1 Overview of GNU Modula-2

1.1 What is GNU Modula-2

GNU Modula-2 is a front end (<http://gcc.gnu.org/frontends.html>) for the GNU Compiler Collection (GCC (<http://gcc.gnu.org/>)). The GNU Modula-2 compiler is compliant with the PIM2, PIM3, PIM4 and ISO dialects. Also implemented are a complete set of free ISO libraries and PIM libraries.

¹

1.2 Why use GNU Modula-2

There are a number of advantages of using GNU Modula-2 rather than translate an existing project into another language.

The first advantage is of maintainability of the original sources and the ability to debug the original project source code using a combination of gm2 and gdb.

The second advantage is that gcc runs on many processors and platforms. gm2 builds and runs on powerpc64le, amd64, i386, aarch64 to name but a few processors.

gm2 can produce swig interface headers to allow access from Python and other scripting languages. It can also be used with C/C++ and generate shared libraries.

The compiler provides semantic analysis and run time checking (full ISO Modula-2 checking is implemented) and there is a plugin which can, under certain conditions, detect run time errors at compile time.

The compiler supports PIM2, PIM3, PIM4 and ISO dialects of Modula-2, work is underway to implement M2R10. Many of the GCC builtins are available and access to assembly programming is achieved using the same syntax as that used by GCC.

The gm2 driver allows third party libraries to be installed alongside gm2 libraries. For example if the user specifies library `foo` using `-flibs=foo` the driver will check the standard GCC install directory for a sub directory `foo` containing the library contents. The library module search path is altered accordingly for compile and link.

1.3 How to get source code using git

GNU Modula-2 is now in the GCC git tree (<https://gcc.gnu.org/git.html>).

¹ The four Modula-2 dialects supported are defined in the following references:

PIM2: 'Programming in Modula-2', 2nd Edition, Springer Verlag, 1982, 1983 by Niklaus Wirth (PIM2).

PIM3: 'Programming in Modula-2', 3rd Corrected Edition, Springer Verlag, 1985 (PIM3).

PIM4: 'Programming in Modula-2', 4th Edition, Springer Verlag, 1988 (PIM4 (<http://freepages.modula2.org/report4/modula-2.html>)).

ISO: the ISO Modula-2 language as defined in 'ISO/IEC Information technology - programming languages - part 1: Modula-2 Language, ISO/IEC 10514-1 (1996)'

1.4 GNU Modula-2 Features

- the compiler currently complies with Programming in Modula-2 Edition 2, 3, 4 and ISO Modula-2. Users can switch on specific language features by using: ‘-fpim’, ‘-fpim2’, ‘-fpim3’, ‘-fpim4’ or ‘-fiso’.
- the option ‘-fswig’ will automatically create a swig interface file which corresponds to the definition module of the file being compiled.
- exception handling is compatible with C++ and swig. Modula-2 code can be used with C or C++ code.
- Python can call GNU Modula-2 modules via swig.
- shared libraries can be built.
- fixed sized types are now available from ‘SYSTEM’.
- variables can be declared at addresses.
- much better dwarf-2 debugging support and when used with ‘gdb’ the programmer can display RECORDs, ARRAYS, SETs, subranges and constant char literals in Modula-2 syntax.
- supports sets of any ordinal size (memory permitting).
- easy interface to C, and varargs can be passed to C routines.
- many Logitech libraries have been implemented and can be accessed via: ‘-flibs=m2log,m2pim,m2iso’.
- coroutines have been implemented in the PIM style and these are accessible from SYSTEM. A number of supporting libraries (executive and file descriptor mapping to interrupt vector libraries are available through the ‘-flibs=m2iso,m2pim’ switch).
- can be built as a cross compiler (for embedded microprocessors such as the AVR and the ARM).

2 Using GNU Modula-2

This document contains the user and design issues relevant to the Modula-2 front end to gcc.

2.1 Example compile and link

The `gm2` command is the GNU compiler for the Modula-2 language and supports many of the same options as `gcc`. See Section “Option Summary” in *Using the GNU Compiler Collection (GCC)*. This manual only documents the options specific to `gm2`.

This section describes how to compile and link a simple hello world program. It provides a few examples of using the different options mentioned in see Section “Compiler options” in `gm2`. Assuming that you have a file called `hello.mod` in your current directory which contains:

```
MODULE hello ;

FROM StrIO IMPORT WriteString, WriteLn ;

BEGIN
    WriteString ('hello world') ; WriteLn
END hello.
```

You can compile and link it by: ‘`gm2 -g hello.mod`’. The result will be an ‘`a.out`’ file created in your directory.

You can split this command into two steps if you prefer. The compile step can be achieved by: ‘`gm2 -g -c -fscaffold-main hello.mod`’ and the link via: ‘`gm2 -g hello.o`’.

¹

2.2 Compiler options

This section describes the compiler options specific to GNU Modula-2 for generic flags details See Section “Invoking GCC” in `gcc`.

For any given input file, the file name suffix determines what kind of compilation is done. The following kinds of input file names are supported:

- `file.mod`** Modula-2 implementation or program source files. See the ‘`-fmod=`’ option if you wish to compile a project which uses a different source file extension.
- `file.def`** Modula-2 definition module source files. Definition modules are not compiled separately, in GNU Modula-2 definition modules are parsed as required when program or implementation modules are compiled. See the ‘`-fdef=`’ option if you wish to compile a project which uses a different source file extension.

¹ To see all the compile actions taken by ‘`gm2`’ users can also add the ‘`-v`’ flag at the command line, for example:

‘`gm2 -v -g -I. hello.mod`’

This displays the sub processes initiated by ‘`gm2`’ which can be useful when trouble shooting.

You can specify more than one input file on the `gm2` command line,

- g** create debugging information so that debuggers such as `gdb` can inspect and control executable.
- I** used to specify the search path for definition and implementation modules. An example is: `gm2 -g -c -I.:.../..libs foo.mod`. If this option is not specified then the default path is added which consists of the current directory followed by the appropriate language dialect library directories.
- fauto-init** turns on auto initialization of pointers to NIL. Whenever a block is created all pointers declared within this scope will have their addresses assigned to NIL.
- fbounds** turns on run time subrange, array index and indirection via NIL pointer checking.
- fcase** turns on compile time checking to check whether a CASE statement requires an ELSE clause when on was not specified.
- fcpp** preprocess the source with ‘`cpp -lang-asm -traditional-cpp`’ For further details about these options See Section “Invocation” in `cpp`. If ‘`-fcpp`’ is supplied then all definition modules and implementation modules which are parsed will be prepossessed by ‘`cpp`’.
- fdebug-builtins** call a real function, rather than the builtin equivalent. This can be useful for debugging parameter values to a builtin function as it allows users to single step code into an intrinsic function.
- fdef=** recognize the specified suffix as a definition module filename. The default implementation and module filename suffix is `.def`. If this option is used GNU Modula-2 will still fall back to this default if a requested definition module is not found.
- fdump-system-exports** display all inbuilt system items. This is an internal command line option.
- fexceptions** turn on exception handling code. By default this option is on. Exception handling can be disabled by ‘`-fno-exceptions`’ and no references are made to the run time exception libraries.
- fextended-opaque** allows opaque types to be implemented as any type. This is a GNU Modula-2 extension and it requires that the implementation module defining the opaque type is available so that it can be resolved when compiling the module which imports the opaque type.
- ffloatvalue** turns on run time checking to check whether a floating point number is about to exceed range.

-fgen-module-list=filename

attempt to find all modules when linking and generate a module list. If the *filename* is ‘-’ then the contents are not written and only used to force the linking of all module ctors. This option cannot be used if ‘-fuse-list=’ is enabled.

-findex generate code to check whether array index values are out of bounds. Array index checking can be disabled via ‘-fno-index’.

-fiso turn on ISO standard features. Currently this enables the ISO SYSTEM module and alters the default library search path so that the ISO libraries are searched before the PIM libraries. It also effects the behavior of DIV and MOD operators. See Section “Dialect” in *gm2*.

-flibs= modifies the default library search path. The libraries supplied are: m2pim, m2iso, m2min, m2log and m2cor. These map onto the Programming in Modula-2 base libraries, ISO standard libraries, minimal library support, Logitech compatible library and Programming in Modula-2 with coroutines. Multiple libraries can be specified and are comma separated with precedence going to the first in the list. It is not necessary to use -flibs=m2pim or -flibs=m2iso if you also specify -fpim, -fpim2, -fpim3, -fpim4 or -fiso. Unless you are using -flibs=m2min you should include m2pim as they provide the base modules which all other dialects utilize. The option ‘-fno-libs=-’ disables the ‘*gm2*’ driver from modifying the search and library paths.

-static-libgm2

On systems that provide the m2 runtimes as both shared and static libraries, this option forces the use of the static version.

-fm2-g improve the debugging experience for new programmers at the expense of generating **nop** instructions if necessary to ensure single stepping precision over all code related keywords. An example of this is in termination of a list of nested IF statements where multiple END keywords are mapped onto a sequence of **nop** instructions.

-fm2-lower-case

render keywords in error messages using lower case.

-fm2-pathname=

specify the module mangled prefix name for all modules in the following include paths.

-fm2-pathnameI

for internal use only: used by the driver to copy the user facing -I option.

-fm2-plugin

insert plugin to identify run time errors at compile time (default on).

-fm2-prefix=

specify the module mangled prefix name. All exported symbols from a definition module will have the prefix name.

-fm2-statistics

generates quadruple information: number of quadruples generated, number of quadruples remaining after optimization and number of source lines compiled.

-fm2-strict-type

experimental flag to turn on the new strict type checker.

-fm2-whole-program

compile all implementation modules and program module at once. Notice that you need to take care if you are compiling different dialect modules (particularly with the negative operands to modulus). But this option, when coupled together with **-O3**, can deliver huge performance improvements.

-fmod= recognize the specified suffix as implementation and module filenames. The default implementation and module filename suffix is **.mod**. If this option is used GNU Modula-2 will still fall back to this default if it needs to read an implementation module and the specified suffixed filename does not exist.

-fnil generate code to detect accessing data through a **NIL** value pointer. Dereferencing checking through a **NIL** pointer can be disabled by '**-fno-nil**'.

-fpim turn on PIM standard features. Currently this enables the PIM **SYSTEM** module and determines which identifiers are pervasive (declared in the base module). If no other '**-fpim[234]**' switch is used then division and modulus operators behave as defined in PIM4. See Section "Dialect" in **gm2**.

-fpim2 turn on PIM-2 standard features. Currently this removes **SIZE** from being a pervasive identifier (declared in the base module). It places **SIZE** in the **SYSTEM** module. It also effects the behavior of **DIV** and **MOD** operators. See Section "Dialect" in **gm2**.

-fpim3 turn on PIM-3 standard features. Currently this only effects the behavior of **DIV** and **MOD** operators. See Section "Dialect" in **gm2**.

-fpim4 turn on PIM-4 standard features. Currently this only effects the behavior of **DIV** and **MOD** operators. See Section "Dialect" in **gm2**.

-fpositive-mod-floor-div

forces the **DIV** and **MOD** operators to behave as defined by PIM4. All modulus results are positive and the results from the division are rounded to the floor. See Section "Dialect" in **gm2**.

-fpthread

link against the pthread library. By default this option is on. It can be disabled by '**-fno-pthread**'. GNU Modula-2 uses the GCC pthread libraries to implement coroutines (see the **SYSTEM** implementation module).

-frange generate code to check the assignment range, return value range set range and constructor range. Range checking can be disabled via '**-fno-range**'.

-freturn generate code to check that functions always exit with a **RETURN** and do not fall out at the end. Return checking can be disabled via '**-fno-return**'.

-fruntime-modules=

specify, using a comma separated list, the run time modules and their order. These modules will initialized first before any other modules in the application dependency. By default the run time modules list is set to `m2iso:RTentity,m2iso:Storage,m2iso:SYSTEM,m2iso:M2RTS,m2iso:RTErrors,m2iso:IOLink`. Note that these modules will only be linked into your executable if they are required. Adding a long list of dependent modules will not effect the size of the executable it merely states the initialization order should they be required.

-fscaffold-dynamic

the option ensures that ‘gm2’ will generate a dynamic scaffold infrastructure when compiling implementation and program modules. By default this option is on. Use ‘`-fno-scaffold-dynamic`’ to turn it off or select ‘`-fno-scaffold-static`’.

-fscaffold-c

generate a C source scaffold for the current module being compiled.

-fscaffold-c++

generate a C++ source scaffold for the current module being compiled.

-fscaffold-main

force the generation of the ‘main’ function. This is not necessary if the ‘-c’ is omitted.

-fscaffold-static

the option ensures that ‘gm2’ will generate a static scaffold within the program module. The static scaffold consists of sequences of calls to all dependent module initialization and finalization procedures. The static scaffold is useful for debugging and single stepping the initialization blocks of implementation modules.

-fshared generate a shared library from the module.**-fsoft-check-all**

turns on all run time checks. This is the same as invoking GNU Modula-2 using the command options `-fnil -frange -findex -fwholevalue -fwholediv -fcase -freturn`.

-fsources

displays the path to the source of each module. This option can be used at compile time to check the correct definition module is being used.

-fswig generate a swig interface file.**-funbounded-by-reference**

enable optimization of unbounded parameters by attempting to pass non VAR unbounded parameters by reference. This optimization avoids the implicit copy inside the callee procedure. GNU Modula-2 will only allow unbounded parameters to be passed by reference if, inside the callee procedure, they are not written to, no address is calculated on the array and it is not passed as a VAR

parameter. Note that it is possible to write code to break this optimization, therefore this option should be used carefully. For example it would be possible to take the address of an array, pass the address and the array to a procedure, read from the array in the procedure and write to the location using the address parameter.

Due to the dangerous nature of this option it is not enabled when the ‘-O’ option is specified.

-fuse-list=filename

if ‘-fscaffold-static’ is enabled then use the file `filename` for the initialization order of modules. Whereas if ‘-fscaffold-dynamic’ is enabled then use this file to force linking of all module ctors. This option cannot be used if ‘-fgen-module-list=’ is enabled.

-fwholediv

generate code to detect whole number division by zero or modulus by zero.

-fwholevalue

generate code to detect whole number overflow and underflow.

-Wcase-enum

generate a warning if a CASE statement selects on an enumerated type expression and the statement is missing one or more CASE labels. No warning is issued if the CASE statement has a default ELSE clause. The option ‘-Wall’ will turn on this flag.

-Wuninit-variable-checking

issue a warning if a variable is used before it is initialized. The checking only occurs in the first basic block in each procedure. It does not check parameters, array types or set types.

-Wuninit-variable-checking=all,known,cond

issue a warning if a variable is used before it is initialized. The checking will only occur in the first basic block in each procedure if ‘known’ is specified. If ‘cond’ or ‘all’ is specified then checking continues into conditional branches of the flow graph. All checking will stop when a procedure call is invoked or the top of a loop is encountered. The option ‘-Wall’ will turn on this flag with ‘-Wuninit-variable-checking=known’. The ‘-Wuninit-variable-checking=all’ will increase compile time.

This section describes the linking related options. There are three linking strategies available which are dynamic scaffold, static scaffold and user defined. The dynamic scaffold is enabled by default and each module will register itself to the run time ‘M2RTS’ via a constructor. The static scaffold mechanism will invoke each modules ‘_init’ and ‘_finish’ function in turn via a sequence of calls from within ‘main’. Lastly the user defined strategy can be implemented by turning off the dynamic and static options via ‘-fno-scaffold-dynamic’ and ‘-fno-scaffold-static’.

In the simple test below:

```
$ gm2 hello.mod
```

the driver will add the options ‘`-fscaffold-dynamic`’ and ‘`-fgen-module-list=`’ which generate a list of application modules and also creates the ‘`main`’ function with calls to ‘`M2RTS`’. It can be useful to add the option ‘`-fsources`’ which displays the source files as they are parsed and summarizes whether the source file is required for compilation or linking.

If you wish to split the above command line into a compile and link then you could use these steps:

```
$ gm2 -c -fscaffold-main hello.mod
$ gm2 hello.o
```

The ‘`-fscaffold-main`’ informs the compiler to generate the ‘`main`’ function and scaffold. You can enable the environment variable ‘`GCC_M2LINK_RTFLAG`’ to trace the construction and destruction of the application. The values for ‘`GCC_M2LINK_RTFLAG`’ are shown in the table below:

value	meaning
<hr/>	
all	turn on all flags below
module	trace modules as they register themselves
hex	display the hex address of the init/fini functions
warning	show any warnings
pre	generate module list prior to dependency resolution
dep	trace module dependency resolution
post	generate module list after dependency resolution
force	generate a module list after dependency and forced ordering is complete

The values can be combined using a comma separated list.

One of the advantages of the dynamic scaffold is that the driver behaves in a similar way to the other front end drivers. For example consider a small project consisting of 4 definition implementation modules (‘`a.def`’, ‘`a.mod`’, ‘`b.def`’, ‘`b.mod`’, ‘`c.def`’, ‘`c.mod`’, ‘`d.def`’, ‘`d.mod`’) and a program module ‘`program.mod`’.

