterator](#)

#### 4.60.1 Detailed Description

```
template<typename _It, typename _Op, typename _Tp>
struct __gnu_parallel::__replace_if_selector< _It, _Op, _Tp >
```

std::replace() selector.

Definition at line 156 of file for\_each\_selectors.h.

#### 4.60.2 Constructor & Destructor Documentation

##### 4.60.2.1 \_\_replace\_if\_selector()

```
template<typename _It, typename _Op, typename _Tp>
__gnu_parallel::__replace_if_selector< _It, _Op, _Tp >::__replace_if_selector (
 const _Tp & __new_val) [inline], [explicit]
```

Constructor.

##### Parameters

|                        |                        |
|------------------------|------------------------|
| <code>__new_val</code> | Value to replace with. |
|------------------------|------------------------|

Definition at line 164 of file for\_each\_selectors.h.

#### 4.60.3 Member Function Documentation

##### 4.60.3.1 operator>()()

```
template<typename _It, typename _Op, typename _Tp>
bool __gnu_parallel::__replace_if_selector< _It, _Op, _Tp >::operator() (
 _Op & __o,
 _It __i) [inline]
```

Functor execution.

##### Parameters

|                  |                              |
|------------------|------------------------------|
| <code>__o</code> | Operator.                    |
| <code>__i</code> | iterator referencing object. |

Definition at line 170 of file `for_each_selectors.h`.

References `__gnu_parallel::__replace_if_selector<_It, _Op, _Tp>::__new_val`.

#### 4.60.4 Member Data Documentation

##### 4.60.4.1 `__new_val`

```
template<typename _It, typename _Op, typename _Tp>
const _Tp& __gnu_parallel::__replace_if_selector<_It, _Op, _Tp>::__new_val
```

Value to replace with.

Definition at line 159 of file `for_each_selectors.h`.

Referenced by `__gnu_parallel::__replace_if_selector<_It, _Op, _Tp>::operator()`.

##### 4.60.4.2 `_M_finish_iterator`

```
template<typename _It >
_It __gnu_parallel::__generic_for_each_selector<_It>::_M_finish_iterator [inherited]
```

`_Iterator` on last element processed; needed for some algorithms (e. g. `std::transform()`).

Definition at line 47 of file `for_each_selectors.h`.

The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

#### 4.61 `__gnu_parallel::__replace_selector<_It, _Tp>` Struct Template Reference

Inheritance diagram for `__gnu_parallel::__replace_selector<_It, _Tp>`:

### Public Member Functions

### 4.62.1 Detailed Description

Scoped lock idiom.

Definition at line 228 of file `concurrency.h`.

The documentation for this class was generated from the following file:

- [concurrency.h](#)

## 4.63 \_\_gnu\_parallel::\_\_transform1\_selector<\_It> Struct Template Reference

Inheritance diagram for `__gnu_parallel::__transform1_selector<_It>`:

### Public Member Functions

- template<typename \_Op >  
bool [operator\(\)](#) (\_Op &\_\_o, \_It \_\_i)

## Public Attributes

- [\\_It \\_M\\_finish\\_iterator](#)

## 4.63.1 Detailed Description

```
template<typename _It>
struct __gnu_parallel::__transform1_selector<_It>
```

std::transform() \_\_selector, one input sequence variant.

Definition at line 100 of file for\_each\_selectors.h.

## 4.63.2 Member Function Documentation

## 4.63.2.1 operator&gt;()

```
template<typename _It>
template<typename _Op>
bool __gnu_parallel::__transform1_selector<_It>::operator() (
 _Op & __o,
 _It __i) [inline]
```

Functor execution.

## Parameters

|                                                                                                       |                              |
|-------------------------------------------------------------------------------------------------------|------------------------------|
| <a href="#">_o</a> | Operator.                    |
| <a href="#">_i</a> | iterator referencing object. |

Definition at line 107 of file for\_each\_selectors.h.

## 4.63.3 Member Data Documentation

## 4.63.3.1 \_M\_finish\_iterator

```
template<typename _It>
_It __gnu_parallel::__generic_for_each_selector<_It>::_M_finish_iterator [inherited]
```

\_\_iterator on last element processed; needed for some algorithms (e. g. std::transform()).

Definition at line 47 of file for\_each\_selectors.h.

The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

#### 4.64 \_\_gnu\_parallel::\_\_transform2\_selector<\_It> Struct Template Reference

Inheritance diagram for \_\_gnu\_parallel::\_\_transform2\_selector<\_It>:

##### Public Member Functions

- `template<typename _Op >`  
`bool operator\(\) (_Op &__o, _It __i)`

##### Public Attributes

- `_It \_M\_finish\_iterator`

##### 4.64.1 Detailed Description

```
template<typename _It>
struct __gnu_parallel::__transform2_selector<_It>
```

std::transform() \_\_selector, two input sequences variant.

Definition at line 116 of file for\_each\_selectors.h.

## 4.64.2 Member Function Documentation

4.64.2.1 `operator()`

```
template<typename _It>
template<typename _Op >
bool __gnu_parallel::__transform2_selector< _It >::operator() (
 _Op & __o,
 _It __i) [inline]
```

Functor execution.

## Parameters

|                  |                              |
|------------------|------------------------------|
| <code>__o</code> | Operator.                    |
| <code>__i</code> | iterator referencing object. |

Definition at line 123 of file `_each_selectors.h`.

## 4.64.3 Member Data Documentation

4.64.3.1 `_M_finish_iterator`

```
template<typename _It >
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator [inherited]
```

`_M_finish_iterator` on last element processed; needed for some algorithms (e. g. `std::transform()`).

Definition at line 47 of file `_each_selectors.h`.