To link this project we could:

```
$ gm2 -g -c a.mod
$ gm2 -g -c b.mod
$ gm2 -g -c c.mod
$ gm2 -g -c d.mod
$ gm2 -g program.mod a.o b.o c.o d.o
```

The module initialization sequence is defined by the ISO standard to follow the import graph traversal. The initialization order is the order in which the corresponding separate modules finish the processing of their import lists.

However, if required, you can override this using ‘`-fruntime-modules=a,b,c,d`’ for example which forces the initialization sequence to ‘`a`’, ‘`b`’, ‘`c`’ and ‘`d`’.

2.3 Elementary data types

This section describes the elementary data types supported by GNU Modula-2. It also describes the relationship between these data types and the equivalent C data types.

The following data types are supported: INTEGER, LONGINT, SHORTINT, CARDINAL, LONGCARD, SHORTCARD, BOOLEAN, REAL, LONGREAL, SHORTREAL, COMPLEX, LONGCOMPLEX, SHORTCOMPLEX and CHAR.

An equivalence table is given below:

GNU Modula-2	GNU C
<hr/>	
INTEGER	int
LONGINT	long long int
SHORTINT	short int
CARDINAL	unsigned int
LONGCARD	long long unsigned int
SHORTCARD	short unsigned int
BOOLEAN	bool
REAL	double
LONGREAL	long double
SHORTREAL	float
CHAR	char
SHORTCOMPLEX	complex float
COMPLEX	complex double
LONGCOMPLEX	complex long double

Note that GNU Modula-2 also supports fixed sized data types which are exported from the SYSTEM module. See Section “The PIM system module” in gm2. See Section “The ISO system module” in gm2.

2.4 Permanently accessible base procedures.

This section describes the procedures and functions which are always visible.

2.4.1 Standard procedures and functions common to PIM and ISO

The following procedures are implemented and conform with Programming in Modula-2 and ISO Modula-2: NEW, DISPOSE, INC, DEC, INCL, EXCL and HALT. The standard functions are: ABS, CAP, CHR, FLOAT, HIGH, LFLOAT, LTRUNC, MIN, MAX, ODD, SFLOAT, STRUNC TRUNC and VAL. All these functions and procedures (except HALT, NEW, DISPOSE and, under non constant conditions, LENGTH) generate in-line code for efficiency.

```
(*  
  ABS - returns the positive value of i.  
*)  
  
PROCEDURE ABS (i: <any signed type>) : <any signed type> ;
```

```
(*  
  CAP - returns the capital of character ch providing  
        ch lies within the range 'a'..'z'. Otherwise ch
```

```

        is returned unaltered.
*)

PROCEDURE CAP (ch: CHAR) : CHAR ;

(*
CHR - converts a value of a <whole number type> into a CHAR.
CHR(x) is shorthand for VAL(CHAR, x).
*)

PROCEDURE CHR (x: <whole number type>) : CHAR ;

(*
DISPOSE - the procedure DISPOSE is replaced by:
DEALLOCATE(p, TSIZE(p^)) ;
The user is expected to import the procedure DEALLOCATE
(normally found in the module, Storage.)

In: a variable p: of any pointer type which has been
     initialized by a call to NEW.
Out: the area of memory
      holding p^ is returned to the system.
      Note that the underlying procedure DEALLOCATE
      procedure in module Storage will assign p to NIL.
*)

PROCEDURE DISPOSE (VAR p:<any pointer type>) ;

(*
DEC - can either take one or two parameters. If supplied
with one parameter then on the completion of the call to
DEC, v will have its predecessor value. If two
parameters are supplied then the value v will have its
n'th predecessor. For these reasons the value of n
must be >=0.
*)

PROCEDURE DEC (VAR v: <any base type>; [n: <any base type> = 1]) ;

(*
EXCL - excludes bit element e from a set type s.
*)

PROCEDURE EXCL (VAR s: <any set type>; e: <element of set type s>) ;

```

```

(*
  FLOAT - will return a REAL number whose value is the same as o.
*)

PROCEDURE FLOAT (o: <any whole number type>) : REAL ;

(*
  FLOATS - will return a SHORTREAL number whose value is the same as o.
*)

PROCEDURE FLOATS (o: <any whole number type>) : REAL ;

(*
  FLOATL - will return a LONGREAL number whose value is the same as o.
*)

PROCEDURE FLOATL (o: <any whole number type>) : REAL ;

(*
  HALT - will call the HALT procedure inside the module M2RTS.
  Users can replace M2RTS.
*)

PROCEDURE HALT ;

(*
  HIGH - returns the last accessible index of an parameter declared as
  ARRAY OF CHAR.  Thus

    PROCEDURE foo (a: ARRAY OF CHAR) ;
      VAR
        c: CARDINAL ;
      BEGIN
        c := HIGH(a)
      END foo ;

      BEGIN
        foo('hello')
      END

      will cause the local variable c to contain the value 5
*)

PROCEDURE HIGH (a: ARRAY OF CHAR) : CARDINAL ;

```

```

(*
  INC - can either take one or two parameters. If supplied
  with one parameter then on the completion of the call to
  INC, v will have its successor value. If two
  parameters are supplied then the value v will have its
  n'th successor. For these reasons the value of n
  must be >=0.
*)

PROCEDURE INC (VAR v: <any base type>; [n: <any base type> = 1]) ;

(*
  INCL - includes bit element e to a set type s.
*)

PROCEDURE INCL (VAR s: <any set type>; e: <element of set type s>) ;

(*
  LFLOAT - will return a LONGREAL number whose value is the same as o.
*)

PROCEDURE LFLOAT (o: <any whole number type>) : LONGREAL ;

(*
  LTRUNC - will return a LONG<type> number whose value is the
  same as o. PIM2, PIM3 and ISO Modula-2 will return
  a LONGCARD whereas PIM4 returns LONGINT.
*)

PROCEDURE LTRUNC (o: <any floating point type>) : LONG<type> ;

(*
  MIN - returns the lowest legal value of an ordinal type.
*)

PROCEDURE MIN (t: <ordinal type>) : <ordinal type> ;

(*
  MAX - returns the largest legal value of an ordinal type.
*)

PROCEDURE MAX (t: <ordinal type>) : <ordinal type> ;

```

```

(*
  NEW - the procedure NEW is replaced by:
  ALLOCATE(p, TSIZE(p^)) ;
  The user is expected to import the procedure ALLOCATE
  (normally found in the module, Storage.)

  In:  a variable p: of any pointer type.
  Out: variable p is set to some allocated memory
        which is large enough to hold all the contents of p^.
*)

PROCEDURE NEW (VAR p:<any pointer type>) ;

(*
  ODD - returns TRUE if the value is not divisible by 2.
*)

PROCEDURE ODD (x: <whole number type>) : BOOLEAN ;

(*
  SFLOAT - will return a SHORTREAL number whose value is the same
  as o.
*)

PROCEDURE SFLOAT (o: <any whole number type>) : SHORTREAL ;

(*
  STRUNC - will return a SHORT<type> number whose value is the same
  as o. PIM2, PIM3 and ISO Modula-2 will return a
  SHORTCARD whereas PIM4 returns SHORTINT.
*)

PROCEDURE STRUNC (o: <any floating point type>) : SHORT<type> ;

(*
  TRUNC - will return a <type> number whose value is the same as o.
  PIM2, PIM3 and ISO Modula-2 will return a CARDINAL
  whereas PIM4 returns INTEGER.
*)

PROCEDURE TRUNC (o: <any floating point type>) : <type> ;

(*
  TRUNCS - will return a <type> number whose value is the same
  as o. PIM2, PIM3 and ISO Modula-2 will return a

```

```

        SHORTCARD whereas PIM4 returns SHORTINT.
*)

PROCEDURE TRUNCS (o: <any floating point type>) : <type> ;

(*
  TRUNCL - will return a <type> number whose value is the same
  as o. PIM2, PIM3 and ISO Modula-2 will return a
  LONGCARD whereas PIM4 returns LONGINT.
*)

PROCEDURE TRUNCL (o: <any floating point type>) : <type> ;

(*
  VAL - converts data i of <any simple data type 2> to
  <any simple data type 1> and returns this value.
  No range checking is performed during this conversion.
*)

PROCEDURE VAL (<any simple data type 1>,
               i: <any simple data type 2>) : <any simple data type 1> ;

```

2.4.2 ISO specific standard procedures and functions

The standard function LENGTH is specific to ISO Modula-2 and is defined as:

```

(*
  IM - returns the imaginary component of a complex type.
  The return value will be the same type as the imaginary field
  within the complex type.
*)

PROCEDURE IM (c: <any complex type>) : <floating point type> ;

(*
  INT - returns an INTEGER value which has the same value as v.
  This function is equivalent to: VAL(INTEGER, v).
*)

PROCEDURE INT (v: <any ordinal type>) : INTEGER ;

(*
  LENGTH - returns the length of string a.
*)

PROCEDURE LENGTH (a: ARRAY OF CHAR) : CARDINAL ;

```

This function is evaluated at compile time, providing that string **a** is a constant. If **a** cannot be evaluated then a call is made to **M2RTS.Length**.

```

(*
  ODD - returns a BOOLEAN indicating whether the whole number
        value, v, is odd.
*)

PROCEDURE ODD (v: <any whole number type>) : BOOLEAN ;

(*
  RE - returns the real component of a complex type.
  The return value will be the same type as the real field
  within the complex type.
*)

PROCEDURE RE (c: <any complex type>) : <floating point type> ;

```

2.5 Behavior of the high procedure function

This section describes the behavior of the standard procedure function **HIGH** and it includes a table of parameters with the expected return result. The standard procedure function will return the last accessible indice of an **ARRAY**. If the parameter to **HIGH** is a static array then the result will be a **CARDINAL** value matching the upper bound in the **ARRAY** declaration.

The section also describes the behavior of a string literal actual parameter and how it relates to **HIGH**. The PIM2, PIM3, PIM4 and ISO standard is silent on the issue of whether a **nul** is present in an **ARRAY OF CHAR** actual parameter.

If the first parameter to **HIGH** is an unbounded **ARRAY** the return value from **HIGH** will be the last accessible element in the array. If a constant string literal is passed as an actual parameter then it will be **nul** terminated. The table and example code below describe the effect of passing an actual parameter and the expected **HIGH** value.

```

MODULE example1 ;

PROCEDURE test (a: ARRAY OF CHAR) ;
VAR
  x: CARDINAL ;
BEGIN
  x := HIGH (a) ;
  ...
END test ;

BEGIN
  test ('') ;
  test ('1') ;
  test ('12') ;

```

```
    test ('123') ;
END example1.
```

Actual parameter HIGH (a) a[HIGH (a)] = nul		
''	0	TRUE
'1'	1	TRUE
'12'	2	TRUE
'123'	3	TRUE

A constant string literal will be passed to an **ARRAY OF CHAR** with an appended nul **CHAR**. Thus if the constant string literal '' is passed as an actual parameter (in example1) then the result from **HIGH(a)** will be 0.

```
MODULE example2 ;

PROCEDURE test (a: ARRAY OF CHAR) ;
VAR
  x: CARDINAL ;
BEGIN
  x := HIGH (a) ;
  ...
END test ;

VAR
  str0: ARRAY [0..0] OF CHAR ;
  str1: ARRAY [0..1] OF CHAR ;
  str2: ARRAY [0..2] OF CHAR ;
  str3: ARRAY [0..3] OF CHAR ;
BEGIN
  str0 := 'a' ; (* No room for the nul terminator. *)
  test (str0) ;
  str1 := 'ab' ; (* No room for the nul terminator. *)
  test (str1) ;
  str2 := 'ab' ; (* Terminated with a nul. *)
  test (str2) ;
  str2 := 'abc' ; (* Terminated with a nul. *)
  test (str3) ;
END example2.
```

Actual parameter HIGH (a) a[HIGH (a)] = nul		
str0	0	FALSE
str1	1	FALSE
str2	2	TRUE
str3	3	TRUE

2.6 GNU Modula-2 supported dialects

This section describes the dialects understood by GNU Modula-2. It also describes the differences between the dialects and any command line switches which determine dialect behaviour.

The GNU Modula-2 compiler is compliant with four dialects of Modula-2. The language as defined in 'Programming in Modula-2' 2nd Edition, Springer Verlag, 1982, 1983 by Niklaus Wirth (PIM2), 'Programming in Modula-2', 3rd Corrected Edition, Springer Verlag, 1985 (PIM3) and 'Programming in Modula-2', 4th Edition, Springer Verlag, 1988 (PIM4) <http://freepages.modula2.org/report4/modula-2.html> and the ISO Modula-2 language as defined in ISO/IEC Information technology - programming languages - part 1: Modula-2 Language, ISO/IEC 10514-1 (1996) (ISO).

The command line switches ‘-fpim2’, ‘-fpim3’, ‘-fpim4’ and ‘-fiso’ can be used to force mutually exclusive features. However by default the compiler will not aggressively fail if a non mutually exclusive feature is used from another dialect. For example it is possible to specify ‘-fpim2’ and still utilize ‘DEFINITION’ ‘MODULES’ which have no export list.

Some dialect differences will force a compile time error, for example in PIM2 the user must IMPORT SIZE from the module SYSTEM, whereas in PIM3 and PIM4 SIZE is a pervasive function. Thus compiling PIM4 source code with the ‘-fpim2’ switch will cause a compile time error. This can be fixed quickly with an additional IMPORT or alternatively by compiling with the ‘-fpim4’ switch.

However there are some very important differences between the dialects which are mutually exclusive and therefore it is vital that users choose the dialects with care when these language features are used.

2.6.1 Integer division, remainder and modulus

The most dangerous set of mutually exclusive features found in the four dialects supported by GNU Modula-2 are the INTEGER division, remainder and modulus arithmetic operators. It is important to note that the same source code can be compiled to give different run time results depending upon these switches! The reference manual for the various dialects of Modula-2 are quite clear about this behavior and sadly there are three distinct definitions.

The table below illustrates the problem when a negative operand is used.

Pim2/3				Pim4			ISO		
lval	rval	DIV	MOD	DIV	MOD	DIV	MOD	/	REM
31	10	3	1	3	1	3	1	3	1
-31	10	-3	-1	-4	9	-4	9	-3	-1
31	-10	-3	1	-3	1	Exception	-3	1	
-31	-10	3	-1	4	9	Exception	3	-1	

See also P24 of PIM2, P27 of PIM3, P29 of PIM4 and P201 of the ISO Standard. At present all dialect division, remainder and modulus are implemented as above, apart from the exception calling in the ISO dialect. Instead of exception handling the results are the same as the PIM4 dialect. This is a temporary implementation situation.

2.7 Exception implementation

This section describes how exceptions are implemented in GNU Modula-2 and how command line switches affect their behavior. The option ‘`-fsoft-check-all`’ enables all software checking of nil dereferences, division by zero etc. Additional code is produced to check these conditions and exception handlers are invoked if the conditions prevail.

Without ‘`-fsoft-check-all`’ these exceptions will be caught by hardware (assuming the hardware support exists) and a signal handler is invoked. The signal handler will in turn THROW an exception which will be caught by the appropriate Modula-2 handler. However the action of throwing an exception from within a signal handler is implementation defined (according to the C++ documentation). For example on the x86_64 architecture this works whereas on the i686 architecture it does not. Therefore to ensure portability it is recommended to use ‘`-fsoft-check-all`’.

²

2.8 How to detect run time problems at compile time

Consider the following program:

```
MODULE assignvalue ;  (*!m2iso+gm2*)

PROCEDURE bad () : INTEGER ;
VAR
    i: INTEGER ;
BEGIN
    i := -1 ;
    RETURN i
END bad ;

VAR
    foo: CARDINAL ;
BEGIN
    (* The m2rte plugin will detect this as an error, post
       optimization. *)
    foo := bad ()
END assignvalue.
```

here we see that the programmer has overlooked that the return value from ‘bad’ will cause an overflow to ‘foo’. If we compile the code with the following options:

```
$ gm2 -g -fsoft-check-all -O2 -c assignvalue.mod
assignvalue.mod:16:0:inevitable that this error will occur at run time,
assignment will result in an overflow
```

The gm2 semantic plugin is automatically run and will generate a warning message for every exception call which is known as reachable. It is highly advised to run the optimizer (‘`-O2`’ or ‘`-O3`’) with ‘`-fsoft-check-all`’ so that the compiler is able to run the optimizer and perform variable and flow analysis before the semantic plugin is invoked.

² ‘`-fsoft-check-all`’ can be effectively combined with ‘`-O2`’ to semantically analyze source code for possible run time errors at compile time.

The ‘-Wuninit-variable-checking’ can be used to identify uninitialized variables within the first basic block in a procedure. The checking is limited to variables so long as they are not an array or set or a variant record or var parameter.

The following example detects whether a sub component within a record is uninitialized.

```
MODULE testlarge2 ;

TYPE
    color = RECORD
        r, g, b: CARDINAL ;
    END ;

    pixel = RECORD
        fg, bg: color ;
    END ;

PROCEDURE test ;
VAR
    p: pixel ;
BEGIN
    p.fg.r := 1 ;
    p.fg.g := 2 ;
    p.fg.g := 3 ;    (* Deliberate typo should be p.fg.b.  *)
    p.bg := p.fg ;   (* Accessing an uninitialized field.  *)
END test ;

BEGIN
    test
END testlarge2.
$ gm2 -c -Wuninit-variable-checking testlarge2.mod
testlarge2.mod:19:13: warning: In procedure ‘test’: attempting to
access expression before it has been initialized
  19 |     p.bg := p.fg ;   (* Accessing an uninitialized field.  *)
      |           ^~~~
```

The following example detects if an individual field is uninitialized.

```
MODULE testwithnoptr ;

TYPE
    Vec = RECORD
        x, y: CARDINAL ;
    END ;

PROCEDURE test ;
VAR
    p: Vec ;
BEGIN
    WITH p DO
```

```

x := 1 ;
x := 2 (* Deliberate typo, user meant y. *)
END ;
IF p.y = 2
THEN
END
END test ;

BEGIN
test
END testwithnoptr.

```

The following example detects a record is uninitialized via a pointer variable in a ‘WITH’ block.

```

$ gm2 -g -c -Wuninit-variable-checking testwithnoptr.mod
testwithnoptr.mod:21:8: warning: In procedure ‘test’: attempting to
access expression before it has been initialized
21 |     IF p.y = 2
      |
MODULE testnew6 ;

FROM Storage IMPORT ALLOCATE ;

TYPE
    PtrToVec = POINTER TO RECORD
        x, y: INTEGER ;
    END ;

PROCEDURE test ;
VAR
    p: PtrToVec ;
BEGIN
    NEW (p) ;
    WITH p^ DO
        x := 1 ;
        x := 2 (* Deliberate typo, user meant y. *)
    END ;
    IF p^.y = 2
    THEN
    END
END test ;

BEGIN
test
END testnew6.

$ gm2 -g -c -Wuninit-variable-checking testnew6.mod

```

```
testnew6.mod:19:9: warning: In procedure 'test': attempting to
access expression before it has been initialized
19 |     IF p^.y = 2
|     ^~~~
```

2.9 GNU Modula-2 language extensions

This section introduces the GNU Modula-2 language extensions. The GNU Modula-2 compiler allows abstract data types to be any type, not just restricted to a pointer type providing the ‘-fextended-opaque’ option is supplied See Section “Compiler options” in gm2.

Declarations can be made in any order, whether they are types, constants, procedures, nested modules or variables.

GNU Modula-2 also allows programmers to interface to C and assembly language.

GNU Modula-2 provides support for the special tokens `--LINE--`, `--FILE--`, `--FUNCTION--` and `--DATE--`. Support for these tokens will occur even if the ‘-fcpp’ option is not supplied. A table of these identifiers and their data type and values is given below:

Scope	GNU Modula-2 token	Data type and example value
anywhere	<code>--LINE--</code>	Constant Literal compatible with CARDINAL, INTEGER and WORD. Example 1234
anywhere	<code>--FILE--</code>	Constant string compatible with parameter ARRAY OF CHAR or an ARRAY whose SIZE is >= string length. Example "hello.mod"
procedure	<code>--FUNCTION--</code>	Constant string compatible with parameter ARRAY OF CHAR or an ARRAY whose SIZE is >= string length. Example "calc"
module	<code>--FUNCTION--</code>	Example "module hello initialization"
anywhere	<code>--DATE--</code>	Constant string compatible with parameter ARRAY OF CHAR or an ARRAY whose SIZE is >= string length. Example "Thu Apr 29 10:07:16 BST 2004"
anywhere	<code>--COLUMN--</code>	Gives a constant literal number determining the left hand column

```
where the first _ appears in
__COLUMN__. The left most column
is 1.
```

The preprocessor ‘cpp’ can be invoked via the ‘-fcpp’ command line option. This in turn invokes ‘cpp’ with the following arguments ‘-traditional -lang=asm’. These options preserve comments and all quotations. ‘gm2’ treats a ‘#’ character in the first column as a preprocessor directive unless ‘-fno-cpp’ is supplied.

For example here is a module which calls `FatalError` via the macro `ERROR`.

```
MODULE cpp ;

FROM SYSTEM IMPORT ADR, SIZE ;
FROM libc IMPORT exit, printf, malloc ;

PROCEDURE FatalError (a, file: ARRAY OF CHAR;
                      line: CARDINAL;
                      func: ARRAY OF CHAR) ;
BEGIN
  printf ("%s:%d:fatal error, %s, in %s\n",
         ADR (file), line, ADR (a), ADR (func)) ;
  exit (1)
END FatalError ;

#define ERROR(X) FatalError(X, __FILE__, __LINE__, __FUNCTION__)

VAR
  pc: POINTER TO CARDINAL;
BEGIN
  pc := malloc (SIZE (CARDINAL)) ;
  IF pc = NIL
  THEN
    ERROR ('out of memory')
  END
END cpp.
```

Another use for the C preprocessor in Modula-2 might be to turn on debugging code. For example the library module `FormatStrings.mod` uses procedures from `DynamicStrings.mod` and to track down memory leaks it was useful to track the source file and line where each string was created. Here is a section of `FormatStrings.mod` which shows how the debugging code was enabled and disabled by adding `-fcpp` to the command line.

```
FROM DynamicStrings IMPORT String, InitString, InitStringChar, Mark,
                     ConCat, Slice, Index, char,
                     Assign, Length, Mult, Dup, ConCatChar,
                     PushAllocation, PopAllocationExemption,
                     InitStringDB, InitStringCharStarDB,
                     InitStringCharDB, MultDB, DupDB, SliceDB ;
```

```

(*
#define InitString(X) InitStringDB(X, __FILE__, __LINE__)
#define InitStringCharStar(X) InitStringCharStarDB(X, __FILE__, \
                                         __LINE__)
#define InitStringChar(X) InitStringCharDB(X, __FILE__, __LINE__)
#define Mult(X,Y) MultDB(X, Y, __FILE__, __LINE__)
#define Dup(X) DupDB(X, __FILE__, __LINE__)
#define Slice(X,Y,Z) SliceDB(X, Y, Z, __FILE__, __LINE__)
*)

PROCEDURE doDSdbEnter ;
BEGIN
    PushAllocation
END doDSdbEnter ;

PROCEDURE doDSdbExit (s: String) ;
BEGIN
    s := PopAllocationExemption (TRUE, s)
END doDSdbExit ;

PROCEDURE DSdbEnter ;
BEGIN
END DSdbEnter ;

PROCEDURE DSdbExit (s: String) ;
BEGIN
END DSdbExit ;

(*
#define DBsbEnter doDBsbEnter
#define DBsbExit  doDBsbExit
*)

PROCEDURE Sprintf1 (s: String; w: ARRAY OF BYTE) : String ;
BEGIN
    DSdbEnter ;
    s := FormatString (HandleEscape (s), w) ;
    DSdbExit (s) ;
    RETURN s
END Sprintf1 ;

```

It is worth noting that the overhead of this code once `-fcpp` is not present and `-O2` is used will be zero since the local empty procedures `DSdbEnter` and `DSdbExit` will be thrown away by the optimization passes of the GCC backend.

2.9.1 Optional procedure parameter

GNU Modula-2 allows the last parameter to a procedure or function parameter to be optional. For example in the ISO library COROUTINES.def the procedure NEWROUTINE is defined as having an optional fifth argument (`initProtection`) which, if absent, is automatically replaced by NIL.

```
PROCEDURE NEWROUTINE (procBody: PROC; workspace: SYSTEM.ADDRESS;
                      size: CARDINAL; VAR cr: ROUTINE;
                      [initProtection: PROTECTION = NIL]);
```

(* Creates a new coroutine whose body is given by procBody,
 and returns the identity of the coroutine in cr.
 workspace is a pointer to the work space allocated to
 the coroutine; size specifies the size of this workspace
 in terms of SYSTEM.LOC.

The optional fifth argument may contain a single parameter
 which specifies the initial protection level of the coroutine.
*)

The implementation module COROUTINES.mod implements this procedure using the following syntax:

```
PROCEDURE NEWROUTINE (procBody: PROC; workspace: SYSTEM.ADDRESS;
                      size: CARDINAL; VAR cr: ROUTINE;
                      [initProtection: PROTECTION]);
```

BEGIN

```
END NEWROUTINE ;
```

Note that it is illegal for this declaration to contain an initializer value for `initProtection`. However it is necessary to surround this parameter with the brackets [and]. This serves to remind the programmer that the last parameter was declared as optional in the definition module.

Local procedures can be declared to have an optional final parameter in which case the initializer is mandatory in the implementation or program module.

GNU Modula-2 also provides additional fixed sized data types which are all exported from the SYSTEM module. See Section “The PIM system module” in gm2. See Section “The ISO system module” in gm2.

2.10 Type compatibility

This section discuss the issues surrounding assignment, expression and parameter compatibility, their effect of the additional fixed sized datatypes and also their effect of run time checking. The data types supported by the compiler are:

GNU Modula-2	scope	switches
<hr/>		
INTEGER	pervasive	
LONGINT	pervasive	

SHORTINT	pervasive
CARDINAL	pervasive
LONGCARD	pervasive
SHORTCARD	pervasive
BOOLEAN	pervasive
BITSET	pervasive
REAL	pervasive
LONGREAL	pervasive
SHORTREAL	pervasive
CHAR	pervasive
SHORTCOMPLEX	pervasive
COMPLEX	pervasive
LONGCOMPLEX	pervasive
LOC	SYSTEM -fiso
BYTE	SYSTEM
WORD	SYSTEM
ADDRESS	SYSTEM

The following extensions are supported for most architectures (please check SYSTEM.def).

INTEGER8	SYSTEM
INTEGER16	SYSTEM
INTEGER32	SYSTEM
INTEGER64	SYSTEM
CARDINAL8	SYSTEM
CARDINAL16	SYSTEM
CARDINAL32	SYSTEM
CARDINAL64	SYSTEM
BITSET8	SYSTEM
BITSET16	SYSTEM
BITSET32	SYSTEM
WORD16	SYSTEM
WORD32	SYSTEM
WORD64	SYSTEM
REAL32	SYSTEM
REAL64	SYSTEM
REAL96	SYSTEM
REAL128	SYSTEM
COMPLEX32	SYSTEM
COMPLEX64	SYSTEM
COMPLEX96	SYSTEM
COMPLEX128	SYSTEM

The Modula-2 language categorizes compatibility between entities of possibly differing types into three sub components: expressions, assignments, and parameters. Parameter

compatibility is further divided into two sections for pass by reference and pass by value compatibility.

For more detail on the Modula-2 type compatibility see the Modula-2 ISO standard BS ISO/IEC 10514-1:1996 page 121-125. For detail on the PIM type compatibility see Programming in Modula-2 Edition 4 page 29, (Elementary Data Types).

2.10.1 Expression compatibility

Modula-2 restricts the types of expressions to the same type. Expression compatibility is a symmetric relation.

For example two sub expressions of `INTEGER` and `CARDINAL` are not expression compatible (<http://freepages.modula2.org/report4/modula-2.html> and ISO Modula-2).

In GNU Modula-2 this rule is also extended across all fixed sized data types (imported from `SYSTEM`).

2.10.2 Assignment compatibility

This section discusses the assignment issues surrounding assignment compatibility of elementary types (`INTEGER`, `CARDINAL`, `REAL` and `CHAR` for example). The information here is found in more detail in the Modula-2 ISO standard BS ISO/IEC 10514-1:1996 page 122.

Assignment compatibility exists between the same sized elementary types.

Same type family of different sizes are also compatible as long as the `MAX(type)` and `MIN(type)` is known. So for example this includes the `INTEGER` family, `CARDINAL` family and the `REAL` family.

The reason for this is that when the assignment is performed the compiler will check to see that the expression (on the right of the `:=`) lies within the range of the designator type (on the left hand side of the `:=`). Thus these ordinal types can be assignment compatible. However it does mean that `WORD32` is not compatible with `WORD16` as `WORD32` does not have a minimum or maximum value and therefore cannot be checked. The compiler does not know which of the two bytes from `WORD32` should be copied into `WORD16` and which two should be ignored. Currently the types `BITSET8`, `BITSET16` and `BITSET32` are assignment incompatible. However this restriction maybe lifted when further run time checking is achieved.

Modula-2 does allow `INTEGER` to be assignment compatible with `WORD` as they are the same size. Likewise GNU Modula-2 allows `INTEGER16` to be compatible with `WORD16` and the same for the other fixed sized types and their sized equivalent in either `WORDn`, `BYTE` or `LOC` types. However it prohibits assignment between `WORD` and `WORD32` even though on many systems these sizes will be the same. The reasoning behind this rule is that the extended fixed sized types are meant to be used by applications requiring fixed sized data types and it is more portable to forbid the blurring of the boundaries between fixed sized and machine dependent sized types.

Intermediate code run time checking is always generated by the front end. However this intermediate code is only translated into actual code if the appropriate command line switches are specified. This allows the compiler to perform limited range checking at compile time. In the future it will allow the extensive GCC optimizations to propagate constant values through to the range checks which if they are found to exceed the type range will result in a compile time error message.

2.10.3 Parameter compatibility

Parameter compatibility is divided into two areas, pass by value and pass by reference (VAR). In the case of pass by value the rules are exactly the same as assignment. However in the second case, pass by reference, the actual parameter and formal parameter must be the same size and family. Furthermore INTEGER and CARDINALs are not treated as compatible in the pass by reference case.

The types BYTE, LOC, WORD and WORDn derivatives are assignment and parameter compatible with any data type of the same size.

2.11 Unbounded by reference

This section documents a GNU Modula-2 compiler switch which implements a language optimization surrounding the implementation of unbounded arrays. In GNU Modula-2 the unbounded array is implemented by utilizing an internal structure `struct {dataType *address, unsigned int high}`. So given the Modula-2 procedure declaration:

```
PROCEDURE foo (VAR a: ARRAY OF dataType) ;
BEGIN
  IF a[2]= (* etc *)
END foo ;
```

it is translated into GCC `trees`, which can be represented in their C form thus:

```
void foo (struct {dataType *address, unsigned int high} a)
{
  if (a.address[2] == /* etc */
}
```

Whereas if the procedure `foo` was declared as:

```
PROCEDURE foo (a: ARRAY OF dataType) ;
BEGIN
  IF a[2]= (* etc *)
END foo ;
```

then it is implemented by being translated into the following GCC `trees`, which can be represented in their C form thus:

```
void foo (struct {dataType *address, unsigned int high} a)
{
  dataType *copyContents = (dataType *)alloca (a.high+1);
  memcpy(copyContents, a.address, a.high+1);
  a.address = copyContents;

  if (a.address[2] == /* etc */
}
```

This implementation works, but it makes a copy of each non VAR unbounded array when a procedure is entered. If the unbounded array is not changed during procedure `foo` then this implementation will be very inefficient. In effect Modula-2 lacks the `REF` keyword of Ada. Consequently the programmer maybe tempted to sacrifice semantic clarity for greater efficiency by declaring the parameter using the `VAR` keyword in place of `REF`.

The **-funbounded-by-reference** switch instructs the compiler to check and see if the programmer is modifying the content of any unbounded array. If it is modified then a copy will be made upon entry into the procedure. Conversely if the content is only read and never modified then this non VAR unbounded array is a candidate for being passed by reference. It is only a candidate as it is still possible that passing this parameter by reference could alter the meaning of the source code. For example consider the following case:

```

PROCEDURE StrConCat (VAR a: ARRAY OF CHAR; b, c: ARRAY OF CHAR) ;
BEGIN
    (* code which performs string a := b + c *)
END StrConCat ;

PROCEDURE foo ;
VAR
    a: ARRAY [0..3] OF CHAR ;
BEGIN
    a := 'q' ;
    StrConCat(a, a, a)
END foo ;

```

In the code above we see that the same parameter, **a**, is being passed three times to **StrConCat**. Clearly even though parameters **b** and **c** are never modified it would be incorrect to implement them as pass by reference. Therefore the compiler checks to see if any non VAR parameter is type compatible with any VAR parameter and if so it generates run time procedure entry checks to determine whether the contents of parameters **b** or **c** matches the contents of **a**. If a match is detected then a copy is made and the **address** in the unbounded **structure** is modified.

The compiler will check the address range of each candidate against the address range of any VAR parameter, providing they are type compatible. For example consider:

```

PROCEDURE foo (a: ARRAY OF BYTE; VAR f: REAL) ;
BEGIN
    f := 3.14 ;
    IF a[0]=BYTE(0)
    THEN
        (* etc *)
    END
END foo ;

PROCEDURE bar ;
BEGIN
    r := 2.0 ;
    foo(r, r)
END bar ;

```

Here we see that although parameter, **a**, is a candidate for the passing by reference, it would be incorrect to use this transformation. Thus the compiler detects that parameters, **a** and **f** are type compatible and will produce run time checking code to test whether the address range of their respective contents intersect.