The documentation for this struct was generated from the following file:

- [\\_each\\_selectors.h](#)

#### 4.65 `__gnu_parallel::__unary_negate<_Predicate, argument_type>` Class Template Reference

Inheritance diagram for `__gnu_parallel::__unary_negate<_Predicate, argument_type>`:

##### Public Types

- typedef [argument\\_type](#) `argument_type`
- typedef bool [result\\_type](#)

##### Public Member Functions

- **`__unary_negate`** (const `_Predicate` &`__x`)
- bool **`operator()`** (const [argument\\_type](#) &`__x`)

##### Protected Attributes

- `_Predicate _M_pred`

##### 4.65.1 Detailed Description

```
template<typename _Predicate, typename argument_type>
class __gnu_parallel::__unary_negate<_Predicate, argument_type>
```

Similar to `std::unary_negate`, but giving the argument types explicitly.

Definition at line 173 of file `base.h`.

##### 4.65.2 Member Typedef Documentation

4.65.2.1 `argument_type`

```
typedef argument_type std::unary_function< argument_type , bool >::argument_type [inherited]
```

`argument_type` is the type of the argument

Definition at line 108 of file `stl_function.h`.

4.65.2.2 `result_type`

```
typedef bool std::unary_function< argument_type , bool >::result_type [inherited]
```

`result_type` is the return type

Definition at line 111 of file `stl_function.h`.

The documentation for this class was generated from the following file:

## 4.66.1 Detailed Description

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename > class _Base>
class __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >
```

Template class `__versa_string`.

Data structure managing sequences of characters and character-like objects.

Definition at line 56 of file `vstring.h`.

## 4.66.2 Constructor &amp; Destructor Documentation

4.66.2.1 `__versa_string()` [1/10]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::__versa_string (
 const _Alloc & __a = _Alloc()) [inline], [explicit], [noexcept]
```

Construct an empty string using allocator `a`.

Definition at line 138 of file `vstring.h`.

Referenced by `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base>::substr()`.

4.66.2.2 `__versa_string()` [2/10]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::__versa_string (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str) [inline]
```

Construct string with copy of value of `__str`.

## Parameters

|                    |                |
|--------------------|----------------|
| <code>__str</code> | Source string. |
|--------------------|----------------|

Definition at line 146 of file `vstring.h`.

#### 4.66.2.3 `__versa_string()` [3/10]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::__versa_string (
 __versa_string< _CharT, _Traits, _Alloc, _Base > && __str) [inline], [noexcept]
```

String move constructor.

##### Parameters

|                    |                |
|--------------------|----------------|
| <code>__str</code> | Source string. |
|--------------------|----------------|

The newly-constructed string contains the exact contents of `__str`. The contents of `__str` are a valid, but unspecified string.

Definition at line 158 of file `vstring.h`.

#### 4.66.2.4 `__versa_string()` [4/10]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::__versa_string (
 std::initializer_list< _CharT > __l,
 const _Alloc & __a = _Alloc()) [inline]
```

Construct string from an initializer list.

##### Parameters

|                  |                                                   |
|------------------|---------------------------------------------------|
| <code>__l</code> | <code>std::initializer_list</code> of characters. |
| <code>__a</code> | Allocator to use (default is default allocator).  |

Definition at line 166 of file `vstring.h`.

#### 4.66.2.5 `__versa_string()` [5/10]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::__versa_string (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
 size_type __pos,
 size_type __n = npos) [inline]
```

Construct string as copy of a substring.

## Parameters

|                    |                                                   |
|--------------------|---------------------------------------------------|
| <code>__str</code> | Source string.                                    |
| <code>__pos</code> | Index of first character to copy from.            |
| <code>__n</code>   | Number of characters to copy (default remainder). |

Definition at line 177 of file `vstring.h`.

4.66.2.6 `__versa_string()` [6/10]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::__versa_string (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
 size_type __pos,
 size_type __n,
 const _Alloc & __a) [inline]
```

Construct string as copy of a substring.

## Parameters

|                    |                                        |
|--------------------|----------------------------------------|
| <code>__str</code> | Source string.                         |
| <code>__pos</code> | Index of first character to copy from. |
| <code>__n</code>   | Number of characters to copy.          |
| <code>__a</code>   | Allocator to use.                      |

Definition at line 192 of file `vstring.h`.

4.66.2.7 `__versa_string()` [7/10]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::__versa_string (
 const _CharT * __s,
 size_type __n,
 const _Alloc & __a = _Alloc()) [inline]
```

Construct string initialized by a character array.

## Parameters

|                  |                                                  |
|------------------|--------------------------------------------------|
| <code>__s</code> | Source character array.                          |
| <code>__n</code> | Number of characters to copy.                    |
| <code>__a</code> | Allocator to use (default is default allocator). |

NB: `__s` must have at least `__n` characters, `'0'` has no special meaning.

Definition at line 209 of file `vstring.h`.

#### 4.66.2.8 `__versa_string()` [8/10]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::__versa_string (
 const _CharT * __s,
 const _Alloc & __a = _Alloc()) [inline]
```

Construct string as copy of a C string.

##### Parameters

|                  |                                                  |
|------------------|--------------------------------------------------|
| <code>__s</code> | Source C string.                                 |
| <code>__a</code> | Allocator to use (default is default allocator). |

Definition at line 218 of file `vstring.h`.

#### 4.66.2.9 `__versa_string()` [9/10]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::__versa_string (
 size_type __n,
 _CharT __c,
 const _Alloc & __a = _Alloc()) [inline]
```

Construct string as multiple characters.

##### Parameters

|                  |                                                  |
|------------------|--------------------------------------------------|
| <code>__n</code> | Number of characters.                            |
| <code>__c</code> | Character to use.                                |
| <code>__a</code> | Allocator to use (default is default allocator). |

Definition at line 228 of file `vstring.h`.

4.66.2.10 `__versa_string()` [10/10]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
template<class _InputIterator, typename = std::RequireInputIter<_InputIterator>>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::__versa_string (
 _InputIterator __beg,
 _InputIterator __end,
 const _Alloc & __a = _Alloc()) [inline]
```

Construct string as copy of a range.

## Parameters

|                    |                                                  |
|--------------------|--------------------------------------------------|
| <code>__beg</code> | Start of range.                                  |
| <code>__end</code> | End of range.                                    |
| <code>__a</code>   | Allocator to use (default is default allocator). |

Definition at line 243 of file `vstring.h`.

4.66.2.11 `~__versa_string()`

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::~~__versa_string () [inline], [noexcept]
```

Destroy the string instance.

Definition at line 250 of file `vstring.h`.

## 4.66.3 Member Function Documentation

4.66.3.1 `append()` [1/7]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string& __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::append (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str) [inline]
```

Append a string to this string.

## Parameters

|                    |                       |
|--------------------|-----------------------|
| <code>__str</code> | The string to append. |
|--------------------|-----------------------|

**Returns**

Reference to this string.

Definition at line 693 of file vstring.h.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::size()`.

Referenced by `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::append()`, `__gnu_cxx::operator+()`, and `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::operator+=()`.

**4.66.3.2 append()** [2/7]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string& __gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::append (
 const __versa_string<_CharT, _Traits, _Alloc, _Base > & __str,
 size_type __pos,
 size_type __n) [inline]
```

Append a substring.

**Parameters**

|                    |                                                             |
|--------------------|-------------------------------------------------------------|
| <code>__str</code> | The string to append.                                       |
| <code>__pos</code> | Index of the first character of <code>str</code> to append. |
| <code>__n</code>   | The number of characters to append.                         |

**Returns**

Reference to this string.

**Exceptions**

|                                |                                           |
|--------------------------------|-------------------------------------------|
| <code>std::out_of_range</code> | if <code>pos</code> is not a valid index. |
|--------------------------------|-------------------------------------------|

This function appends `__n` characters from `__str` starting at `__pos` to this string. If `__n` is larger than the number of available characters in `__str`, the remainder of `__str` is appended.

Definition at line 710 of file vstring.h.

**4.66.3.3 append()** [3/7]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
```

```
__versa_string& __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::append (
 const _CharT * __s,
 size_type __n) [inline]
```

Append a C substring.

#### Parameters

|                  |                                     |
|------------------|-------------------------------------|
| <code>__s</code> | The C string to append.             |
| <code>__n</code> | The number of characters to append. |

#### Returns

Reference to this string.

Definition at line 722 of file `vstring.h`.

#### 4.66.3.4 `append()` [4/7]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string& __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::append (
 const _CharT * __s) [inline]
```

Append a C string.

#### Parameters

|                  |                         |
|------------------|-------------------------|
| <code>__s</code> | The C string to append. |
|------------------|-------------------------|

#### Returns

Reference to this string.

Definition at line 735 of file `vstring.h`.

#### 4.66.3.5 `append()` [5/7]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string& __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::append (
 size_type __n,
 _CharT __c) [inline]
```

Append multiple characters.

**Parameters**

|                        |                                     |
|------------------------|-------------------------------------|
| <code>_↵<br/>_n</code> | The number of characters to append. |
| <code>_↵<br/>_c</code> | The character to use.               |

**Returns**

Reference to this string.

Appends `n` copies of `c` to this string.

Definition at line 752 of file `vstring.h`.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::size()`.

**4.66.3.6 append()** [6/7]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string& __gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::append (
 std::initializer_list<_CharT > __l) [inline]
```

Append an `initializer_list` of characters.

**Parameters**

|                                          |                                                            |
|------------------------------------------|------------------------------------------------------------|
| <code>↵<br/>_↵<br/>↵<br/>_↵<br/>/</code> | The <code>initializer_list</code> of characters to append. |
|------------------------------------------|------------------------------------------------------------|

**Returns**

Reference to this string.

Definition at line 762 of file `vstring.h`.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::append()`.

4.66.3.7 `append()` [7/7]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
template<class _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
__versa_string& __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::append (
 _InputIterator __first,
 _InputIterator __last) [inline]
```

Append a range of characters.

## Parameters

|                      |                                                     |
|----------------------|-----------------------------------------------------|
| <code>__first</code> | Iterator referencing the first character to append. |
| <code>__last</code>  | Iterator marking the end of the range.              |

## Returns

Reference to this string.

Appends characters in the range [first,last) to this string.

Definition at line 781 of file `vstring.h`.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::replace()`.

4.66.3.8 `assign()` [1/8]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string& __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::assign (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str) [inline]
```

Set value to contents of another string.

## Parameters

|                    |                       |
|--------------------|-----------------------|
| <code>__str</code> | Source string to use. |
|--------------------|-----------------------|

## Returns

Reference to this string.

Definition at line 804 of file `vstring.h`.

Referenced by `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::assign()`, and `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::operator=()`.

**4.66.3.9** `assign()` [2/8]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string& __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::assign (
 __versa_string< _CharT, _Traits, _Alloc, _Base > && __str) [inline], [noexcept]
```

Set value to contents of another string.

**Parameters**

|                    |                       |
|--------------------|-----------------------|
| <code>__str</code> | Source string to use. |
|--------------------|-----------------------|

**Returns**

Reference to this string.

This function sets this string to the exact contents of `__str`. `__str` is a valid, but unspecified string.

Definition at line 820 of file `vstring.h`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::swap()`.

**4.66.3.10** `assign()` [3/8]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string& __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::assign (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
 size_type __pos,
 size_type __n) [inline]
```

Set value to a substring of a string.