2.12 Building a shared library

This section describes building a tiny shared library implemented in Modula-2 and built with `libtool`. Suppose a project consists of two definition modules and two implementation modules and a program module `a.def`, `a.mod`, `b.def`, `b.mod` and `c.mod`. The first step is to compile the modules using position independent code. This can be achieved by the following three commands:

```
libtool --tag=CC --mode=compile gm2 -g -c a.mod -o a.lo
libtool --tag=CC --mode=compile gm2 -g -c b.mod -o b.lo
libtool --tag=CC --mode=compile gm2 -g -c c.mod -o c.lo
```

The second step is to generate the shared library initialization and finalization routines. We can do this by asking `gm2` to generate a list of dependent modules and then use this to generate the scaffold. We also must compile the scaffold.

```
gm2 -c -g -fmakelist c.mod
gm2 -c -g -fmakeinit -fshared c.mod
libtool --tag=CC --mode=compile g++ -g -c c_m2.cpp -o c_m2.lo
```

The third step is to link all these `.lo` files.

```
libtool --mode=link gcc -g c_m2.lo a.lo b.lo c.lo \
-L$(prefix)/lib64 \
-rpath `pwd` -lgm2 -lstdc++ -lm -o libabc.la
```

At this point the shared library `libabc.so` will have been created inside the directory `.libs`.

2.13 How to produce swig interface files

This section describes how Modula-2 implementation modules can be called from Python (and other scripting languages such as TCL and Perl). GNU Modula-2 can be instructed to create a swig interface when it is compiling an implementation module. Swig then uses the interface file to generate all the necessary wrapping to that the desired scripting language may access the implementation module.

Here is an example of how you might call upon the services of the Modula-2 library module `NumberIO` from Python3.

The following commands can be used to generate the Python3 module:

```
export src='directory to the sources'
export prefix='directory to where the compiler is installed'
gm2 -I${src} -c -g -fswig ${src}/../../../../gm2-libs/NumberIO.mod
gm2 -I${src} -c -g -fmakelist ${src}/../../../../gm2-libs/NumberIO.mod

gm2 -I${src} -c -g -fmakeinit -fshared \
${src}/../../../../gm2-libs/NumberIO.mod

swig -c++ -python3 NumberIO.i

libtool --mode=compile g++ -g -c -I${src} NumberIO_m2.cpp \
-o NumberIO_m2.lo
```

```

libtool --tag=CC --mode=compile gm2 -g -c \
-I${src}../../gm2-libs \
${src}../../../../gm2-libs/NumberIO.mod -o NumberIO.lo

libtool --tag=CC --mode=compile g++ -g -c NumberIO_wrap.cxx \
-I/usr/include/python3 -o NumberIO_wrap.lo

libtool --mode=link gcc -g NumberIO_m2.lo NumberIO_wrap.lo \
-L${prefix}/lib64 \
-rpath `pwd` -lgm2 -lstdc++ -lm -o libNumberIO.la

cp .libs/libNumberIO.so _NumberIO.so

```

The first four commands, generate the swig interface file `NumberIO.i` and python wrap files `NumberIO_wrap.cxx` and `NumberIO.py`. The next three `libtool` commands compile the C++ and Modula-2 source code into `.lo` objects. The last `libtool` command links all the `.lo` files into a `.la` file and includes all shared library dependencies.

Now it is possible to run the following Python script (called `testnum.py`):

```

import NumberIO

print ("1234 x 2 =", NumberIO.NumberIO_StrToInt("1234")*2)
like this:
$ python3 testnum.py
1234 x 2 = 2468

```

See Section “Producing a Python module” in `gm2` for another example which uses the `UNQUALIFIED` keyword to reduce the module name clutter from the viewport of Python3.

2.13.1 Limitations of automatic generated of Swig files

This section discusses the limitations of automatically generating swig files. From the previous example we see that the module `NumberIO` had a swig interface file `NumberIO.i` automatically generated by the compiler. If we consider three of the procedure definitions in `NumberIO.def` we can see the success and limitations of the automatic interface generation.

```

PROCEDURE StrToHex (a: ARRAY OF CHAR; VAR x: CARDINAL) ;
PROCEDURE StrToInt (a: ARRAY OF CHAR; VAR x: INTEGER) ;
PROCEDURE ReadInt (VAR x: CARDINAL) ;

```

Below are the swig interface prototypes:

```

extern void NumberIO_StrToHex (char *_m2_address_a,
                               int _m2_high_a, unsigned int *OUTPUT);
/* parameters: x is known to be an OUTPUT */
extern void NumberIO_StrToInt (char *_m2_address_a,
                               int _m2_high_a, int *OUTPUT);
/* parameters: x is guessed to be an OUTPUT */
extern void NumberIO_ReadInt (int *x);
/* parameters: x is unknown */

```

In the case of `StrToHex` it can be seen that the compiler detects that the last parameter is an output. It explicitly tells swig this by using the parameter name `OUTPUT` and in the

following comment it informs the user that it knows this to be an output parameter. In the second procedure `StrToInt` it marks the final parameter as an output, but it tells the user that this is only a guess. Finally in `ReadInt` it informs the user that it does not know whether the parameter, `x`, is an output, input or an inout parameter.

The compiler decides whether to mark a parameter as either: `INPUT`, `OUTPUT` or `INOUT` if it is read before written or visa versa in the first basic block. At this point it will write output that the parameter is known. If it is not read or written in the first basic block then subsequent basic blocks are searched and the result is commented as a guess. Finally if no read or write occurs then the parameter is commented as unknown. However, clearly it is possible to fool this mechanism. Nevertheless automatic generation of implementation module into swig interface files was thought sufficiently useful despite these limitations.

In conclusion it would be wise to check all parameters in any automatically generated swig interface file. Furthermore you can force the automatic mechanism to generate correct interface files by reading or writing to the `VAR` parameter in the first basic block of a procedure.

2.14 How to produce a Python module

This section describes how it is possible to produce a Python module from Modula-2 code. There are a number of advantages to this approach, it ensures your code reaches a wider audience, maybe it is easier to initialize your application in Python.

The example application here is a pedagogical two dimensional gravity next event simulation. The Python module needs to have a clear API which should be placed in a single definition module. Furthermore the API should only use fundamental pervasive data types and strings. Below the API is contained in the file `twoDsim.def`:

```
DEFINITION MODULE twoDsim ;

EXPORT UNQUALIFIED gravity, box, poly3, poly5, poly6, mass,
      fix, circle, pivot, velocity, accel, fps,
      replayRate, simulateFor ;
(*
   gravity - turn on gravity at: g m^2
*)

PROCEDURE gravity (g: REAL) ;

(*
   box - place a box in the world at (x0,y0),(x0+i,y0+j)
*)

PROCEDURE box (x0, y0, i, j: REAL) : CARDINAL ;

(*
   poly3 - place a triangle in the world at:
```

```
(x0,y0),(x1,y1),(x2,y2)
*)

PROCEDURE poly3 (x0, y0, x1, y1, x2, y2: REAL) : CARDINAL ;

(*
  poly5 - place a pentagon in the world at:
  (x0,y0),(x1,y1),(x2,y2),(x3,y3),(x4,y4)
*)

PROCEDURE poly5 (x0, y0, x1, y1,
                 x2, y2, x3, y3, x4, y4: REAL) : CARDINAL ;

(*
  poly6 - place a hexagon in the world at:
  (x0,y0),(x1,y1),(x2,y2),(x3,y3),(x4,y4),(x5,y5)
*)

PROCEDURE poly6 (x0, y0, x1, y1,
                 x2, y2, x3, y3,
                 x4, y4, x5, y5: REAL) : CARDINAL ;

(*
  mass - specify the mass of an object and return the, id.
*)

PROCEDURE mass (id: CARDINAL; m: REAL) : CARDINAL ;

(*
  fix - fix the object to the world.
*)

PROCEDURE fix (id: CARDINAL) : CARDINAL ;

(*
  circle - adds a circle to the world. Center
            defined by: x0, y0 radius, r.
*)

PROCEDURE circle (x0, y0, r: REAL) : CARDINAL ;
```

```

(*
  velocity - give an object, id, a velocity, vx, vy.
*)

PROCEDURE velocity (id: CARDINAL; vx, vy: REAL) : CARDINAL ;

(*
  accel - give an object, id, an acceleration, ax, ay.
*)

PROCEDURE accel (id: CARDINAL; ax, ay: REAL) : CARDINAL ;

(*
  fps - set frames per second.
*)

PROCEDURE fps (f: REAL) ;

(*
  replayRate - set frames per second during replay.
*)

PROCEDURE replayRate (f: REAL) ;

(*
  simulateFor - render for, t, seconds.
*)

PROCEDURE simulateFor (t: REAL) ;

END twodsim.
```

The keyword UNQUALIFIED can be used to ensure that the compiler will provide externally accessible functions `gravity`, `box`, `poly3`, `poly5`, `poly6`, `mass`, `fix`, `circle`, `pivot`, `velocity`, `accel`, `fps`, `replayRate`, `simulateFor` rather than name mangled alternatives. Hence in our Python3 application we could write:

```

#!/usr/bin/env python3

from twodsim import *

b = box (0.0, 0.0, 1.0, 1.0)
b = fix (b)
```

```

c1 = circle (0.7, 0.7, 0.05)
c1 = mass (c1, 0.01)
c2 = circle (0.7, 0.1, 0.05)
c2 = mass (c2, 0.01)
c2 = fix (c2)
gravity (-9.81)
fps (24.0*4.0)
replayRate (24.0)
print ("creating frames")
try:
    simulateFor (1.0)
    print ("all done")
except:
    print ("exception raised")

```

which accesses the various functions defined and implemented by the module `twoDsim`. The Modula-2 source code is compiled via:

```

$ gm2 -g -fiso -c -fswig twoDsim.mod
$ gm2 -g -fiso -c -fmakelist twoDsim.mod
$ gm2 -g -fiso -c -fmakeinit twoDsim.mod

```

The first command both compiles the source file creating `twoDsim.o` and produces a swig interface file `swig.i`. We now use `swig` and `g++` to produce and compile the interface wrappers:

```

$ libtool --mode=compile g++ -g -c twoDsim_m2.cpp -o twoDsim_m2.lo
$ swig -c++ -python3 twoDsim.i
$ libtool --mode=compile g++ -c -fPIC twoDsim_wrap.cxx \
  -I/usr/include/python3 -o twoDsim_wrap.lo
$ libtool --mode=compile gm2 -g -fPIC -fiso -c deviceGnuPic.mod
$ libtool --mode=compile gm2 -g -fPIC -fiso -c roots.mod
$ libtool --mode=compile gm2 -g -fPIC -fiso -c -fswig \
  twoDsim.mod -o twoDsim.lo

```

Finally the application is linked into a shared library:

```

$ libtool --mode=link gcc -g twoDsim_m2.lo twoDsim_wrap.lo \
  roots.lo deviceGnuPic.lo \
  -L${prefix}/lib64 \
  -rpath `pwd` -lgm2 -lstdc++ -lm -o libtwoDsim.la
cp .libs/libtwoDsim.so _twoDsim.so

```

The library name must start with `_` to comply with the Python3 module naming scheme.

2.15 Interfacing GNU Modula-2 to C

The GNU Modula-2 compiler tries to use the C calling convention wherever possible however some parameters have no C equivalent and thus a language specific method is used. For example unbounded arrays are passed as a `struct {void *address, unsigned int high}` and the contents of these arrays are copied by callee functions when they are declared as non VAR parameters. The VAR equivalent unbounded array parameters need no copy, but still use the `struct` representation.

The recommended method of interfacing GNU Modula-2 to C is by telling the definition module that the implementation is in the C language. This is achieved by using the tokens DEFINITION MODULE FOR "C". Here is an example `libprintf.def`.

```
DEFINITION MODULE FOR "C" libprintf ;

EXPORT UNQUALIFIED printf ;

PROCEDURE printf (a: ARRAY OF CHAR; ...) : [ INTEGER ] ;

END libprintf.
```

the UNQUALIFIED keyword in the definition module informs GNU Modula-2 not to prefix the module name to exported references in the object file.

The `printf` declaration states that the first parameter semantically matches `ARRAY OF CHAR` but since the module is for the C language it will be mapped onto `char *`. The token `...` indicates a variable number of arguments (varargs) and all parameters passed here are mapped onto their C equivalents. Arrays and constant strings are passed as pointers. Lastly `[INTEGER]` states that the caller can ignore the function return result if desired.

The hello world program can be rewritten as:

```
MODULE hello ;

FROM libprintf IMPORT printf ;

BEGIN
    printf ("hello world\n")
END hello.
```

and it can be compiled by:

`'gm2 -g hello.mod -lc'`

In reality the '`-lc`' is redundant as `libc` is always included in the linking process. It is shown here to emphasize that the C library or object file containing `printf` must be present. The search path for modules can be changed by using '`-I`'.

If a procedure function is declared using varargs then some parameter values are converted. The table below summarizes the default conversions and default types used.

Actual Parameter	Default conversion	Type of actual value passed
<hr/>		
123	none	long long int
"hello world"	none	const char *
a: ARRAY OF CHAR	ADR (a)	char *
a: ARRAY [0..5] OF CHAR	ADR (a)	char *
3.14	none	long double

If you wish to pass `int` values then you should explicitly convert the constants using one of the conversion mechanisms. For example: `INTEGER(10)` or `VAL(INTEGER, 10)` or `CAST(INTEGER, 10)`.

2.16 Interface to assembly language

The interface for GNU Modula-2 to assembly language is almost identical to GNU C. The only alterations are that the keywords `asm` and `volatile` are in capitals, following the Modula-2 convention.

A simple, but highly non optimal, example is given below. Here we want to add the two CARDINALs `foo` and `bar` together and return the result. The target processor is assumed to be executing the `x86_64` instruction set.

```
PROCEDURE Example (foo, bar: CARDINAL) : CARDINAL ;
VAR
    myout: CARDINAL ;
BEGIN
    ASM VOLATILE ("movq %1,%rax; addq %2,%rax; movq %%rax,%0"
        : "=rm" (myout)          (* outputs *)
        : "rm" (foo), "rm" (bar)  (* inputs *)
        : "rax") ;              (* we trash *)
    RETURN( myout )
END Example ;
```

For a full description of this interface we refer the reader to the GNU C manual.

See Section “Extensions to the C Language Family” in `gcc`.

The same example can be written using the newer extensions of naming the operands rather than using numbered arguments.

```
PROCEDURE Example (foo, bar: CARDINAL) : CARDINAL ;
VAR
    myout: CARDINAL ;
BEGIN
    ASM VOLATILE (
        "movq %[left],%rax; addq %[right],%rax; movq %%rax,%[output]"
        : [output] "=rm" (myout)          (* outputs *)
        : [left] "rm" (foo), [right] "rm" (bar)  (* inputs *)
        : "rax") ;              (* we trash *)
    RETURN( myout )
END Example ;
```

Both examples generate exactly the same code. It is worth noting that the specifier “`rm`” indicates that the operand can be either a register or memory. Of course you must choose an instruction which can take either, but this allows the compiler to take make more efficient choices depending upon the optimization level given to the compiler.

2.17 Data type alignment

GNU Modula-2 allows you to specify alignment for types and variables. The syntax for alignment is to use the ISO pragma directives `<* bytealignment (expression) and *>`. These directives can be used after type and variable declarations.

The ebnf of the alignment production is:

```
Alignment := [ ByteAlignment ] =:
ByteAlignment := '<*' AttributeExpression '*'>' =:
```

```
AlignmentExpression := "(" ConstExpression ")" =:
```

The Alignment ebnf statement may be used during construction of types, records, record fields, arrays, pointers and variables. Below is an example of aligning a type so that the variable `bar` is aligned on a 1024 address.

```
MODULE align ;

TYPE
  foo = INTEGER <* bytealignment(1024) *> ;

VAR
  z : INTEGER ;
  bar: foo ;
BEGIN
END align.
```

The next example aligns a variable on a 1024 byte boundary.

```
MODULE align2 ;

VAR
  x : CHAR ;
  z : ARRAY [0..255] OF INTEGER <* bytealignment(1024) *> ;
BEGIN
END align2.
```

Here the example aligns a pointer on a 1024 byte boundary.

```
MODULE align4 ;

FROM SYSTEM IMPORT ADR ;
FROM libc IMPORT exit ;

VAR
  x : CHAR ;
  z : POINTER TO INTEGER <* bytealignment(1024) *> ;
BEGIN
  IF ADR(z) MOD 1024=0
  THEN
    exit(0)
  ELSE
    exit(1)
  END
END align4.
```

In example `align5` record field `y` is aligned on a 1024 byte boundary.

```
MODULE align5 ;

FROM SYSTEM IMPORT ADR ;
FROM libc IMPORT exit ;
```

```

TYPE
  rec = RECORD
    x: CHAR ;
    y: CHAR <* bytealignment(1024) *> ;
  END ;
VAR
  r: rec ;
BEGIN
  IF ADR(r.y) MOD 1024=0
  THEN
    exit(0)
  ELSE
    exit(1)
  END
END align5.

```

In the example below module align6 declares foo as an array of 256 INTEGERs. The array foo is aligned on a 1024 byte boundary.

```

MODULE align6 ;

FROM SYSTEM IMPORT ADR ;
FROM libc IMPORT exit ;

TYPE
  foo = ARRAY [0..255] OF INTEGER <* bytealignment(1024) *> ;

VAR
  x : CHAR ;
  z : foo ;
BEGIN
  IF ADR(z) MOD 1024=0
  THEN
    exit(0)
  ELSE
    exit(1)
  END
END align6.