**Parameters**

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__str</code> | The string to use.                   |
| <code>__pos</code> | Index of the first character of str. |
| <code>__n</code>   | Number of characters to use.         |

**Returns**

Reference to this string.

## Exceptions

|                                |                                             |
|--------------------------------|---------------------------------------------|
| <code>std::out_of_range</code> | if <code>__pos</code> is not a valid index. |
|--------------------------------|---------------------------------------------|

This function sets this string to the substring of `__str` consisting of `__n` characters at `__pos`. If `__n` is larger than the number of available characters in `__str`, the remainder of `__str` is used.

Definition at line 841 of file `vstring.h`.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::size()`.

4.66.3.11 `assign()` [4/8]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string& __gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::assign (
 const _CharT * __s,
 size_type __n) [inline]
```

Set value to a C substring.

## Parameters

|                  |                              |
|------------------|------------------------------|
| <code>__s</code> | The C string to use.         |
| <code>__n</code> | Number of characters to use. |

## Returns

Reference to this string.

This function sets the value of this string to the first `__n` characters of `__s`. If `__n` is larger than the number of available characters in `__s`, the remainder of `__s` is used.

Definition at line 858 of file `vstring.h`.

4.66.3.12 `assign()` [5/8]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string& __gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::assign (
 const _CharT * __s) [inline]
```

Set value to contents of a C string.

**Parameters**

|                                                                                                                       |                      |
|-----------------------------------------------------------------------------------------------------------------------|----------------------|
| <a href="#"></a><br><code>__s</code> | The C string to use. |
|-----------------------------------------------------------------------------------------------------------------------|----------------------|

**Returns**

Reference to this string.

This function sets the value of this string to the value of `__s`. The data is copied, so there is no dependence on `__s` once the function returns.

Definition at line 874 of file `vstring.h`.

**4.66.3.13 assign()** [6/8]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string& __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::assign (
 size_type __n,
 _CharT __c) [inline]
```

Set value to multiple characters.

**Parameters**

|                                                                                                                         |                                 |
|-------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| <a href="#"></a><br><code>__n</code> | Length of the resulting string. |
| <a href="#"></a><br><code>__c</code> | The character to use.           |

**Returns**

Reference to this string.

This function sets the value of this string to `__n` copies of character `__c`.

Definition at line 891 of file `vstring.h`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::size()`.

4.66.3.14 `assign()` [7/8]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
template<class _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
__versa_string& __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::assign (
 _InputIterator __first,
 _InputIterator __last) [inline]
```

Set value to a range of characters.

## Parameters

|                      |                                                     |
|----------------------|-----------------------------------------------------|
| <code>__first</code> | Iterator referencing the first character to append. |
| <code>__last</code>  | Iterator marking the end of the range.              |

## Returns

Reference to this string.

Sets value of string to characters in the range [first,last).

Definition at line 910 of file `vstring.h`.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::replace()`.

4.66.3.15 `assign()` [8/8]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string& __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::assign (
 std::initializer_list< _CharT > __l) [inline]
```

Set value to an `initializer_list` of characters.

## Parameters

|                  |                                                            |
|------------------|------------------------------------------------------------|
| <code>__l</code> | The <code>initializer_list</code> of characters to assign. |
|------------------|------------------------------------------------------------|

## Returns

Reference to this string.

Definition at line 920 of file vstring.h.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::assign()`.

#### 4.66.3.16 `at()` [1/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const_reference __gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::at (
 size_type __n) const [inline]
```

Provides access to the data contained in the string.

##### Parameters

|                         |                                       |
|-------------------------|---------------------------------------|
| <code>__↔<br/>_n</code> | The index of the character to access. |
|-------------------------|---------------------------------------|

##### Returns

Read-only (const) reference to the character.

##### Exceptions

|                                |                                          |
|--------------------------------|------------------------------------------|
| <code>std::out_of_range</code> | If <code>__n</code> is an invalid index. |
|--------------------------------|------------------------------------------|

This function provides for safer data access. The parameter is first checked that it is in the range of the string. The function throws `out_of_range` if the check fails.

Definition at line 578 of file vstring.h.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::size()`.

#### 4.66.3.17 `at()` [2/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
reference __gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::at (
 size_type __n) [inline]
```

Provides access to the data contained in the string.

## Parameters

|                         |                                       |
|-------------------------|---------------------------------------|
| <code>__↵<br/>_n</code> | The index of the character to access. |
|-------------------------|---------------------------------------|

## Returns

Read/write reference to the character.

## Exceptions

|                                |                                          |
|--------------------------------|------------------------------------------|
| <code>std::out_of_range</code> | If <code>__n</code> is an invalid index. |
|--------------------------------|------------------------------------------|

This function provides for safer data access. The parameter is first checked that it is in the range of the string. The function throws `out_of_range` if the check fails. Success results in unsharing the string.

Definition at line 600 of file `vstring.h`.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base>::size()`.

4.66.3.18 `back()` [1/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
reference __gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base>::back () [inline], [noexcept]
```

Returns a read/write reference to the data at the last element of the string.

Definition at line 633 of file `vstring.h`.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base>::operator[]()`, and `__gnu_cxx::__versa_↵  
string<_CharT, _Traits, _Alloc, _Base>::size()`.

4.66.3.19 `back()` [2/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const_reference __gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base>::back () const [inline],
[noexcept]
```

Returns a read-only (constant) reference to the data at the last element of the string.

Definition at line 641 of file `vstring.h`.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base>::operator[]()`, and `__gnu_cxx::__versa_↵  
string<_CharT, _Traits, _Alloc, _Base>::size()`.

**4.66.3.20 begin()** [1/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::begin () [inline], [noexcept]
```

Returns a read/write iterator that points to the first character in the string. Unshares the string.