```

2.18 Packing data types

The pragma `<* bytealignment(0) *>` can be used to specify that the fields within a RECORD are to be packed. Currently this only applies to fields which are declared as subranges, ordinal types and enumerated types. Here is an example of how two subranges might be packed into a byte.

```

TYPE
  bits3c = [0..7] ;
  bits3i = [-4..3] ;

```

```
byte = RECORD
    <* bytealignment(0) *>
    x: bits3c ;
    <* bitsunused(2) *>
    y: bits3i ;
END ;
```

Notice that the user has specified that in between fields `x` and `y` there are two bits unused.

Now the user wishes to create a record with byte numbers zero and one occupied and then an `INTEGER32` field which is four byte aligned. In this case byte numbers two and three will be unused. The pragma `bytealignment` can be issued at the start of the record indicating the default alignment for the whole record and this can be overridden by individual fields if necessary.

```
rec = RECORD
    <* bytealignment (1) *> ;
    a, b: byte ;
    x: INTEGER32 <* bytealignment(4) *> ;
END ;
```

In the following example the user has specified that a record has two fields `p` and `q` but that there are three bytes unused between these fields.

```
header = RECORD
    <* bytealignment(1) *>
    p: byte ;
    <* bytesunused(3) *>
    q: byte ;
END ;
```

The pragma `<* bytesunused(x) *>` can only be used if the current field is on a byte boundary. There is also a `SYSTEM` pseudo procedure function `TBITSIZE(T)` which returns the minimum number of bits necessary to represent type `T`.

Another example of packing record bit fields is given below:

```
MODULE align21 ;

FROM libc IMPORT exit ;

TYPE
    colour = (red, blue, green, purple, white, black) ;

soc = PACKEDSET OF colour ;

rec = RECORD
    <* bytealignment(0) *>
    x: soc ;
    y: [-1..1] ;
END ;
```

```

VAR
  r: rec ;
  v: CARDINAL ;
BEGIN
  v := SIZE(r) ;
  IF SIZE(r)#1
  THEN
    exit(1)
  END ;
  r.x := soc{blue} ;
  IF r.x#soc{blue}
  THEN
    exit(2)
  END
END align21.

```

Here we see that the total size of this record is one byte and consists of a six bit set type followed by a 2 bit integer subrange.

2.19 Accessing GNU Modula-2 Built-ins

This section describes the built-in constants and functions defined in GNU Modula-2. The following compiler constants can be accessed using the `__ATTRIBUTE__ __BUILTIN__` keywords. These are not part of the Modula-2 language and they may differ depending upon the target architecture but they provide a method whereby common libraries can interface to a different underlying architecture.

The built-in constants are: `BITS_PER_UNIT`, `BITS_PER_WORD`, `BITS_PER_CHAR` and `UNITS_PER_WORD`. They are integrated into GNU Modula-2 by an extension to the `ConstFactor` rule:

```

ConstFactor := ConstQualIdentOrSet | Number | ConstString |
  "(" ConstExpression ")" | "NOT" ConstFactor |
  ConstAttribute =:
ConstAttribute := "__ATTRIBUTE__ __BUILTIN__ "(" "(" Ident ")" ")" =:

```

Here is an example taken from the ISO library `SYSTEM.def`:

```

CONST
  BITSPERLOC    = __ATTRIBUTE__ __BUILTIN__ ((BITS_PER_UNIT)) ;
  LOCSPERWORD   = __ATTRIBUTE__ __BUILTIN__ ((UNITS_PER_WORD)) ;

```

Built-in functions are transparent to the end user. All built-in functions are declared in `DEFINITION MODULES` and are imported as and when required. Built-in functions are declared in definition modules by using the `__BUILTIN__` keyword. Here is a section of the ISO library `LongMath.def` which demonstrates this feature.

```

PROCEDURE __BUILTIN__ sqrt (x: LONGREAL): LONGREAL;
(* Returns the square root of x *)

```

This indicates that the function `sqrt` will be implemented using the gcc built-in maths library. If gcc cannot utilize the built-in function (for example if the programmer requested

the address of `sqrt`) then code is generated to call the alternative function implemented in the **IMPLEMENTATION MODULE**.

Sometimes a function exported from the **DEFINITION MODULE** will have a different name from the built-in function within gcc. In such cases the mapping between the GNU Modula-2 function name and the gcc name is expressed using the keywords `__ATTRIBUTE__ __BUILTIN__ ((Ident))`. For example the function `sqrt` in `LongMath.def` maps onto the gcc built-in function `sqrtl` and this is expressed as:

```
PROCEDURE __ATTRIBUTE__ __BUILTIN__ ((sqrtl)) sqrt
    (x: LONGREAL) : LONGREAL;
    (* Returns the positive square root of x *)
```

The following module `Builtins.def` enumerates the list of built-in functions which can be accessed in GNU Modula-2. It also serves to define the parameter and return value for each function:

```
DEFINITION MODULE Builtins ;

FROM SYSTEM IMPORT ADDRESS ;

(* Floating point intrinsic procedure functions.  *)

PROCEDURE __BUILTIN__ isnanf (x: SHORTREAL) : INTEGER ;
PROCEDURE __BUILTIN__ isnan (x: REAL) : INTEGER ;
PROCEDURE __BUILTIN__ isnanl (x: LONGREAL) : INTEGER ;

(*
   longjmp - this GCC builtin restricts the val to always 1.
*)
(* do not use these two builtins, as gcc, only really
   anticipates that the Ada front end should use them
   and it only uses them in its runtime exception handling.
   We leave them here in the hope that someday they will
   behave more like their libc counterparts.  *)

PROCEDURE __BUILTIN__ longjmp (env: ADDRESS; val: INTEGER) ;
PROCEDURE __BUILTIN__ setjmp (env: ADDRESS) : INTEGER ;

(*
   frame_address - returns the address of the frame.
   The current frame is obtained if level is 0,

```

```

        the next level up if level is 1 etc.
*)

PROCEDURE __BUILTIN__ frame_address (level: CARDINAL) : ADDRESS ;

(*
    return_address - returns the return address of function.
        The current function return address is
        obtained if level is 0,
        the next level up if level is 1 etc.
*)

PROCEDURE __BUILTIN__ return_address (level: CARDINAL) : ADDRESS ;

(*
    alloca_trace - this is a no-op which is used for internal debugging.
*)

PROCEDURE alloca_trace (returned: ADDRESS; nBytes: CARDINAL) : ADDRESS ;

END Builtins.
```

Although this module exists and will result in the generation of in-line code if optimization flags are passed to GNU Modula-2, users are advised to utilize the same functions from more generic libraries. The built-in mechanism will be applied to these generic libraries where appropriate. Note for the mathematical routines to be in-lined you need to specify the ‘-ffast-math -O’ options.

2.20 The PIM system module

```

DEFINITION MODULE SYSTEM ;

EXPORT QUALIFIED BITSPERBYTE, BYTESPERWORD,
        ADDRESS, WORD, BYTE, CSIZE_T, CSSIZE_T, (*
        Target specific data types. *)
        ADR, TSIZE, ROTATE, SHIFT, THROW, TBITSIZE ;
        (* SIZE is also exported if -fpim2 is used. *)

CONST
    BITSPERBYTE    = __ATTRIBUTE__ __BUILTIN__ ((BITS_PER_UNIT)) ;
    BYTESPERWORD   = __ATTRIBUTE__ __BUILTIN__ ((UNITS_PER_WORD)) ;

(* Note that the full list of system and sized datatypes include:
    LOC, WORD, BYTE, ADDRESS,
```

(and the non language standard target types)

```
INTEGER8, INTEGER16, INTEGER32, INTEGER64,
CARDINAL8, CARDINAL16, CARDINAL32, CARDINAL64,
WORD16, WORD32, WORD64, BITSET8, BITSET16,
BITSET32, REAL32, REAL64, REAL128, COMPLEX32,
COMPLEX64, COMPLEX128, CSIZE_T, CSSIZE_T.
```

Also note that the non-standard data types will move into another module in the future. *)

(* The following types are supported on this target:

```
TYPE
  (* Target specific data types. *)
*)
```

*

```
all the functions below are declared internally to gm2
=====
```

```
PROCEDURE ADR (VAR v: <anytype>): ADDRESS;
(* Returns the address of variable v. *)
```

```
PROCEDURE SIZE (v: <type>) : ZType;
(* Returns the number of BYTES used to store a v of
any specified <type>. Only available if -fpim2 is used.
*)
```

```
PROCEDURE TSIZE (<type>) : CARDINAL;
(* Returns the number of BYTES used to store a value of the
specified <type>.
*)
```

```
PROCEDURE ROTATE (val: <a set type>;
                  num: INTEGER): <type of first parameter>;
(* Returns a bit sequence obtained from val by rotating up/right
or down/right by the absolute value of num. The direction is
down/right if the sign of num is negative, otherwise the direction
is up/left.
*)
```

```
PROCEDURE SHIFT (val: <a set type>;
                 num: INTEGER): <type of first parameter>;
(* Returns a bit sequence obtained from val by shifting up/left
or down/right by the absolute value of num, introducing
```

```

zeros as necessary. The direction is down/right if the sign of
num is negative, otherwise the direction is up/left.

*)

PROCEDURE THROW (i: INTEGER) <* noreturn *> ;
(*
THROW is a GNU extension and was not part of the PIM or ISO
standards. It throws an exception which will be caught by the
EXCEPT block (assuming it exists). This is a compiler builtin
function which interfaces to the GCC exception handling runtime
system.

GCC uses the term throw, hence the naming distinction between
the GCC builtin and the Modula-2 runtime library procedure Raise.
The later library procedure Raise will call SYSTEM.THROW after
performing various housekeeping activities.

*)

PROCEDURE TBITSIZE (<type>) : CARDINAL ;
(* Returns the minimum number of bits necessary to represent
<type>. This procedure function is only useful for determining
the number of bits used for any type field within a packed RECORD.
It is not particularly useful elsewhere since <type> might be
optimized for speed, for example a BOOLEAN could occupy a WORD.

*)
*)

(* The following procedures are invoked by GNU Modula-2 to
shift non word sized set types. They are not strictly part
of the core PIM Modula-2, however they are used
to implement the SHIFT procedure defined above,
which are in turn used by the Logitech compatible libraries.

Users will access these procedures by using the procedure
SHIFT above and GNU Modula-2 will map SHIFT onto one of
the following procedures.

*)

(*
ShiftVal - is a runtime procedure whose job is to implement
the SHIFT procedure of ISO SYSTEM. GNU Modula-2 will
inline a SHIFT of a single WORD sized set and will only
call this routine for larger sets.

*)

PROCEDURE ShiftVal (VAR s, d: ARRAY OF BITSET;
                    SetSizeInBits: CARDINAL;
                    ShiftCount: INTEGER) ;

```

```
(*  
    ShiftLeft - performs the shift left for a multi word set.  
        This procedure might be called by the back end of  
        GNU Modula-2 depending whether amount is known at  
        compile time.  
*)  
  
PROCEDURE ShiftLeft (VAR s, d: ARRAY OF BITSET;  
                      SetSizeInBits: CARDINAL;  
                      ShiftCount: CARDINAL) ;  
  
(*  
    ShiftRight - performs the shift left for a multi word set.  
        This procedure might be called by the back end of  
        GNU Modula-2 depending whether amount is known at  
        compile time.  
*)  
  
PROCEDURE ShiftRight (VAR s, d: ARRAY OF BITSET;  
                      SetSizeInBits: CARDINAL;  
                      ShiftCount: CARDINAL) ;  
  
(*  
    RotateVal - is a runtime procedure whose job is to implement  
        the ROTATE procedure of ISO SYSTEM. GNU Modula-2 will  
        inline a ROTATE of a single WORD (or less)  
        sized set and will only call this routine for larger  
        sets.  
*)  
  
PROCEDURE RotateVal (VAR s, d: ARRAY OF BITSET;  
                      SetSizeInBits: CARDINAL;  
                      RotateCount: INTEGER) ;  
  
(*  
    RotateLeft - performs the rotate left for a multi word set.  
        This procedure might be called by the back end of  
        GNU Modula-2 depending whether amount is known at  
        compile time.  
*)  
  
PROCEDURE RotateLeft (VAR s, d: ARRAY OF BITSET;  
                      SetSizeInBits: CARDINAL;
```

```

        RotateCount: CARDINAL) ;

(*
  RotateRight - performs the rotate right for a multi word set.
  This procedure might be called by the back end of
  GNU Modula-2 depending whether amount is known at
  compile time.
*)

PROCEDURE RotateRight (VAR s, d: ARRAY OF BITSET;
                      SetSizeInBits: CARDINAL;
                      RotateCount: CARDINAL) ;

END SYSTEM.
```

The different dialects of Modula-2 PIM-[234] and ISO Modula-2 declare the function SIZE in different places. PIM-[34] and ISO Modula-2 declare SIZE as a pervasive function (declared in the base module). PIM-2 defined SIZE in the SYSTEM module (as shown above).

GNU Modula-2 allows users to specify the dialect of Modula-2 by using the `-fiso` and `-fpim2` command line switches.

The data types CSIZE_T and CSSIZE_T are also exported from the SYSTEM module. The type CSIZE_T is unsigned and is mapped onto the target C data type `size_t` whereas the type CSSIZE_T is mapped onto the signed C data type `ssize_t`.

It is anticipated that these should only be used to provide cross platform definition modules for C libraries.

There are also a variety of fixed sized INTEGER and CARDINAL types. The variety of the fixed sized types will depend upon the target architecture.

2.21 The ISO system module

```

DEFINITION MODULE SYSTEM;

(* Gives access to system programming facilities that are probably
   non portable. *)

(* The constants and types define underlying properties of storage *)

EXPORT QUALIFIED BITSPERLOC, LOCSPERWORD,
        LOC, BYTE, WORD, ADDRESS, CSIZE_T, CSSIZE_T, (*
        Target specific data types. *)
        ADDADR, SUBADR, DIFADR, MAKEADR, ADR, ROTATE,
        SHIFT, CAST, TSIZE,

(* Internal GM2 compiler functions *)
        ShiftVal, ShiftLeft, ShiftRight,
```

```

        RotateVal, RotateLeft, RotateRight,
        THROW, TBITSIZE ;

CONST
        (* <implementation-defined constant> ; *)
        BITSUPERLOC = __ATTRIBUTE__ __BUILTIN__ ((BITS_PER_UNIT)) ;
        (* <implementation-defined constant> ; *)
        LOCSPERWORD = __ATTRIBUTE__ __BUILTIN__ ((UNITS_PER_WORD)) ;
        (* <implementation-defined constant> ; *)
        LOCSPERBYTE = 8 DIV BITSUPERLOC ;

(* Note that the full list of system and sized datatypes include:
   LOC, WORD, BYTE, ADDRESS,
   (and the non language standard target types)

   INTEGER8, INTEGER16, INTEGER32, INTEGER64,
   CARDINAL8, CARDINAL16, CARDINAL32, CARDINAL64,
   WORD16, WORD32, WORD64, BITSET8, BITSET16,
   BITSET32, REAL32, REAL64, REAL128, COMPLEX32,
   COMPLEX64, COMPLEX128, CSIZE_T, CSSIZE_T.

   Also note that the non-standard data types will
   move into another module in the future.  *)

(*
   All the data types and procedures below are declared internally.
=====
TYPE
(* Target specific data types.  *)

TYPE
LOC; (* A system basic type. Values are the uninterpreted
       contents of the smallest addressable unit of storage *)
ADDRESS = POINTER TO LOC;
WORD = ARRAY [0 .. LOCSPERWORD-1] OF LOC;

(* BYTE and LOCSPERBYTE are provided if appropriate for machine *)

TYPE
BYTE = ARRAY [0 .. LOCSPERBYTE-1] OF LOC;

PROCEDURE ADDADDR (addr: ADDRESS; offset: CARDINAL): ADDRESS;
(* Returns address given by (addr + offset), or may raise
   an exception if this address is not valid.
*)

```

```
PROCEDURE SUBADR (addr: ADDRESS; offset: CARDINAL): ADDRESS;
(* Returns address given by (addr - offset), or may raise an
exception if this address is not valid.
*)
```

```
PROCEDURE DIFADR (addr1, addr2: ADDRESS): INTEGER;
(* Returns the difference between addresses (addr1 - addr2),
or may raise an exception if the arguments are invalid
or address space is non-contiguous.
*)
```

```
PROCEDURE MAKEADR (high: <some type>; ...): ADDRESS;
(* Returns an address constructed from a list of values whose
types are implementation-defined, or may raise an
exception if this address is not valid.
```

In GNU Modula-2, MAKEADR can take any number of arguments which are mapped onto the type ADDRESS. The first parameter maps onto the high address bits and subsequent parameters map onto lower address bits. For example:

```
a := MAKEADR(BYTE(0FEH), BYTE(0DCH), BYTE(0BAH), BYTE(098H),
BYTE(076H), BYTE(054H), BYTE(032H), BYTE(010H)) ;
```

then the value of, a, on a 64 bit machine is: 0FEDCBA9876543210H

The parameters do not have to be the same type, but constants must be typed.

```
*)
```

```
PROCEDURE ADR (VAR v: <anytype>): ADDRESS;
(* Returns the address of variable v. *)
```

```
PROCEDURE ROTATE (val: <a packedset type>;
num: INTEGER): <type of first parameter>;
(* Returns a bit sequence obtained from val by rotating up/right
or down/right by the absolute value of num. The direction is
down/right if the sign of num is negative, otherwise the direction
is up/left.
*)
```

```
PROCEDURE SHIFT (val: <a packedset type>;
num: INTEGER): <type of first parameter>;
(* Returns a bit sequence obtained from val by shifting up/left
or down/right by the absolute value of num, introducing
zeros as necessary. The direction is down/right if the sign of
```

```

        num is negative, otherwise the direction is up/left.
*)

PROCEDURE CAST (<targettype>; val: <anytype>): <targettype>;
(* CAST is a type transfer function. Given the expression
   denoted by val, it returns a value of the type <targettype>.
   An invalid value for the target value or a
   physical address alignment problem may raise an exception.
*)

PROCEDURE TSIZE (<type>; ... ): CARDINAL;
(* Returns the number of LOCS used to store a value of the
   specified <type>. The extra parameters, if present,
   are used to distinguish variants in a variant record.
*)

PROCEDURE THROW (i: INTEGER) <* noreturn *> ;
(*
   THROW is a GNU extension and was not part of the PIM or ISO
   standards. It throws an exception which will be caught by the
   EXCEPT block (assuming it exists). This is a compiler builtin
   function which interfaces to the GCC exception handling runtime
   system.
   GCC uses the term throw, hence the naming distinction between
   the GCC builtin and the Modula-2 runtime library procedure Raise.
   The later library procedure Raise will call SYSTEM.THROW after
   performing various housekeeping activities.
*)

PROCEDURE TBITSIZE (<type>) : CARDINAL ;
(* Returns the minimum number of bits necessary to represent
   <type>. This procedure function is only useful for determining
   the number of bits used for any type field within a packed RECORD.
   It is not particularly useful elsewhere since <type> might be
   optimized for speed, for example a BOOLEAN could occupy a WORD.
*)

(* The following procedures are invoked by GNU Modula-2 to
   shift non word set types. They are not part of ISO Modula-2
   but are used to implement the SHIFT procedure defined above. *)

(*
   ShiftVal - is a runtime procedure whose job is to implement
   the SHIFT procedure of ISO SYSTEM. GNU Modula-2 will
   inline a SHIFT of a single WORD sized set and will only

```

```
call this routine for larger sets.  
*)  
  
PROCEDURE ShiftVal (VAR s, d: ARRAY OF BITSET;  
                     SetSizeInBits: CARDINAL;  
                     ShiftCount: INTEGER) ;  
  
(*  
  ShiftLeft - performs the shift left for a multi word set.  
  This procedure might be called by the back end of  
  GNU Modula-2 depending whether amount is known at  
  compile time.  
*)  
  
PROCEDURE ShiftLeft (VAR s, d: ARRAY OF BITSET;  
                     SetSizeInBits: CARDINAL;  
                     ShiftCount: CARDINAL) ;  
  
(*  
  ShiftRight - performs the shift left for a multi word set.  
  This procedure might be called by the back end of  
  GNU Modula-2 depending whether amount is known at  
  compile time.  
*)  
  
PROCEDURE ShiftRight (VAR s, d: ARRAY OF BITSET;  
                     SetSizeInBits: CARDINAL;  
                     ShiftCount: CARDINAL) ;  
  
(*  
  RotateVal - is a runtime procedure whose job is to implement  
  the ROTATE procedure of ISO SYSTEM. GNU Modula-2 will  
  inline a ROTATE of a single WORD (or less)  
  sized set and will only call this routine for larger  
  sets.  
*)  
  
PROCEDURE RotateVal (VAR s, d: ARRAY OF BITSET;  
                     SetSizeInBits: CARDINAL;  
                     RotateCount: INTEGER) ;  
  
(*  
  RotateLeft - performs the rotate left for a multi word set.  
  This procedure might be called by the back end of
```

```

        GNU Modula-2 depending whether amount is known at
        compile time.

*)

PROCEDURE RotateLeft (VAR s, d: ARRAY OF BITSET;
                      SetSizeInBits: CARDINAL;
                      RotateCount: CARDINAL) ;

(*
    RotateRight - performs the rotate right for a multi word set.
    This procedure might be called by the back end of
    GNU Modula-2 depending whether amount is known at
    compile time.
*)

PROCEDURE RotateRight (VAR s, d: ARRAY OF BITSET;
                      SetSizeInBits: CARDINAL;
                      RotateCount: CARDINAL) ;

END SYSTEM.
```

The data types `CSIZE_T` and `CSSIZE_T` are also exported from the `SYSTEM` module. The type `CSIZE_T` is unsigned and is mapped onto the target C data type `size_t` whereas the type `CSSIZE_T` is mapped onto the signed C data type `ssize_t`.

It is anticipated that these should only be used to provide cross platform definition modules for C libraries.

There are also a variety of fixed sized `INTEGER` and `CARDINAL` types. The variety of the fixed sized types will depend upon the target architecture.

2.22 Release map

GNU Modula-2 is now part of GCC and therefore will adopt the GCC release schedule. It is intended that GNU Modula-2 implement more of the GCC builtins (vararg access) and GCC features.

There is an intention to implement the ISO generics and the M2R10 dialect of Modula-2. It will also implement all language changes. If you wish to see something different please email `gm2@nongnu.org` with your ideas.

2.23 Documentation

The GNU Modula-2 documentation is available on line <https://gcc.gnu.org/onlinedocs> or in the pdf, info, html file format.

2.24 Regression tests for gm2 in the repository

The regression testsuite can be run from the gcc build directory:

```
$ cd build-gcc
$ make check -j 24
```

which runs the complete testsuite for all compilers using 24 parallel invocations of the compiler. Individual language testsuites can be run by specifying the language, for example the Modula-2 testsuite can be run using:

```
$ cd build-gcc
$ make check-m2 -j 24
```

Finally the results of the testsuite can be emailed to the gcc-testresults (<https://gcc.gnu.org/lists.html>) list using the `test_summary` script found in the gcc source tree:

```
$ 'directory to the sources'/contrib/test_summary
```

2.25 Limitations

Logitech compatibility library is incomplete. The principle modules for this platform exist however for a comprehensive list of completed modules please check the documentation `gm2.html`.

2.26 Objectives

- The intention of GNU Modula-2 is to provide a production Modula-2 front end to GCC.
- It should support all Niklaus Wirth PIM Dialects [234] and also ISO Modula-2 including a re-implementation of all the ISO modules.
- There should be an easy interface to C.
- Exploit the features of GCC.
- Listen to the requests of the users.

2.27 FAQ

2.27.1 Why use the C++ exception mechanism in GCC, rather than a bespoke Modula-2 mechanism?

The C++ mechanism is tried and tested, it also provides GNU Modula-2 with the ability to link with C++ modules and via swig it can raise Python exceptions.

2.28 Community

You can subscribe to the GNU Modula-2 mailing by sending an email to: `gm2-subscribe@nongnu.org` or by <http://lists.nongnu.org/mailman/listinfo/gm2>. The mailing list contents can be viewed <http://lists.gnu.org/archive/html/gm2>.

2.29 Other languages for GCC

These exist and can be found on the frontends web page on the gcc web site (<http://gcc.gnu.org/frontends.html>).

2.30 License of GNU Modula-2

GNU Modula-2 is free software, the compiler is held under the GPL v3 <http://www.gnu.org/licenses/gpl.txt>, its libraries (pim, iso and Logitech compatible) are under the GPL v3 with the GCC run time library exception clause.

Under Section 7 of GPL version 3, you are granted additional permissions described in the GCC Runtime Library Exception, version 3.1, as published by the Free Software Foundation.

You should have received a copy of the GNU General Public License and a copy of the GCC Runtime Library Exception along with this program; see the files COPYING3 and COPYING.RUNTIME respectively. If not, see <<http://www.gnu.org/licenses/>>.

More information on how these licenses work is available <http://www.gnu.org/licenses/licenses.html> on the GNU web site.

GNU General Public License

Version 3, 29 June 2007

Copyright © 2007 Free Software Foundation, Inc. <https://www.fsf.org>

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The GNU General Public License is a free, copyleft license for software and other kinds of works.

The licenses for most software and other practical works are designed to take away your freedom to share and change the works. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change all versions of a program—to make sure it remains free software for all its users. We, the Free Software Foundation, use the GNU General Public License for most of our software; it applies also to any other work released this way by its authors. You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for them if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs, and that you know you can do these things.

To protect your rights, we need to prevent others from denying you these rights or asking you to surrender the rights. Therefore, you have certain responsibilities if you distribute copies of the software, or if you modify it: responsibilities to respect the freedom of others.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must pass on to the recipients the same freedoms that you received. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

Developers that use the GNU GPL protect your rights with two steps: (1) assert copyright on the software, and (2) offer you this License giving you legal permission to copy, distribute and/or modify it.

For the developers' and authors' protection, the GPL clearly explains that there is no warranty for this free software. For both users' and authors' sake, the GPL requires that modified versions be marked as changed, so that their problems will not be attributed erroneously to authors of previous versions.

Some devices are designed to deny users access to install or run modified versions of the software inside them, although the manufacturer can do so. This is fundamentally incompatible with the aim of protecting users' freedom to change the software. The systematic pattern of such abuse occurs in the area of products for individuals to use, which is precisely where it is most unacceptable. Therefore, we have designed this version of the GPL to prohibit the practice for those products. If such problems arise substantially in other domains, we stand ready to extend this provision to those domains in future versions of the GPL, as needed to protect the freedom of users.

Finally, every program is threatened constantly by software patents. States should not allow patents to restrict development and use of software on general-purpose computers, but in those that do, we wish to avoid the special danger that patents applied to a free program could make it effectively proprietary. To prevent this, the GPL assures that patents cannot be used to render the program non-free.

The precise terms and conditions for copying, distribution and modification follow.

TERMS AND CONDITIONS

0. Definitions.

“This License” refers to version 3 of the GNU General Public License.

“Copyright” also means copyright-like laws that apply to other kinds of works, such as semiconductor masks.

“The Program” refers to any copyrightable work licensed under this License. Each licensee is addressed as “you”. “Licensees” and “recipients” may be individuals or organizations.

To “modify” a work means to copy from or adapt all or part of the work in a fashion requiring copyright permission, other than the making of an exact copy. The resulting work is called a “modified version” of the earlier work or a work “based on” the earlier work.

A “covered work” means either the unmodified Program or a work based on the Program.

To “propagate” a work means to do anything with it that, without permission, would make you directly or secondarily liable for infringement under applicable copyright law, except executing it on a computer or modifying a private copy. Propagation includes copying, distribution (with or without modification), making available to the public, and in some countries other activities as well.

To “convey” a work means any kind of propagation that enables other parties to make or receive copies. Mere interaction with a user through a computer network, with no transfer of a copy, is not conveying.

An interactive user interface displays “Appropriate Legal Notices” to the extent that it includes a convenient and prominently visible feature that (1) displays an appropriate copyright notice, and (2) tells the user that there is no warranty for the work (except to the extent that warranties are provided), that licensees may convey the work under this License, and how to view a copy of this License. If the interface presents a list of user commands or options, such as a menu, a prominent item in the list meets this criterion.

1. Source Code.

The “source code” for a work means the preferred form of the work for making modifications to it. “Object code” means any non-source form of a work.

A “Standard Interface” means an interface that either is an official standard defined by a recognized standards body, or, in the case of interfaces specified for a particular programming language, one that is widely used among developers working in that language.

The “System Libraries” of an executable work include anything, other than the work as a whole, that (a) is included in the normal form of packaging a Major Component, but which is not part of that Major Component, and (b) serves only to enable use of the work with that Major Component, or to implement a Standard Interface for which an implementation is available to the public in source code form. A “Major Component”, in this context, means a major essential component (kernel, window system, and so on) of the specific operating system (if any) on which the executable work runs, or a compiler used to produce the work, or an object code interpreter used to run it.

The “Corresponding Source” for a work in object code form means all the source code needed to generate, install, and (for an executable work) run the object code and to modify the work, including scripts to control those activities. However, it does not include the work’s System Libraries, or general-purpose tools or generally available free programs which are used unmodified in performing those activities but which are not part of the work. For example, Corresponding Source includes interface definition files associated with source files for the work, and the source code for shared libraries and dynamically linked subprograms that the work is specifically designed to require, such as by intimate data communication or control flow between those subprograms and other parts of the work.

The Corresponding Source need not include anything that users can regenerate automatically from other parts of the Corresponding Source.

The Corresponding Source for a work in source code form is that same work.

2. Basic Permissions.

All rights granted under this License are granted for the term of copyright on the Program, and are irrevocable provided the stated conditions are met. This License explicitly affirms your unlimited permission to run the unmodified Program. The output from running a covered work is covered by this License only if the output, given its content, constitutes a covered work. This License acknowledges your rights of fair use or other equivalent, as provided by copyright law.

You may make, run and propagate covered works that you do not convey, without conditions so long as your license otherwise remains in force. You may convey covered works to others for the sole purpose of having them make modifications exclusively for you, or provide you with facilities for running those works, provided that you comply with the terms of this License in conveying all material for which you do not control copyright. Those thus making or running the covered works for you must do so exclusively on your behalf, under your direction and control, on terms that prohibit them from making any copies of your copyrighted material outside their relationship with you.

Conveying under any other circumstances is permitted solely under the conditions stated below. Sublicensing is not allowed; section 10 makes it unnecessary.

3. Protecting Users’ Legal Rights From Anti-Circumvention Law.

No covered work shall be deemed part of an effective technological measure under any applicable law fulfilling obligations under article 11 of the WIPO copyright treaty adopted on 20 December 1996, or similar laws prohibiting or restricting circumvention of such measures.

When you convey a covered work, you waive any legal power to forbid circumvention of technological measures to the extent such circumvention is effected by exercising rights under this License with respect to the covered work, and you disclaim any intention to limit operation or modification of the work as a means of enforcing, against the work's users, your or third parties' legal rights to forbid circumvention of technological measures.

4. Conveying Verbatim Copies.

You may convey verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice; keep intact all notices stating that this License and any non-permissive terms added in accord with section 7 apply to the code; keep intact all notices of the absence of any warranty; and give all recipients a copy of this License along with the Program.

You may charge any price or no price for each copy that you convey, and you may offer support or warranty protection for a fee.

5. Conveying Modified Source Versions.

You may convey a work based on the Program, or the modifications to produce it from the Program, in the form of source code under the terms of section 4, provided that you also meet all of these conditions:

- a. The work must carry prominent notices stating that you modified it, and giving a relevant date.
- b. The work must carry prominent notices stating that it is released under this License and any conditions added under section 7. This requirement modifies the requirement in section 4 to "keep intact all notices".
- c. You must license the entire work, as a whole, under this License to anyone who comes into possession of a copy. This License will therefore apply, along with any applicable section 7 additional terms, to the whole of the work, and all its parts, regardless of how they are packaged. This License gives no permission to license the work in any other way, but it does not invalidate such permission if you have separately received it.
- d. If the work has interactive user interfaces, each must display Appropriate Legal Notices; however, if the Program has interactive interfaces that do not display Appropriate Legal Notices, your work need not make them do so.

A compilation of a covered work with other separate and independent works, which are not by their nature extensions of the covered work, and which are not combined with it such as to form a larger program, in or on a volume of a storage or distribution medium, is called an "aggregate" if the compilation and its resulting copyright are not used to limit the access or legal rights of the compilation's users beyond what the individual works permit. Inclusion of a covered work in an aggregate does not cause this License to apply to the other parts of the aggregate.

6. Conveying Non-Source Forms.

You may convey a covered work in object code form under the terms of sections 4 and 5, provided that you also convey the machine-readable Corresponding Source under the terms of this License, in one of these ways:

- a. Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by the Corresponding Source fixed on a durable physical medium customarily used for software interchange.
- b. Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by a written offer, valid for at least three years and valid for as long as you offer spare parts or customer support for that product model, to give anyone who possesses the object code either (1) a copy of the Corresponding Source for all the software in the product that is covered by this License, on a durable physical medium customarily used for software interchange, for a price no more than your reasonable cost of physically performing this conveying of source, or (2) access to copy the Corresponding Source from a network server at no charge.
- c. Convey individual copies of the object code with a copy of the written offer to provide the Corresponding Source. This alternative is allowed only occasionally and noncommercially, and only if you received the object code with such an offer, in accord with subsection 6b.
- d. Convey the object code by offering access from a designated place (gratis or for a charge), and offer equivalent access to the Corresponding Source in the same way through the same place at no further charge. You need not require recipients to copy the Corresponding Source along with the object code. If the place to copy the object code is a network server, the Corresponding Source may be on a different server (operated by you or a third party) that supports equivalent copying facilities, provided you maintain clear directions next to the object code saying where to find the Corresponding Source. Regardless of what server hosts the Corresponding Source, you remain obligated to ensure that it is available for as long as needed to satisfy these requirements.
- e. Convey the object code using peer-to-peer transmission, provided you inform other peers where the object code and Corresponding Source of the work are being offered to the general public at no charge under subsection 6d.

A separable portion of the object code, whose source code is excluded from the Corresponding Source as a System Library, need not be included in conveying the object code work.