Definition at line 316 of file vstring.h.

Referenced by `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::crend()`, and `__gnu_cxx::__versa_↵string< _CharT, _Traits, _Alloc, _Base >::rend()`.

**4.66.3.21 begin()** [2/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const_iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::begin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first character in the string.

Definition at line 327 of file vstring.h.

**4.66.3.22 c\_str()**

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const _CharT* __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::c_str () const [inline],
[noexcept]
```

Return const pointer to null-terminated contents.

This is a handle to internal data. Do not modify or dire things may happen.

Definition at line 1648 of file vstring.h.

**4.66.3.23 capacity()**

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::capacity () const [inline],
[noexcept]
```

Returns the total number of characters that the string can hold before needing to allocate more memory.

Definition at line 487 of file vstring.h.

Referenced by `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::push_back()`, and `__gnu_cxx::__versa_↵string< _CharT, _Traits, _Alloc, _Base >::shrink_to_fit()`.

#### 4.66.3.24 `cbegin()`

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const_iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::cbegin () const
[inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first character in the string.

Definition at line 391 of file `vstring.h`.

#### 4.66.3.25 `cend()`

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const_iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::cend () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last character in the string.

Definition at line 399 of file `vstring.h`.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base>::size()`.

#### 4.66.3.26 `clear()`

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
void __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::clear () [inline], [noexcept]
```

Erases the string, making it empty.

Definition at line 515 of file `vstring.h`.

#### 4.66.3.27 `compare()` [1/6]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
int __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str) const [inline]
```

Compare to a string.

## Parameters

|                    |                            |
|--------------------|----------------------------|
| <code>__str</code> | String to compare against. |
|--------------------|----------------------------|

## Returns

Integer < 0, 0, or > 0.

Returns an integer < 0 if this string is ordered before `__str`, 0 if their values are equivalent, or > 0 if this string is ordered after `__str`. Determines the effective length `rlen` of the strings to compare as the smallest of `size()` and `str.size()`. The function then compares the two strings by calling `traits::compare(data(), str.data(), rlen)`. If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.

Definition at line 2074 of file `vstring.h`.

References `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::data()`, `std::min()`, and `__gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::size()`.

Referenced by `__gnu_cxx::operator<()`, `__gnu_cxx::operator<=()`, `__gnu_cxx::operator==()`, `__gnu_cxx::operator>()`, and `__gnu_cxx::operator>=()`.

4.66.3.28 `compare()` [2/6]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename,
typename > class _Base>
int __gnu_cxx::__versa_string<_CharT, _Traits, _Alloc, _Base >::compare (
 size_type __pos,
 size_type __n,
 const __versa_string<_CharT, _Traits, _Alloc, _Base > & __str) const
```

Compare substring to a string.

## Parameters

|                    |                                        |
|--------------------|----------------------------------------|
| <code>__pos</code> | Index of first character of substring. |
| <code>__n</code>   | Number of characters in substring.     |
| <code>__str</code> | String to compare against.             |

## Returns

Integer < 0, 0, or > 0.

Form the substring of this string from the `__n` characters starting at `__pos`. Returns an integer < 0 if the substring is ordered before `__str`, 0 if their values are equivalent, or > 0 if the substring is ordered after `__str`. Determines the effective length `rlen` of the strings to compare as the smallest of the length of the substring and `__str.size()`. The function then compares the two strings by calling `traits::compare(substring.data(), str.data(), rlen)`. If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.

Definition at line 460 of file vstring.tcc.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::data()`, `std::min()`, and `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::size()`.

#### 4.66.3.29 compare() [3/6]

```
template<typename _CharT , typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
int __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare (
 size_type __pos1,
 size_type __n1,
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
 size_type __pos2,
 size_type __n2) const
```

Compare substring to a substring.

##### Parameters

|                     |                                               |
|---------------------|-----------------------------------------------|
| <code>__pos1</code> | Index of first character of substring.        |
| <code>__n1</code>   | Number of characters in substring.            |
| <code>__str</code>  | String to compare against.                    |
| <code>__pos2</code> | Index of first character of substring of str. |
| <code>__n2</code>   | Number of characters in substring of str.     |

##### Returns

Integer < 0, 0, or > 0.

Form the substring of this string from the `__n1` characters starting at `__pos1`. Form the substring of `__str` from the `__n2` characters starting at `__pos2`. Returns an integer < 0 if this substring is ordered before the substring of `__str`, 0 if their values are equivalent, or > 0 if this substring is ordered after the substring of `__str`. Determines the effective length `rlen` of the strings to compare as the smallest of the lengths of the substrings. The function then compares the two strings by calling `traits::compare(substring.data(),str.substr(pos2,n2).data(),rlen)`. If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.

Definition at line 477 of file vstring.tcc.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::data()`, and `std::min()`.

#### 4.66.3.30 compare() [4/6]

```
template<typename _CharT, typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
int __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare (
 const _CharT * __s) const
```

Compare to a C string.

## Parameters

|                  |                              |
|------------------|------------------------------|
| <code>__s</code> | C string to compare against. |
|------------------|------------------------------|

## Returns

Integer < 0, 0, or > 0.

Returns an integer < 0 if this string is ordered before `__s`, 0 if their values are equivalent, or > 0 if this string is ordered after `__s`. Determines the effective length `rlen` of the strings to compare as the smallest of `size()` and the length of a string constructed from `__s`. The function then compares the two strings by calling `traits::compare(data(),s,rlen)`. If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.

Definition at line 496 of file `vstring.tcc`.

4.66.3.31 `compare()` [5/6]

```
template<typename _CharT, typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
int __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare (
 size_type __pos,
 size_type __n1,
 const _CharT * __s) const
```

Compare substring to a C string.

## Parameters

|                    |                                        |
|--------------------|----------------------------------------|
| <code>__pos</code> | Index of first character of substring. |
| <code>__n1</code>  | Number of characters in substring.     |
| <code>__s</code>   | C string to compare against.           |

## Returns

Integer < 0, 0, or > 0.

Form the substring of this string from the `__n1` characters starting at `__pos`. Returns an integer < 0 if the substring is ordered before `__s`, 0 if their values are equivalent, or > 0 if the substring is ordered after `__s`. Determines the effective length `rlen` of the strings to compare as the smallest of the length of the substring and the length of a string constructed from `__s`. The function then compares the two string by calling `traits::compare(substring.data(),s,rlen)`. If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.

Definition at line 512 of file `vstring.tcc`.

4.66.3.32 `compare()` [6/6]

```
template<typename _CharT, typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
int __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare (
 size_type __pos,
 size_type __n1,
 const _CharT * __s,
 size_type __n2) const
```

Compare substring against a character array.

## Parameters

|                    |                                        |
|--------------------|----------------------------------------|
| <code>__pos</code> | Index of first character of substring. |
| <code>__n1</code>  | Number of characters in substring.     |
| <code>__s</code>   | character array to compare against.    |
| <code>__n2</code>  | Number of characters of s.             |

## Returns

Integer < 0, 0, or > 0.

Form the substring of this string from the `__n1` characters starting at `__pos`. Form a string from the first `__n2` characters of `__s`. Returns an integer < 0 if this substring is ordered before the string from `__s`, 0 if their values are equivalent, or > 0 if this substring is ordered after the string from `__s`. Determines the effective length `rlen` of the strings to compare as the smallest of the length of the substring and `__n2`. The function then compares the two strings by calling `traits::compare(substring.data(), __s, rlen)`. If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.

NB: `__s` must have at least `n2` characters, `\0` has no special meaning.

Definition at line 529 of file `vstring.tcc`.

4.66.3.33 `copy()`

```
template<typename _CharT, typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base >::size_type __gnu_cxx::__versa_string< _CharT, ↵
_Traits, _Alloc, _Base >::copy (
 _CharT * __s,
 size_type __n,
 size_type __pos = 0) const
```

Copy substring into C string.

**Parameters**

|                    |                                   |
|--------------------|-----------------------------------|
| <code>__s</code>   | C string to copy value into.      |
| <code>__n</code>   | Number of characters to copy.     |
| <code>__pos</code> | Index of first character to copy. |

**Returns**

Number of characters actually copied

**Exceptions**

|                                       |                                   |
|---------------------------------------|-----------------------------------|
| <code><i>std::out_of_range</i></code> | If <code>pos &gt; size()</code> . |
|---------------------------------------|-----------------------------------|

Copies up to `__n` characters starting at `__pos` into the C string `s`. If `__pos` is greater than `size()`, `out_of_range` is thrown.

Definition at line 255 of file `vstring.tcc`.

**4.66.3.34 `crbegin()`**

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const_reverse_iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::crbegin ()
const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last character in the string. Iteration is done in reverse element order.

Definition at line 408 of file `vstring.h`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::end()`.

**4.66.3.35 `crend()`**

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const_reverse_iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::crend ()
const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first character in the string. Iteration is done in reverse element order.

Definition at line 417 of file `vstring.h`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::begin()`.

**4.66.3.36** `data()`

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const _CharT* __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::data () const [inline],
[noexcept]
```

Return const pointer to contents.

This is a handle to internal data. Do not modify or dire things may happen.

Definition at line 1658 of file `vstring.h`.

Referenced by `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare()`, `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find()`, `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_first_↵not_of()`, `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_first_of()`, `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_last_of()`, and `std::operator<<()`.

**4.66.3.37** `empty()`

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::empty () const [inline],
[noexcept]
```

Returns true if the string is empty. Equivalent to `*this == ""`.

Definition at line 523 of file `vstring.h`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::size()`.

**4.66.3.38** `end()` [1/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last character in the string. Unshares the string.

Definition at line 335 of file `vstring.h`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::size()`.

Referenced by `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::crbegin()`, and `__gnu_cxx::__versa_↵string< _CharT, _Traits, _Alloc, _Base >::rbegin()`.

**4.66.3.39** `end()` [2/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const_iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::end () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last character in the string.

Definition at line 346 of file `vstring.h`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::size()`.

**4.66.3.40** `erase()` [1/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string& __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::erase (
 size_type __pos = 0,
 size_type __n = npos) [inline]
```

Remove characters.

**Parameters**

|                    |                                                     |
|--------------------|-----------------------------------------------------|
| <code>__pos</code> | Index of first character to remove (default 0).     |
| <code>__n</code>   | Number of characters to remove (default remainder). |

**Returns**

Reference to this string.

**Exceptions**

|                                |                                                         |
|--------------------------------|---------------------------------------------------------|
| <code>std::out_of_range</code> | If <code>__pos</code> is beyond the end of this string. |
|--------------------------------|---------------------------------------------------------|

Removes `__n` characters from this string starting at `__pos`. The length of the string is reduced by `__n`. If there are  $< __n$  characters to remove, the remainder of the string is truncated. If `__p` is beyond end of string, `out_of_range` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1174 of file `vstring.h`.