A “User Product” is either (1) a “consumer product”, which means any tangible personal property which is normally used for personal, family, or household purposes, or (2) anything designed or sold for incorporation into a dwelling. In determining whether a product is a consumer product, doubtful cases shall be resolved in favor of coverage. For a particular product received by a particular user, “normally used” refers to a typical or common use of that class of product, regardless of the status of the particular user or of the way in which the particular user actually uses, or expects or is expected to use, the product. A product is a consumer product regardless of whether the product has substantial commercial, industrial or non-consumer uses, unless such uses represent the only significant mode of use of the product.

“Installation Information” for a User Product means any methods, procedures, authorization keys, or other information required to install and execute modified versions of a covered work in that User Product from a modified version of its Corresponding Source.

The information must suffice to ensure that the continued functioning of the modified object code is in no case prevented or interfered with solely because modification has been made.

If you convey an object code work under this section in, or with, or specifically for use in, a User Product, and the conveying occurs as part of a transaction in which the right of possession and use of the User Product is transferred to the recipient in perpetuity or for a fixed term (regardless of how the transaction is characterized), the Corresponding Source conveyed under this section must be accompanied by the Installation Information. But this requirement does not apply if neither you nor any third party retains the ability to install modified object code on the User Product (for example, the work has been installed in ROM).

The requirement to provide Installation Information does not include a requirement to continue to provide support service, warranty, or updates for a work that has been modified or installed by the recipient, or for the User Product in which it has been modified or installed. Access to a network may be denied when the modification itself materially and adversely affects the operation of the network or violates the rules and protocols for communication across the network.

Corresponding Source conveyed, and Installation Information provided, in accord with this section must be in a format that is publicly documented (and with an implementation available to the public in source code form), and must require no special password or key for unpacking, reading or copying.

7. Additional Terms.

“Additional permissions” are terms that supplement the terms of this License by making exceptions from one or more of its conditions. Additional permissions that are applicable to the entire Program shall be treated as though they were included in this License, to the extent that they are valid under applicable law. If additional permissions apply only to part of the Program, that part may be used separately under those permissions, but the entire Program remains governed by this License without regard to the additional permissions.

When you convey a copy of a covered work, you may at your option remove any additional permissions from that copy, or from any part of it. (Additional permissions may be written to require their own removal in certain cases when you modify the work.) You may place additional permissions on material, added by you to a covered work, for which you have or can give appropriate copyright permission.

Notwithstanding any other provision of this License, for material you add to a covered work, you may (if authorized by the copyright holders of that material) supplement the terms of this License with terms:

- a. Disclaiming warranty or limiting liability differently from the terms of sections 15 and 16 of this License; or
- b. Requiring preservation of specified reasonable legal notices or author attributions in that material or in the Appropriate Legal Notices displayed by works containing it; or
- c. Prohibiting misrepresentation of the origin of that material, or requiring that modified versions of such material be marked in reasonable ways as different from the original version; or

- d. Limiting the use for publicity purposes of names of licensors or authors of the material; or
- e. Declining to grant rights under trademark law for use of some trade names, trademarks, or service marks; or
- f. Requiring indemnification of licensors and authors of that material by anyone who conveys the material (or modified versions of it) with contractual assumptions of liability to the recipient, for any liability that these contractual assumptions directly impose on those licensors and authors.

All other non-permissive additional terms are considered “further restrictions” within the meaning of section 10. If the Program as you received it, or any part of it, contains a notice stating that it is governed by this License along with a term that is a further restriction, you may remove that term. If a license document contains a further restriction but permits relicensing or conveying under this License, you may add to a covered work material governed by the terms of that license document, provided that the further restriction does not survive such relicensing or conveying.

If you add terms to a covered work in accord with this section, you must place, in the relevant source files, a statement of the additional terms that apply to those files, or a notice indicating where to find the applicable terms.

Additional terms, permissive or non-permissive, may be stated in the form of a separately written license, or stated as exceptions; the above requirements apply either way.

8. Termination.

You may not propagate or modify a covered work except as expressly provided under this License. Any attempt otherwise to propagate or modify it is void, and will automatically terminate your rights under this License (including any patent licenses granted under the third paragraph of section 11).

However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, you do not qualify to receive new licenses for the same material under section 10.

9. Acceptance Not Required for Having Copies.

You are not required to accept this License in order to receive or run a copy of the Program. Ancillary propagation of a covered work occurring solely as a consequence of using peer-to-peer transmission to receive a copy likewise does not require acceptance.

However, nothing other than this License grants you permission to propagate or modify any covered work. These actions infringe copyright if you do not accept this License. Therefore, by modifying or propagating a covered work, you indicate your acceptance of this License to do so.

10. Automatic Licensing of Downstream Recipients.

Each time you convey a covered work, the recipient automatically receives a license from the original licensors, to run, modify and propagate that work, subject to this License. You are not responsible for enforcing compliance by third parties with this License.

An “entity transaction” is a transaction transferring control of an organization, or substantially all assets of one, or subdividing an organization, or merging organizations. If propagation of a covered work results from an entity transaction, each party to that transaction who receives a copy of the work also receives whatever licenses to the work the party’s predecessor in interest had or could give under the previous paragraph, plus a right to possession of the Corresponding Source of the work from the predecessor in interest, if the predecessor has it or can get it with reasonable efforts.

You may not impose any further restrictions on the exercise of the rights granted or affirmed under this License. For example, you may not impose a license fee, royalty, or other charge for exercise of rights granted under this License, and you may not initiate litigation (including a cross-claim or counterclaim in a lawsuit) alleging that any patent claim is infringed by making, using, selling, offering for sale, or importing the Program or any portion of it.

11. Patents.

A “contributor” is a copyright holder who authorizes use under this License of the Program or a work on which the Program is based. The work thus licensed is called the contributor’s “contributor version”.

A contributor’s “essential patent claims” are all patent claims owned or controlled by the contributor, whether already acquired or hereafter acquired, that would be infringed by some manner, permitted by this License, of making, using, or selling its contributor version, but do not include claims that would be infringed only as a consequence of further modification of the contributor version. For purposes of this definition, “control” includes the right to grant patent sublicenses in a manner consistent with the requirements of this License.

Each contributor grants you a non-exclusive, worldwide, royalty-free patent license under the contributor’s essential patent claims, to make, use, sell, offer for sale, import and otherwise run, modify and propagate the contents of its contributor version.

In the following three paragraphs, a “patent license” is any express agreement or commitment, however denominated, not to enforce a patent (such as an express permission to practice a patent or covenant not to sue for patent infringement). To “grant” such a patent license to a party means to make such an agreement or commitment not to enforce a patent against the party.

If you convey a covered work, knowingly relying on a patent license, and the Corresponding Source of the work is not available for anyone to copy, free of charge and under the terms of this License, through a publicly available network server or other readily accessible means, then you must either (1) cause the Corresponding Source to be so

available, or (2) arrange to deprive yourself of the benefit of the patent license for this particular work, or (3) arrange, in a manner consistent with the requirements of this License, to extend the patent license to downstream recipients. “Knowingly relying” means you have actual knowledge that, but for the patent license, your conveying the covered work in a country, or your recipient’s use of the covered work in a country, would infringe one or more identifiable patents in that country that you have reason to believe are valid.

If, pursuant to or in connection with a single transaction or arrangement, you convey, or propagate by procuring conveyance of, a covered work, and grant a patent license to some of the parties receiving the covered work authorizing them to use, propagate, modify or convey a specific copy of the covered work, then the patent license you grant is automatically extended to all recipients of the covered work and works based on it.

A patent license is “discriminatory” if it does not include within the scope of its coverage, prohibits the exercise of, or is conditioned on the non-exercise of one or more of the rights that are specifically granted under this License. You may not convey a covered work if you are a party to an arrangement with a third party that is in the business of distributing software, under which you make payment to the third party based on the extent of your activity of conveying the work, and under which the third party grants, to any of the parties who would receive the covered work from you, a discriminatory patent license (a) in connection with copies of the covered work conveyed by you (or copies made from those copies), or (b) primarily for and in connection with specific products or compilations that contain the covered work, unless you entered into that arrangement, or that patent license was granted, prior to 28 March 2007.

Nothing in this License shall be construed as excluding or limiting any implied license or other defenses to infringement that may otherwise be available to you under applicable patent law.

12. No Surrender of Others’ Freedom.

If conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot convey a covered work so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not convey it at all. For example, if you agree to terms that obligate you to collect a royalty for further conveying from those to whom you convey the Program, the only way you could satisfy both those terms and this License would be to refrain entirely from conveying the Program.

13. Use with the GNU Affero General Public License.

Notwithstanding any other provision of this License, you have permission to link or combine any covered work with a work licensed under version 3 of the GNU Affero General Public License into a single combined work, and to convey the resulting work. The terms of this License will continue to apply to the part which is the covered work, but the special requirements of the GNU Affero General Public License, section 13, concerning interaction through a network will apply to the combination as such.

14. Revised Versions of this License.

The Free Software Foundation may publish revised and/or new versions of the GNU General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies that a certain numbered version of the GNU General Public License “or any later version” applies to it, you have the option of following the terms and conditions either of that numbered version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of the GNU General Public License, you may choose any version ever published by the Free Software Foundation.

If the Program specifies that a proxy can decide which future versions of the GNU General Public License can be used, that proxy’s public statement of acceptance of a version permanently authorizes you to choose that version for the Program.

Later license versions may give you additional or different permissions. However, no additional obligations are imposed on any author or copyright holder as a result of your choosing to follow a later version.

15. Disclaimer of Warranty.

THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM “AS IS” WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. Limitation of Liability.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MODIFIES AND/OR CONVEYS THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

17. Interpretation of Sections 15 and 16.

If the disclaimer of warranty and limitation of liability provided above cannot be given local legal effect according to their terms, reviewing courts shall apply local law that most closely approximates an absolute waiver of all civil liability in connection with the Program, unless a warranty or assumption of liability accompanies a copy of the Program in return for a fee.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively state the exclusion of warranty; and each file should have at least the “copyright” line and a pointer to where the full notice is found.

*one line to give the program's name and a brief idea of what it does.
Copyright (C) year name of author*

*This program is free software: you can redistribute it and/or modify
it under the terms of the GNU General Public License as published by
the Free Software Foundation, either version 3 of the License, or (at
your option) any later version.*

*This program is distributed in the hope that it will be useful, but
WITHOUT ANY WARRANTY; without even the implied warranty of
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU
General Public License for more details.*

*You should have received a copy of the GNU General Public License
along with this program. If not, see <https://www.gnu.org/licenses/>.*

Also add information on how to contact you by electronic and paper mail.

If the program does terminal interaction, make it output a short notice like this when it starts in an interactive mode:

*program Copyright (C) year name of author
This program comes with ABSOLUTELY NO WARRANTY; for details type 'show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type 'show c' for details.*

The hypothetical commands ‘show w’ and ‘show c’ should show the appropriate parts of the General Public License. Of course, your program’s commands might be different; for a GUI interface, you would use an “about box”.

You should also get your employer (if you work as a programmer) or school, if any, to sign a “copyright disclaimer” for the program, if necessary. For more information on this, and how to apply and follow the GNU GPL, see <https://www.gnu.org/licenses/>.

The GNU General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Lesser General Public License instead of this License. But first, please read <https://www.gnu.org/licenses/why-not-lgpl.html>.

Contributing to GNU Modula-2

Please do and please read the GNU Emacs info under

- * Standards: ([standards](#)). GNU coding standards.
- * Intellectual Property: : Keeping Free Software Free

You might consider joining the GM2 Mailing list before you start coding. The mailing list may be subscribed via a web interface <http://lists.nongnu.org/mailman/listinfo/gm2> or via email gm2-subscribe@nongnu.org.

Many thanks and enjoy your coding!

3 EBNF of GNU Modula-2

This chapter contains the EBNF of GNU Modula-2. This grammar currently supports both PIM and ISO dialects. The rules here are automatically extracted from the crammer files in GNU Modula-2 and serve to document the syntax of the extensions described earlier and how they fit in with the base language.

Note that the first six productions are built into the lexical analysis phase.

4 PIM and ISO library definitions

This chapter contains M2F, PIM and ISO libraries.

4.1 Base libraries

These are the base libraries for the GNU Modula-2 compiler. These modules originally came from the M2F compiler and have been cleaned up and extended. They provide a basic interface to the underlying operating system via libc. They also include a number of libraries to allow access to compiler built-ins. Perhaps the largest difference to PIM and ISO libraries is the **DynamicString** module which declares the type **String**. The heavy use of this opaque data type results in a number of equivalent modules that can either handle **ARRAY OF CHAR** or **String**.

These modules have been extensively tested and are used throughout building the GNU Modula-2 compiler.

4.1.14 gm2-libs/GetOpt

```

DEFINITION MODULE GetOpt ;

FROM SYSTEM IMPORT ADDRESS ;
FROM DynamicStrings IMPORT String ;

CONST
    no_argument = 0 ;
    required_argument = 1 ;
    optional_argument = 2 ;

TYPE
    LongOptions ;
    PtrToInteger = POINTER TO INTEGER ;

(*
    GetOpt - call C getopt and fill in the parameters:
        optarg, optind, optarg and optopt.
*)

PROCEDURE GetOpt (argc: INTEGER; argv: ADDRESS; optstring: String;
                  VAR optarg: String;
                  VAR optind, optarg, optopt: INTEGER) : CHAR ;

(*
    InitLongOptions - creates and returns a LongOptions empty array.
*)

PROCEDURE InitLongOptions () : LongOptions ;

(*
    AddLongOption - appends long option {name, has_arg, flag, val} to the
        array of options and new long options array is
        returned.
    The old array, lo, should no longer be used.

(from man 3 getopt)
    The meanings of the different fields are:

        name      is the name of the long option.

        has_arg
            is: no_argument (or 0) if the option does not take an
            argument; required_argument (or 1) if the option

```

requires an argument; or optional_argument (or 2) if the option takes an optional argument.

flag specifies how results are returned for a long option. If flag is NULL, then getopt_long() returns val. (For example, the calling program may set val to the equivalent short option character). Otherwise, getopt_long() returns 0, and flag points to a variable which is set to val if the option is found, but left unchanged if the option is not found.

val is the value to return, or to load into the variable pointed to by flag.

The last element of the array must be filled with zeros.

*)

```

   zeros as necessary. The direction is down/right if the sign of
   num is negative, otherwise the direction is up/left.
  *)

PROCEDURE THROW (i: INTEGER) <* noreturn *> ;
(*
  THROW is a GNU extension and was not part of the PIM or ISO
  standards. It throws an exception which will be caught by the
  EXCEPT block (assuming it exists). This is a compiler builtin
  function which interfaces to the GCC exception handling runtime
  system.

  GCC uses the term throw, hence the naming distinction between
  the GCC builtin and the Modula-2 runtime library procedure Raise.
  The later library procedure Raise will call SYSTEM.THROW after
  performing various housekeeping activities.
*)

PROCEDURE TBITSIZE (<type>) : CARDINAL ;
  (* Returns the minimum number of bits necessary to represent
   <type>. This procedure function is only useful for determining
   the number of bits used for any type field within a packed RECORD.
   It is not particularly useful elsewhere since <type> might be
   optimized for speed, for example a BOOLEAN could occupy a WORD.
  *)
*)

(* The following procedures are invoked by GNU Modula-2 to
shift non word sized set types. They are not strictly part
of the core PIM Modula-2, however they are used
to implement the SHIFT procedure defined above,

```

which are in turn used by the Logitech compatible libraries.

Users will access these procedures by using the procedure SHIFT above and GNU Modula-2 will map SHIFT onto one of the following procedures.

*)

(*

ShiftVal - is a runtime procedure whose job is to implement the SHIFT procedure of ISO SYSTEM. GNU Modula-2 will inline a SHIFT of a single WORD sized set and will only call this routine for larger sets.

*)

```
PROCEDURE ShiftVal (VAR s, d: ARRAY OF BITSET;
                     SetSizeInBits: CARDINAL;
                     ShiftCount: INTEGER) ;
```

(*

ShiftLeft - performs the shift left for a multi word set.
This procedure might be called by the back end of
GNU Modula-2 depending whether amount is known at
compile time.