**4.66.3.41** `erase()` [2/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
```

```
iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::erase (
 const_iterator __position) [inline]
```

Remove one character.

#### Parameters

|                         |                                               |
|-------------------------|-----------------------------------------------|
| <code>__position</code> | Iterator referencing the character to remove. |
|-------------------------|-----------------------------------------------|

#### Returns

iterator referencing same location after removal.

Removes the character at `__position` from this string. The value of the string doesn't change if an error is thrown.

Definition at line 1191 of file `vstring.h`.

#### 4.66.3.42 `erase()` [3/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::erase (
 const_iterator __first,
 const_iterator __last) [inline]
```

Remove a range of characters.

#### Parameters

|                      |                                                     |
|----------------------|-----------------------------------------------------|
| <code>__first</code> | Iterator referencing the first character to remove. |
| <code>__last</code>  | Iterator referencing the end of the range.          |

#### Returns

Iterator referencing location of first after removal.

Removes the characters in the range `[first,last)` from this string. The value of the string doesn't change if an error is thrown.

Definition at line 1216 of file `vstring.h`.

**4.66.3.43** `find()` [1/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename,
typename > class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base >::size_type __gnu_cxx::__versa_string< _CharT, ↵
_Traits, _Alloc, _Base >::find (
 const _CharT * __s,
 size_type __pos,
 size_type __n) const
```

Find position of a C substring.

**Parameters**

|                    |                                                           |
|--------------------|-----------------------------------------------------------|
| <code>__s</code>   | C string to locate.                                       |
| <code>__pos</code> | Index of character to search from.                        |
| <code>__n</code>   | Number of characters from <code>__s</code> to search for. |

**Returns**

Index of start of first occurrence.

Starting from `__pos`, searches forward for the first `__n` characters in `__s` within this string. If found, returns the index where it begins. If not found, returns `npos`.

Definition at line 270 of file `vstring.tcc`.

Referenced by `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find()`, and `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_first_of()`.

**4.66.3.44** `find()` [2/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
 size_type __pos = 0) const [inline], [noexcept]
```

Find position of a string.

**Parameters**

|                    |                                                |
|--------------------|------------------------------------------------|
| <code>__str</code> | String to locate.                              |
| <code>__pos</code> | Index of character to search from (default 0). |

**Returns**

Index of start of first occurrence.

Starting from `__pos`, searches forward for value of `__str` within this string. If found, returns the index where it begins. If not found, returns `npos`.

Definition at line 1694 of file `vstring.h`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::data()`, `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find()`, and `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::size()`.

**4.66.3.45 `find()`** [3/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find (
 const _CharT * __s,
 size_type __pos = 0) const [inline]
```

Find position of a C string.

**Parameters**

|                    |                                                |
|--------------------|------------------------------------------------|
| <code>__s</code>   | C string to locate.                            |
| <code>__pos</code> | Index of character to search from (default 0). |

**Returns**

Index of start of first occurrence.

Starting from `__pos`, searches forward for the value of `__s` within this string. If found, returns the index where it begins. If not found, returns `npos`.

Definition at line 1709 of file `vstring.h`.

**4.66.3.46 `find()`** [4/4]

```
template<typename _CharT, typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::size_type __gnu_cxx::__versa_string< _CharT, ↵
_Traits, _Alloc, _Base >::find (
 _CharT __c,
 size_type __pos = 0) const [noexcept]
```

Find position of a character.

**Parameters**

|                    |                                                |
|--------------------|------------------------------------------------|
| <code>__c</code>   | Character to locate.                           |
| <code>__pos</code> | Index of character to search from (default 0). |

**Returns**

Index of first occurrence.

Starting from `__pos`, searches forward for `__c` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 294 of file `vstring.tcc`.

**4.66.3.47 find\_first\_not\_of() [1/4]**

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_first_not_of (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
 size_type __pos = 0) const [inline], [noexcept]
```

Find position of a character not in string.

**Parameters**

|                    |                                                |
|--------------------|------------------------------------------------|
| <code>__str</code> | String containing characters to avoid.         |
| <code>__pos</code> | Index of character to search from (default 0). |

**Returns**

Index of first occurrence.

Starting from `__pos`, searches forward for a character not contained in `__str` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 1926 of file `vstring.h`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::data()`, and `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::size()`.

4.66.3.48 `find_first_not_of()` [2/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename,
typename > class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base >::size_type __gnu_cxx::__versa_string< _CharT, ↵
_Traits, _Alloc, _Base >::find_first_not_of (
 const _CharT * __s,
 size_type __pos,
 size_type __n) const
```

Find position of a character not in C substring.

## Parameters

|                    |                                          |
|--------------------|------------------------------------------|
| <code>__s</code>   | C string containing characters to avoid. |
| <code>__pos</code> | Index of character to search from.       |
| <code>__n</code>   | Number of characters from s to consider. |

## Returns

Index of first occurrence.

Starting from `__pos`, searches forward for a character not contained in the first `__n` characters of `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 392 of file `vstring.tcc`.

4.66.3.49 `find_first_not_of()` [3/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_first_not_of (
 const _CharT * __s,
 size_type __pos = 0) const [inline]
```

Find position of a character not in C string.

## Parameters

|                    |                                                |
|--------------------|------------------------------------------------|
| <code>__s</code>   | C string containing characters to avoid.       |
| <code>__pos</code> | Index of character to search from (default 0). |

## Returns

Index of first occurrence.

Starting from `__pos`, searches forward for a character not contained in `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 1957 of file vstring.h.

#### 4.66.3.50 find\_first\_not\_of() [4/4]

```
template<typename _CharT, typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base >::size_type __gnu_cxx::__versa_string< _CharT, ↵
_Traits, _Alloc, _Base >::find_first_not_of (
 _CharT __c,
 size_type __pos = 0) const [noexcept]
```

Find position of a different character.

##### Parameters

|                    |                                                |
|--------------------|------------------------------------------------|
| <code>__c</code>   | Character to avoid.                            |
| <code>__pos</code> | Index of character to search from (default 0). |

##### Returns

Index of first occurrence.

Starting from `__pos`, searches forward for a character other than `__c` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 405 of file vstring.tcc.

#### 4.66.3.51 find\_first\_of() [1/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_first_of (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
 size_type __pos = 0) const [inline], [noexcept]
```

Find position of a character of string.

##### Parameters

|                    |                                                |
|--------------------|------------------------------------------------|
| <code>__str</code> | String containing characters to locate.        |
| <code>__pos</code> | Index of character to search from (default 0). |

**Returns**

Index of first occurrence.

Starting from `__pos`, searches forward for one of the characters of `__str` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 1799 of file `vstring.h`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::data()`, and `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::size()`.

**4.66.3.52 `find_first_of()`** [2/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename,
typename > class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base >::size_type __gnu_cxx::__versa_string< _CharT, ↵
_Traits, _Alloc, _Base >::find_first_of (
 const _CharT * __s,
 size_type __pos,
 size_type __n) const
```

Find position of a character of C substring.

**Parameters**

|                    |                                                         |
|--------------------|---------------------------------------------------------|
| <code>__s</code>   | String containing characters to locate.                 |
| <code>__pos</code> | Index of character to search from.                      |
| <code>__n</code>   | Number of characters from <code>s</code> to search for. |

**Returns**

Index of first occurrence.

Starting from `__pos`, searches forward for one of the first `__n` characters of `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 353 of file `vstring.tcc`.

**4.66.3.53 `find_first_of()`** [3/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_first_of (
 const _CharT * __s,
 size_type __pos = 0) const [inline]
```

Find position of a character of C string.

**Parameters**

|                    |                                                |
|--------------------|------------------------------------------------|
| <code>__s</code>   | String containing characters to locate.        |
| <code>__pos</code> | Index of character to search from (default 0). |

**Returns**

Index of first occurrence.

Starting from `__pos`, searches forward for one of the characters of `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 1829 of file `vstring.h`.

**4.66.3.54 find\_first\_of()** [4/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_first_of (
 _CharT __c,
 size_type __pos = 0) const [inline], [noexcept]
```

Find position of a character.

**Parameters**

|                    |                                                |
|--------------------|------------------------------------------------|
| <code>__c</code>   | Character to locate.                           |
| <code>__pos</code> | Index of character to search from (default 0). |

**Returns**

Index of first occurrence.

Starting from `__pos`, searches forward for the character `__c` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Note: equivalent to `find(c, pos)`.

Definition at line 1848 of file `vstring.h`.

References `__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find()`.

4.66.3.55 `find_last_not_of()` [1/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_last_not_of (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
 size_type __pos = npos) const [inline], [noexcept]
```

Find last position of a character not in string.

## Parameters

|                    |                                                       |
|--------------------|-------------------------------------------------------|
| <code>__str</code> | String containing characters to avoid.                |
| <code>__pos</code> | Index of character to search back from (default end). |

## Returns

Index of last occurrence.

Starting from `__pos`, searches backward for a character not contained in `__str` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 1989 of file `vstring.h`.

4.66.3.56 `find_last_not_of()` [2/4]

```
template<typename _CharT, typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base >::size_type __gnu_cxx::__versa_string< _CharT, ↵
_Traits, _Alloc, _Base >::find_last_not_of (
 const _CharT * __s,
 size_type __pos,
 size_type __n) const
```

Find last position of a character not in C substring.

## Parameters

|                    |                                                       |
|--------------------|-------------------------------------------------------|
| <code>__s</code>   | C string containing characters to avoid.              |
| <code>__pos</code> | Index of character to search back from.               |
| <code>__n</code>   | Number of characters from <code>s</code> to consider. |

## Returns

Index of last occurrence.

Starting from `__pos`, searches backward for a character not contained in the first `__n` characters of `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 417 of file vstring.tcc.

#### 4.66.3.57 find\_last\_not\_of() [3/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_last_not_of (
 const _CharT * __s,
 size_type __pos = npos) const [inline]
```

Find last position of a character not in C string.

##### Parameters

|                    |                                                       |
|--------------------|-------------------------------------------------------|
| <code>__s</code>   | C string containing characters to avoid.              |
| <code>__pos</code> | Index of character to search back from (default end). |

##### Returns

Index of last occurrence.

Starting from `__pos`, searches backward for a character not contained in `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 2020 of file vstring.h.

#### 4.66.3.58 find\_last\_not\_of() [4/4]

```
template<typename _CharT, typename _Traits , typename _Alloc , template< typename, typename,
typename > class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base >::size_type __gnu_cxx::__versa_string< _CharT, ↵
_Traits, _Alloc, _Base >::find_last_not_of (
 _CharT __c,
 size_type __pos = npos) const [noexcept]
```

Find last position of a different character.

##### Parameters

|                    |                                                       |
|--------------------|-------------------------------------------------------|
| <code>__c</code>   | Character to avoid.                                   |
| <code>__pos</code> | Index of character to search back from (default end). |

**Returns**

Index of last occurrence.

Starting from `__pos`, searches backward for a character other than `__c` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 439 of file `vstring.tcc`.

**4.66.3.59 `find_last_of()`** [1/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_last_of (
 const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
 size_type __pos = npos) const [inline], [noexcept]
```

Find last position of a character of string.

**Parameters**

|                    |                                                       |
|--------------------|-------------------------------------------------------|
| <code>__str</code> | String containing characters to locate.               |
| <code>__pos</code> | Index of character to search back from (default end). |

**Returns**

Index of last occurrence.