*)

```

(*
  getopt - the getopt() function parses the command-line arguments.
  Its arguments argc and argv are the argument count and array as
  passed to the main() function on program invocation. An element of
  argv that starts with '-' (and is not exactly "--" or "-") is an
  option element. The characters of this element (aside from the
  initial '-') are option characters. If getopt() is called
  repeatedly, it returns successively each of the option characters
  from each of the option elements.
*)

4.2 PIM and Logitech 3.0 Compatible

These modules are provided to enable legacy Modula-2 applications to build with GNU Modula-2. It is advised that these module should not be used for new projects, maybe the ISO libraries or the native compiler PIM libraries (FIO) should be used instead.

Here is an outline of the module layering:

Above the line are user level PIM [234] and Logitech 3.0 compatible modules. Below the line Logitech 3.0 advised that these modules should be considered part of the runtime system. The libraries do not provide all the features found in the Logitech libraries as a number of these features were MS-DOS related. Essentially the basic input/output, file system, string manipulation and conversion routines are provided. Access to DOSCALL, graphics, time and date are not as these were constrained by the limitations of MS-DOS.

The following libraries are contained within the base GNU Modula-2 libraries and are also Logitech-3.0 compatible: See Section 4.1.1 [gm2-libs/ASCII], page 80, See Section 4.1.38 [gm2-libs/Storage], page 161, and See Section 4.1.22 [gm2-libs/MathLib0], page 129. These libraries are always available for any dialect of the language (although their implementation and behaviour might differ, for example Storage ISO and PIM).

The following libraries are Logitech-3.0 compatible but fall outside the base GNU Modula-2 libraries.

              RealToString, StringToReal,
              LongRealToString, StringToLongReal ;

(*
  SetNoOfExponentDigits - sets the number of exponent digits to be
    used during future calls of LongRealToString
    and RealToString providing that the width
    is sufficient.
    If this value is set to 0 (the default) then
    the number digits used is the minimum necessary.■
*)

PROCEDURE SetNoOfExponentDigits (places: CARDINAL) ;

(*
  RealToString - converts a real, r, into a right justified string, str.■
  The number of digits to the right of the decimal point
  is given in, digits. The value, width, represents the
  maximum number of characters to be used in the string,
  str.

  If digits is negative then exponent notation is used
  whereas if digits is positive then fixed point notation■
  is used.

  If, r, is less than 0.0 then a '-' preceeds the value,
  str. However, if, r, is >= 0.0 a '+' is not added.

  If the conversion of, r, to a string requires more
  than, width, characters then the string, str, is set
  to a nul string and, ok is assigned FALSE.

  For fixed point notation the minimum width required is
  ABS(width)+8

  For exponent notation the minimum width required is
  ABS(digits)+2+log10(magnitude).

  if r is a NaN then the string 'nan' is returned formatted and■
  ok will be FALSE.
)

```

*)

```
PROCEDURE RealToString (r: REAL; digits, width: INTEGER;
                      VAR str: ARRAY OF CHAR; VAR ok: BOOLEAN) ;
```

(*

LongRealToString - converts a real, r, into a right justified string, str.
 The number of digits to the right of the decimal point
 is given in, digits. The value, width, represents the
 maximum number of characters to be used in the string,
 str.

If digits is negative then exponent notation is used
 whereas if digits is positive then fixed point notation
 is used.

If, r, is less than 0.0 then a '-' preceeds the value,
 str. However, if, r, is >= 0.0 a '+' is not added.

If the conversion of, r, to a string requires more
 than, width, characters then the string, str, is set
 to a nul string and, ok is assigned FALSE.

For fixed point notation the minimum width required is
 $\text{ABS}(\text{width})+8$

For exponent notation the minimum width required is
 $\text{ABS}(\text{digits})+2+\log_{10}(\text{magnitude})$.

Examples:

RealToString(100.0, 10, 10, a, ok)	->	'100.000000'
RealToString(100.0, -5, 12, a, ok)	->	' 1.00000E+2'

RealToString(123.456789, 10, 10, a, ok)	->	'123.456789'
RealToString(123.456789, -5, 13, a, ok)	->	' 1.23456E+2'

RealToString(123.456789, -2, 15, a, ok)	->	' 1.23E+2'
---	----	------------

if r is a NaN then the string 'nan' is returned formatted and
 ok will be FALSE.

*)

   (left or right) by the absolute value of num, introducing
   zeros as necessary. The direction is down if the sign of
   num is negative, otherwise the direction is up.
*)

PROCEDURE THROW (i: INTEGER) <* noreturn *> ;
(*
   THROW is a GNU extension and was not part of the PIM or ISO
   standards. It throws an exception which will be caught by the EXCEPT
   block (assuming it exists). This is a compiler builtin function which
   interfaces to the GCC exception handling runtime system.
   GCC uses the term throw, hence the naming distinction between
   the GCC builtin and the Modula-2 runtime library procedure Raise.
   The later library procedure Raise will call SYSTEM.THROW after
   performing various housekeeping activities.
*)

PROCEDURE TBITSIZE (<type>) : CARDINAL ;
(* Returns the minimum number of bits necessary to represent
   <type>. This procedure function is only useful for determining
   the number of bits used for any type field within a packed RECORD.
   It is not particularly useful elsewhere since <type> might be
   optimized for speed, for example a BOOLEAN could occupy a WORD.
*)

(* The following procedures are invoked by GNU Modula-2 to
   shift non word sized set types. They are not strictly part
   of the core PIM Modula-2, however they are used
   to implement the SHIFT procedure defined above,
   which are in turn used by the Logitech compatible libraries.

Users will access these procedures by using the procedure
SHIFT above and GNU Modula-2 will map SHIFT onto one of
the following procedures.
*)

(*
ShiftVal - is a runtime procedure whose job is to implement
   the SHIFT procedure of ISO SYSTEM. GNU Modula-2 will
   inline a SHIFT of a single WORD sized set and will
   only call this routine for larger sets.
*)

```

```
PROCEDURE ShiftVal (VAR s, d: ARRAY OF BITSET;
                    SetSizeInBits: CARDINAL;
                    ShiftCount: INTEGER) ;

(*
  ShiftLeft - performs the shift left for a multi word set.
  This procedure might be called by the back end of
  GNU Modula-2 depending whether amount is known at
  compile time.
*)

PROCEDURE ShiftLeft (VAR s, d: ARRAY OF BITSET;
                     SetSizeInBits: CARDINAL;
                     ShiftCount: CARDINAL) ;

(*
  ShiftRight - performs the shift left for a multi word set.
  This procedure might be called by the back end of
  GNU Modula-2 depending whether amount is known at
  compile time.
*)

PROCEDURE ShiftRight (VAR s, d: ARRAY OF BITSET;
                      SetSizeInBits: CARDINAL;
                      ShiftCount: CARDINAL) ;

(*
  RotateVal - is a runtime procedure whose job is to implement
  the ROTATE procedure of ISO SYSTEM.  GNU Modula-2 will
  inline a ROTATE of a single WORD (or less)
  sized set and will only call this routine for
  larger sets.
*)

PROCEDURE RotateVal (VAR s, d: ARRAY OF BITSET;
                     SetSizeInBits: CARDINAL;
                     RotateCount: INTEGER) ;

(*
  RotateLeft - performs the rotate left for a multi word set.
  This procedure might be called by the back end of
  GNU Modula-2 depending whether amount is known
  at compile time.
```

```
*)
```

```
PROCEDURE RotateLeft (VAR s, d: ARRAY OF BITSET;  
                      SetSizeInBits: CARDINAL;  
                      RotateCount: CARDINAL) ;
```

```
(*
```

```
    RotateRight - performs the rotate right for a multi word set.  
    This procedure might be called by the back end of  
    GNU Modula-2 depending whether amount is known at  
    compile time.
```

```
*)
```

```
PROCEDURE RotateRight (VAR s, d: ARRAY OF BITSET;  
                      SetSizeInBits: CARDINAL;  
                      RotateCount: CARDINAL) ;
```

```
END SYSTEM.
```

```

4.4 M2 ISO Libraries

This directory contains the ISO definition modules and some corresponding implementation modules. The definition files: ChanConsts.def, CharClass.def, ComplexMath.def, ConvStringLong.def, ConvStringReal.def, ConvTypes.def, COROUTINES.def, EXCEPTIONS.def, GeneralUserExceptions.def, IOChan.def, IOConsts.def, IOLink.def, IOLink.def, IOResult.def, LongComplexMath.def, LongConv.def, LongIO.def, LongMath.def, LongStr.def, LowLong.def, LowReal.def, M2EXCEPTION.def, Processes.def, ProgramArgs.def, RawIO.def, RealConv.def, RealIO.def, RealMath.def, RealStr.def, RndFile.def, Semaphores.def, SeqFile.def, SIOResult.def, SLongIO.def, SRawIO.def, SRealIO.def, StdChans.def, STextIO.def, Storage.def, StreamFile.def, Strings.def, SWholeIO.def, SysClock.def, SYSTEM.def, TERMINATION.def, TextIO.def, WholeConv.def, WholeIO.def and WholeStr.def were defined by the International Standard Information technology - programming languages BS ISO/IEC 10514-1:1996E Part 1: Modula-2, Base Language.

The Copyright to the definition files ChanConsts.def, CharClass.def, ComplexMath.def, ConvStringLong.def, ConvStringReal.def, ConvTypes.def, COROUTINES.def, EXCEPTIONS.def, GeneralUserExceptions.def, IOChan.def, IOConsts.def, IOLink.def, IOLink.def, IOResult.def, LongComplexMath.def, LongConv.def, LongIO.def, LongMath.def, LongStr.def, LowLong.def, LowReal.def, M2EXCEPTION.def, Processes.def, ProgramArgs.def, RawIO.def, RealConv.def, RealIO.def, RealMath.def, RealStr.def, RndFile.def, Semaphores.def, SeqFile.def, SIOResult.def, SLongIO.def, SRawIO.def, SRealIO.def, StdChans.def, STextIO.def, Storage.def, StreamFile.def, Strings.def, SWholeIO.def, SysClock.def, SYSTEM.def, TERMINATION.def, TextIO.def, WholeConv.def, WholeIO.def and WholeStr.def belong to ISO/IEC (International Organization for Standardization and International Electrotechnical Commission). The licence allows them to be distributed with the compiler (as described on page 707 of the Information technology - Programming languages Part 1: Modula-2, Base Language. BS ISO/IEC 10514-1:1996).

All implementation modules and ClientSocket.def, LongWholeIO.def, M2RTS.def, MemStream.def, pth.def, RandomNumber.def, RTdata.def, RTentity.def, RTfio.def, RTio.def, ShortComplexMath.def, ShortIO.def, ShortWholeIO.def, SimpleCipher.def, SLongWholeIO.def, SShortIO.def, SShortWholeIO.def, StringChan.def and wraptime.def are Copyright of the FSF and are held under the GPLv3 with runtime exceptions.

Under Section 7 of GPL version 3, you are granted additional permissions described in the GCC Runtime Library Exception, version 3.1, as published by the Free Software Foundation.

You should have received a copy of the GNU General Public License and a copy of the GCC Runtime Library Exception along with this program; see the files COPYING3 and COPYING.RUNTIME respectively. If not, see <http://www.gnu.org/licenses/>.

Notice that GNU Modula-2 contains additional libraries for input/output of SHORTREAL, SHORTCARD, SHORTINT, LONGCARD, LONGINT data types. It also provides a RandomNumber, SimpleCipher and ClientSocket modules as well as low level modules which allow the IO libraries to coexist with their PIM counterparts.

4.4.1 gm2-libs-iso/COROUTINES

```

(*
  Description: provides an ISO module which can write to a memory
  buffer or read from a memory buffer.
*)

FROM IOChan IMPORT ChanId ;
FROM ChanConsts IMPORT FlagSet, OpenResults ;
FROM SYSTEM IMPORT ADDRESS, LOC ;

(*
Attempts to obtain and open a channel connected to a contigeous
buffer in memory. The write flag is implied; without the raw
flag, text is implied. If successful, assigns to cid the identity of
the opened channel, assigns the value opened to res.
If a channel cannot be opened as required,
the value of res indicates the reason, and cid identifies the
invalid channel.

The parameters, buffer, length and used maybe updated as
data is written. The buffer maybe reallocated
and its address might alter, however the parameters will
always reflect the current active buffer. When this
channel is closed the buffer is deallocated and
buffer will be set to NIL, length and used will be set to
zero.

   All the data types and procedures below are declared internally.
=====
TYPE
```

```

(* Target specific data types.  *)

TYPE
LOC; (* A system basic type. Values are the uninterpreted
       contents of the smallest addressable unit of storage *)
ADDRESS = POINTER TO LOC;
WORD = ARRAY [0 .. LOCSPERWORD-1] OF LOC;

(* BYTE and LOCSPERBYTE are provided if appropriate for machine *)

TYPE
BYTE = ARRAY [0 .. LOCSPERBYTE-1] OF LOC;

PROCEDURE ADDADR (addr: ADDRESS; offset: CARDINAL): ADDRESS;
(* Returns address given by (addr + offset), or may raise
   an exception if this address is not valid.
*)

PROCEDURE SUBADR (addr: ADDRESS; offset: CARDINAL): ADDRESS;
(* Returns address given by (addr - offset), or may raise an
   exception if this address is not valid.
*)

PROCEDURE DIFADR (addr1, addr2: ADDRESS): INTEGER;
(* Returns the difference between addresses (addr1 - addr2),
   or may raise an exception if the arguments are invalid
   or address space is non-contiguous.
*)

PROCEDURE MAKEADR (high: <some type>; ...): ADDRESS;
(* Returns an address constructed from a list of values whose
   types are implementation-defined, or may raise an
   exception if this address is not valid.

In GNU Modula-2, MAKEADR can take any number of arguments
which are mapped onto the type ADDRESS. The first parameter
maps onto the high address bits and subsequent parameters map
onto lower address bits. For example:

a := MAKEADR(BYTE(OFEH), BYTE(ODCH), BYTE(OBAH), BYTE(098H),
              BYTE(076H), BYTE(054H), BYTE(032H), BYTE(010H)) ;

then the value of, a, on a 64 bit machine is: 0FEDCBA9876543210H

The parameters do not have to be the same type, but constants
_must_ be typed.
*)

```

```

PROCEDURE ADR (VAR v: <anytype>): ADDRESS;
(* Returns the address of variable v. *)

PROCEDURE ROTATE (val: <a packedset type>;
                   num: INTEGER): <type of first parameter>;
(* Returns a bit sequence obtained from val by rotating up/right
   or down/right by the absolute value of num. The direction is
   down/right if the sign of num is negative, otherwise the direction
   is up/left.
*)

PROCEDURE SHIFT (val: <a packedset type>;
                  num: INTEGER): <type of first parameter>;
(* Returns a bit sequence obtained from val by shifting up/left
   or down/right by the absolute value of num, introducing
   zeros as necessary. The direction is down/right if the sign of
   num is negative, otherwise the direction is up/left.
*)

PROCEDURE CAST (<targettype>; val: <anytype>): <targettype>;
(* CAST is a type transfer function. Given the expression
   denoted by val, it returns a value of the type <targettype>.
   An invalid value for the target value or a
   physical address alignment problem may raise an exception.
*)

PROCEDURE TSIZE (<type>; ... ): CARDINAL;
(* Returns the number of LOCS used to store a value of the
   specified <type>. The extra parameters, if present,
   are used to distinguish variants in a variant record.
*)

PROCEDURE THROW (i: INTEGER) <* noreturn *> ;
(*
THROW is a GNU extension and was not part of the PIM or ISO
standards. It throws an exception which will be caught by the
EXCEPT block (assuming it exists). This is a compiler builtin
function which interfaces to the GCC exception handling runtime
system.
GCC uses the term throw, hence the naming distinction between
the GCC builtin and the Modula-2 runtime library procedure Raise.
The later library procedure Raise will call SYSTEM.THROW after
performing various housekeeping activities.
*)

PROCEDURE TBITSIZE (<type>) : CARDINAL ;

```

```
(* Returns the minimum number of bits necessary to represent
   <type>. This procedure function is only useful for determining
   the number of bits used for any type field within a packed RECORD.
   It is not particularly useful elsewhere since <type> might be
   optimized for speed, for example a BOOLEAN could occupy a WORD.
*)

Table of Contents

1 Overview of GNU Modula-2	1
1.1 What is GNU Modula-2	1
1.2 Why use GNU Modula-2	1
1.3 How to get source code using git	1
1.4 GNU Modula-2 Features	2
2 Using GNU Modula-2	3
2.1 Example compile and link	3
2.2 Compiler options	3
2.3 Elementary data types	9
2.4 Permanently accessible base procedures	10
2.4.1 Standard procedures and functions common to PIM and ISO	10
2.4.2 ISO specific standard procedures and functions	15
2.5 Behavior of the high procedure function	16
2.6 GNU Modula-2 supported dialects	18
2.6.1 Integer division, remainder and modulus	18
2.7 Exception implementation	19
2.8 How to detect run time problems at compile time	19
2.9 GNU Modula-2 language extensions	22
2.9.1 Optional procedure parameter	25
2.10 Type compatibility	25
2.10.1 Expression compatibility	27
2.10.2 Assignment compatibility	27
2.10.3 Parameter compatibility	28
2.11 Unbounded by reference	28
2.12 Building a shared library	30
2.13 How to produce swig interface files	30
2.13.1 Limitations of automatic generated of Swig files	31
2.14 How to produce a Python module	32
2.15 Interfacing GNU Modula-2 to C	35
2.16 Interface to assembly language	37
2.17 Data type alignment	37
2.18 Packing data types	39
2.19 Accessing GNU Modula-2 Built-ins	41
2.20 The PIM system module	47
2.21 The ISO system module	51
2.22 Release map	56
2.23 Documentation	56
2.24 Regression tests for gm2 in the repository	56
2.25 Limitations	57
2.26 Objectives	57
2.27 FAQ	57

2.27.1 Why use the C++ exception mechanism in GCC, rather than a bespoke Modula-2 mechanism?	57
2.28 Community	57
2.29 Other languages for GCC.....	57
2.30 License of GNU Modula-2	58
GNU General Public License	59
Contributing to GNU Modula-2.....	69
3 EBNF of GNU Modula-2.....	71
4 PIM and ISO library definitions	80
4.1 Base libraries.....	80
